Earl Fitzwilliam expressed his fear that but little would after all be effected, although the Duke of Buckingham had in consequence of the intentions of his colleagues felt himself compelled to retire from the Cabinet. If the measure to be brought forward embraced the sliding scale—if it were not large and efficient in its operation, it, he was convinced, would prove a failure.

After a few words from the Duke of Wellington, the Duke of Buckingham declared that his opinions upon the Corn Laws had undergone no alteration; that a measure had been proposed by his late colleagues on the subject which he found it impossible to support, and that as an honest man he had no alternative but to retire from the Ministry. On no other question had there been the slightest difference of opinion, and although upon that one point they were opposed, yet every other measure which Her Majesty's Government might bring forward, and which would conduce to the interests of the country, should have his cordial support. The motion for the Address was then agreed to.

HOUSE OF COMMONS.

Thursday.—A number of writs were moved for, and various notices given.

Sir Robert Peel then rose and said—"I beg to give notice that on Wednesday next it is my intention to move that the House do resolve itself into a committee of the whole house, for the purpose of taking into consideration the laws which affect the importation of foreign corn into this country." The right hon. Baronet said he would even have fixed so early a day as Monday for this important subject, but some papers relating to it would require to be read by hon. members preparatory to the discussion, and he thought that sufficient time ought to be allowed with that view.

The Speaker having read a copy of the Queen's Speech, Lord March then rose to move an address in answer to it. He adverted briefly to most of its topics, and took a decided tone upon those two which are at this moment of the most immediate interest—the Finances and the Corn-laws. He urged the necessity of providing a revenue which should be equal to our necessary expenditure, and protested against the false and foolish economy of crippling the nation in its means of defence. He thought that ships of war ought not to be risked upon service without their due complements of men, nor regiments on foreign stations exposed to mortality for want of a sufficient force to furnish the necessary relief. At the same time he was anxious that the taxation which might be necessary for the establishments of the country should be of such a nature as would not press heavily upon the poorer classes. On the subject of the Corn Laws, he must say that he preferred to see their revision undertaken by those who would give a just protection to agriculture (and the landed interests desired no more) than by a party, some of whom were for a fixed duty of 8*s.*, and some for the removal of all protection whatever. He concluded by reading the address which he had to propose, and which, as usual, closely followed the tenour of the Speech.

Mr. Beckett seconded the Address, and dwelt with some enthusiasm on the birth and baptism of an heir to the throne; trusting that the introduction of the youthful Prince within the pale of the Church would strengthen it by another pillar from the same family which had already furnished so many to its support. He touched lightly on foreign affairs, but felt it his painful duty to declare that at home distress had widely increased; insomuch that some, who not long since had been the dispensers of charity to their neighbours, were now reduced to seek it for themselves. He was persuaded that prosperity could never be reached and maintained in this country without some provision for the regular employment of the poor.—Mr. Ewart spoke at some length on the subject of commercial reform.

Lord J. Russell expressed his satisfaction with the Address. After adverting to the presence of the King of Prussia in this country, on the interesting occasion of the birth of the Prince of Wales, and reviewing the state of our foreign relations, he turned to the condition of the country. He expressed his surprise that the scheme of emigration, which had been so generally talked about as being likely to be proposed by Government, should now turn out to be an unfounded notion; and also referred to the "dramatic exhibitions" of the delegates of the advocates of a Ten Hours' Bill in their interviews with Sir R. Peel and other Members of Government. After some remarks on the agitation about the Poor-law, he proceeded to the subject of the Corn-laws; and expressed a hope that Sir R. Peel would propose an alteration based on sound principles, and which would have the effect of allaying the agitation instead of merely stimulating it. Should he do so, he would receive his cordial support; and in any measures which he might propose, he would have that justice from the Liberal party which was denied to the Government of Lord Melbourne.

Sir R. Peel replied to Lord J. Russell. He confessed that he had been deceived by the delegates on the subject of the Ten Hours' Bill, and denied that he was any party to the publication of the report of their interview with him. He entirely disapproved of that publication, and thought that the printing of every word which passed in such interviews was injurious, and destructive of that candour which should prevail between parties waiting on public men. He was surprised that Lord J. Russell, with his experience of public affairs, should have thought, because it was reported in a newspaper paragraph, that Government were considering a scheme of emigration, that, therefore, Government were bound to entertain such a project. As to the Corn-laws, he had already given notice of a day next week, when he would fully explain his intentions. Mr. Villiers and Mr. Escott both addressed the House; after which the Address was agreed to.

CITY.

Money Market, Friday.—Consols for money closed at 89¼; Three per Cents. Reduced, 89½; Three-and-a-Half per Cents. Reduced, 99⅝; New Three-and-a-Half per Cents., 98⅝; Long Annuities (expiring Jan. 5, 1860), 12 11-16; India Stock, 247½ to 248½; and Bank Stock, 167¾ to 168¼.

Metropolis and its Vicinity.

Opening of Parliament.—On Thursday the Queen went in state to the House of Lords, to open the session of Parliament with a speech from the throne. At half-past one the Royal procession formed at Buckingham Palace with the usual state ceremonies. Her Majesty wore her splendid diamond circlet, and her state robe was borne by the Pages of Honour in Waiting. Prince Albert appeared in a field-marshal's uniform, and wore the collars and other ensigns of different orders of knighthood. A short time previously to the departure of the royal *cortége*, his Majesty the King of Prussia, and the Princes Ferdinand, Augustus, and Leopold of Saxe-Cobourg, in royal carriages, and escorted by a party of the Life Guards, left the palace for the House of Peers. The band of the Foot Guards composing the Queen's Guard was on the palace lawn, receiving his Majesty on his appearance with a Prussian march, and playing "God save the Queen" on his departure. On his arrival at the House the King of Prussia was received with loud cheers: he appeared to pay great attention to the brilliant scene, and received with marked courtesy the various noblemen who were presented to him. The King wore the same uniform as at the christening of the Prince of Wales, but with the addition of the collar of the Order of the Garter. A few minutes after two, the firing of the usual salute announced the approach of her Majesty, who almost immediately appeared, led by Prince Albert, and attended by the members of the Royal Household and the great officers of state. The Duke of Wellington bore the sword of state, the Duke of Rutland the crown, and the Earl of Shaftesbury the cap of maintenance. Her Majesty looked well, and appeared in good spirits. An unusual number of persons had assembled along the whole line of road taken by the procession; and her Majesty was received with every demonstration of attachment and respect.

Visits of the King of Prussia.—On Saturday morning his Majesty the King of Prussia, and the leading members of the Royal suite, arrived in Town by a special train from Windsor, with the intention of honouring his Excellency Chevalier Bunsen, the Prussian Minister, with his company to a *déjeûné.* A select party had been invited to meet his Majesty, and the repast consisted of the choicest delicacies of the season. The table was ornamented by a profusion of fruit and flowers, and, arranged along the centre, were several beautiful trophies. At the conclusion of the luncheon, his Majesty rose, and, without any prefatory remarks, gave the health of "Her Majesty, the Queen;" and then, with marked emphasis, said, "may God bless her!" Lord Ashley shortly afterwards gave "His Majesty the King of Prussia, may God bless him in time and eternity." Every respect having been observed by the assembled guests to this toast, his Majesty, who appeared moved by the cordiality of the company present, proposed the health of "his Excellency Chevalier Bunsen, and his amiable wife and family." The King, it seems, intended visiting the Tower, the Mint, and the Thames Tunnel; but, in consequence of his protracted stay with Chevalier Bunsen, was compelled to postpone these visits, and after luncheon immediately proceeded to Paddington, and from thence, by a special train, to Windsor.—On Sunday morning at nine o'clock his Majesty arrived in Town from Windsor by a special train, and immediately proceeded to Buckingham Palace. Here he was joined by the Duke of Cambridge; and after a short interval his Majesty proceeded to St. Paul's cathedral, where he arrived a few minutes before ten. On alighting at the western entrance, he was received by the prebendaries of the cathedral, the Lord Mayor, and Sheriffs, and conducted to a stall fitted up expressly for the occasion. The Dean and Chapter had ordered that no curtailment of accommodation should take place in that portion of the cathedral usually thrown open during divine service; and the consequence was that the interior of the cathedral was thronged by persons anxious to avail themselves of this opportunity to obtain a view of his Majesty. A sermon appropriate to the occasion was preached by the Bishop of London; and after divine service the King accompanied the Lord Mayor to the Mansion-house, and having partaken of a *déjeûné*, proceeded to St. James's Palace, where the King of Hanover's apartments had been prepared for his reception. In the afternoon his Majesty attended divine worship in the Royal German Chapel, after which he paid a visit to the Duchess of Gloucester, and at five o'clock returned by a special train to Windsor.—On Monday the King took his departure from Windsor Castle, and arrived in Town by a special train about one o'clock. His Majesty first visited the model prison in Copenhagen-fields, the different parts of which he appeared to examine with much interest, and on taking leave expressed his approbation of the arrangements. The King then proceeded to visit Newgate prison, where his Majesty was received by the Lady Mayoress, Mrs. Fry, and several other ladies, as well as the different officers connected with the establishment. His Majesty, conducting Mrs. Fry, and followed by the remainder of the company, proceeded to the female ward, where Mrs. Fry explained at some length the system pursued in this prison with respect to the females. In reply to an inquiry from the King, whether they received any religious instruction, Mrs. Fry stated that religious duties were observed every night and morning; and added, that though formerly this part of the prison had been unsafe even for her to enter, now, through the blessing of Divine Providence, the exertions of her and her friends had been crowned with success, and many of the prisoners left the walls of the gaol in perfect penitence, and eventually became useful and honourable members of society. After going through the usual religious duties, Mrs. Fry offered up an extemporaneous prayer, invoking a blessing on his Christian Majesty, his beloved consort, and his prosperous country. On commencing the prayer Mrs. Fry knelt, an example which was immediately followed by the King and all present. The King then retired, in company with Mrs. Fry, to whom his Majesty offered his arm; and having conducted her to the carriage, accompanied that lady to her villa at Upton, near Barking, where his Majesty partook of a *déjeûné.* His Majesty returned to St. James's Palace at a quarter past five, and afterwards, attended by his suite, proceeded to Drury-lane Theatre. After leaving the theatre, his Majesty, at half-past eight, proceeded to Stafford-house, to honour the Duke and Duchess of Sutherland with his company at dinner. The entertainment, on this occasion, is said to have been one of the most magnificent ever given in this or any other country. Several members of the Royal Family, and a select party, were invited to meet his Majesty. On leaving Stafford-house, the King returned to Buckingham Palace, where his Majesty and suite slept that night.—On Tuesday morning the King, attended by his suite, left Buckingham Palace before ten o'clock, and proceeded to Somerset-house, to be admitted a Fellow of the Royal Society. That body had assembled in considerable numbers at a special meeting held at nine o'clock, for the purpose of the election. His Majesty was received by the Council and Sir John Lubbock, Bart. Vice-president. In the absence of the President, the Marquis of Northampton, Sir John Lubbock expressed to his Majesty "the great gratification with which the society would see the august name of his Majesty, who was venerated as the encourager of art, of literature, and science, enrolled in their charter-book, in the same page with those of their beloved Sovereign and her illustrious consort; and they begged leave, accordingly, to present the charter-book to his Majesty for that purpose." His Majesty then signed his name in the charter-book, and expressed his gratification at having his name enrolled among the fellows of the society. Baron Alexander von Humboldt, formerly elected a foreign member, was also duly admitted a fellow. Mr. Murchison, president of the Geological Society, then addressed the King to the effect that the society of which he was the president requested that his Majesty would become an honorary member of their body, as they would feel a peculiar pride in having the name of a monarch whose dominions abounded with objects of geological interest inscribed in the book of the society. His Majesty acceded to the request, and, accompanied by the president, the Earl of Aberdeen, and other gentlemen, went to the apartments of the Geological Society, where a rare collection of fossils was submitted for the King's inspection. Having taken a cordial leave of the members of these learned institutions, his Majesty proceeded to the British Museum, visiting, on his way, the house of Mr. Solly, in Bedford-row, to inspect that gentleman's collection of paintings of the school of Raphael. It was of that gentleman that the late King of Prussia bought the valuable collection which now adorns the gallery of the Museum at Berlin. His Majesty arrived at the British Museum a few minutes after eleven, and was received by Sir Henry Ellis, principal librarian, the Bishop of London, Sir Robert Inglis, and different officers of the establishment. His Majesty remained three hours, inspecting the various objects of interest, from which he appeared to derive considerable gratification, more particularly in the manuscript department and the saloon of the Elgin marbles. In the former of these, after inspecting all the most rare and valuable MSS., an original manuscript, in the hand-writing of his ancestor Frederick the Great, was submitted to him. The MS. contained Frederick's reflections on the military character of Charles XII. of Sweden, in which he gives it as his decided opinion that Charles XII. was not a sound tactician; for if he had been such, he would never have thought of carrying an army over a barbarous country to Moskow. His Majesty appeared highly interested with this letter. Before leaving, the King expressed his desire of again seeing the Magna Charta, his Majesty having seen it previously on his visit to this country with his father, the late King of Prussia, in 1814. Having inspected everything of interest in the institution, his Majesty expressed astonishment at the great additions which had been made to the museum since 1814, and left about two for Buckingham Palace, to dress previously to honouring the Duke of Sussex with his company to luncheon at Kensington Palace. In the evening the Duke of Wellington gave a grand banquet to the King at Apsley-house, where a select and distinguished circle of guests, including the Duke and Duchess of Cambridge, and the Princess Augusta of Cambridge, were invited to meet his Majesty.—On Wednesday morning the King again quitted Buckingham Palace at an early hour to visit the remaining objects of interest in the Metropolis which his Majesty had not yet inspected. At half-past eight his Majesty embarked on board a steam-packet at Hungerford wharf, and went down the river to visit the Thames Tunnel. On his arrival, he was received by the chairman, Mr. B. Hawes, M.P., several of the Directors, and by Sir Isambard Brunel, the engineer. Although the hour was early, a number of visitors had also assembled to welcome his Majesty. On being conducted through the tunnel by Sir I. Brunel, who explained the different parts of it, the King expressed great admiration at the stupendous nature of the undertaking, and exclaimed, "It surpasses all I have heard of it before. I thought the accounts had been exaggerated; but now that I see it, the statements respecting it are short of reality." The King inquired what depth of water there was above them, and was informed from 30 to 36 feet at highest tides. His Majesty appeared to be much gratified with the details of the work as described to him by Sir I. Brunel, and on taking his leave was loudly cheered by the workmen and visitors assembled. The King then proceeded to the Tower, where, it seems, his arrival had not been anticipated. It being low water, his Majesty was unable to proceed alongside the Tower-stairs in the steamer, and landed in one of the watermen's boats hailed from the stairs for the purpose. His Majesty seemed amused at the evident consternation his unexpected arrival had created amongst the officers connected with the fortress, and laughed heartily at the bustle that ensued. Having inspected the horse armoury, and other places of interest in the Tower, his Majesty was met by Major Elrington, the Governor, and the Commanding Officer of the Guards, who expressed their regret that the usual honours were not observed on his Majesty's arrival. The ruins of the Grand Storehouse were the part last visited by the King, who greatly admired the Maltese gun which was saved from the fire, and immediately after returned to Buckingham Palace for the purpose of receiving addresses from several public bodies. Among the most interesting of these was one presented by Archdeacon Hare, who attended with the clergy of the Archdeaconry of Lewes, to congratulate his Majesty on his arrival in this country, and his having undertaken the responsible office of godfather to the Prince of Wales, together with his munificent donation towards the establishment of a bishopric at Jerusalem. After listening to the Address with deep attention, his Majesty replied, "My reverend gentlemen—The expression of Christian sympathy from so respectable a portion of the National Clergy of this country is highly gratifying to me, and I say 'Amen' to all the prayers and wishes you express." A deputation also waited on his Majesty from the Society for promoting Christianity amongst the Jews, and presented a congratulatory Address to his Majesty on his many virtues, and the invaluable services he had performed in the cause of Christianity; particularly expressing their admiration of the Catholic zeal and Scriptural wisdom displayed by his Majesty in the conception and execution of the plan for the erection of a Protestant bishopric in the Holy City. The deputation concluded by offering for his Majesty's acceptance a copy of the Scriptures, which they stated had been bound by the hands of Jewish converts, trained and supported in honest industry within the precincts of an institution founded by the Society for that especial purpose. His Majesty replied in the following words: "My Lords and Gentlemen, In what you have been pleased to say respecting my person, I can only acknowledge the effects of a very warm affection. I am conscious of having simply wished to make your nascent establishment on Mount Zion available for all Continental Protestant churches, and I rejoice in the spirit and success of the efforts of the venerable prelates who are at the head of your church in realising my wish. I shall continue to look upon your society as prominently instrumental in the execution of this plan. Accept my thanks for the valuable present you offer me. Finally, I thank you for all your Christian aspirations; and I wish to you, both as a body and individually, every prosperity and blessing from Almighty God." After receiving several other Addresses, and giving an audience to the Prince of Capua, his Majesty and suite honoured the Archbishop of Canterbury and Mrs. Howley with his company at luncheon in Lambeth Palace. At four the King returned to Buckingham Palace, and in the evening dined with the Duke and Duchess of Cambridge at Cambridge House, and in the latter part of the evening honoured Covent Garden theatre by his presence.—On Thursday the King, after his return from the House of Lords, received deputations from Protestant Dissenting ministers, after which his Majesty visited the Queen Dowager, and honoured the Earl and Countess of Jersey, and the Duchess Dowager of Richmond, with visits at their respective residences. His Majesty also went to Cambridge House, to visit their Royal Highnesses the Duke and Duchess of Cambridge, and, before returning to Buckingham Palace, proceeded to Apsley House, to pay a visit to the Duke of Wellington.

Public Meetings.—A public meeting has been held at the London Tavern, of merchants, land-owners, and others interested in the prosperity of the colony of the Cape of Good Hope, for the purpose of adopting measures to prevent that colony from being overlooked in any Government scheme of emigration, in consequence of a despatch from the governor, Sir G. Napier, dated March 15, 1841, and addressed to Lord J. Russell, wherein his Excellency disputes the facts mentioned in the memorial of 1,000 of the principal inhabitants, which points out the advantages likely to accrue to the colony by Government setting apart 12,000*l.* annually from quit-rents on Government lands, in order to provide free passage for mechanics and labourers from Europe. The meeting was numerously attended, D. C. Guthrie, Esq., in the chair. Mr. Borrodaile first addressed the meeting, and entered into the various objections of the despatch, which he endeavoured to controvert by facts of his own experience, and the present statistics of the colony, and concluded by moving the first resolution,—"That Cape Colony labours under great disadvantages from the want of a sufficient number of steady and industrious labourers, for the profitable employment of whom, as well as for additional capital, there is a wide field in the colony." Mr. Maynard, in seconding the motion, said he knew a property in Albany, only twenty years ago a wilderness, which was bought for 3,600*l.* He also mentioned that in public tenders carpenters were put down at 10*s.* 6*d.* a-day, and that shepherds' assistants were receiving from 15*l.* to 30*l.* per annum, with food and lodging. Mr. Venning moved the second resolution,—"That it was the opinion of the meeting that the state of the colony was truly set forth in the statement of the memorialists." Mr. Borradaile read a long memorial to Lord J. Russell, signed by 250 landowners and merchants resident in this country, to which his lordship returned an answer, "That he did not consider the Cape an unfit place for emigration, but only objected to making Government bankrupt for the purpose." The meeting was addressed by several other gentlemen, and finally a deputation was appointed to wait on Lord Stanley, Secretary for the Colonies, in support of the statements of the two memorials. One of the speakers said that in his estate of 5,000 acres, only 300 were under plough for want of labourers, and that there were 7,500,000 acres of good land uncultivated. Mr. Burnie, in moving a vote of thanks to the chairman, commented on the absurdity of sending emigrants 17,000 miles, when the Cape was so near, and its climate so suitable to the English constitution. The resolutions were all carried unanimously.—On Monday a public meeting was held, pursuant to public notice, for the purpose of receiving the report of the trades' delegates relative to the present position of the masons, who, it seems, are still on strike at the Houses of Parliament and Woolwich dockyard. The meeting was numerously attended. The chairman, who was a Mr. Dunning, bookbinder, stated that this was the twentieth week of the strike, which when it commenced embraced 375 individuals, of whom only five had proved false to the cause. They were compelled now to apply to the other trades for assistance, because at this time of the year most of the stonemasons were out of employment; but get them once over the season of frost, there were plenty of works requiring hands, and if they could once be carried over the winter season, they must triumph. Mr. Goulton, a painter, moved the first resolution, commendatory of the "steady, manly, and straightforward" conduct of the masons during the strike; which having been seconded, was carred unanimously. Several other resolutions were also carried, expressing the feeling entertained by the meeting of the conduct of the quarrymen of Devonshire in refusing to quarry stone for the works of Messrs. Grissell and Peto; condemning the conduct of the Commissioners of Woods and Forests, and the Lords of the Admiralty, in supporting those gentlemen, and pledging the meeting to support the masons in their strike so long as it shall last. The meeting was addressed by Messrs. Wakley and Feargus O'Connor at some length, to whom votes of thanks were passed.

Metropolitan Improvements.—It is stated that, in addition to Kingston-house, the Halfway-house on the Knightsbridge-road is to come down, in order to widen the road from Hyde-park corner. The Commissioners of Woods and Forests, &c., have purchased the houses at Kensington, in order to form an appropriate entrance into the town; whilst at Bayswater, it is said, the villas will be again continued along the line of road.—A meeting was held on Saturday in the Adelphi, for the purpose of forming an association for the purpose of watching, on the part of the public, the plans and improvements now proceeding in the Metropolis. The Chairman, C. W. Dilke, Esq., having stated the proposed objects, the meeting was addressed by Mr. Fowler and several other gentlemen, who pointed out the many serious mistakes and failures of plans which have recently taken place owing to the incompetence of Committees of the House and other parties.—The first stone of the New Houses of Parliament will be laid by her Majesty early in the summer.—It is intended by the Court of Common Council to petition Government for the removal of the old houses in Postern-row, Tower-hill, to make way for extensive improvements in the City, the cost of which, if carried out, will, it is said, be about 10,000*l*.

Accidents and Inquests.—Great alarm was created on Thursday morning in Charles-street, Drury-lane, by the sudden falling in of three houses, whereby two persons were killed, and many others wounded. It appears that these houses, as well as several others adjoining, have long been in a dilapidated state; and at the inquest which is to be held a strict investigation into the circumstances connected with the accident is expected to take place.—On Saturday an inquest was held on Jacob Simms, Esq., one of the magistrates for the county of Essex, who destroyed himself by cutting his throat. From the evidence it appeared that deceased had lately been subject to low spirits and occasional fits of mental aberration; but no specific cause was stated for the commission of the act. The jury returned a verdict of "Temporary insanity."

Spitalfields.—The Lords Commissioners of the Treasury, in compliance with an application, have requested the Board of Ordnance to give directions that the following articles—viz. 673 blankets, 173 palliasses, 1,000 sheets, 500 bolster-cases, and 471 flannel shirts, may be immediately supplied to the Committee for the relief of the distressed weavers in Spitalfields, to be applied to the purpose intended.

Woolwich.—Yesterday the King of Prussia and Prince Albert arrived at an early hour, attended by his Majesty's suite and a number of distinguished individuals, and visited the Royal Arsenal and the various objects of interest it contains. A large body of troops were then assembled on the Common, and a review took place in presence of his Majesty, who also witnessed a display of the ricochet, ball, and rocket practice in the marshes, and mortar and howitzer practice on the common. His Majesty and the distinguished party by whom he was attended afterwards partook of an elegant *déjeûné* in the mess-room of the Artillery, and at 2 o'clock embarked for Ostend under a Royal salute, and with all the honours which have marked his progress during his visit to England.

Provincial News.

Brighton.—This town has been during the last week in a state of some excitement, in consequence of the expected visit of her Majesty and Prince Albert. Considerable activity prevails at the Pavilion, where a great number of workmen have, for several days, been engaged in painting and decorating the interior; and several alterations are making for the accommodation of the nursery, as it is understood that the Prince of Wales and the Princess Royal will accompany her Majesty during her visit, which, it is rumoured, will be continued for six weeks. On Monday, a numerous meeting of the principal tradesmen of the town was held at the Town Hall, the High Constable in the chair, for the purpose of considering what steps should be taken to receive her Majesty and Prince Albert; but as the precise period of her Majesty's intended visit is not yet fixed, nothing more was done than the appointment of a committee.

Bristol.—It is stated that in consequence of a number of valuable letters, containing money, having lately been stolen from the post-offices in this city, and a representation to that effect having been made to the Postmaster-General, Mr. Ramsay, one of the examiners, was sent down to investigate the matter, and, if possible, to discover the parties. With the assistance of the police, information, it seems, was obtained which caused suspicion to fall on two of the clerks, one of whom has been in the office many years. The result is, that the two clerks have been suspended, and Mr. Ramsay, it is understood, is gone to lay the circumstances before the Postmaster-General, and to receive instructions as to ulterior proceedings.

Bury.—A local paper, the *Herald*, states that there is not a single person confined for debt in the gaol of this town; a circumstance which, it is added, has never before occurred during a period of forty-four years.

Falmouth.—Accounts have been received of the following alleged act of piracy, which was committed in this harbour on the night of the 25th ult. It appears that Capt. Williams, of the schooner Brisk, belonging to Bristol, which was at the time lying in this harbour, having business to attend to in the town, left the vessel early in the evening, and on getting ashore gave directions to his men to be in attendance for him at eleven o'clock. Capt. Williams was in waiting at the time appointed, but there being no boat he engaged a pilot to put him on board his vessel, but had not proceeded far when it was discovered that the vessel had sailed, and had got out of the harbour. The coast guard were immediately apprised of the affair, and several "clippers" were set afloat in chase of the vessel; but a heavy gale of wind coming on at the time rendered egress from the harbour impossible. On Tuesday, intelligence was received that the vessel had arrived at Bristol, when the mate and crew were taken into custody, and examined before the magistrate. The Captain in his charge stated that he had never given any person permission to sail without him, and that the crew by so doing had revolted against his authority. The crew being called on for their defence, the mate said that the captain went on shore under the pretence of buying a small quantity of canvass, and remained on shore the whole of the day. There were a great many of the vessels in port getting under weigh, on seeing which he said to the men, that he supposed they should have the captain on board presently, and told them to set the foresail and make ready. Shortly after, finding that the captain did not come on board, he got the vessel under weigh and sailed, as otherwise the vessel would have drowned herself in half an hour. He further added, "that the men were paid by the run, and they were not going to be detained there while the captain chose to be taking his pleasure on shore." The owner also, he said, had told him that if the captain was incompetent, he was to take the command. This was denied by both the captain and the owner. The magistrate said it was a case of piracy, for which in law they were all liable to be hanged, and they must be taken to Falmouth and tried for the offence.

Hulme.—A serious accident, attended with loss of life, has occurred in this town, in the boiler-house attached to the cotton-mill of Messrs. John Pooley and Son, Clarence-street, near the Cavalry Barracks. It was caused by the rent and collapse of an internal boiler flue, which immediately caused the steam, hot water, fire, burning coals, &c., to be driven out of the fire-doors with great force, scalding four men so seriously that three of them died the same day, and the fourth remains in a very precarious state. An inquest has been held, and after a lengthened investigation a verdict of "Accidental death" was returned, unaccompanied by a deodand.

Leeds.—We have noticed, in previous Numbers, some public meetings and other proceedings that have taken place in this and the neighbouring manufacturing districts, relative to a Bill to be proposed to Parliament for shortening the time of labour in the factories; and in forwarding which, it will be remembered that Lord Ashley has, for a long time, shown himself a strenuous and persevering advocate. During the past week, a letter has been addressed by his Lordship to the Short-time Committees of Cheshire, Lancashire, and Yorkshire, announcing that Sir Robert Peel has definitively made known his intention to oppose the Bill. His Lordship, after announcing this determination of the Premier, which, he says, he must conclude is to be regarded as the reply of the whole Government on this important question, concludes with the following words:—"Though painfully disappointed, I am not disheartened, nor am I at a loss either what course to take, or what advice to give—I shall persevere unto my last hour, and so must you; we must exhaust every legitimate means that the Constitution affords, in petitions to Parliament, in public meetings, and in friendly conferences with your employers—but you must infringe no law, and offend no proprieties; we must all work together as responsible men, who will one day give an account of their motives and actions; if this course be approved, no consideration shall detach me from your cause—if not, you must select another advocate. I know that, in resolving on this step, I exclude myself altogether from the tenure of office; I rejoice in the sacrifice, happy to devote the remainder of my days, be they many or be they few, as God in his wisdom shall determine, to an effort, however laborious, to ameliorate your moral and social condition."

Portsmouth.—H. M. S. *Vindictive*, which was driven ashore during the heavy gale of last week, has been taken into dock, and, on examination, has been found to have sustained extensive injury. All the damage, however, appears to be in the fore part of the ship, and not abaft, as was supposed from her mizen-mast having been cut away. It appears that nearly the whole of her false keel is gone, and that about thirty feet of her main keel forward are destroyed, her gripe is gone, the stern about seven feet up destroyed, her frame greatly shaken, her copper much ruffled, and the oakum for about three streaks from the garboard started fore and aft. It is said that it will be necessary to take out her guns and all her stores before she can be repaired, and that it will be a month or six weeks before she can again be ready for sea. It is understood that there will be a court-martial to investigate the matter.—The *Wolverine*, 16, Commander Johnson, arrived in this port on Sunday from the eastward; and it is said, that after completing her stores and ship's company, she will proceed to China.

Sheffield.—A local paper, the "Independent," states that it is enabled to announce, on authority, that an official communication has been received from Lord Wharncliffe, President of the Council, stating that the Privy Council have decided to advise her Majesty to grant a Charter of Incorporation to this borough.—On Monday a serious accident occurred in this town by the bursting of a steam-boiler at the Philadelphia Works, whereby considerable damage was done, and two men engaged near the spot at the time were so seriously injured that the recovery of one is considered hopeless, and the other remains at the infirmary in a dangerous state. The cause of the accident is not yet precisely known.

Southampton.—On Saturday a vestry meeting was held in the parish of Lyndhurst, in this county, in consequence of a resolution moved at a previous meeting "that in consequence of the great increase of the poor-rates since the incorporation in the New Forest Union, it was desirable to detach the parish therefrom." Mr. Sturgeon, of Pondhead Lodge, addressed the meeting at considerable length, and expressed the disappointment of himself and his fellow-parishioners at the result of the introduction of the New Poor Law system into that district. The parish accounts, he said, showed that during six years previously to the formation of the union the annual sum levied had gradually decreased, and that in the year 1836, the last previously to the incorporation, the rates only amounted to 321*l*. In 1837, however, there was a levy of 344*l*.; in 1838, 409*l*.; in 1839, 453*l*.; in 1840, 501*l*.; in 1841, 586*l*.; and this was exclusive of expenses incurred in building the union workhouse, which had been defrayed by the sale of parish property. After some further observations condemnatory of the whole system of the New Poor Law, he concluded by moving that a petition to the Legislature be prepared, praying that the parish of Lyndhurst might be disunited from the New Forest Union, or that the New Poor Law might be altogether repealed. This resolution having been seconded, Mr. Lainson moved an amendment for postponing all further consideration of the matter for six months, as he had an impression that 300*l*. had been saved in the last six years; had it been otherwise, the motion should have had his support. No one being found willing to second the amendment, the original motion was carried with only one dissentient voice, and a day named for preparing the petition.

Weymouth.—A memorial addressed to the Archbishop of Canterbury against the prevailing doctrines of Popery and Puseyism is now in progress of signature by the inhabitants and visitors of this town and Melcombe Regis.

Windsor.—On Saturday morning an inspection of the 72d Highlanders, under the command of Col. Arbuthnot, took place in the Home-park. The Queen, the King of Prussia, and Prince Albert witnessed the spectacle from the southern windows of the Queen's boudoir. The various evolutions were performed with great dexterity and precision, and their Majesties and Prince Albert expressed their unqualified approbation of the soldier-like appearance of the regiment, and the manner in which they performed the different exercises. The day being unusually fine, rendered the scene brilliant and interesting, and a great number of persons assembled in the Park at an early hour to witness the review. Her Majesty and the Prince, the King of Prussia, and the Duke of Wellington, were loudly cheered as they left the Terrace. Her Majesty and Prince Albert afterwards appeared at their private drawing-room window, where they remained during the time the regiments were marching from the Park. Immediately after the inspection, Prince Albert, accompanied by his Majesty the King of Prussia and attendants, drove in the pony phaetons up the Long-walk.—On Monday the King of Prussia took his departure from the Castle, and on his way to Slough was enthusiastically cheered by crowds of persons, who lined the various thoroughfares through which the royal *cortége* passed to the railway station. Before his departure, his Majesty left the sum of 100*l*. to be distributed among the poor of the town.

Railways.—The half-yearly meeting of the proprietors of the Liverpool and Manchester Railway has been held at Liverpool, Mr. C. Lawrance, chairman of the board of directors, presiding. The secretary read the report, which commenced by alluding to the existing distress and embarrassment, and to the influence which they had on the affairs of the company. It appeared that the receipts for the half-year were, in the coaching department, 80,549*l.* 14*s.* 7*d.*; merchandise department, 53,974*l.* 19*s.* 11*d.*; coal department, 3,006*l.* 3*s.* 4*d.*; total, 137,530*l.* 17*s.* 10*d.* The gross expenditure for the same period was 70,080*l.* 5*s.* 7*d.*, leaving a net profit for the half-year ending the 31st Dec., 1841, of 67,450*l.* 12*s.* 4*d.* Add to the profit the surplus from the half-year ending June, 1841, and the disposable fund is 74,182*l.* 9*s.* 7*d.* The number of shares entitled to a dividend is 12,090 hundred pound shares. The directors recommend a dividend of 5*l.* per share, amounting to 60,450*l.*: also the payment of a third instalment of the reserved interest on 5,100 original 100*l.* shares, 1*l.* per share, 5,100*l.*; and on the 5,100 first quarter shares 2*s.* per share, 510*l.*; total, 66,060*l.*, which, being deducted from the available fund, as above stated, will leave a balance of 8,122*l.* 9*s.* 7*d.* to be carried to the next half-year's account. We are informed by the "Railway Times" that the number of passengers carried on the Great Western Railway on Tuesday, the 25th ult. (the day of the christening of the Prince of Wales) was 6,375. A few days since the passenger train from Haswell to Hartlepool was proceeding towards Castle Eden, when a rail was sprung in such a manner as to enter the fore part of the coach, passing through diagonally, and lodging in the higher corner of the opposite part of the roof. The coach was full of passengers, but no one, fortunately, received any injury. The bar, however, it seems, touched one gentleman's hat, and another was thrown from his seat by the shock, to which circumstance his preservation is attributed, as the rail struck through the part where he was sitting, and, had he retained that position, would, it is thought, inevitably have killed him on the spot.—On Tuesday some alarm was occasioned by a report that an accident had occurred by the fall of the buildings at the Cowlairs station on the Edinburgh and Glasgow Railway. The accounts were much exaggerated, a portion only of the building having fallen, by which five men were injured, but no lives were lost.

IRELAND.

Dublin.—The contested election for this city, which terminated on Saturday, passed over without much excitement or any disturbance of the peace; and on the announcement being officially made by the sheriffs, that Mr. Gregory was returned by a large majority, all parties returned to their homes without any great demonstration of public feeling.—Serious accounts have been received from the provinces, detailing the effects of the hurricane on the 26th ult., from which it appears that loss of life and property to a great extent has been the consequence. The injury done to Wellesley-bridge, Limerick, is said to amount to upwards of two thousand pounds. The manors and demesnes of Lords Waterford, Carew, and Duncannon, have suffered greatly; the finest timber being destroyed and all the beautiful seats in the county of Waterford being more or less damaged. In some parts of the south, it seems, large quantities of potatoes have been swept away; and the demesnes in the county Limerick have lost some of their finest timber trees. Several vessels were wrecked on the coasts of Kerry and about Limerick. A Galway paper communicates the intelligence of the loss of thirty-five fishing boats during the night of the hurricane, with crews of from five to six persons in each boat, making a total loss of life of 170 to 180 persons. This event took place to the north of Sline head. Several other wrecks, attended with serious loss of life, are also detailed in the provincial papers.—The members of the Society of Friends have, it is said, been strenuously exerting themselves to save the life of the murderer Delahunt, on the ground that he is a monomaniac. His execution is appointed to take place this day.—A meeting of the Repeal Association was held on Tuesday, when, after some preliminary business, Mr. O'Connell rose, and having made some allusions to a repeal meeting that had been recently held in Dundalk, referred to the recent election for this city, observing that they could no longer measure swords with the Tories. They had, he said, an overwhelming majority to support them in England, and in Ireland one or two additional triumphs were not so much a matter of importance to them as that they should unfurl the repeal flag. The late election was the last at which he should ever vote for any man not a Repealer. Win or lose, he would never again vote for any but a Repealer in Dublin. He had courted the Orangemen, he proceeded to say, for years, and had made the experiment of the Precursor Society to ascertain whether an Imperial Parliament would render justice to Ireland, and the utter inutility of both attempts had been demonstrated. Yet, he would ask, had they deserved the contempt and injustice with which they had been treated? He trusted, however, that the contrast between them and their enemies would be maintained. He wanted nothing to sustain his own creed except its own innate strength. He asked no bayonets or force of any description in its defence, and he conceded to every man what he demanded for himself—perfect political rights. Mr. O'Connell then proceeded, at some considerable length, to comment on a letter that had been published some time since by the Earl of Shrewsbury, in reference to the Roman Catholic religion; after which, some subscriptions were announced, and the secretary informed the meeting that the signatures to petitions for repeal received since last day of meeting amounted to 55,000. Mr. Fitzpatrick, a town councillor, then addressed the meeting, alluding with considerable warmth to the recent election for this city, and calling on his fellow-citizens to work for repeal. If Mr. O'Connell should die, the repeal banner would be pulled down; and though they might answer him with cries of "No," he still said "Yes." They might, he said, take up arms, they might and very likely would be driven by Tory persecution to fight, and if they fought they would be defeated. At all events, let them come forward now with their money, get a Parliament of their own, and then they need fear nothing. Mr. O'Connell said in the first place, he did not intend to die until repeal was obtained; and in the next, he felt satisfied that the people of Ireland were sufficiently well instructed, were too sober and temperate, and knew too well their duty to the higher powers, to do anything calculated to produce a revolutionary convulsion. Several other subjects of little interest were discussed, and Mr. O'Connell continued his address to a great length. On the evening of the same day he left Dublin for London, to be present at the opening of Parliament on Thursday.

Cork.—A local paper states that the old adage "It is a bad wind that blows nobody good" has just been verified at Doneraile, inasmuch as the late storm, which blew down nearly 1,000 trees on the estate of Lord Viscount Doneraile, has brought comfort to the poor of that town and neighbourhood; his lordship having ordered that they should be permitted to take away for their own use the tops and branches of all the trees so blown down.

THEATRICALS.

Drury-Lane.—On Monday his Majesty the King of Prussia honoured this theatre with his presence. The performance commenced at six instead of seven, at the King's request, to admit of his Majesty's dining at Stafford House, with the Duke and Duchess of Sutherland, at half-past eight. The play selected for the occasion by the King was "The Two Gentlemen of Verona." His Majesty, who arrived at the theatre punctually at six, was received by Mr. Macready with the formalities observed on such occasions, and conducted to the Queen's private box, on entering which he was greeted with loud cheers from every part of the house, which he acknowledged by bowing repeatedly both to the boxes and the pit. The house, though full, was not crowded, owing, it is supposed, to the fact that his Majesty's visit had not been made known by previous announcement. The national anthem was first sung by the whole strength of the company, and drew forth loud and long-continued applause from all parts of the House, in which the King joined. The comedy then followed, and was throughout well performed; the acting, though not received with general enthusiasm, appearing to give considerable gratification to his Majesty, who was more frequent in the applause he gave than any one else in the house, and appeared perfectly to understand its different merits. The King was furnished, on entering the box, with a book containing the play, and paid great attention to every scene. Immediately on its conclusion, or rather before the last scene was quite over, his Majesty retired from the box amidst the cheers of the house; and on entering the carriage in waiting for him, was also much cheered by the multitude without.

Covent-Garden.—On Wednesday the King of Prussia honoured this theatre with his presence, where a crowded audience had assembled to welcome him. His Majesty had dined with the Duke of Cambridge, and for his accommodation the hour of performance was postponed till eight, and the pantomime played as the first piece, to allow of his witnessing the whole play selected by his Majesty for the occasion, which was the "Merry Wives of Windsor." The King entered the theatre shortly after ten, and his appearance was the signal for the same gratifying demonstrations as have marked his progress among every class of the English public. The audience rose to receive him, and cheered again and again, whilst his Majesty presenting himself in front of the box, and repeatedly bowing to the different parts of the house, seemed fully to appreciate this kindness. The whole vocal strength of the company then appeared on the stage, to sing the Prussian national anthem of "Der Landes Vater," harmonised for this occasion by the Chevalier Neukomm, and the words arranged by M. Benedict. "God Save the Queen" was then sung, after which followed the drama, which was throughout well performed. The ballads introduced were cleverly sung, more particularly the duet "I know a bank," by Madame Vestris and Miss Rainforth, which was encored by his Majesty and the whole audience. Throughout the entire play the King paid marked attention to the acting, and was frequent in his plaudits. His Majesty and suite stayed till the middle of the fourth act, when he retired privately, and consequently without calling for any further demonstration of respect. A large assemblage of persons had collected outside the theatre, who loudly cheered his Majesty on his departure.

Haymarket.—A new comedy was produced at this theatre on Saturday under the title of "Marriage." The following is an outline of the plot:—*Mr. Wortley*, an elderly gentleman of fortune (played by Mr. H. Wallack), arrives in London at the height of the fashionable season, with his ward, *Adelaide Temple* (Mrs. C. Pettingall), on a visit to *Lady Belgrave.* It appears that *Miss Temple* has at heart no disinclination to receive the addresses of *Sir Harry Vivid* (Mr. Wallack), a gay and somewhat fickle man of fashion. But there is a certain *Mr. Baldwin* (Mr. Stuart), a mysterious and gloomy personage, fatally addicted to gambling, who has fixed his affections upon *Miss Temple*, but suspecting her predisposition in favour of *Sir Harry*, he deems it impossible to gain the lady unless he can succeed in estranging her regard from the baronet. To effect this, he devises a two-fold scheme in concert with a gambling associate, *Dronk* (Mr. Webster); the first of which is to introduce *Sir Harry* to a beautiful girl, *Clara Irvine* (Mrs. E. Yarnold), in the hope that her attractions may wean him from his attachment to *Miss Temple*, and that the latter lady, high-born and proud, with something of the coquette in her disposition, may repel him with scorn when she hears of this new attachment. The second part of the scheme is, as *Sir Harry* has not yet taken any decided part in politics, to entangle him into a connexion with a Radical Association called the *Pro Bono Publico* Society, in the assurance that no step would more effectually injure him in the esteem of the haughty and aristocratic girl. The first of these plans succeeds, *Sir Harry* falling in love with *Clara*, whom he sees at a fancy fair, which is introduced on the stage with some effect. He receives a letter from *Clara*, making an appointment, when he writes a note accepting it; but before it is sent, a deputation from the *Pro Bono Publico* Society wait on him to request that he will take the chair at one of their meetings, which he indignantly rejects. They, however, require his refusal in writing, to which he consents; but in mistake gives them the note he had written for *Clara*, and sends to the latter the answer meant for the deputation. This brings about an *éclaircissement*. *Clara* in an interview with *Vivid* discloses the plot which is working against his happiness; and *Miss Temple*, who, in revenge for *Sir Harry's* fickleness, had employed *Baldwin* to spread a counter report of her intended marriage with him, becomes reconciled to *Sir Harry*; whilst *Mr. Baldwin* suddenly renounces the error of his ways, and gives his hand and heart to *Clara*, who, it seems, had long been in secret devoted to him. The acting of the performers was good, and well sustained; more especially that of Mr. Wallack, Mrs. Pettingall, and Mrs. Yarnold. The piece appeared to be regarded by the audience as too long, and in many parts tedious, the performance occupying more than four hours: but on the whole it was well received, and announced for repetition every night, amid considerable applause.

Miscellaneous.

Capture of Slavers.—By intelligence received at Portsmouth, we learn that H.M. brig Waterwitch, Lieut. Matson, captured on the 20th Oct. the slave-vessel Don Francisco, fitted for receiving slaves. On the 28th of the same month she captured the notorious slaver the Ermalinda, with a cargo valued at upwards of 4000*l.*, including a London-built carriage that cost 400*l.*, and a pair of handsome greys, intended as a bribe from the slave-merchant (owner of the prize) for the purchase of slaves. The prize was sent to Sierra Leone for condemnation.

Newspaper Statistics.—A morning paper gives the following list of the number of newspapers at present published in different parts of the world:—In Spain there are 12 newspapers; in Portugal, 17; in Switzerland, 36; in Russia and Poland, 84; in Holland, 150; in Great Britain, nearly 300; in Prussia, 288; in the other Germanic states, 305; in Australia, 9; in Asia, 27; in Africa, 12; and in America, 1,138. The total number of newspapers published in Europe is 2,148.

Red Crab of India.—An Indian correspondent of the *Times* recently gave a long account of a species of crab, which he appears to think has hitherto been unnoticed; the following extracts from his letter may be interesting to our readers:—"Within a short distance of Point Palmyra, on the Coromandel coast, and on the road leading by the sea-side to the far famed Black Pagoda, is to be met with, at certain seasons of the year, a peculiar species of crab, which it would appear has hitherto escaped the notice of naturalists. As myself and a friend were walking, during the month of May, from the lighthouse towards Patamoondie, the sands before us assumed a uniform red hue, as if they had been covered with a scarlet cloth, which extended as far nearly as the eye could reach. The ground over which we were passing was composed of the burrows of myriads of minute red crabs, which the moment they became sensible of our approach scuttled away into their hiding-places, leaving the sand at a short distance, both before and behind us, in its natural state. On taking one and examining it minutely we found it differed materially from the common marine crab, being divested of the caudicle peculiar to the latter, and in lieu of it being furnished with an acicular spike, which it seemed to possess the power of erecting or depressing at will as a weapon of defence. The *scutum* also, instead of being hard and calcareous, was very soft and compressible, and filled with a red fluid approaching the colour of vermilion. At some short distance from us we noticed a flamingo busily engaged in feeding on these creatures, and the plumage of this bird being of a bright scarlet probably enables it the more easily to steal among its watchful prey unheeded, and without alarming them. In about a month afterwards the periodical rains set in, and we lost sight of this marine phalanx altogether. There is an aquatic dwarf shrub, which prevails to some extent hereabout, called by the natives of the neighbourhood 'Sal-Balu,' or 'Sand-Saul,' the root of which, when properly handled, is capable of imparting beautiful and permanent crimson dye to cottons, little if at all inferior to that received under the name of Adrianople or Turkey red. No known acid or alkali has yet been discovered that will discharge the 'Sal-Baludye.' The same is procured only on this immediate part of the coast, and a large quantity of cotton twist is stained with it, which finds its way into all the bazaars in the southern districts of Hindostan. A salookdar (a small freeholder) possesses the above monopoly, and retains the secret of the art to himself, by which means he derives annually a very considerable revenue. The red crab feeds upon the root of this marine shrub."

French Duel.—We learn from *Galignani's Messenger*, that a duel with swords took place a few days ago between two ladies of Paris. The fair combatants, who, it is said, are known for their wit, beauty, and fashion, quarrelled about an affair of love, and a hostile meeting was the consequence. One of the ladies was wounded, but not dangerously.

Law.

COURT OF CHANCERY.—*Woodcock* v. *Rennick.*—An appeal from a decree of the Master of the Rolls. The question was, whether the representatives of a person who died before a power of appointment was exercised were excluded from all benefit. It was contended that the will which gave the power, conferred also a present gift, which the person exercising the power could not take away. The Master of the Rolls decided that the representatives could not take. The Lord Chancellor confirmed the decision of the lower Court.

ROLLS COURT.—*Branfill* v. *Brydges.*—An injunction had been granted to restrain John Wm. Egerton Brydges, who is a lunatic, and tenant for life of an estate called Lee Priory, near Canterbury, and Frederick Dashwood Swann, his committee, from cutting timber upon the estate. On the 24th Jan., 1839, an order of reference had been made in the cause, in pursuance of which the Master made a report, signed in Aug. 1840, as of the 14th Feb., 1840, and thereby certified that certain trees therein enumerated were fit to be felled. The present application now asked that this report might be reviewed, and that the Master might prosecute so much of the order as directed him to inquire whether it would be proper to fell any trees on account of decay, or because the felling would improve the growth of others planted or left standing, for ornament or shelter. Lord Langdale said he should therefore refer it to the Master to inquire generally what timber ought to be cut, with liberty for the Master to adopt the evidence taken on the former occasion, and to state special circumstances. If the bill did not seek the object of the reference, it would be better to amend it.

Ibbotson v. *Selwin.*—Harriet Townes, a witness in the cause, had been committed to the Fleet for not attending to give her evidence; she was now willing to give that evidence, and the object of the present application was for a *habeas corpus* to the Warden of the Fleet, directing him to bring up the prisoner before the examiner for the purpose of being examined from time to time. Lord Langdale made the order.

COURT OF QUEEN'S BENCH.—*The Queen* v. *Feargus O'Connor and White.*—A criminal information had been moved, as reported in a previous Number, against Mr. O'Connor the proprietor, and Mr. White the printer, of the "Northern Star" newspaper, for a libel on the character of Mr. Anstey, a master of Rugby School. Counsel now appeared for the defendants, not to show cause against the rule, but, by offering an apology, and by the fullest recantation of the alleged libel, to request that the rule might not be pressed. Mr. Anstey's counsel said that his client had no desire except to vindicate his own character, and to place himself in his proper situation before the public, and especially in reference to the school, and had no objection that the rule should now be discharged. Rule discharged upon payment of costs.

Exparte Daniel Long, a Burgess of the Borough of Bridport.—An application for a rule to show cause why a criminal information should not be filed against Alexander Dundas Ross Wishart Baillie Cochrane, Esq., for an attempt to bribe one Joseph Keach, a burgess of the borough, at the last election which took place there. Rule granted.

In re Allen.—In this case two rules had been obtained, one calling on an attorney to answer the matters contained in certain affidavits, and another to take off the file one of the affidavits which had been filed in answer to the first rule. The ground of the application was, that the deponent, a person named Rose, had been convicted of subornation of perjury. Cause was now shown against the two rules. At the end of the arguments the Court decided that the rule, calling on the attorney to answer the matters of the affidavits, must be discharged, but without costs. The other rule for taking the affidavit off the file was declared to have been made absolute, likewise without costs.

The Queen v. *the Justices of the West Riding of Yorkshire.*—An application for a rule to show cause why a *certiorari* should not issue to bring up certain depositions that had been taken before the justices against a man named R. Dee, on a charge of administering poison to five young women. The poison thus administered was stated to be cantharides. The Court refused the application.

The Queen v. *the Rev. Henry Cleveland.*—A rule had been obtained, as noticed in a previous Number, for filing a criminal information against the defendant, who was rector of Barkstone, in the county and diocese of Lincoln, for having written a libellous letter concerning Earl Fitzhardinge. The defendant by his counsel now expressed the greatest regret for what he had done, and admitted that there was not to his knowledge the slightest foundation for any of the imputations conveyed in the letter he had written, and he threw himself entirely on the forbearance and mercy of the noble Earl. He stated too that the noble Earl had behaved to him in the most forgiving and generous manner, and only required that the rule for a criminal information should be absolute with costs, but had expressed his intention not to act upon the rule when thus made absolute. To these terms feeling that he had not a shadow of defence, the defendant was perfectly willing to accede, and submitted to have the rule made absolute in the manner stated. Rule made absolute with costs.

The Queen v. *the Mayor and Corporation of Sandwich.*—In this case a *mandamus* had been applied for, to command the defendants to execute a bond of compensation to Mr. Mourelyan, who had formerly filled the office of town clerk of the borough of Sandwich, and who had been removed from office by the new corporation. The rule having been granted, cause was shown against it, but the Court decided that the rule must be made absolute.

The Queen v. *the Eastern Counties Railway.*—In this case a rule for a *mandamus* had been obtained to command the directors of this company to raise an arch to the height of 16 feet above a road which it passed in the parish of Stepney. The arch it seems was only 15 feet high, and the directors had proposed to lower the road the other foot, which the commissioners of pavements objected to. The Court were of opinion that the directors would satisfy the intention of the Legislature by relaying the road on the same level at the required distance or height from the centre of the arch, and therefore gave judgment for the defendants.

BAIL COURT.—*The late Accident on the Great Western Railway.*—An application for a rule to show cause why a writ of *certiorari* should not issue to remove into this Court an inquisition taken before the coroner for Berkshire, on the body of Charles Williams, one of the persons killed by the late accident on the Great Western Railway, in order that the same might be quashed. The objections urged against the inquisition were that—in the first place it did not set forth the cause of death with sufficient certainty; in the next place, that it nowhere appeared on the face of the inquisition that the coroner before whom it was taken had sufficient jurisdiction; and also that the deodand of 1000*l.* was levied on the engine, tender, and carriage—in fact, on the whole of the train, whereas that part only of the train from which deceased fell was liable to a deodand. A variety of other technical objections were also urged. Rule granted.

Johnson v. *Mathews.*—A writ of *distringas* had been obtained against the defendant in this case, on the ground that the plaintiff's attorney's clerk, after repeated calls at the defendant's house, and also at Covent Garden Theatre, had not been able to meet with him so as to serve the process of the Court upon him. Application was now made for a rule to show cause why the writ of *distringas* should not be set aside on the plea that the allegations of the plaintiff were entirely without truth. Rule granted.

COURT OF COMMON PLEAS.—*Borradaile* v. *Hunter and Others.*—An application for a rule to show cause why the verdict found for the defendants should not be set aside, and the verdict entered for the plaintiffs. The action was tried at the London Sittings after last Term, before Mr. Justice Erskine and a special jury as reported in this Paper at the time, and was brought by the widow of the Rev. Mr. Borradaile, the late Vicar of Wandsworth, to recover 1000*l.*, the amount of a policy of insurance effected on the life of the Rev. Gentleman. The claim was resisted on the ground that the insured had committed suicide by throwing himself into the Thames, and had thereby vitiated the policy, one of the conditions of which was, that it should be void if the insured died by "his own hand." On the part of the plaintiffs it was contended that deceased had not died by "his own hand," inasmuch as at the time of committing the act, he was in a state of insanity, unable to distinguish right from wrong, and therefore not a responsible agent. The jury found a verdict to the following effect:—"That deceased threw himself into the Thames with the intent to destroy life, being unable at the time to distinguish right from wrong." It was then arranged that on that finding the verdict should be entered for the defendants, leave being given to the plaintiff to move to enter the verdict for her, in order that the Court might decide whether the finding of the jury was tantamount to a verdict of insanity. Application was now accordingly made for a rule *nisi*, which the Court granted.

Shoobridge v. *Ward, Clerk*—*Weld, Clerk,* v. *Ward, Clerk.*—These were issues directed by this court under the Tithe Commutation Act, in which the questions raised for the jury were, first, whether there was a certain known portion of the parish of Tenterden, consisting of lands called uplands, and whether there was an immemorial district modus or customary payment of 4*d.* per acre in lieu of the vicarial tithes of these lands; and secondly, a similar question as to lands called town lands, and a district modus or customary payment of 6*d.* per acre in respect of these tithes. The jury found on both issues for the defendants, and an application was afterwards made for new trials on the ground of misdirection, and of the verdicts being against the evidence. The Court were of opinion that the precise merits of the case had not been submitted to the attention of the jury, and it thought that the plaintiffs in both cases were entitled to have the opinion of a jury on all the issues. The rules for new trials must therefore be made absolute.

Wright v. *King.*—This action was brought by the plaintiff, who had been cook in the house of defendant, to recover compensation in damages from the defendant for a malicious arrest and false imprisonment, to which she had been subjected on the charge of having stolen several pounds of suet, which plaintiff maintained she had a right to as part of her perquisites of "fat and kitchen stuff." Verdict for the plaintiff—damages 10*l.*

COURT OF EXCHEQUER.—*Oltery* v. *Ortenwood and Brown.*—A case in which it was charged that a conspiracy had been entered into by various parties to obtain a fraudulent judgment against the defendant Brown, upon a bill of exchange for a large amount. The case was referred to one of the Masters of the Court to investigate all the facts, and he now made his report, from which it appeared that the charges were, in a great degree, well founded. The Court considered that the facts as reported by the Master were extremely suspicious as regarded the plaintiff's attorney, who under all the circumstances thought they must pay all the costs of the proceedings.

Doe, on the demise of Allis, v. *Owen.*—A case in which the plaintiff had been admitted by an order of Baron Alderson, made during the pendency of the suit, to sue *in forma pauperis,* in "Lovewell and Curtis," 5 Mees. and Wels., 158. This Court having expressed some doubt whether an order to sue *in forma pauperis* made after the commencement of the suit was valid, a rule was obtained to rescind the Judge's order admitting the plaintiff. Cause was now shown against the rule. The Court adopted the decision of the Court of Common Pleas in the case referred to, and discharged the rule with costs.

Jewison v. *Dyson.*—An application for a new trial in a case touching the power of the Crown to appoint a coroner for a portion of the County of York, in right of the Duchy of Lancaster. The plaintiff claimed as the appointee of the Crown, and the defendant as the coroner elected by the freeholders for the West Riding. The verdict (after a trial of two days at the summer assizes for Yorkshire) was found for the plaintiff, and in the next term a rule was obtained to set aside that verdict. The Court discharged the rule.

Rodwell v. *Phillips.*—This was an action tried by Lord Abinger at Guildhall, to recover upon a contract for the sale of growing fruit and vegetables. The plaintiff was nonsuited, on the ground that the contract declared on was in writing, and required a stamp to render it admissible in evidence. A rule having been obtained to set aside the nonsuit, on the ground that the evidence tendered by the plaintiff was improperly rejected, counsel was heard last term in support of and against the rule, and the court took time to consider the question. Lord Abinger now delivered the judgment of the court, to the effect that the contract declared on this case could not be considered as a contract for the sale of goods and merchandise, and did not fall within the exception in the Stamp Act. The court therefore held that the evidence was properly rejected, and discharged the rule to set aside the nonsuit.

Whitehead and others, Assignees, v. *Anderson.*—Mr. Baron Parke pronounced the judgment in this, the facts of which were turned into a special case. It appeared that the defendant, who was the vendor of a cargo of timber at Quebec, sought to exercise the right of stoppage *in transitu,* on the ground that notice had been given to the shipowner, who had not the custody of the goods, the ship being on the high seas, and the principal resident in England. Under those circumstances, the court thought the notice to the shipowner was insufficient, and gave judgment for the plaintiffs.

Bourichault v. *Hart.*—This was an issue to try whether the plaintiff was an infant at the time certain legal proceedings were instituted against him, which terminated in a judgment. It was in the nature of a writ of error for error in fact, and is technically called a writ of error *coram vobis,* the error assigned being that the plaintiff was an infant when the action was commenced. Witnesses having satisfactorily proved that the plaintiff was under age when the procedings commenced, the jury returned a verdict for the plaintiff.

Lessingham v. *Friseby.*—This was an action on an apprentice deed, and the defendant, who was the master of the apprentice, was charged with neglecting to teach the plaintiff's son the business of an artist's brush and tool maker, and to lodge and board him, according to the terms of the indenture. Verdict for the plaintiff; damages, 10*l.*

Bishop v. *Williams.*—This was an action to recover 28*l.* 17*s.* 6*d.* for money lent and money paid by the plaintiff for the use of the defendant. The defendant pleaded a set-off of a larger sum than the plaintiff claimed. Verdict for the defendant.

The Attorney-General v. *Thomas.*—This was an information instituted by the Customs department, to recover penalties against Robert Thomas, for illegally unshipping 383 gallons of foreign brandy which had not paid the duty. The transaction took place near Newport, South Wales, and the value of the brandy seized with the duty was stated to be 400*l.* The defence was that the evidence did not connect defendant with the unshipping of the brandy. The jury returned a verdict for the Crown, which was taken to secure payment of the single penalty of 400*l.* The case of "The Attorney-General *v.* William Thomas," which was precisely similar in all its circumstances to the former case, was arranged by consent on the same terms without trial.

The Attorney-General v. *Belton.*—This was also an information at the instance of the Board of Customs to recover penalties against the defendant for harbouring a quantity of tobacco which had not paid duty, but the duty on which amounted to 700*l.* The defence set up was that the defendant did not know the tobacco was on his premises, where it was found concealed. Verdict for the Crown.

CENTRAL CRIMINAL COURT.—William Yates, charged with having defrauded several charitable institutions in the Metropolis, an account of which has already been given in this Paper, was tried for the offence on Tuesday. The evidence adduced was only what has already been before the public. The prisoner had nothing to say in his defence, or witnesses to call, and was sentenced by the Recorder to be transported for life.

COURT OF BANKRUPTCY.—*In re W. Hitchcock.*—The case of this bankrupt, an account of which has already appeared in this Paper, has again occupied the Court for several days, and on Thursday, after a lengthened examination of Messrs. Cooke and Gladstone by the asignees of the estate, Mr. Commissioner Holroyd entered into an elaborate review of the leading points in the case, and said there was no doubt that the bankrupt had been guilty of fraud in the admitted concealment of large portions of the property of the creditors, while he certainly could not commend the conduct of Messrs. Cooke and Gladstone. Their conduct as to the references must be disapproved of by every one, particularly in regard to Mr. Wheeler. They might, perhaps, be liable in a civil suit for that, but he could not say that it would subject them to any criminal proceedings. He could not believe the bankrupt's statements when he said that his concealments were all urged upon him by Cooke and Gladstone, for it had abundantly appeared in the course of these proceedings that they had made large payments to many persons, those payments being the proceeds of the sale of goods sent from his premises in Regent-street. It was said, however, that two of the assignees were satisfied in this case that the bankrupt had made as full disclosures as it was in his power to make, and that at last he had spoken the truth, and if this were an ordinary case he would no hesitate in passing his final examination. But this was indeed a very extraordinary case, and he was sorry to say his duty was n to consider their satisfaction alone, but from what had come o here the law said that he was the person to decide. Many of the items in his balance sheet were unvouched, particularly that as to his profits, and under all the circumstances of this case, he was bound to say that the final examination of the bankrupt must be adjourned *sine die.*

MARK LANE, FRIDAY, FEB. 4.—Of English Wheat there is little left over from Monday, and that consists of inferior qualities; prices may be considered the same as on that day. Of free Foreign there has been a pretty good sale during the week for consumption, and of Bonded there are buyers at reduced rates, but holders will not give way.—Barley, Peas and Beans are a dull sale but not cheaper, and the Oat trade continues flat.—The discussion of the Corn Laws, and the probability of less restrictive measures being introduced, has not produced any sensation here, but parties are waiting quietly the result of Sir Robert Peel's determination on Wednesday next.

TATTERSALL'S, THURSDAY.—Owing to the absence of several members at the opening of Parliament, the attendance was smaller than on Monday, and the betting much less animated. In one instance, however, it was interesting, inasmuch as a bet of 11 to 1 agst Chatham to 25*l.*, served in some measure to calm the fears of his backers, excited by his decline on Monday, and a report that, in consequence of sickness in the stable, he had been sent to Marsons. Auckland was backed for about 150*l.* at 23 to 1, and amongst others the Dirce colt and the Artful Dodger were in frequent demand. The Chester Cup betting was confined to Lanercost, who was backed for upwards of 100*l.* at 10 to 1.

GAZETTE OF THE WEEK.

INSOLVENTS.—J. S. Lennard, Half Moon-crescent, White Conduit-fields, victualler—J. Hunnybun, Cambridge, ironmonger—W. Thompson, Spitalfields, hat manufacturer.

BANKRUPTS.—J. D. Wells, George-street, Mansion-house, commission agent—J. Wates, Old Kent-road, victualler—J. Spanton, Bermondsey street, cheesemonger—J. Jolley, St. Alban's place, Haymarket, builder—S. Owen, Conway, Carnarvon, innkeeper—J. Holt, Livesey, Lancaster, grocer—H. A. Buber, Lindfield, Sussex, maltster—R. Hazell, Ramsbury, Wilts, corn dealer—C. Nicholls, Shrewsbury, flannel merchant—T. Cheshire, Smethewick, Stafford, miller—J. Buckett, Oxford, sheep dealer—T. Seddon, Gray's-inn-road, upholsterer—J. Hayward, Milverton, Warwickshire, miller—R. Irwin and J. G. Irwin, Manchester, drapers—J. Nash and R. L. Nash, Bristol, brewers—E. Mallan, Great Russell-street, Bloomsbury, dentist—J. Roberts and W. Roberts, Padiham, Lancashire, cotton-spinners—J. C. Clarke, Water-lane, merchant—D. Davies, sen., and D. Davies, jun., Glanclywedog, flannel-manufacturers—E. Stratton, Longcot, Berkshire, corn dealer.

SCOTCH SEQUESTRATIONS.—G. Law, Morton, Edinburgh, farmer—R. S. Bain, Stirling, grocer—A. Black, Glasgow, merchant—J. Wishart, Glasgow, wine-merchant—J. Leggate, Wishawtown, wood merchant—C. Johnston, Dundee, merchant.

BIRTHS.—At Madeira, on the 9th ult., the lady of G. Stoddart, Esq., Her Britannic Majesty's Consul, of a son—At Madeira, the 10th ult., the lady of W. Hinton, Esq., of a daughter—On the 27th ult., at Eton College, the lady of the Rev. C. Luxmoore, of twins. The infants lived but a few hours—In Farringdon-street, the 29th ult., the wife of S. Lovejoy, Esq., of a son—On the 30th ult., at the Rectory, Nacton, Suffolk, the lady of the Rev. Harry Edgell, of a daughter—On the 30th ult., Mrs. J. L. Brownsmith, of 9, York road, Lambeth, of a daughter—At Chelsea, on the 30th ult., the lady of E. Power, Esq., of a son.

MARRIED.—At Bramdean, Hants, on Tuesday, the 25th ult., the Rev. J. B. Bourne, rector of Colmere and Priors Dean, to Margaret Sophia, eldest daughter of H. Wood, Esq., of Bramdean House—On the 29th ult., at St. Leonard's, Upper Deal, Mr. T. H. Bicknell, of 64, Conduit-street, Hanover-square, to Sarah, daughter of H. Elvery, Esq., of Deal, Kent—At Naples, at the residence of the British Minister, on Thursday, the 13th of January last, C. Romilly, Esq., son of the late Sir Samuel Romilly, to the Lady Georgiana Russell, daughter of the late Duke of Bedford—At Dublin, on Sunday last, Mr. C. Kean to Miss Ellen Tree.

DIED.—A few days since, aged 56, Mr. Aldridge, the Royal Gardener in charge of the Forcing Grounds at Kew—On the 29th ult., at his residence in St. James's-square, his Grace the Duke of Cleveland—On the 31st ult., Mr. Davidge, the well-known actor, aged 48—On the 18th ult., Lieut.-Col. Soil, treatment of stiff . . . 73
Stephens's Book of the Farm, rev. 73
Tea, Assam, its discovery . 67 b, 70
Thunbergia aurantiaca a greenhouse plant 70
Timber, effect of rapid growth on 67
Violets, Russian, to flower in winter 73

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the OFFICE, 3, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, February 5, 1842.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

No. 7. SATURDAY, FEBRUARY 12, 1842. Price 6d.

MYATT'S VICTORIA RHUBARB.

J. AND W. MYATT having a good Stock of Strong Roots raised by offsets from the original Seedling, can supply them at 10*l*. per hundred.—N. B. As various spurious sorts have been sold and are now selling under the name of "Myatt's Victoria," purchasers would do well to require them warranted. —Manor Farm, Deptford, Oct. 23, 1841.

ROBINSON'S NORTHERN BEAUTY DAHLIA.

S. GIRLING having purchased the entire Stock of the above DAHLIA, plants will be sent out in May next at 10s. 6d. each; admitted to be one of the most distinct and beautiful Dahlias to be sent out next season. For particulars, refer to the *Floricultural Cabinet* of January. It took the 5th Prize at Salt-hill Open Show in Sept. last, and was generally admired.

FLOWER-SEEDS.—Thirty-six Packets of the most approved Annual, or Hardy Biennial and Perennial Flower-Seeds, for 10*s*., or Eighteen Packets 5*s*., forwarded, postage free, to any part. Apply to Mr. Brown, Curator, Botanic Garden, Colchester; and to prevent disappointment, any preferred species should be specified in the order.—Jan. 1st, 1842.

BRACHYCOME IBERIDIFOLI SEED in small packets at 5*s*., to be had of W. J. NUTTING, Seedsman, 46, Cheapside. Lisianthus Russellianus, 2*s*. 6*d*.; Pink, from fine named flowers, 2*s*. 6*d*.; Calceolarias, from 30 varieties, 2*s*. 6*d*.; Pansies, selected from a few first-rate flowers, 5*s*.; do., from a superior collection, 2*s*. 6*d*.; Dahlia Scapigera Mexicana, 1*s*.; Clintonia pulchella, 1*s*.; Schizopetalon Walkerii, 1*s*.; Phlox Drummondii, 1*s*.; &c. &c.—Packets of the following Cucumbers at 2*s*. 6*d*.: Man of Kent (Barnes'), Victory of Suffolk (Allen's), Prize-fighter, Weedon's Frame, Roman Emperor, and Windsor Prize.

☞ A Catalogue of Seeds to be had on application.

CARNATIONS AND PICOTEES.

MESSRS. W. and F. YOUELL have a few pairs to spare of that most beautiful Rose Flake, Wilson's Harriet, which is considered by the first judges in the kingdom to be decidedly the most perfect flower of its class ever raised. Also that splendid Red Picotee, Anacreon. The above will be forwarded per post, free, to any part of the kingdom by inclosing a post-office order for 18s.—For their extensive Collection see Catalogue, which can be obtained by inclosing two post-stamps.
Great Yarmouth Nursery.

CHARLES FARNES, 128, St. JOHN-STREET, LONDON, begs respectfully to call the attention of his Friends to the following select List of Annual Flower-Seeds, &c. A general Catalogue of which may be had on application. Also his Catalogue of all the new sorts of Vegetable and Agricultural Seeds, &c.

NEW DAHLIAS.

GEORGE WHEELER, Nurseryman, &c., Warminster, Wilts, begs to announce the following for the ensuing Season:—ASMODEUS (Davis's), a Seedling of last year, colour nearly black, shape "the mould of form," rich velvet petal; obtained the 1st Prize at Bath, 1st at Chippenham, and 4th at Salt Hill, the only Shows at which it was exhibited; and from the confidence the raiser has of its being a first-rate flower, it is offered this season at 10*s*. 6*d*. per Plant. All orders to be executed immediately after the 20th of May. This flower was raised by Mr. Davis, whose "Maid of Bath" is so well known to all growers, and which by the *Gardener's Gazette* is shown to have been the most successful Dahlia of last season, having been exhibited in 51 winning stands, whereas the next in point of success came not within 20 of that number.

PRINCE ALBERT (Adams's), fine shaded bronze, quite a distinct variety, most perfect in petal, and altogether a noble, first-rate show flower. Strong Plants early in May, 10*s*. 6*d*. each.

WESTBURY RIVAL (Hall's), fine bright puce, very constant, a full high centre; a decided improvement on "President of the West;" one of the finest selfs of the season, and a first-rate show flower. Strong Plants early in May, 10*s*. 6*d*. each.

G. W.'s Catalogue of first-rate Show Dahlias will very shortly be ready, and will be forwarded, post-paid, on application.—G. W. embraces this opportunity of acquainting his friends and the public in general, that by the kindness of the Rev. Mr. Rous, the raiser of those beautiful Cinerarias, Prince Albert, and Lavertonense, he is enabled to offer good Plants of each kind at 5*s*. each. The stock of Seed of that fine and very superior long-frame Cucumber cultivated by Mr. Hamlett, and universally admired by the numerous growers who saw the fruit, is in G. W.'s possession, and will be sold at 6s. per dozen seeds; warranted to be all good, and of the genuine kind.

J. KERNAN begs to inform his Friends that he has now completed his selection of FLOWER-SEEDS, among which will be found every novelty worthy of cultivation recently introduced, as well as the seeds from first-rate collections of Calceolarias, Mimulus, Ipomœas, Gloxinia rubra, Stocks, Asters, Balsams, Zinnias, Thunbergias, &c. &c.; as also all the better and more esteemed Vegetable Seeds: Grainge's Early White Broccoli, Mercer's Cauliflower, Brussels Sprouts (foreign seed), Seymour's superb Giant Celery; Kerrison's Hothouse, Syon House, Roman Emperor, Horticultural, and Windsor prize Cucumbers; as well as Seeds of the very choicest Melons, all the better early and succession Peas, principally saved by the most select growers, who supply this unequalled market.—4, Great Russell-street, Covent Garden.

All the better kinds of Agricultural Grasses, separate or mixed. Selected Field Turnips, Winter and Spring Tares, Ash-leaved and Early Frame Potatoes, New Globe Mangold Wurzel, &c. &c., Mats, and Mushroom Spawn; Pruning and Budding Knives.

BLUE TREVIRANIA, OR ACHIMENES LONGIFLORA.

MESSRS. MOUNTJOY AND SON have much pleasure in informing their Friends and the Public, that they can supply good Bulbs of the above most beautiful Plant, at 21*s*., which, before they vegetate, might be transmitted by Post. M. & Son take this opportunity of mentioning that they will have Plants in May, price 10*s*. 6*d*., of their fine Seedling DAHLIA "Horace," the colour of which is a very rich and extremely dark plum. From its erect habit, it is a beautiful border variety, as well as being a first-rate Show Flower.

A remittance or reference is respectfully requested from unknown correspondents.—Ealing, Middlesex, Feb. 1, 1842.

ARAUCARIA IMBRICATA—Fine strong Plants one year from seed.—The most noble, hardy, and splendid ORNAMENTAL EVERGREEN TREES ever introduced into the British empire are now selling at Messrs. W. and F. YOUELL'S NURSERY, GREAT YARMOUTH, at 3*l*. 3*s*. per dozen, or 25*l*. per 100. Specimens may be seen, and orders taken at their Agents', Messrs. Flanagan and Co., No. 9, Mansion-house-street; and at Messrs. Gibbs and Co's., Seedsmen, Piccadilly, London.

A. J. STEWART, SALT-HILL NURSERY, near WINDSOR, begs to invite the attention of the Nobility, Gentry, &c. to his superb collection of CAMELLIAS. Having recently increased his Stock on peculiarly advantageous terms, he is enabled to offer the following Twenty New and First-class Varieties, in fine healthy condition, for the very moderate sum of Ten Guineas, to include baskets, &c.; viz.—Duchesse d'Orleans, Henry Favre, Turnbullii, Amabilis de New York, Saccoi Nova, Cocquettii, Palmer's Perfection, Alba Londonensis, Emilie Grandiflora, Beallii, Fasciculata Alba, Ochroleuca, Cooperii, Eliza, Dahliæflora Ignea, Spectabilis Maculata, Frederic le Grand, Lady Henrietta, Frankfortiensis, and Hendersonii. Nearly every other approved kind in cultivation can also be had at the same reasonable rate.

A. J. S. respectfully informs the Floral Public that his two Seedling PELARGONIUMS are now ready; viz.—Prince Albert, an extremely delicate pink, with white centre, and dark crimson spot: the trusses are remarkably large, the flowers firm and perfectly round, and the habit very compact. Price 42*s*. Duke of Wellington has under petals of pure white; the upper petals are covered with rich maroon, excepting a slight margin; the trusses are fine, and rise well above the foliage. Price 42*s*.

A. J. S. still possesses a good Stock of his splendid Seedling VERBENAS, Stewartia and Rosea Magniflora, described in No. 42 of the "Gardeners' Chronicle;" they are warranted first-rate in every respect, and decidedly distinct from any hitherto produced. Stone Pots, 3 strong plants in each, 15*s*., with usual allowance to the trade.

NEW GARDEN-SEEDS.

MESSRS. SUTTON and SON respectfully intimate to the Readers of "The Gardeners' Chronicle," that they devote a great portion of their Nursery-grounds to the growth of Garden-Seeds, including the best of the new kinds of Vegetable and Flower-Seeds as soon as introduced. The grounds being at considerable distances from each other, and of different soils, are very favourable for preserving Seeds true to their sorts. With these advantages, Messrs. Sutton supply all kinds of Garden-Seeds warranted New and True, catalogues of which are published annually. A complete collection of Kitchen-garden Seeds, including all the most esteemed kinds, 3*l*. 10*s*. A similar assortment in quantities suited for a smaller establishment, 2*l*. 2*s*.

An assortment of Hardy Flower-Seeds,		50 most showy sorts	£1	1	0
Ditto	ditto	30 sorts	0	12	6
Ditto	ditto (the best)	30 new sorts	0	15	0
A full collection of 150 sorts			3	3	0
Fifty choice Ranunculuses by name			0	15	0

For the accommodation of Customers residing in distant parts of England, goods are delivered Free of Expense to the Railway Stations and Packet Wharfs in London.

Messrs. Sutton having had much experience in packing Seeds for exportation, have confidence in soliciting orders for that purpose, for which 10 per cent. will be charged upon the above sums for packing.—Reading Nursery, Feb. 8.

WOODLANDS NURSERY, MARESFIELD, NEAR UCKFIELD, SUSSEX.

WILLIAM WOOD and SON have the pleasure of offering to their numerous Friends and the Public, the undermentioned Roses, all warranted most splendid Varieties, at the following reduced prices:—

	Per doz.		Per 100.
Fine Standard Roses	30*s*.	or	10*l*. 0*s*.
Half-standard, ditto	12*s*.	,,	5*l*. 0*s*.
Fine Half-standard ditto	18*s*.	,,	6*l*. 0*s*.
Extra Fine, Half-standard ditto	24*s*.	,,	7*l*. 10*s*.
Fine Dwarf Roses	12*s*.	,,	3*l*. 15*s*.
Extra Fine Dwarf ditto	18*s*.	,,	5*l*. 0*s*.
Climbing ditto, very strong	9*s*. to 12*s*.	,,	2*l*. 10*s*.

W. W. and Son also beg to recommend the present season, as well adapted for transplanting Roses. Plants will be presented GRATIS with each order. Amateurs are still invited to apply for Rose Catalogues, and Lists of general Nursery Stock.—Woodlands, Feb. 9th.

MESSRS. TYSO and SON, Wallingford, Berks, respectfully invite the attention of the Cultivators of RANUNCULUSES to their extensive collection of this deservedly admired Flower, which they offer in assortments as under:—

* 100 Different superb named sorts, one root of each	5	0	0
* 50 ditto ditto	2	10	0
* 100 ditto, fine sorts, ditto	2	10	0
* 100 Extra fine named Mixtures	1	0	0
100 Selected Seedling Mixtures, strong grower	0	10	0
100 Fine Semi-doubles, free bloomers	0	4	0
Seedling Ranunculuses.			
* 50 Splendid new show Varieties, one root of each	10	0	0
* 50 Very fine named Varieties, ditto	6	0	0
* Seed saved by impregnation from the above flowers, per paper	5*s*. and 10*s*.		

⁂ The end of February is the best season for planting.

Carnations and Picotees.			
25 Superb named sorts, one pair of each	3	0	0

The articles marked thus *, weighing less than 16 ounces, can now be transmitted by post, and will be sent, carefully packed, and prepaid, without additional charge, to gentlemen forwarding the cash with the order.

Messrs. T. and Son's General Descriptive Priced Catalogue, for 1842, may be had *gratis*, on pre-paid application, enclosing a twopenny postage label.

HUNDRED-FOLD POTATOES.—A New SEEDLING, selected for cultivation by the grower of 250 kinds from the Seed, as the most abundant and the best flavoured, is for SALE, in peck bags, at 5s. each, at Messrs. Flanagan & Co.'s, Mansion House-street; Mr. Gibbs's, 26, Down-street, Piccadilly; Messrs. Warner and Co.'s, 28, Cornhill; Mr. James Carter's, 238, Holborn; Messrs. Minier, Adams, and Co.'s, 68, Strand; Mr. F. Chatwin's, 6, Hungerford market; and at the "Gardeners' Gazette" Office, 320, Strand.

WANTS a SITUATION as GARDENER, a married man without family, aged 28. Can produce satisfactory testimonials as to ability and character. Letters to be addressed to B. Y., at Messrs. Warner's, seedsmen, Cornhill, London.

WANTS a SITUATION as GARDENER, a respectable active Single Man, aged 30 years, having a practical knowledge of his business in all its various branches. Can have two years' character from his late employer; also can have reference from a family of distinction. His entire study would be the welfare of his employer. Direct to T. F., Elm-lodge, Camden Town.

WANTS a SITUATION as GARDENER, a Young Man, aged 26, who thoroughly understands his business in all its departments; can be well recommended from his last situation. Address, J. C., Rogers' Nursery, Eaton Square, Pimlico.

WANTED by a Married Man who has had great experience in every branch of Horticulture and Foresting, a SITUATION as GARDENER. Any Landed Proprietor wishing to embellish his estate, would find the Advertiser capable of conducting any improvements, let them be ever so extensive. References of the greatest respectability can be given. Address, pre-paid, to T. M., 29, Market-place, Cambridge.

WANTS a SITUATION as GARDENER, a Married Man, aged 28, who understands Hothouse, Greenhouse, and Early Forcing, Kitchen Garden, and Propagation of Plants. Also the management of Cattle and Meadow Land, if required. Can have nearly two years' good character from the gentleman he has just left, and a recommendation of nine years from his previous place in the country. Direct to A. B., Mr. Trotman's, 9, Lower Road, Islington.

WANTED by a young Man, who has been for some time in one of the first Establishments in Belgium, a Situation as PROPAGATOR. He perfectly understands the Propagation of Camellias, Rhododendrons, Azaleas, &c., and can, if required, undertake the management of Pines, and general forcing. A situation near London would be preferred. Address by letter, post paid, to A.Z., Gardeners' Chronicle Office, 3, Charles-street, Covent Garden.

WANTS a SITUATION as GARDENER, a Married Man, age 41, who has acquired with twenty years' practice, a thorough knowledge of Pines, Vines, Framing, and other branches of Forcing; Kitchen Gardening, Exotic and hardy Plants. Can have 11 years' unexceptionable character from the family he has just left, which was on account of the breaking up of the establishment. Please direct or apply to G. W., Mr. Chandler's, Nurseryman, Wandsworth-road, Surrey.

WANTED as Servant in a Small Family at Kensington, a Young Man from the Country, about 21; one that has not been in service will not be objected to, provided he is active, industrious, and willing to learn and make himself useful. He will be required to work in a small garden about half the day, under the direction of the principal, and to wait at table, and be otherwise employed in the house during the other part. Wages 12*l*. One suit of livery, and one of garden clothes. Letters only (post-paid) to be addressed A. B. Z., Post-office, Kensington Gravel-pits, stating age, height, and reference.

H. HAMMOND begs to return thanks to his numerous friends and the Public for their liberal orders for his new White Cape Broccoli, as advertised in the *Chronicle* of Oct. 16; and to inform those that are not supplied with that valuable article that he has a few packets left which can be had of Messrs. Flanagan, Seedsmen, Mansion-House Street, London, who know the stock.—Mundford Nursery, Feb. 10.

NATURAL GRASSES.

MESSRS. SUTTON having been engaged many years in growing and collecting PERMANENT GRASSES for eminent Agriculturists in Berkshire and the surrounding counties, have great confidence in soliciting the commands of the readers of the *Gardeners' Chronicle* in any part of the United Kingdom, to whom will be given references to Noblemen and others who have expressed themselves desirous of recommending Messrs. Sutton's Seeds.

It is necessary that the nature of the soil should be described, when the most proper sorts and proportions will be supplied; the names of which and other relative information may be previously obtained by application.—Reading Nursery, Feb. 1st.

KENSINGTON NURSERY.
Under the Patronage of the Queen.

RICHARD FORREST and CO. beg respectfully to direct attention to their extensive Nursery stock in general, which never was finer than this year. The collection of Hardy Evergreens, and American Plants, Hybrid Azaleas and Rhododendrons, Pinus, &c., are extensive and select; and printed Catalogues may be had on application. Their Fruit-tree department, in particular, consists of everything worth cultivating, correct to name; and the trees of all ages were never so fine as they are this season. Their collection of Camellias, Rhododendrons, Arborea, Erica, Eastern Azaleas, and other interesting Greenhouse Plants, will well repay a timely inspection; and Catalogues of them also may be had on application.

TO GENTLEMEN AND AMATEUR FLORISTS.

TO BE PARTED WITH, a few Hundred Roots of that choice and beautiful Flower the RANUNCULUS, at 42*s*. per hundred, with Names. Planting-time, February and March. Apply, pre-paid, Mr. Eyre, Farnham, Surrey. Also he has a few healthy young Plants left of his superb Seedling GERANIUM "Lavinia," at 40*s*. per plant (no abatement); and which gave so much satisfaction to every gentleman who saw it in his house.

HOT-WATER APPARATUS, upon the most improved and economical principles, for Horticultural and other Buildings.—STEPHENSON and CO., Agents for the Old Park Iron-works, and Manufacturers, 61, Gracechurch street, London, annex the following list of prices of Hot-water Pipes of the best description, to assist persons desirous of adopting this mode of heating in their calculations of the probable expense, and respectfully solicit an opportunity of tendering their price for the completion of any work required. Socket-pipe for Hot Water, of two, three, and four inches diameter, at 2*s*. 3*d*., 3*s*. 3*d*., and 4*s*. 3*d*. per yard. Ditto, with Troughs for Orchidaceous-houses, three and four inches diameter, at 4*s*. 9*d*. and 6*s*. 9*d*. per yard.

The much-approved Conical Boilers made of strong plate-copper, and which require no furnace or setting in brickwork, from 5*l*. 5*s*. upwards. Also, every other description of Boilers of the most approved construction. Further particulars may be obtained at the Warehouses, Gracechurch-street, where also may be seen a variety of patterns of Iron and Strained-wire Fencing, Hurdles, Brass and Iron Bedsteads, &c. &c.

NEW AND SUPERIOR SEEDLING DAHLIAS FOR 1842.

JAMES EDWARD, FLORIST, LAYERTHORPE, YORK, begs most respectfully to invite the attention of Cultivators of the Dahlia to the following Three Seedling Varieties raised in 1840, and first proved in 1841, which are quite distinct from any hitherto presented; of very superior habit, and constant in producing good Show Flowers throughout the season; in proof of which J. E. begs to state that he has shown above 200 blooms of the three, during the season, at various Exhibitions open to all England, and has had nine Seedling Prizes awarded for them, namely,—four 1st prizes, three second ditto, and two third ditto; they have also been shown in the following winning trays:—

In the 1st Tray of 24 at the Horticultural Society, York, Aug. 18,
2d ,, 24 ,, ,, ,,
1st ,, 18 ,, ,, ,,
2d ,, 36 at the Botanical Gardens, Hull, Sept. 2d;
2d ,, 12 ,, ,, ,,
1st ,, 24 at the Horticul. Soc., Scarborough, Sept. 3d;
1st ,, 12 ,, ,, ,,
1st ,, 6 ,, ,, ,,
1st ,, 48 at the Yorkshire Philosophical Soc., Sep. 9th;
1st ,, 36 ,, Botanical Gardens, Sheffield, Sept. 15th;
1st ,, 36 ,, Horticultural Soc., Barnsley, Sept. 21st;
1st ,, 24 ,, ,, ,,
1st ,, 48 ,, Botanical Gardens, Leeds, Sept. 22d;
1st ,, 48 ,, Horticultural Society, York, Sep. 24th;
2d ,, 24 ,, ,, ,,

Besides having taken other Prizes in addition to the above.

PREMIER. Fine bronze salmon, very superior form, of excellent habit, throwing its blooms well above the foliage, and always to be depended upon in producing good show flowers. This variety obtained the first prize, in its class, at the York Ancient Florists' Society, September 20th, and had also the premier prize awarded, as the best Dahlia of any colour.—Height 4 to 5 feet.—Plants 10*s.* 6*d.*

MARY JANE.—White ground, very deeply tipped and edged with purpled carmine—constant throughout the season, well up in the centre, of excellent habit, and never fails in producing good flowers. This variety obtained the first and second prize at Scarborough, as the best light-ground flower tipped or edged, and has justly been pronounced the most distinct and attractive Dahlia ever produced in its class.—Height 4 feet.—Plants 10*s.* 6*d.*

DUKE OF RICHMOND.—Fine light pink and yellow, colours beautifully blended together, with a light-yellow tip at the end of each petal, similar to the Duchess of Richmond, but quite distinct from that variety; very superior habit, always constant, and will prove a noble and excellent show flower.—Height 5 feet.—Plants 10*s.* 6*d.*

Good strong plants will be sent out the first week in May; and for the convenience of parties at a distance, orders will be received, and plants supplied, by Mr. George Charlwood, Seedsman, Covent Garden, London; and Messrs. Henderson, Nurserymen, Brechin, Scotland. No allowance to the trade unless 12 plants are ordered, and a remittance or respectable reference will be required from unknown correspondents. J. E. can also supply plants of all the best Dahlias in cultivation, of which a catalogue is annually printed, and can be had on application.

We the undersigned, members of the Committee of the York Horticultural Society, do attest the correctness of Mr. Edward's description of the above Dahlias; and we strongly recommend them as distinct varieties from any yet sent out, and well worth a place in the most limited collection.

James Richardson	Richard Land	John North
John Roper	John Walker	Jas. Lancelot Foster
J. Heseltine	Edward Bearpark	William West
Henry Bellerby	Robert Dempsey	John Robinson.
William Dove		

Report of the York Amateur Florist Society, held on Monday, August 9th, 1841.—The Judges and Members of this Society consider it their duty to notice a seedling Dahlia of last year (sent for inspection) raised by Mr. Edward, Nurseryman, of this city. The colour is pure white, with a dark tip of purpled carmine; the form, depth of petal, and above all, good eye, require no consideration to pronounce it one of the best Dahlias yet seen of its class; and from the evident superiority of this distinct variety over such flowers as Glory of Plymouth, Beauty of the Plain, &c., there is no doubt but the year 1842 will cause these flowers to fall in the rear when brought into competition with the seedling exhibited this day, as it may safely be pronounced a gem of the first water, and will reflect the greatest credit on the fortunate raiser, for so long as Dahlias remain in cultivation this flower must form a prominent feature in a stand of six.—*From the York Courant.*

PRODUCTIVE LIFE ASSURANCE SOCIETY and MARITIME FUND empowered by Acts of Parliament. Offices, 29, Moorgate-street, Bank, London.

Board of Directors.

John Blogg, Esq., Guildford-st., Russell-square.
Donald Grassick, Esq., Bedford-place, Kent-road.
Hyam Hyams, Esq., Cornhill.
George Rose Innes, Esq., Billiter-street, City.
J. Linnit, Esq., Argyll-street, Regent-street.
W. T. Smith, Esq., Public Office, Southampton-buildings.

(With power to add to their number.)

Treasurer.—Hyam Hyams, Esq.

Auditors.

Robert Dover, Esq., Cornhill.
Amos Hodgson, Esq., Ordnance Office, Tower.
James Walton, Esq., Grocers' Hall.

Arbitrators.

Charles Compton, Esq.
Peter Ellis, Esq.
John Tidd Pratt, Esq

Bankers.—The Bank of England.

Physician.—William Brewer, M.D., F.R.S., &c., 21, George-street, Hanover-square.

Surgeon.—David Lewis, Esq., 28, Artillery-place West, Finsbury.

Solicitors.—Messrs. Chatfield, Wingate and Hart, Cornhill.

Actuary. Francis G. P. Neison, Esq.

Chief Agent for the Maritime Fund.—Thomas Bull, Esq., 91, Minories, London.

This Society is established on the principles of Mutual Life Assurance, with a division of the whole amount of profits among all the assurers, to whom the books of the Society always lie open for inspection. A General Meeting takes place annually, at which is given a detailed account of the business of the Society. No policy stamp duty charged on assurances above the term of ten years.

The Maritime Fund is a department of the Society which affords to captains and mariners the same facilities and advantages of life assurance which residents in England have hitherto enjoyed. Upon this fund, at a comparatively small cost, a member (should he be lost at sea on a particular voyage) will provide an annuity for his wife as long as she lives, in proportion to what he has paid.

Every particular may be known by applying to Mr. Bull, agent; or to the Secretary, at the offices, 29, Moorgate-street.

GEORGE B. SCOTT, Secretary.

EXPIRATION of LEASE and SALE of NURSERY STOCK.

MESSRS. PROTHEROE and MORRIS beg to remind those persons who may wish to furnish their Gardens with choice articles at a probable small cost, that the sale of the Valuable and extensive Nursery Stock growing upon the Premises, Wyndham Road, Camberwell, commences on Monday, Feb. 14th, at 11 o'clock precisely. Messrs. P. and M. direct particular attention to the manner in which this Stock is lotted, so as to meet the views of all parties, whether quantity or selections only are required. Catalogues may be had of the Auctioneers, Leytonstone; of Messrs. Buchanan & Co., Camberwell; at the Mart, and principal Seedshops.

HENRY SPARE acknowledges with heartfelt gratitude the following CONTRIBUTIONS, but for which himself and family must have suffered the greatest distress and privation. He is also deeply impressed with the kindness of his late Noble Employer towards his two eldest children; and he begs to add and return his special thanks to Mr. Loudon for his gratuitous and prompt appeal on his behalf, to the Editors of the *Gardeners' Chronicle* and *Gardeners' Gazette* for their notice of his case, to Mr. Munro and the other gentleman who kindly received and forwarded the various sums collected to himself, and to Mr. Kernan, who has been most zealous and indefatigable, and has truly proved himself a Gardeners' friend.

HEATING BY HOT WATER, WITH THE CIRCULATION OF ATMOSPHERIC AIR.

J. WEEKS & CO., Architects, &c., Gloucester-place, King's-road, Chelsea, Hothouse Builders, and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER; see the 3rd and 37th Numbers of the *Gardeners' Chronicle.*

References may be had, and their works seen, at Mr. Perry's Nursery, Banbury; Mr. Green's, Lower Cheam; Messrs. Henderson's, Pine-apple Nursery; Messrs. Rollisson's Nursery, Tooting; Mr. Knight's Exotic Nursery, Chelsea; Messrs. Low's, Clapton Nursery; Mr. Catleugh's Nursery, Chelsea; Mr. Gaines's Nursery, Battersea; Mr. Buck's, Portland Nursery; Mr. Young's, Milford Nursery; Mr. Smith's Nursery, Dalston; Mr. Woodroff's Nursery, Kensall Green; Mr. Hopgood's Nursery, Bayswater; Mr. Willmer's Nursery, Chelsea; and at most of the Nobility and Gentlemen's Seats in the country.

Every particular to be had at their Horticultural Manufactory, Gloucester place, Chelsea, near Sloane-square.

SLATE CISTERNS, SHELVES, TROUGHS, &c., for Horticultural purposes.—EDWARD BECK, Manufacturer, Isleworth, near Brentford. Orders, Working Drawings, &c., forwarded by post, will receive due attention.

*** Slate Edgings for Flower Borders, &c.

Publishing Monthly, with Four coloured Engravings,
Price 2*s.* 6*d.*

PAXTON'S MAGAZINE OF BOTANY. The Number for FEBRUARY contains beautifully-coloured figures of *Cattleya Aclandiæ*, *Brugmansia floribunda*, *Mahonia aquifolium*, and *Loasa Pentlandica*, with the history and directions for the culture of each: also comprehensive Papers on the science of Gardening, including the phenomena of impregnation and germination in the seed of plants; the Culture of Gesnera rupestris; on Arranging and Planting Specimens in Conservatories; the Propagation of Tropæolum tricolorum; Notices of Plants figured in the floral periodicals for December and January, and of those flowering in the suburban nurseries; with a copious Calendar of Operations for the month.

This work comprises, monthly, four admirably-coloured plates, and twenty-four pages of interesting and useful letter-press. The admirers of flowers are requested to observe—

1. That all the drawings are taken from nature, and are consequently made from plants which have flowered in Britain.
2. That, with few exceptions, they are all done by one artist, whose abilities are of the highest order, and who travels himself to the places where the plants are in flower.
3. That they are lithographed on zinc by the same individual, and, being coloured in a superior manner, have all the spirit and elegance, and much of the finish, of the original drawing.
4. That about one-half of the drawings are from plants which have never before been figured in this country, the rest representing the most popular novelties, as well as the more neglected, though sometimes far handsomer, old species; the majority being such as can be cultivated by every one possessing a flower-border and a greenhouse or frame.

It may, in conclusion, be safely asserted that, both for the beauty of its embellishments, and the utility of its contents, this work is well adapted to the wants of all who delight in gardening; and as the improved system of having the plates lithographed commences with this Number, and as it is intended that each volume shall now be perfect in itself, the present is a desirable opportunity for those who wish to become subscribers.

London: W. S. Orr and Co., Paternoster-row.

In one small volume, price 15*s.*

PAXTON'S POCKET BOTANICAL DICTIONARY.

In what may be called an age of Cyclopædias, when the compression of a great variety of information into one volume, in order to bring it within the means of persons of all ranks, is so universally sought, it is evidently desirable that the Gardener, and those connected with his profession, should be as well accommodated as other classes in this particular. No such work existing, however, prior to the issue of the present publication, its value will be at once apparent; since it combines the more essential features of a Botanical Catalogue, an Horticultural Guide, and a Technical Glossary.

Besides being of this comprehensive description, it is especially adapted for the Amateur or Floriculturist; who may, by carrying it in his pocket, examine all the plants that are at any time submitted to his inspection, and immediately derive every intelligence respecting the peculiarities or affinities of particular species which could reasonably be wished for. This is an advantage that can only be sufficiently estimated by those who have felt the want of such an assistant; and to all such individuals, as well as to every agent or friend of horticulture, the Pocket Botanical Dictionary is decidedly indispensable.

London: J. Andrews, Bond-street; Orr & Co., Paternoster-row.

Uniform with the "Elements," price 3*s.* 6*d.*

COOLEY'S GEOMETRICAL PROPOSITIONS DEMONSTRATED; or a Supplement to Euclid: being a KEY to the Exercises appended to the "Elements," for the use of Teachers and private Students. Upwards of 120 Propositions deduced from the first Six Books of Euclid, are illustrated in it by new diagrams.

"Will be found of considerable value as an aid to Teachers of the Mathematics."—*New Monthly Mag.*

Whittaker and Co., Ave-Maria-lane London.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their manufactory.

HOTHOUSES, CONSERVATORIES, &c., Made and Fixed complete in all parts of the Kingdom. One, two, and three-light Cucumber and Melon Boxes and Lights of all sizes kept ready for immediate use, packed and sent to all parts of the Kingdom: warranted best material. Two-light Boxes and Lights complete from 1*l.* 8*s.* Garden-Lights Made and Glazed, 1*s.* per foot. At JAS. WATT'S Sash Manufactory, Claremont-place, Old Kent-road. Reference given.

PATENT ASPHALTE PROTECTING MATERIAL.—Extract from *Gardeners' Chronicle*, Dec. 25, 1841, p. 843.—"In the midst of frost it will not be unseasonable to warn all our Readers of the great importance of preventing their more tender Plants that may have been frozen from being thawed suddenly by the sun. All Gardeners know how often Peas frozen below a south wall are killed, and that if any contrivance to prevent their being suddenly thawed is made use of, they recover. What is true of Peas is, to a great extent, true of other things. A few weeks ago we had a severe frost, 16°; at that time young Araucarias exposed to the south died, while others within a few yards, but screened from the sun by stone, did not suffer at all. We may remark by the way that CROGGON'S ASPHALTE ROOFING forms a most excellent material for such screens." In page 8 of same Journal, Jan. 1, 1842, is fully described the purposes to which it is applied by the Royal Horticultural Society. Being a non-conductor it effectually protects from heat or cold.—THOMAS JOHN CROGGON, 8, Ingram-court, Fenchurch-street, London.

Handsomely bound in cloth, with 93 Wood Engravings, price 6s. 6d.
ILLUSTRATIONS OF THE BIBLE, AND CONFIRMATIONS OF SACRED HISTORY, from the Monuments of Egypt. By W. C. Taylor, LL.D.
From the British Magazine.—"This is an elegant and well-executed little book, on a most interesting subject."
London: Tilt and Bogue, Fleet-street.

The Gardeners' Chronicle.

SATURDAY, FEBRUARY 12, 1842.

MEETINGS IN THE ENSUING WEEK.

Tuesday	Horticultural	2 P.M.
	Floricultural	7 P.M.
	Linnean	8 P.M.
	Microscopical (Ann.)	8 P.M.
Wednesday	Microscopical	8 P.M.
Friday	Geological (Ann.)	1 P.M.
	Botanical	8 P.M.

A few weeks ago we directed attention to the manner in which Hyacinths should be treated; and the directions then given (p. 763 and 779, 1841) were sufficient to enable our readers to carry the management of this plant up to the time when it flowers. As the season is advancing, we conclude our extracts from the valuable practical memoranda with which we have been furnished by the skilful friend who supplied us with the others.

After planting, Hyacinths and Tulips do not require much attention until they begin to show above ground in the spring; at that time it is necessary, as they appear, to loosen the earth round them close to the surface, for it is apt to bind close round the stems; one inch below the surface is sufficient.

In general, Hyacinths require no further care until they flower, except in a *very dry season*, when it improves their beauty if water is occasionally given to assist their flowers to expand freely—in which case they appear to differ from Tulips, which are better without it.

As soon as their beauty of flower is over, I always cut off the flower-stems just below the lowest flower, and for this reason: the Hyacinth and Tulip both seed freely, particularly the latter; if the bulb is forming seed, its strength is wasted in great measure by that process; whereas, if the flower-stem is cut off, the bulb has nothing to do but to prepare itself with vigour for blossoming in the ensuing year.

I pay great attention to the protection of the leaves of my Hyacinths and Tulips, and never allow them to be interfered with until nature indicates, by the decay of their points, that the bulb is preparing for rest. I then follow a course with both Hyacinths and Tulips that I believe many do not; which is, to take them up before the leaves are quite decayed, and for this reason—I believe that both of them, after the bulb has attained this period of growth, are only weakened by remaining in the ground, because the offsets are living upon the parent bulb, and consequently weakening it for the flower of the following year. If a Florist wishes for stock, he should let his bulb remain until the leaves are quite decayed. If he wants his bulbs to flower in beauty again, he should follow the practice above mentioned.

When taken up, the bulbs should be removed to a shed sheltered from the sun but free to the air, and any earth adhering to the fibres of roots should remain for some little time; after two or three days they should be looked over and loose earth shaken from them, and as the leaves decay they should be occasionally removed. I have generally placed my bulbs at first on the ground, in the tool-shed, and as they got dry removed them to an airy shelf. When the leaves are nearly decayed, I place them in very shallow baskets, and allow as much air as practicable to be between each root to harden them, turning them every two or three days. By this treatment, and rubbing off any portion of mould attached to the bottom and sides, they are in a fit state to be placed for the summer in a dry room, and by a little occasional attention the rough and outside coat will, by a gentle side pressure of the thumb, be effectually removed, and exhibit the appearance of the bulb clean, smooth, and in good condition. This latter process I generally do in the latter part of August, and at that time remove the remains of such part of the root of the former year, as may not have dropped off previously to this time.

It is hardly necessary to state that any bulb in an unsound state, either from appearance of decay, or from having been injured in taking up, should not be put with those intended for future planting.

When Hyacinths in water have done blooming, I place them in by the heels on a north border with plenty of sand round the bulbs, and give them a good watering, then leave them until the leaves decay; but in this case I let the leaves *decay altogether* before I harvest them, for bulbs in water seldom show any disposition to make offsets, and they require more time to recover the change and become hardened after the effect of the water upon their coats.

The only remaining point that I recollect is the management of offsets. Take those that are round and well-shaped, plant them in the usual manner, but not so deep as the stronger bulbs, and when the flower-stems begin to throw up some distance from the ground, cut them off to enable the bulb to make its growth. The reason for this has been already explained. I think it better to let the stem get up to some height than to cut it off so early as to cause it to decay before it is quite clear of the bulb itself. When the lowest pips begin to separate is perhaps the best time.

In another column will be found some remarks by a correspondent (Rhæcus) upon cheap planting, in which we cordially concur. In most things it is admitted that what is best done is best; but in planting, a contrary opinion is often entertained, and that which is worst done is often considered best. Some writers seem to think that when a plant is torn out of the ground and again stuck into it, all that is requisite to make it grow is performed; and this they call planting. We, however, entertain a widely different opinion.

It is to be remembered that a plant is an organised being, with powers of life adapted to its peculiar nature, which require to be maintained in full vigour, if the individual is to do all that Providence has made it capable of. To secure this, it must feed, for which purpose its roots must be preserved, and subsistence must be provided in the soil it springs from; it must also breathe, which it can only do when freely exposed to the air and to light. Its health, and consequently its rate of growth, will be in proportion to the food it receives, and to its unimpeded respiration, without which its food cannot be digested. With roots half torn away, their fragments buried in a hole chopped out of hard unbroken land, a soil containing a scanty supply of nourishment, and the foliage (or breathing organs) smothered among weeds and coarse herbage, a plant may exist, but only under very unfavourable circumstances. We know that two individuals escaped from the Black Hole of Calcutta, and afterwards became personages of eminence; but would any one prescribe the pestilent air of a dungeon as the means of a man's rising to distinction? Even so it is with plants; they may be mutilated, starved, smothered, and yet some one among them may survive, and in time become a goodly tree. But how many perish! and what loss of time is incurred! This is what is forgotten by those who advocate cheap planting.

If a plant is to do all that nature has given it the power of doing, it must be carefully removed, skilfully replaced in the soil, and furnished with all the food it is capable of consuming; to which end the earth should be broken up by trenching or deep-ploughing, and kept perfectly clear of weeds till the plant is able of itself to overmaster them. The land should even be manured, if naturally sterile.

We know that planters take alarm at these recommendations, and say—"It is very well to tell us we ought to do this and we must do that, but where is the money to come from for all this? We plant for profit, and it would be ruinous to undertake extensive operations upon such a plan." The answer to this is not difficult. Whatever is done, should be done well; if not worth doing well, it is not worth doing at all. It has already been shown in our columns that the fastest-grown timber is the best; and we do not believe that any *proof* to the contrary can be brought forward; the precautions we recommend in planting will have the effect of causing trees to grow at the greatest rate of which they are capable; the reverse is to reduce their rate of growth to its minimum. The result is good timber in one case, and bad in the other.

We admit that this question must be looked at as one of profit; and there is no necessity for considering it in any other point of view. Some years since it was fully discussed by Mr. Withers in a letter to Sir Walter Scott, which appeared in the form of a pamphlet. In this letter the difference between the produce of an acre of land planted cheaply for 3*l.* 10*s.*, and of an acre planted expensively for 15*l.*, was shown to be enormously in favour of the latter. Mr. Withers states that in the former case, after 64 years the profit on the acre would not amount to more than three or four hundred pounds, while in the latter it might be fairly taken at one thousand three hundred pounds, or upwards of twenty pounds a-year during the whole period. In this calculation he assumed that in both instances the money was borrowed to purchase, fence, and plant the land, and also to pay the annual interest, so that it was a complete compound interest account on both sides. Admitting that the difference was exaggerated, still no doubt can be entertained of its being very great.

In these cases, one set of trees must have grown slowly, and the other fast; the first would have formed timber of little value, the latter of the best quality; but admitting that the quality of timber was equal, the difference in quantity must be enormous, as the reader will at once perceive when he considers that "a tree which increases annually eighteen inches in height and two inches in circumference, will make six times as much timber as a tree that increases only twelve inches in height and one inch in circumference."

"How important, then," adds Mr. Withers, "is it, in a profitable point of view, to accelerate the growth of timber! and how insignificant does the additional expense appear when compared with such results!"—in the one case, fine thrifty woods regularly filled with well-grown noble timber, producing wealth to the proprietor and beauty to the country; in the other, ragged moss-grown scrubs, some erect, others prostrate—a few tall and stately, more thin and gaunt, the pictures of vegetable famine—

> And all about old stocks and stubs of trees
> Whereon nor fruit nor leaf was ever seen.

We do not consider it any answer to these remarks to point to single trees growing in rocky places, or to plantations successfully made with care and skill in stony mountainous ground, not capable of being trenched. Plantations may doubtless be established wherever there is soil enough for a tree to fix its roots in; but in such places no return can be obtained equal either in amount or speed to that which will be derived from land well broken and thoroughly prepared at the outset.

CHATSWORTH.

(Continued from page 68.)

The drive by which you approach the great conservatory passes directly through it, so that persons having the privilege of the *entrée* may enjoy a peep at its contents whilst lolling in their carriages and without let or hindrance of any kind. Leaving the conservatory, the drive conducts through the Arboretum, which is yet too much in its infancy to require more than a passing notice. The Pines are thriving remarkably well, and are in many instances judiciously planted on the sides of rocky dells or steep ravines, where their 'sable arms' will speedily produce scenes of much solemnity and beauty. Here are the finest specimens in the kingdom of Abies nobilis and A. Douglásii, both exquisitely beautiful; the latter can scarcely be less than 25ft. high. Here too, as elsewhere, that grandest of all hardy trees, Araucária imbricata, is perfectly at home. To add variety and piquancy to the walk through the Arboretum, an artificial brook has been introduced, which murmurs and meanders as prettily as if it were running in its hereditary course. An additional rock here and there would, however, improve it. Quitting the region of Pines, you enter the American ground, where the collection of Rhododendrons and Azaleas, especially the latter, is very extensive, and in the most prosperous state, owing in a great measure to the humidity of the climate. When Mr. Paxton came to Chatsworth he found two Rhododendrons—they now muster forty thousand!

Among the many bold experiments of which Chatsworth has been the theatre, the "Conservative Wall," as it is called, deserves particular notice, as having opened quite a new field of Horticultural enjoyment*. The name of this wall is no misnomer, it being strictly "conservative" of all the rare plants committed to its care, an effect which is accomplished by means of flues, and curtains and other coverings for the outside in severe weather. Many plants which will neither bear exposure to the open air, nor confinement in a greenhouse, are here made completely comfortable, and flourish with extraordinary luxuriance. Several compartments are occupied by Fuchsias, which have spread themselves over a space of perhaps 15 feet in diameter, and are quite in a glow with flowers. Brugmansia sanguinea, blooming as I saw it, was likewise a most superb object. This wall terminates against the east side of the mansion, and opposite to an extensive Orangery; the latter forming, as it does, part of the façade of the house, comes rather within the province of the architect than the gardener; nevertheless it is cleverly arranged, and the Orange-trees, together with some noble specimens of Rhododendron arboreum and its varieties, are in excellent health; the same may be said of a fine plant of Araucária excelsa, which faces the entrance, and is there seen to great advantage. How perfectly graceful is this species!

Scattered through the park and grounds are a variety of objects which in a hasty sketch like this it were impossible to notice; *e.g.* the Swiss cottage, the Hunting Tower and its prospect, Queen Mary's Bower, the Column transported from the classic shores of Greece, and bearing an inscription (by Lord Morpeth), &c., &c. This list might be swelled almost indefinitely, and yet—and herein is the forte of Chatsworth—the eye is never oppressed with an unmeaning profusion of towers, obelisks, grottoes, temples, pillars, pagodas, *et id genus omne*, as is the case at Alton and Stowe. There is a place for everything, and everything is in its place, instead of the huddling together of ornament which one is so frequently condemned to witness, and which always mars the illusion it was intended to produce.

Before we leave Chatsworth, we must direct our steps to the kitchen-gardens, which, in addition to endless forcing-houses, contain the principal collections of Orchidaceæ, Cacti, &c. The Cacti occupy a long narrow house with an east aspect; but although in good health, they are not yet, as regards the number or stature of the plants, equal to those at Woburn. The Orchidaceæ are dispersed through three or more different houses, not any one of which seems to be exactly what these most perverse and lovely plants would wish. Unfortunately there is as yet no perfect model for an Epiphyte-house, and cultivators are therefore compelled to have recourse to experiments without end: great progress has, however, been made, and I have no doubt that in a year or two Epiphyte-houses will be as well understood, and as readily built, as Vineries or Pine-pits. The collection of Orchidaceæ at Chatsworth is immense, and in the number and rarity of the plants is surpassed only by that of the Messrs. Loddiges. It is eminently rich in East Indian species, thanks to the labours of Mr. Gibson; who was employed some years since by the Duke to ransack the forests of Nepal in quest of novelties in this charming tribe. He is said to have almost freighted a vessel with the results of his labours, and certes the masses of various kinds of Cœlógyne, Dendróbium, &c. attest his diligence and zeal. To the latter genus (Dendrobium), perhaps the most charming in the whole range of Orchidaceæ, Mr. Gibson has made numerous and most important additions; and it is doubtful whether it can number in its ranks any species more perfectly beautiful than D. Devonianum, D. Dalhousianum, D. Paxtoni, and D. sulcatum, for all of which we are indebted to him. Among the magnates of the collection must be noticed a gigantic specimen of Dendrobium speciosum, formerly in the collection of the Rev. J. T. Huntley, and which, report says, that gentleman induced to flower by making it free of his study for some months in the spring. The habit of this plant is especially noble, but the beauty of the flowers is over-vaunted, as they certainly do not entitle the plant to rank higher than a second-rate species in the cultivator's acceptation of the term. Another grand specimen, and also from Mr. Huntley's collection, was Angræcum ebúrneum, the first in point of imposing appearance of all the East Indian Epiphytes that have hitherto reached us. It was flowering profusely, and appeared to me superior in stature and beauty even to the original plant in the Horticultural Society's garden at Chiswick. In plants of this description—I mean the true Air-plant section—Mr. Gibson's mission does not appear to have been so successful; for although small species of Sarcanthus and Saccolabium were added to our knowledge, yet none of them are plants of any consideration. It would seem that we must go to the islands in the Indian seas for handsome Air-plants, and to the Continent for good Dendrobia. Oh that captains of vessels would bear this truth in mind! at least the former part of it; for even to this day we have not a tithe of even the *known* Air-plants. It is something, however, to have received, thanks to Mr. Cumming, Phalænopsis amábilis, and Aérides quinquevúlnera; the latter, perhaps the loveliest of its lovely tribe at Chatsworth. The former has had a narrow escape of flowering itself to death, which plants of this species will infallibly do if not checked in their blossoming propensities; for from the flower-stem first produced sprouts, after a time, a second, and this again gives birth to others; the plant the while having no power to produce fresh leaves, and to meet the pressure on its resources. In the East, no doubt the same causes frequently lead to the destruction of the plant; but *there* the loss is supplied by seed, which of course is not to be done in England; and therefore, cultivators, again I say, beware. Among other notables in this endless collection, some splendid plants of the different Nepal Cœlogynes, especially C. Gardneriana, deserve particular notice; as also do several profuse specimens of the charming Dendrobium nóbile. Scattered through the houses, the wondrous flowers of various species of Stanhópea, Coryanthes, and Cycnoches were in tolerable plenty, and passing strange to gaze upon.

---

* Mr. Loudon has given full particulars of the architecture, &c., of this wall, in his "Gardener's Magazine," to which those who wish for further information are referred.

In one of the forcing-houses is *the* plant of Amherstia nobilis, the principal object of Mr. Gibson's Indian mission: it is still small, but being in high health and vigour, will not long remain so. This plant, too, had a narrow escape; a Kyanised tub in which it was once placed having all but caused its death. When *will* this Amherstia flower!—*Argus.*

(To be continued.)

ON THE CULTURE OF THE PALMA CHRISTI, OR CASTOR-OIL PLANT (RICINUS COMMUNIS) FOR FLOWER-BORDERS.

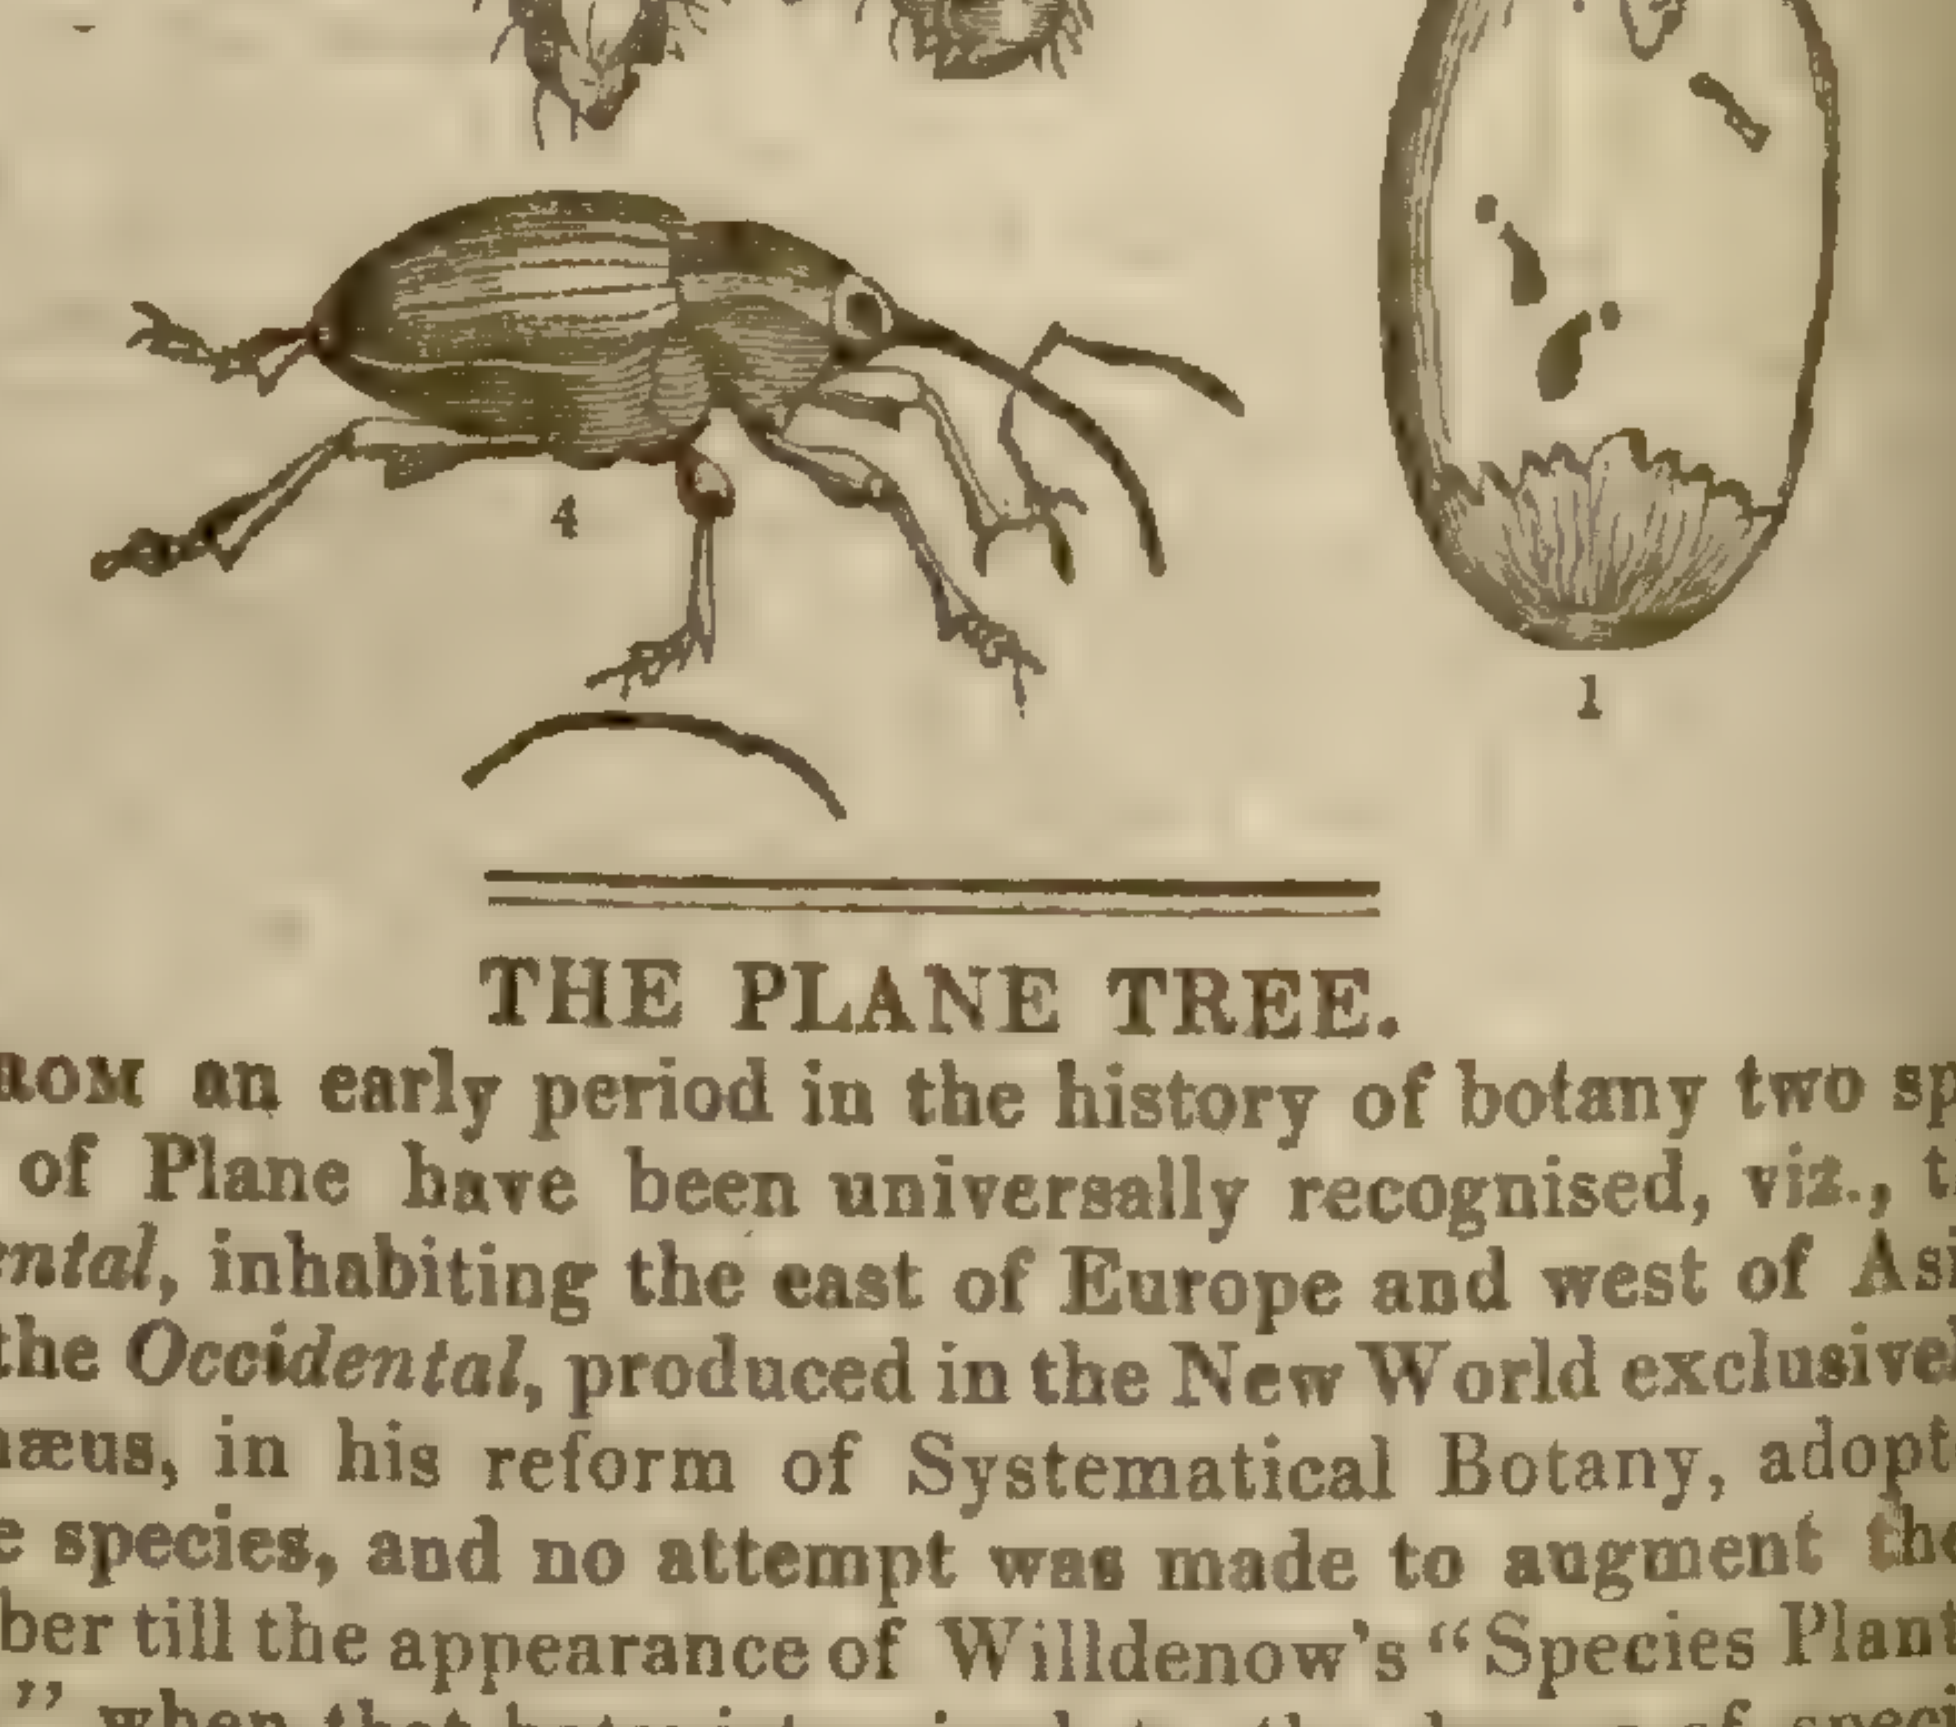
THE Castor-oil plant is generally cultivated in Britain as a tender annual to decorate the greenhouse during summer, while the hardier sorts of greenhouse plants are turned out of doors. In this situation the Ricinus, when allowed plenty of pot-room and rich compost, will attain a considerable height, and being properly arranged among the rest of the plants on a stage, makes a great show; its broad palmated glossy leaves contrasting with the rich crimson of the Cockscombs, and the deep scarlet and other colours of the Balsams and Pelargoniums. There are few gardeners who have the means of doing it, but cultivate the Castor-oil plant in this way; but scarcely any are aware of the grandeur of its appearance when planted out on the open border among Californian annuals, Dahlias, Salvias, shrubby Calceolarias, and Pelargoniums. A few Castor-oil plants, with the stronger-growing sorts of Indian Corn, among the plants in a border, give an air of Oriental grandeur which few have an idea of who have not seen it. I have three plants of the Castor-oil, raised from seed in April last, planted in the border in front of the hothouse; one of them, even in this inclement season (Oct. 22, 1841), has already reached the height of 10 feet, and has 13 branches, most of which are from 3 feet 6 inches to 4 feet long; some of the leaves are 2 feet 6 inches from the base to the apex, and 2 feet 9 inches across from the point of one lobe to that of the other; and the stem is 7 inches in circumference. To obtain fine specimens the following is the treatment I would recommend: about the beginning or middle of March the seeds should be sown singly in 60-pots filled with sandy soil, and the pots plunged in a mild hotbed, as free from steam as possible, as the plants when in the seed-leaf are apt to damp off. The young plants should be shaded from the mid-day sun till they have got two or three rough leaves, when they will require shifting into 48-pots filled with a mixture of decomposed turf, leaf-mould, rotten cow-dung, and sand, in equal proportions. When the roots come in contact with the sides of the pots, at least before they get matted, it will be time to shift them into 24-pots filled with a mixture of half-decomposed brown turf, broken into small pieces, leaf-mould, and fresh sheep's-dung, in equal parts, with a little sand. If the season is not far enough advanced to allow the plants to be put out before the roots get matted, they may again be shifted into No. 18s or 12ves; but none of the mould should be shaken from the roots in shifting. The frame in which they are placed should have plenty of air during the day, and be covered with mats during the night. After the last shift they should be put into a cold frame with plenty of head-room, or in the greenhouse, to harden before planting out, and be watered twice a-week with liquid manure, made in the following way: into a large tub, or cistern, put a barrowful or two (according to the size of the vessel) of fresh sheep's-dung; to each barrowful add 4lbs. of salt, 1lb. black soap, and six large panfuls of soft water, and stir the ingredients well. This manure should not be used till eight or ten days after it is made. When any is taken out, six or eight panfuls of water may be added, and the whole again stirred well together; it should only be used in a liquid state. It is also an excellent liquid manure for Vine borders. About the middle of May the plants may be taken out of the frame or greenhouse, and planted in the open border. Large pits should be dug in the preceding November, where the plants are intended to be put; a barrowful of fresh cow-dung, and another of leaf-mould, rotten turf, and sand in equal parts should be thrown into each pit, and mixed well with a little of the soil; and in this state the pits are left till the time of planting. The compost in the pits should be well stirred up before planting, and the ball of earth about the roots of the plant should be kept entire, only spreading out those roots that may be matted. A good watering may be given after planting, and each plant should be covered with a hand-glass with a moveable cover; and in case of frost, a mat may be thrown over the hand-glass during night. The glass may be left on till all danger from frost is over; but air should be given during the day. The plants may have a good watering of liquid manure every three or four weeks during the summer and autumn. With this treatment the Castor-oil plant will, in a favourable season, attain the height of 15 or 20 feet, if the border in which it is planted be well sheltered. Indian Corn may also be grown in the same manner, and with as much success.—*J. Drummond, Blair-Drummond Gardens.*

ENTOMOLOGY.—No. XXIV.

CURCULIO NUCUM, *the Nut-weevil.*—The maggots, which so frequently disappoint and even disgust us when we are cracking nuts, are the offspring of a beetle so peculiarly formed, that it will be readily recognised when we are once made acquainted with its figure and appearance. Although so few persons have seen the living beetles, they are far from uncommon upon the Hazel and Filbert bushes, from the end of May to the end of August, but they are most abundant in the month of June, when the males are seen roving over the leaves and even flying about nut-groves in search of their mates, but the female is generally engaged in selecting little green tender nuts to deposit her eggs in; when thus employed she will not unfrequently abandon one after a minute investigation, from which it may fairly be presumed that it was either an abortive bud, or it had previously been inoculated with an egg. Having discovered a young nut which suits her taste, she commences by boring a little hole with her minute jaws, which are placed at the extremity of her long slender rostrum, and when it is sufficiently deep she turns round and lays a single egg in the little cavity. The growth of the nut is not retarded or in any way changed by this operation, as is generally the case where fruits or living vegetable substances are penetrated by insects, to form a nidus for their future young; but every part increases in size as the season advances, so that at the expiration of eight or ten days, when the egg hatches, the kernel supplies abundance of food for the young maggot; thus they progress together, both increasing in bulk, until half the kernel or more is consumed, when the fine fat larva having attained its full size, employs its strong jaws in eating a hole in the shell, large enough to admit of its head, and by repeated efforts it soon manages to wriggle out, sometimes whilst the nut is still hanging on the bush, but oftener, I believe, after it has fallen upon the ground, from having ripened prematurely, which is frequently the case with the infected fruit. Having made its exit, the maggot buries itself, and forming an oval cell in the earth, it frequently rests there through the winter, and only changes in the following spring, or even later, to a whitish sensitive chrysalis, through whose skin the members of the future beetle can be traced, as exhibited in the pupa of the Vine-weevil *. Many of the beetles are said not to cast off their exuviæ until the end of July or August, when the animals are so tender and delicate that it requires eight or nine days more to acquire their colour and hardness, as well as sufficient strength to enable them to force their way up to the surface of the earth in the shape and colour of perfect beetles. If this part of their economy has been correctly investigated, it necessarily follows that the latest broods of beetles either live through the winter, and are ready the following spring to inoculate the young nuts, or else that they insert their eggs in the embryo buds which are formed to supply fruit and foliage the succeeding summer. These Weevils will also lay their eggs in almonds; and there seems to be good reason for believing that they, or a species nearly related to them, likewise breed in acorns. I never yet heard of any maggots being found in either plant in England, but of Acorns from foreign countries I have more than once been shown specimens containing the maggots of a Curculio. The nut-maggot (fig. 2) is fat, and of an ochreous white; the head is horny and of a chesnut colour, with small but strong black jaws; the first thoracic segment is large, and tinged with chesnut, and the rest of the body is wrinkled with numerous convex muscles, which assist it to move, especially when it escapes from its cell, for it has no feet, but short rusty hairs are scattered over it, forming transverse series on its back, and there are little breathing-holes or spiracles down each side (fig. 3, magnified).

The Nut-weevil is the Curculio nucum of Linnæus, but is now more generally known as Balaninus nucum * of Germar; it is of a tawny-brown colour, densely clothed with short depressed hairs. The head, which is short, is furnished with a very long curved rostrum, especially in the female, polished and bright chesnut; the base is sometimes black as well as the extremity where the mouth is situated, which is furnished with two jaws like claws, and other organs †; on each side, a little more than one-third of its length from the base, but nearer the middle in the male, are inserted the horns, which are extremely slender; the first joint is long, with a little club at the apex, and in repose this joint is received into a groove cut down each side of the base of the rostrum. The seven following joints gradually decrease in length, and project in an elbow at their union with the first joint. The four apical ones form a small velvety ovate-conic club; the eyes are black; the thorax is semi-ovate and cylindric, the hairs being combed to a ridge down the centre, and there is a pale stripe down each side; the scutum is small, sunk, and oval; the elytra are much broader than the thorax at the base, the shoulders being prominent and rounded—they rapidly narrow to the apex so as to form an elongate triangle—they are clouded or variegated with ochreous and reddish-brown transverse marks, and there are ten punctured striæ on each, which are rather obscure; wings ample; the legs are strong; the thighs clavate, and each has a sharp trigonate tooth beneath; the shanks are sinuated, with a brush of hairs at the apex on the outside; the feet are composed of four joints—the two first are trigonate, the third bilobed, fourth slender clavate and terminated by two strong claws, with a sharp tooth on the inside of each (fig. 4 magnified); the line shows the length of the female, including the rostrum.

It is very remarkable that one seldom finds two larvæ in the same nut. Can this arise from the female beetle, instructed by instinct, knowing that one nut is not sufficient for the support of more than one maggot? However this may be, it cannot be denied that the fine perception of this little animal in distinguishing those nuts which have been punctured, is a proof of the perfection of that sagacity which is so eminently conspicuous in the insect race. I have often observed in nuts approaching maturity minute dots (fig. 1), which are probably the spots where the eggs were inserted, and they are said to be certain signs that they are inhabited by maggots; if this be true, it ought not to be lost sight of by dealers in nuts, as it would be an excellent test of their condition.—*Ruricola.*



THE PLANE TREE.

FROM an early period in the history of botany two species of Plane have been universally recognised, viz., the *Oriental*, inhabiting the east of Europe and west of Asia, and the *Occidental*, produced in the New World exclusively. Linnæus, in his reform of Systematical Botany, adopted these species, and no attempt was made to augment their number till the appearance of Willdenow's "Species Plantarum," when that botanist raised to the degree of species two other Planes, which had been previously regarded as varieties of the Oriental, calling one the Sycamore-leaved (P. acerifolia), and the other the Wedged (P. cuneata). Up to this period, no difficulty had been experienced in distinguishing the Occidental and Oriental species; but the addition of two more seems to have created confusion, and we accordingly find the Occidental Plane not uncommonly confounded with the Sycamore-leaved plant of the East. Moreover, it would seem, from the practice that has obtained of planting the Occidental Plane, where ornament is desired, that an idea exists of one kind of Plane being as good as another. As this is a great mistake, it will be as well to explain to our readers what the peculiar qualities are of each species, and how they are to be known from each other.

The old writers distinguished the Oriental Plane by its large fruit (pilulæ majores), and the Occidental Plane by its small fruit (pilulæ minores), to which was added the form of the leaves, the Oriental Plane having palmated, the occidental angular foliage; that is to say, in the former the divisions of the leaf were described as deep, while in the other they were shallow. These are solid differences, which time has not shaken; and they must always be preserved as marks of division in the genus, whether such divisions indicate species, as was formerly thought, or groups of species, as seems to be the modern opinion.

* *Gardeners' Chronicle*, 1841, p. 293, fig. 4.

* Curtis's Guide Gen., 355, 1.

† Vide Brit. Ent., fol. and pl. 562, for the organs of manducation, &c., of an allied genus.

Division I. Oriental Planes; with leaves deeply divided into five coarsely-toothed lobes, which are usually narrower at the base than the middle. Balls of fruit large.

The true Oriental Plane (P. orientalis) is readily distinguished from all others by its noble shining leaves being divided into lobes, reaching more than half way down to the base, and divided at the margin into many very deep and coarse indentations. These lobes are evidently narrower at the base than in the middle, so that they have a somewhat lozenge-shaped outline. At the part where they join the stalk, the leaves are almost always extended into a wedge-shaped figure, which sometimes becomes so considerable as to connect the leaf-stalk and the lower lobes of the leaves. Its balls of fruit are from three-quarters of an inch to an inch in diameter. This is unquestionably the Platanus, concerning which so much has been said by the writers of antiquity, for the history of which the reader will do well to consult Loudon's "Arboretum Britannicum." It is perfectly hardy, and in all respects a most noble tree.

But it appears that in the East there exists another species with much broader leaves, whose lobes are less lacerated, and, from having a broader base, possess less the figure of a rhomb. This plant has been called by Willdenow the Sycamore-leaved (P. acerifolia), and is sometimes named in this country the Spanish Plane, though it is not found in Spain in either a wild or cultivated state. It has fruit in all respects like that of the Oriental Plane, and its leaves are much less wedge-shaped at the base; often, indeed, not so in any degree, but almost heart-shaped, or, at least, so straight at the base that the margin of the leaf and the leaf-stalk are at right angles to each other. Because of its broad leaves, many persons mistake it for the Occidental Plane, which is a great error. Although we are assured by all authorities that this is an Eastern tree, yet we do not find any exact locality assigned to it. It occurs, however, among the dried plants brought from Cashmere by Dr. Royle, and is, in all probability, regarded by travellers as the Oriental Plane itself. It is perfectly hardy and a majestic tree.

Besides these two Oriental species, the distinctions between which are clearly marked, a third has been added to our list by Willdenow, under the name of the Wedge-leaved (P. cuneata). He tells us that it is the same as the Wave-leaved Plane of our gardens, and if so, is probably a mere variety of the Oriental Plane. It forms a scrubby bush, which often retains its leaves half the winter. The latter are shaped like those of the true Oriental Plane, but are smaller, more wavy at the edge, and sometimes very much wedge-shaped at the base. It appears to be a stunted variety of the Oriental species, found in situations too cold for that plant to grow with its natural luxuriance. To the planter it is of no importance.

Division II. Occidental Planes; with the leaves more or less divided into three or five slightly-toothed lobes, which are broadest at the base. Balls of fruit small.—N.B. In these plants the leaves on young seedlings are often nearly round and very slightly lobed, or are even lozenge-shaped.

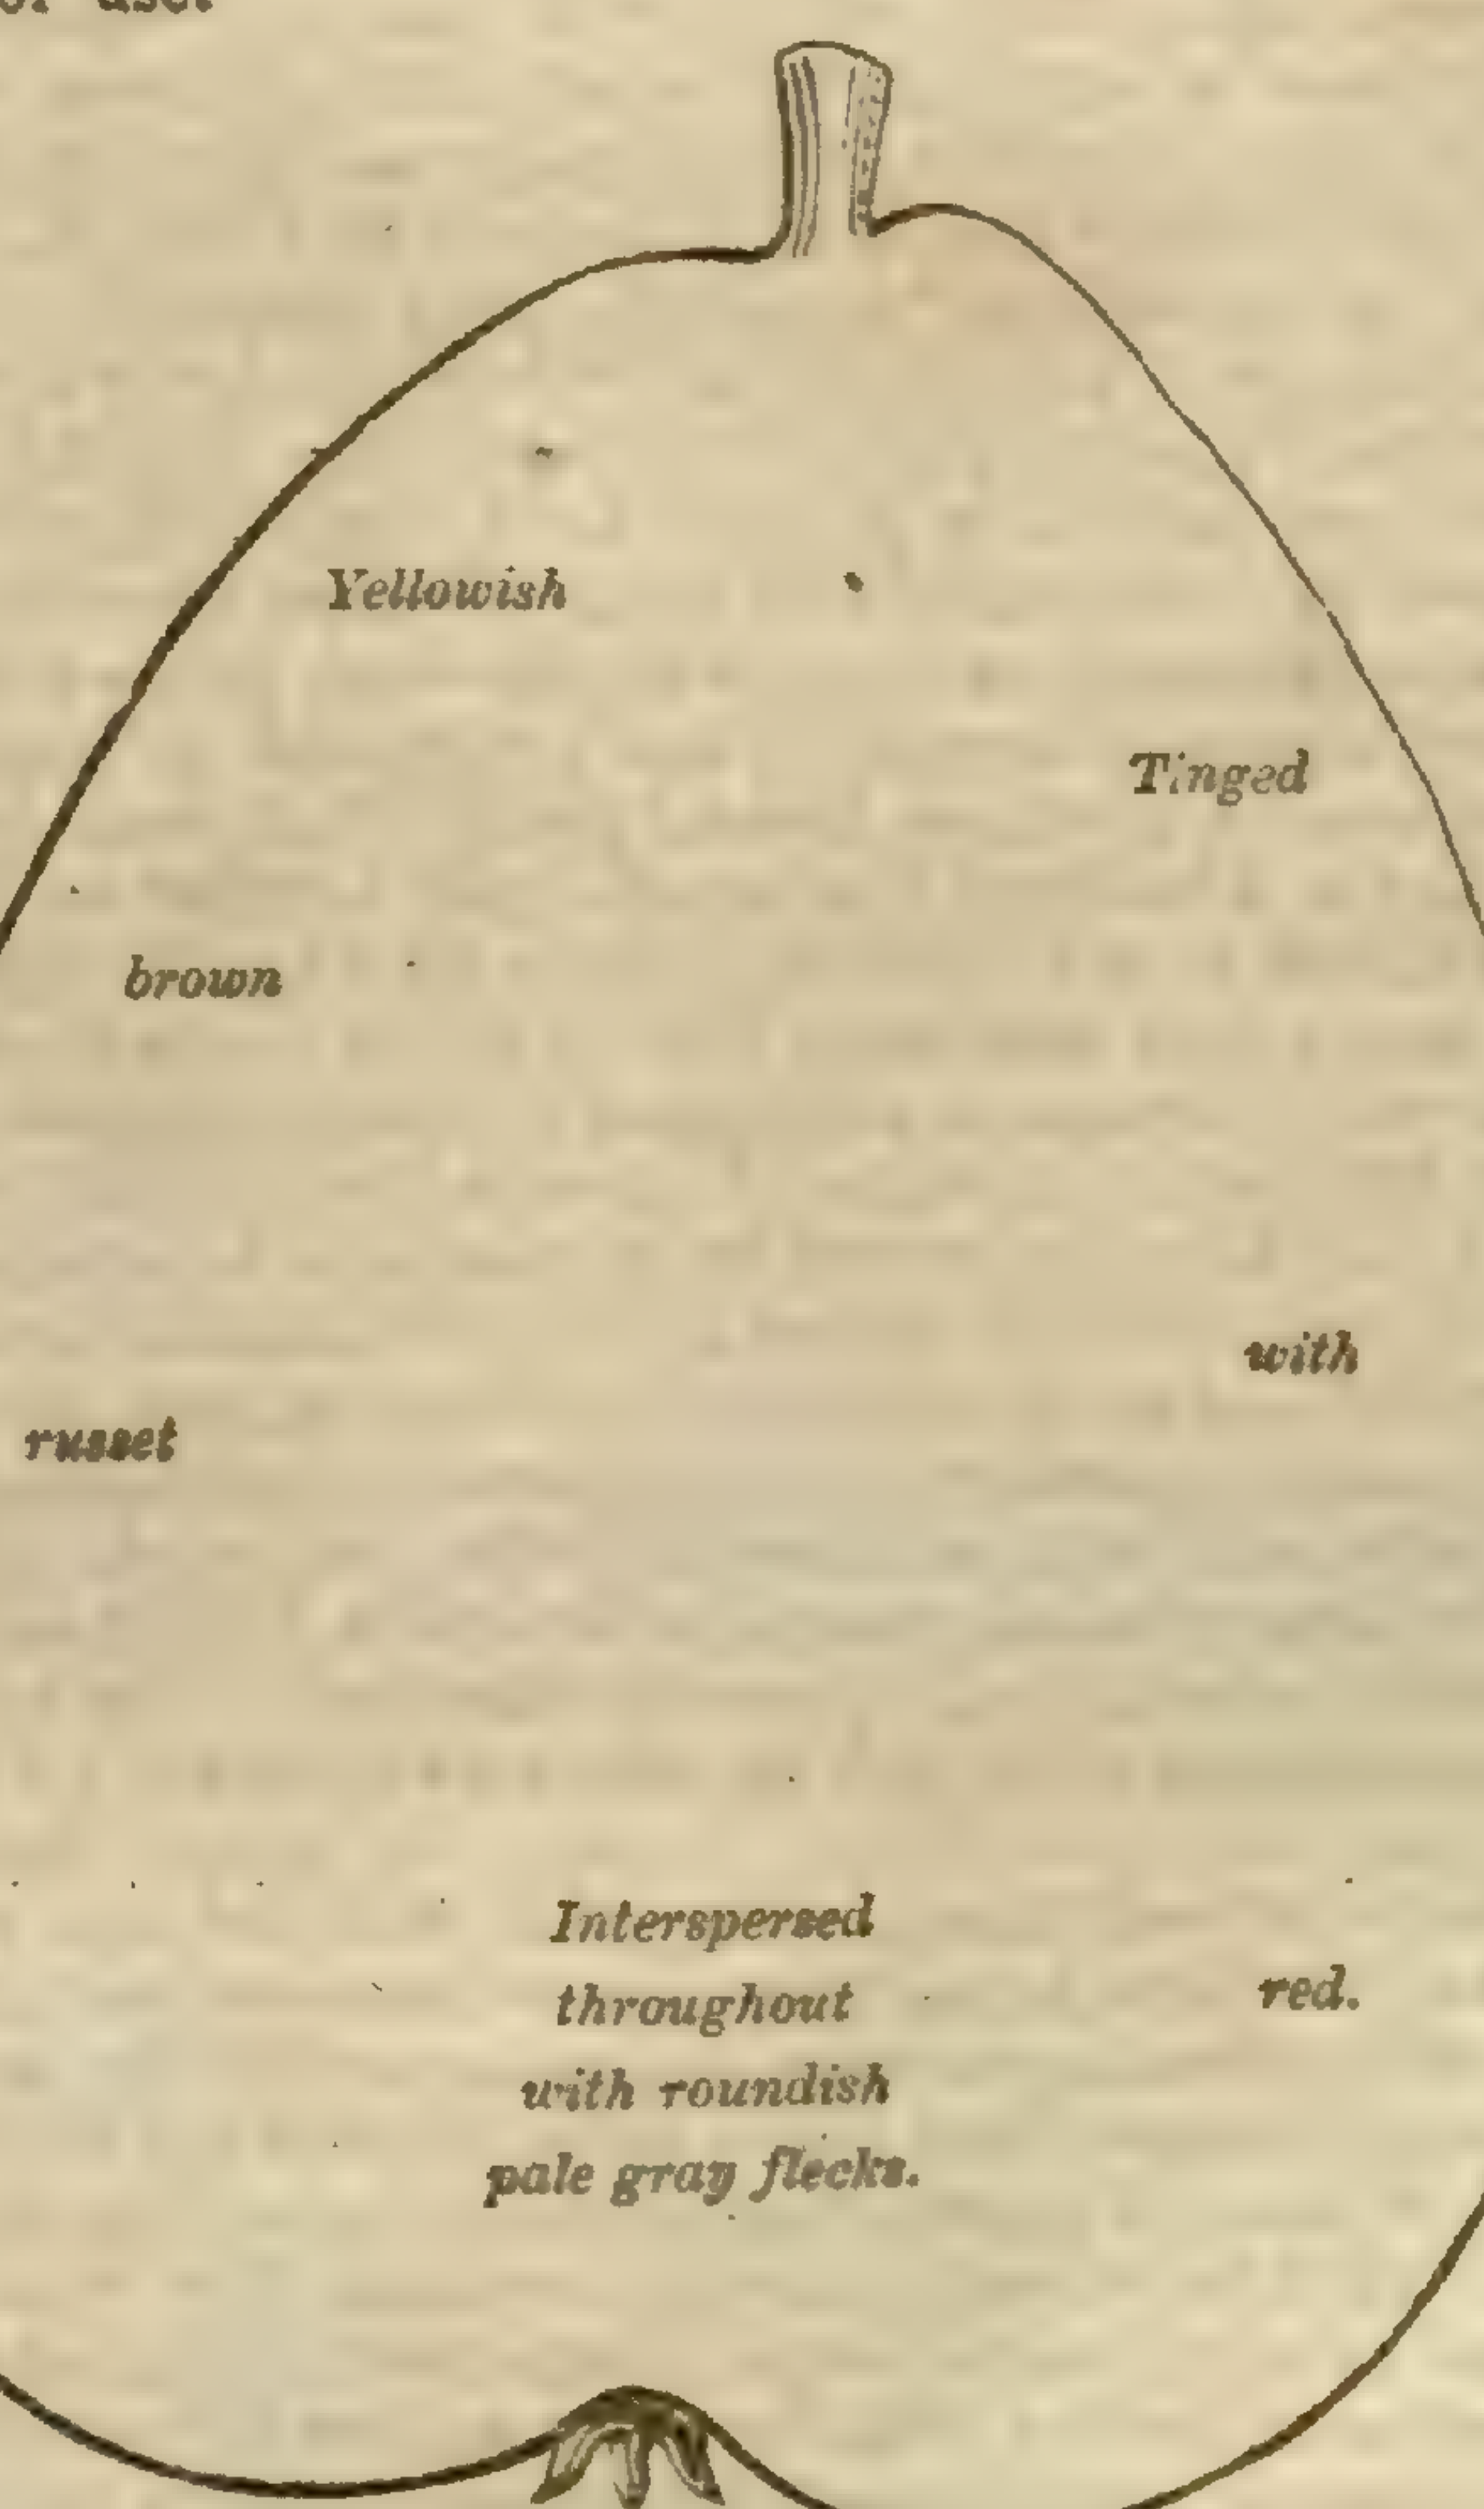
The true Occidental Plane (P. occidentalis) inhabits the United States, and is unknown in a wild state in the Old World. In its native forests, it is represented as forming a magnificent tree, and bears the name of "Button Wood." Once seen, there is no mistaking this species. Its leaves never have the numerous secondary lacerations universally found in the Oriental Planes. Often they are scarcely more than angular, and, in all cases, the lobes taper to a fine point; in a word, they are well described in the language of the old botanists, as resembling bat's wings, an expression that will not apply to any form of the Oriental Plane. A greater distinction however, if possible, than that supplied by the leaves is to be found in the fruit of the Occidental Plane, whose balls are not one half the size of those of the Oriental, nor spiny in anything like the same degree. This did not escape the observation of the old writers, who called the Occidental Plane "Platanus pilulis minoribus." It is the species which has been so unwisely allowed to usurp the place of the Orientals in our plantations and parks. Nine-tenths of the Planes in the country belong to it. But it is so tender that it is rare to see a really handsome specimen; the leaves being half killed by spring frosts, and the foliage, at the best, thin and bare, compared with that of the Oriental Plane. We find from our correspondent Mr. Rivers, that he doubts whether the common park Plane is really the Occidental; because the seedlings raised from the seed, called Platanus occidentalis, imported from the United States, are not the same. He says it differs so widely from that planted in Hyde Park and other places near London, which we say is the true Occidental Plane, that he is at a loss to know who is correct, ourselves or the American nurserymen. The above variety is exceedingly delicate, and in wet, clayey soils will not make a tree more than five or six feet in height, as its shoots canker and die after a wet summer. To this we shall advert presently. In the mean while we can state that we have examined, in Sir W. Hooker's herbarium, wild specimens from West Chester, in Pennsylvania, and from other localities in the United States, and they leave no doubt about the common Plane of the parks and shrubberies near London being that species. Although it is very badly represented in Michaux's work on "American Forest Trees," yet there is even there sufficient to show that the same plant is what was intended by that author for Platanus occidentalis.

But if the Plane of our parks is almost universally the true Occidental Plane, what is that which Mr. Rivers receives from America, so different from the Planes of our parks, and so tender? After the most careful investigation of the history of these plants, it appears not to be distinguished by botanists from the common Occidental sort. It is, however, in the French nurseries as the Occidental Plane; but no description to be found in books will entirely correspond with it. It cannot be the P. cuneata of Willdenow; for that author says his plant came from the East, and distinctly states it to be the same as the P. orientalis undulata of our English nurseries, as has been already shown; a plant which has nothing to do with that now under consideration. It may, indeed, be included in the Platanus vulgaris flabellifolia of Spach, a modern writer upon this subject; but it is hardly worth speculating upon the meaning of an author who first gives a definition which corresponds with the plant before us, then quotes Willdenow's cuneata as a synonyme, although the definition will not correspond with it, and, finally, assures us that it is found in America and "everywhere else where Planes occur." From the evidence that really exists regarding this plant, it is possible that it is a mere variety of the Occidental Plane, for it has the same small fruit. Nevertheless, it is desirable that it should be distinguished, and the name of the Various-leaved, (P. heterophylla,) may be conveniently applied to it; for it has leaves of more different forms than any other, some being lozenge-shaped, others nearly round and entire, others three-lobed, especially when the plant becomes old. Its nearest approach is to the Mexican Plane, but that species has the old leaves covered beneath with a close pile, and is very distinct; it is, perhaps, the same as a woolly species found by Douglas in California; but that is not certain.

The conclusion that we wish our readers to draw from these remarks is, that they should on no account buy any of the Occidental Planes, which are all, more or less, tender, but confine themselves to the true Oriental and Sycamore-leaved species, which alone are hardy, and capable of rewarding the hopes of the planter by producing noble timber trees. We are satisfied that in all those cases where the Occidental Plane is said to become a fine tree, it is the Sycamore-leaved species that is really intended.

KNIGHT'S MONARCH PEAR.

Knight's Monarch Pear was raised by the late Thomas Andrew Knight, Esq., who stated, in his account of this excellent variety, in Vol. 1, p. 106, 2d series of the "Transactions of the Horticultural Society," that he named it the Monarch "under conviction that, for the climate of England, it stands without an equal; and because it appeared in the first year of the reign of our most excellent Monarch" (William the Fourth). The accompanying outline of a fruit, selected of medium size from those produced in the last season on a standard in the garden of the Horticultural Society, represents its size and form. The stalk is, in all cases, remarkably short and thick; the eye is open, in a shallow depression; the general colour is yellowish-brown, tinged with red next the sun, and everywhere interspersed with roundish pale-grey flecks; flesh yellowish, melting, buttery, and rich; slightly musky, but not disagreeably so, and this is less perceptible in a drier season than the past, being then almost lost in the highly saccharine quality of the fruit. The tree grows vigorously, and is a most abundant bearer as a standard; the fruit from which is much higher flavoured than from a wall. January is its season of becoming fit for use.



THE AMATEUR'S GARDEN.—No. VII.

The dull, short days of winter are nearly past; now and then the sun shines brightly; the air is mild, and many other indications present themselves of the coming spring. No time ought, therefore to be lost in finishing the pruning of Gooseberry-bushes, fruit-trees, and Vines upon walls. Roses may also be pruned now. The amateur should never cut out a single branch unless he can give a sound practical reason for what he does. Shrubs and trees are living, organised beings, capable in a high degree of being made subservient to the purposes of man; the question, therefore, should always be, what are the objects to be attained by pruning? The forester prunes to get fine timber, the hedger to make strong and dense fences, and the gardener that his trees may bear an abundant crop of fine fruit; and all these effects are produced in different ways, and are the results of natural laws. Now it will be evident to the most inexperienced in the art, that if the gardener prunes upon the plan of either of the two former, failure less or more is sure to be the result. Our hardy fruit-trees generally bear best when they are allowed to grow to their natural size, as they are seen in the orchards of the market-gardener; but as this would be in many cases inconvenient in small gardens, various modes of training are practised by which the trees are made to grow and fruit in a very limited space. Where they are allowed to grow to their full size, the only pruning required is the thinning out of the branches, so that they may have the full benefit of the sun and air. It may also be necessary, in some instances, to shorten some of the overgrown branches. In all cases where the trees are dwarfed, either by training them as espaliers or in any of the forms so common in all horticultural gardens, it is not a good plan to allow them to send out a number of strong shoots every summer, which are only to be cut away in winter; a much better method is to prune the roots, which will have a tendency to make the branches form fruit-buds, and thus check their luxuriance. Sometimes continued pruning will produce the desired effect; and trees may often be seen, which, after struggling for several years to form wood of which they are always deprived by the knife, give up, as it were, this opposition to the will of the gardener, and quietly set about spending their strength in the formation of fruit-buds.

Amateurs who have been successful thus far in the protection of tender out-door plants, must not be deceived with a few fine days, and leave them uncovered; we may still expect sharp frosts and cutting winds for some time to come. Plants in the greenhouse and frames ought to have abundance of air every fine day by opening the sashes or ventilators in the morning and closing them early in the afternoon. Those intended for bedding out should be induced to grow, so that good cuttings can be got from them. If the soil has been got ready and is in proper order, greenhouse plants may be repotted; but this ought not to be done if the soil is wet. The health of the plants depends much upon the bottoms of the pots being properly drained, and worms kept out of the soil.—*R. F.*

HOME CORRESPONDENCE.

On Planting.—The root-pruning of Mr. Rivers has given the lie to the horticultural distich of

Plant Pears
for your heirs,

and the octogenarian may now "order his rows" with fair hope of reaping a goodly crop in his own lifetime; and the selfish, the "Après moi le déluge" men may be induced to plant from the hope of immediate profit. I wish, however, to add a word of encouragement to all, not merely to plant Pear-trees, but to plant shrubberies, hedgerows, and woods, to profit by old Dumbiedikes' advice to his son, every now and then to be sticking in a tree when he had nothing else to do. I believe it is some very learned Grecian who says—"Never stop to consider about planting a tree, but think twice before you build a house." How often are selfish people deterred by the "Ah, it is too late now; I shall never live to see them come to anything." Although I have no doubt, Mr. Editor, that you will do much good by your horticultural apophthegms and instructions, yet one of the best services you can confer on the public will be the converting the non-planter into the planter. Let any one but begin, and the delight of seeing a thriving plantation, or a brilliant shrubbery of evergreens, or a hedgerow of fine young saplings, will be so great that he will be sure to go on, and he who plants well one acre this year, will, if his means admit, plant two the next. It would seem that planting should be essentially the pursuit of the young, yet it is rarely taken up till middle life, and it appears one never plants till one has got wise. It would be well if some of your readers were to communicate their success and their pleasures as planters; their difficulties, their almost hopelessness at the beginning, and all the consequent enjoyment and the profit. The fame, as well as the success of the Duke of Athol's large Larch plantations ought to stimulate all; as a patriot it put him in the same class as the Cokes and the Russells. Whilst, however, you call on your readers to plant, stimulate them to plant well: there are few things done well that are done cheaply, but of all things least successful is cheap planting. The digging a few holes here and there, and trampling in some hundreds of drawn poles covered with moss, the refuse of some old nursery quarter, sent perhaps 100 miles to save some 5*s.* or 10*s.* per 1000, is not planting, and such plantations are (as is always the case) deservedly left to be choked by weeds and eaten up by rabbits. Tell your readers this is waste of time and labour. This, indeed, is the only really dear planting. Amongst my planting acquaintance, it is curious to observe how many there are who consider that if the tree survives all the rough usage of being torn out out of the ground at 2*d.* a thousand, and sent by land or steam some 200 miles, and then planted at 1000 per day, they are successful planters; one in ten with them is a good average of life and death. I saw some belts last autumn, in Sussex, which I have watched during the last six years; holes had been dug—a clodhopper jammed in the unhappy tree with his heel; six trees had been planted where one would have sufficed, and at the end of six years one stunted scrub remained where three might have grown well; they had been left to their fate, covered with long grass and weeds, "to keep them cool and the ground moist." I was, however, very triumphantly reminded of the falsehood of my prophecies, as some of the most hardy were at last beginning to grow, and having survived the rough usage of their youth, were struggling into trees. You have two duties to perform: advise all to plant; to trench deeply, to weed carefully, to bring young and healthy trees from the nearest spot; to plant with the greatest care, not at 1000 per day, but rather at 100 or less; and, above all, to thin in time—or, what is better still, to plant so far apart as to make thinning for some years unnecessary; and last of all, never to plant after December.—*Rhæcus.*

Prizes for Seedling Florists' Flowers.—I cannot allow the remark of "S. D.," in p. 39, in reply to my letter on the subject of prizes for seedling flowers, to pass unnoticed, as he has misunderstood me in supposing that I intended to confine the offer of handsome premiums to one or two sorts of flower in each year. My idea was, that subscription lists should be simultaneously opened for every kind of flower usually shown for seed-prizes, and considering that such prizes would be open to the competition of the whole kingdom, I did not think it was unreasonable to expect that each flower would find sufficient admirers to make up every year a premium somewhat on the scale I suggested for Pelargoniums. That larger premiums in money would prove an additional stimulus to competition is admitted by "S. D.," as he thinks it would prove "a greater incentive to deception and fraud." If, however, the judges are liable to be thus deceived and cheated, I should not consider them competent to their office. Attempts at deception, however, will always depend more on the character of the exhibitor than on the value of the prize. No amount of premium would tempt the honourable man, whilst a trifle would awaken the cupidity of the unprincipled one. I agree with "S. D." as to the impropriety of any society holding out expectations which would be uncertain of realisation; but "S. D." must be aware that the funds of almost all such societies are made up of subscriptions, and I cannot see why the subscriptions I propose for definite objects should be more uncertain than those contributed for the general purposes of the society. I may have overrated the number and the liberality of the lovers of flowers; but surely, after what we have been told in p. 39, of "ladies and gentlemen thinking it rather beneath them to contend for money," we shall find no difficulty in getting subscriptions. I rejoice to hear that the science of Horticulture so far exalts the minds of its votaries above the ordinary level, as to make them not only regardless of pelf, but actually opposed to the receipt of money as a premium for merit. Let us bear in mind, however, that the growers and the admirers of flowers are not all "ladies and gentlemen," but that there is a large class who professedly cultivate for profit as well as for honour and for pleasure. There may be some difficulty, I admit, in carrying out my plan; and I do not think it right to occupy the columns of the *Chronicle* with discussions on minor details, which can only be settled by the Committee of the society in question. My only object in writing was to call the public attention to the importance of supporting a thoroughly competent and impartial tribunal for testing the merits of new varieties of flowers, and at the same time to suggest a plan for increasing the funds of that society which appears most likely to become the recognised arbiter of Floricultural merit. I am quite willing however to place my subscription at the disposal of the society without any limitation, if the committee prefer it.—*Samuel Bowley, Gloucester.*

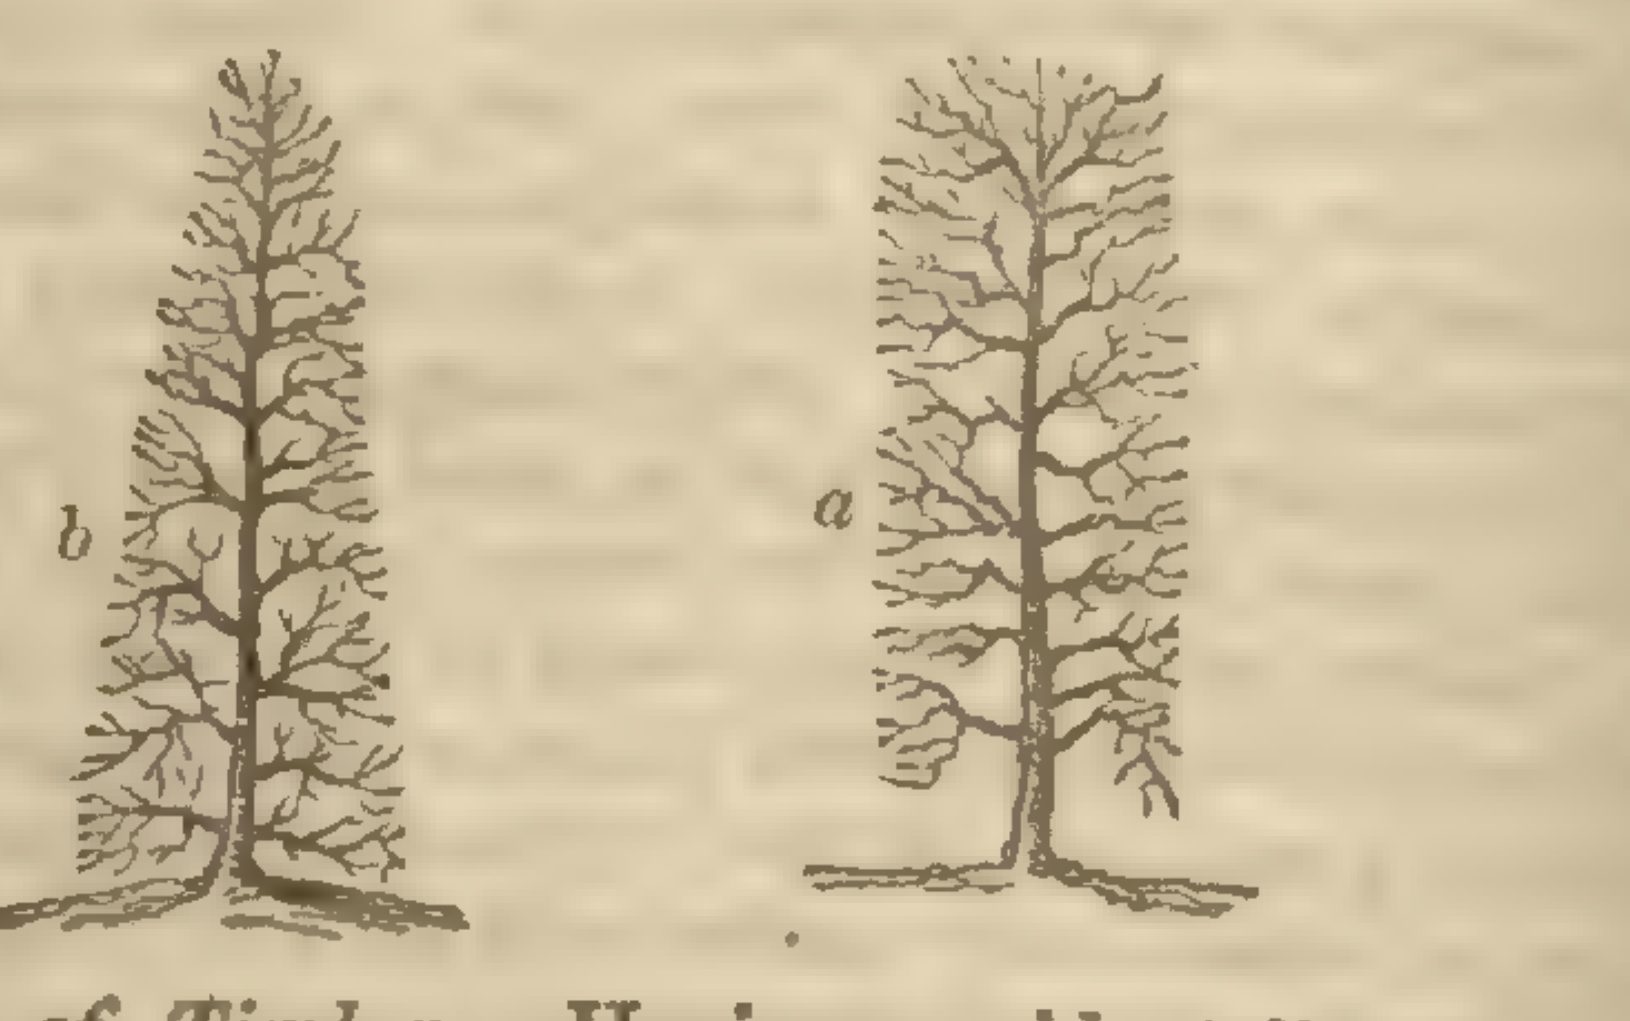
Potato Planting.—I always plant Potatoes early in November, choosing a dry day, and have found them succeed exceedingly well. I cut my sets in the usual way a week before planting, draw the drills about two feet asunder, then put in some good rotten dung, and plant the sets about one foot apart, and put some dung on them. The early sorts I plant 9 inches apart, in rows 18 inches asunder, taking care to earth the drills up to a ridge, which will keep the sets dry and prevent the frost from hurting them. By this method I have Potatoes quite ripe the beginning of September, and have had a most excellent crop. I can recommend the above for small gardens.—*George Jennings, Shrubbery, Buckland, Dover.*

Rot in Potatoes.—I have suffered as much from the rot in Potatoes as most farmers have done. I know of but one cure. Plant whole Potatoes about the size of Walnuts. You will have as good a crop as from cuts, and never hear of a blank.—*Ilex.*

Rot in Potatoes.—As you request information on the rot in the Potato for the benefit of the people in St. Helena, it may be of advantage to them to know what has been said on the same subject in Scotland. A few years ago, the failures were so excessive in Scotland as to attract general attention and spread great alarm. A good many years ago an alarm was created about the curl in the leaf of the Potato, which had caused great deficiency in the crop. Mr. Dickson pointed out that this was owing to the Potatoes being too ripe; he selected the dry end of the long kidney Potato, the end nearest the root, in which there are fewest buds; and he found all the cuts selected from that end to produce curled foliage, while the others did not. This has been ascribed to the food deposited at that end being too much ripened. Before the food can become available to the young embryo or bud in the spring, it must be reduced to the original state of fluid sap from which it was prepared. In grains and other seeds, the food, when just deposited, is found to be in a milky soluble state, which ripens into starch as the ripening process proceeds; and the more ripe the seed, it keeps the better, but requires more action again to reduce it to the soluble state. When the seed is deposited in the ground, the food is found to be reduced to the same milky soluble state, and the same thing takes place in the tuber of the Potato. It is generally found that Corn and Potatoes, &c., spring much quicker and more vigorously when not fully ripe. Potatoes from the cold moorland districts have been always found to produce the best crops of Potatoes; and it has been said that it is because these districts are late, and the Potatoes do not ripen so well: there is, however, found to be a vigour in Potatoes grown in a peat-soil or leaf-mould that unripe Potatoes from clay soil seldom possess; and here the stock is generally annually removed from the upland peat-soil. Unripeness has been also found often to be carried to excess, and from the food being too apt to decompose, rot takes place. It will also take place from carelessness in letting the Potatoes, after being cut, lie in heaps, or be sacked, when rot will take place. It has been found to add greatly to the vigour of the Potato to spread them on the ground a few days after they are lifted, before pitting; they get green in the skin, more of the nature of the stem, and have more vigour. If intended for domestic use, however, this will make them bitter. It has also been found that dusting the sets with quicklime and watering causes them to grow more vigorously. The alkali furnished, and the carbonic acid extracted, are both useful in germination. Nitrogen is also needed in the decomposition of the food, and this is generally found in the form of diastase around the buds; but where deficiency is apprehended, as at the dry end of the Potato, substances containing nitrogen might be useful. The rot has also been ascribed to the varieties failing from the want of renewal from the seed or plum, and there is perhaps more in this than generally believed; any seedlings we have raised are far more vigorous in the foliage than the old varieties; but this would take place by degrees, and will not account for great deficiencies in one year as compared with the preceding. In the year in which the greatest failure took place in Scotland, there were long-continued droughts for weeks together at the time of planting; and as germination will not go on without moisture, it was generally believed this was the greatest cause of failure. In the last year and the year before, the droughts were not long-continued at planting-time, and the failures have been very few as compared with the years before. As cotroborative of drought being the cause, we may mention that in the Nursery-grounds here, where our Potatoes were planted with the spade, and the ground well broken, we never had any failures; whereas, from the same Potatoes planted at the same time in Mr. Fowlds's park with the plough, the whole was a complete failure one year. It will be obvious from the above that many different causes may be at different times in operation; but the pulverising of the ground well, exposing the drills as short a time as possible to the drought, and using well-rotted manure in dry weather, should be a great means of preventing failure. In wet seasons in spring, strawy dung may be best. If the Potatoes are once germinated and grown a little, they will stand a good deal of dry weather.—*R. Lymburn, Kilmarnock.*

Pruning Forest-trees.—Will you allow me to give the public, through the medium of your pages, a short and simple receipt for pruning, which will be better understood than if I wrote a treatise of one hundred pages on the subject, and treated it learnedly? It is this: always look at the top of a tree to be pruned—and every tree requires pruning every eight or ten years at least—and observe if it be double or roundheaded. If double-topped, cut away the worst and most crooked, leaving only one leading shoot; then look down the stem, and if the tree be vigorous, cut away the strongest branches, say two, three, or four of them, according to its vigour. If weakly, take only one of the thickest away; and on no account touch the smaller and lower branches, which aid the growth of the stem, whilst the large branches are perfect robbers of sap. If the head be round and without a straight good leading top-shoot, better cut the head completely away, where it will make a fresh straight shoot: or if it be of the Pine tribe, cut it down altogether; it can never reach a valuable size, or be ornamental. I gave this short receipt for pruning trees lately to the Zoological Society, of which I am an original member, and it was highly approved of, and ere now, I doubt not, put in practice. The thinning of woods is of the greatest importance; though planting thickly makes, for the first few years, a quicker growth by the shelter thus given; all thinning must be gradual and judicious. There is nothing which proves the advantages of thinning so clearly as segments of trees of the same age and on the same soil, but the one well thinned, and the other allowed to remain in its original crowded state. At 10 years of age, the former will show double the girth of the latter. The Belgians understand the management of woods better than any other nation.—*F. A. Mackenzie, Chat. de Talh, Brittany.*

Whitethorn.—Perhaps, after the remarks in your leader of the 15th inst., upon Whitethorn hedges, a hint on pruning them may not be ill-timed, particularly as the subject concerns so many of your readers, both farmers and gardeners. The common practice in cutting Hawthorn hedges is to make the sides as nearly as possible perpendicular, or with a very trifling contraction towards the summit, leaving this last of a square or partially-rounded form. The usual tendency of the plant to grow in a tree-like manner is thus insufficiently checked; and hence the hedge is exceedingly dense at the top, but bare of branches and very much broken towards the base. In the neighbourhood of Chiswick a system of pruning appears to prevail, by which the above most serious defect is completely avoided; and as the method cannot be too generally known or strongly recommended, I annex two rude sketches showing its peculiarities. Figure *a* is a section of a hedge treated in the ordinary way, in which the want of branches at the bottom is made apparent. Figure *b* is a similar section of a hedge, pruned in the mode here advocated. The simple difference between the two is that the latter is always cut so as to assume when viewed from the end a conical figure. By thus repressing the inclination of the bush to spread out laterally to a great distance at the top, it is induced to form branches close down to the ground, and gaps, flaws, or other imperfections, never occur, except from accidental causes. The plan carries with it its own commendation, and need not be further lauded. —*E. K.*



Shrinkage of Timber.—Having accidentally observed that Oak timber shrank in drying very much more in the direction of the circumference of the tree, or of the annual rings, than in the direction of the radius or of the medullary rays, I fancied that I had made a discovery which might be useful in many of the arts. Making, however, some references before I ventured to trouble you with a communication on the subject, I found that I had been anticipated by the late president of the Horticultural Society, whom nothing seems to have escaped. I think, nevertheless, that the fact is not as well and as extensively known as it ought to be, and I believe that the difference in question is greater in Oak than in the Ash and Beech, to which the experiments of Mr. Knight were limited. There is this further reason for noticing the phenomenon, that the paper containing the results of Mr. Knight's inquiries, though given in the Philosophical Transactions for 1817, is omitted in the recently-published selection from his communications to the Royal and Horticultural Societies; an omission which is due, probably, to the circumstance that the paper contains speculations on the cause of the ascent of the sap which subsequent investigations have shown to be erroneous. Mr. Knight's paper, while it describes the fact, and gives the relative quantities of the shrinkage in the two directions, viz., 14 and 3½ per cent., does not allude to the probable cause of the difference, which, it appears to me, may be found in the circumstance that the medullary rays are, in effect, so much wood endways of the grain; and as these organs are more decided in the Oak than in the Ash or Beech, they would account for a greater disproportion in the shrinking of that than in either of the two latter woods. If it should be asked how the medullary rays can prevent the shrinking radially of the woody vessels and fibres which cross them at right angles, and which evidently shrink circumferentially, the fact may be explained by the indentations which the vessels of the medullary rays suffer in passing between the longitudinal vessels, and which so fix the latter at certain distances, that they cannot escape in obedience to the tendency to shrink, unless the medullary vessels suffer a change in length. While examining under the microscope portions of Fir decayed by the dry rot, I have sometimes detached a small portion of medullary tube which on two of its sides was closely indented, corresponding apparently to every fibre and vessel which it had passed, looking as if it had moulded itself to the slightest irregularities formed by the longitudinal organs of the tree. If this be the case generally, it is quite clear that the inability to shrink endways in the medullary rays would explain the comparative permanence in the radial dimensions of the tree, at the same time, perhaps, that the shrinking in the direction of the circumference is increased, inasmuch as the whole of the loss of bulk is compelled to exhaust itself in that line. Thus, probably, the vessels in very dry wood will be found to present a more oblong transverse section than those in newly-cut timber. It may be mentioned that wood, and especially coniferous wood, whose tenacity is completely destroyed by dry rot, without any visible derangement of its organic structure, is in a very favourable state for microscopic examination. It can be broken with the greatest ease across the fibres, and thus sections for viewing as opaque objects may be obtained, more perfect and less injured than when cut, even with the sharpest knife. By a transverse fracture of this kind a portion of a medullary vessel will frequently be detached and lie loosely on the surface of the wood. Returning to the question of shrinkage, it is obvious from the fact, of their having two directions in which timber alters its dimensions little or nothing, is open to various useful applications in the arts. These are drawing-boards, many rough drawing and surveying instruments, and numerous others, together with all the cases in which wood is united with metal or with veneers. It had been long known that planks cut in the direction of the radius, or so that the annual rings crossed the board nearly at right angles to its surface, were less likely to warp than those cut on either side of the centre, and this first led Mr. Knight to investigate the matter; he pointed out the probable importance of this quality in the manufacture of musical instruments, and his views were further explained and illustrated by Mr. Tredgold in the article Joinery in the supplement to the sixth edition of the Encyclopædia Britannica.—*Alfred Ainger.*

Thinning of Plantations.—The notice of your intention to enter into further particulars on the thinning of plantations must give every one who takes an interest in the raising of timber great satisfaction, fot it seems hardly possible that the principles you have already laid down should not at last bring conviction to the minds of those who hold an opposite doctrine. The heresy, for it seems to deserve no milder term, into which the anti-thinners have fallen, appears first to have been promulgated as a principle by a celebrated man of his day, and in the earlier process of timber-raising not undeserving of the character he held. The late Mr. Speechly is alluded to, whose system will be found detailed in a note to Dr. Hunter's (of York) edition of Evelyn's Sylva (page 86, vol. i., 4to edition, 1786.) He had the management of the extensive woods on the Welbeck estate, Notts. His system, as far as raising trees in the nursery is concerned, seems to have been very judicious; but when he gets out of the nursery and into the woods, his judgment seems to desert him. His system was, however, persevered in as long as he lived, and, it is to be feared, has outlived him even to the present day. He begins by planting too thick (page 92), and then sows acorns among the already too thickly-planted trees. If these plantations had been destined to be regularly and freely thinned, the evil would have been confined simply to an unnecessary expense in plants and labour; but his plan appears to have been to take out occasionally some of the Oak and Birch till they were about fifteen years' growth; and then, as he says, (page 94,) "each plant seems as it were in a state of strife with its neighbour; and in a strict sense they are so, and on no other terms than life for life, and he whose fate it is to be once overtopped is soon after compelled to give up the contest for ever." The plants that sprung from the sown acorns must have perished at the first onset. It does not seem to have occurred to him what a loss had been incurred by leaving the trees to destroy each other. After the first 15 or 20 years a profit might have been obtained from the thinnings; and as Oak seems to have been the tree most encouraged, the bark from those thinned out at and after 20 years would have produced no inconsiderable sum. The loss too in the value of the standard Oaks, the victors in the contest above described, from the deficiency of top, lop, and bark, must have been very great, bearing, as they do, a great proportion to the value of the whole tree, for what profit could arise from that source from the miserable brooms, as described by Mr. Speechly (pp. 94, 95); his words are,—"We are very cautious doing the former (thinning), knowing well that if we can but once obtain lengths of timber, time will bring it into thickness (?)—therefore we let them grow very close together for the first fifty years"! Whether he lived to see the effect of his experiment at the end of the first fifty years, does not appear; but by his description of the state of the woods, he might have seen enough to convince him his system was erroneous; for it is a mistake to suppose that Oak timber is alone valuable in proportion to its tallness and straightness. Accompanied with size in circumference, it is no doubt valuable as plank timber; but every wood-forester of experience knows that the best prices are obtained for those Oaks that contain a fine crook, as it is technically called, where the absence of straightness adds to the price. In your forthcoming paper on this subject you will probably give some directions as to the managing woods, with a view to under-wood; for though your rule of thinning trees when heads meet is an admirable one, where under-wood is no object, or the trees are intended eventually to stand in open grove, yet the standards would require to be left at much greater distances where coppice wood is desired.—*M. D. P., Jan.* 27, 1842.

FOREIGN CORRESPONDENCE.

Paris, January 1842.—Floriculture in France, at the present day, is but little advanced from what it was 20 years since; and while England, Germany, Belgium, and Holland are every year making rapid strides in this delightful pursuit, the generality of florists and amateurs here either believe, or affect to believe, that "La Belle France" is perfect, or are too indolent to enter upon the subject with that zeal which is so necessary to insure success. I remember to have read in one of Mr. Hogg's works, of a person who walked 50 miles to see a new flower, so strong was the flower fever upon him; were such a thing to happen here, ninety-nine out of a hundred would consider him fit for a *maison de santé* (madhouse). No; floriculture, that is the study and culture of what in England are called florists' flowers, is almost literally unknown here; and, strange as such an assertion may appear, it is easy of proof: I may appeal to those nurserymen who are in the habit of visiting this country, or to others who, in the simplicity of their hearts, have written to Parisian florists for novelties in Tulips, Ranunculuses, Picotees, or Dahlias; and what has been the result? Disappointment. Allow me then to inform your readers the cause of this, for by pointing out the difference of taste on the two sides of the Channel, much vexation and useless expense may be avoided. It will, I think, be readily conceded, that to her numerous floricultural societies and public exhibitions, England is chiefly indebted for the great progress which has taken place during the last ten years, especially when it is considered that these are generally regulated by popular and well-defined laws, with judges chosen from amongst the most expert in their several departments, who know their duty too well and have too much regard to their reputation wilfully to misplace a stand; thus the characteristics of a well and badly formed flower at once become known and duly appreciated. Here, however, the case is widely different; there is not, that I am aware of, one floricultural association or exhibition in France; and even the horticultural societies are but few in number, and so defective as to afford but very little assistance in developing the properties of a fine Carnation, Auricula, Dahlia, Tulip, or Pink. Can it, then, be any wonder that judges often place a bad collection for a prize and leave the best unnoticed, when they themselves are unacquainted not only with the names of many of the flowers, but with the very rules which should guide their decision? Thus it is that the public remains in ignorance, preferring size to form, and colour before either; and France, which might, from her situation and excellence of climate and diversity of soil, be the first floricultural country in Europe, remains indebted to her neighbours for all she possesses of these delightful flowers. It must not, however, be supposed that because French florists do not excel in these that they are necessarily behind in others; on the contrary, the great number and variety of beautiful Roses sent out by them every year afford sufficient proof of what might be accomplished, were their exertions also directed to other florists' flowers. Auriculas, either green, grey, or white-edged, are hardly ever to be seen; and I have never met with more than three or four small collections in Paris. In Normandy and the North, there are some few amateurs, but the price of such flowers as Col. Taylor, Conqueror of Europe, Waterloo, Britannia, Champion, Freedom, &c. &c., frightens them from forming first-rate collections; Alpines are extensively cultivated, principally for market, and in such places I have often seen very striking and beautiful varieties; some few good selfs are also to be met with, but not sufficiently fine to be worth showing for a prize. Pinks (except the common variety) are, if possible, less seen; and I know of but two growers in this neighbourhood; it may be that they are too small, or continue too short a time in flower, but certain it is, that neither the superb powdering of the one, nor delicate pencilling of the other, attracts much attention; they are to the generality of amateurs known by name, but that is all. Heartsease were some four or five years since in the same lonesome state; the only large varieties then grown were Royal Blue, George IV., and King of the Whites, and these were entirely for bouquets; the case is now altered, and a desire to possess the largest English kinds of this interesting little flower has manifested itself in all parts of France; so that, at the present time, it is regularly initiated into French gardens; but the line of beauty with this is as little understood as with the Dahlia or Picotee: a long, ill-shaped, showy variety would, in nine cases out of ten, be preferred before "Thompson's Eclipse," such is the taste here; and there is no accounting for matters of taste, except upon the very natural supposition of a defective education.

PROCEEDINGS OF SOCIETIES.

AGRICULTURAL SOCIETY.

Feb. 2.—H. Handley, Esq., President, in the chair; 13 gentlemen were elected. Colonel Challoner laid before the Council the Report of the Finance Committee, exhibiting the receipts and expenditure during the past month; and having announced the current cash balance in the bankers' hands on Jan. 31 as 2,135*l.* 8s. 8d., he proceeded to inform the Council the recommendation of the Committee, that a further investment of capital should take place in the purchase of 1,000*l.* stock in the New Three-and-a-Half per Cents. On the motion of the Duke of Richmond, this Report was received and confirmed, and its recommendation directed to be carried into effect. The President read to the Council Professor Sewell's Report on the satisfactory progress of the Cattle Infirmary established by him, and adopted by the Veterinary College at Islington, from which it appeared that an outlay had been made of between 500*l.* and 600*l.* in placing the institution on a permanent basis, and adapting it to the wants of the pupils who daily attended the cases of cattle diseases brought under their notice, and discussed and explained to them by the resident veterinary surgeon. A discussion then took place as to the precise nature and number of the lectures delivered on these diseases to the pupils in the ordinary routine of instruction given to them by the professors at the college, which was concluded by Mr. H. S. Thompson moving, and the Duke of Richmond seconding, the following resolution, which was agreed to by the Council: "That the grant of 200*l.* be continued to the Veterinary College, and that a Report of the proceedings of the College, with reference to the number of cattle lectures and demonstrations, and also the number of pupils receiving certificates, be annually submitted to the Council." The return moved for by the Rev. Mr. Rham, at the last monthly Council, of all sums paid to members of the Council for any services performed for the society since the year 1839, being laid on the table, it appeared that an amount of 93*l.* had been paid to members of the Council during that period. Mr. R. Barker then moved the resolution of which he had given due notice, and it was carried unanimously, viz.—"That an instruction be given to the bye-law committee to prepare a bye-law restraining the future payment of any sum from the funds of the society to any member of the Council for services of any description, executed by him in furtherance of the objects of the society." The Duke of Richmond reported the progress of the arrangements for the meeting at Bristol, which were now in so forward a state as to be nearly completed. Numerous memorials, accompanied with plans and other documents, inviting the society to hold its Annual Country Meeting of 1843 at Leicester, Derby, or Nottingham, were laid before the Council, when it was resolved that the decision of this question should be made at the monthly council, on the 4th of May, and reported to the anniversary meeting to be held on 23d of the same month.

Mr. Shaw gave notice, that he should move the adoption of the following resolution at the next monthly council, to be held on the 2nd of March:—"That a committee be appointed to consider and report upon the expediency of this society's contributing a sum equal to any sum which may be raised by subscription in any district in which the society may hereafter meet; such whole sum to be given in prizes within the district for cattle and implements especially required in that district, and to promote any other object consistent with the object of this society which in the opinion of the council may be calculated to benefit that particular district. Upon the propriety of offering a prize for the best-cultivated farm in the district in which the society may meet, sufficient notice to be given to enable the competitors to go through the rotation; as, for example, that, in 1842, a prize be offered for the best-cultivated farm in the district in which the society may meet in the year 1846, in 1843 for 1847, in 1844 for 1 48, and so on. That competitors be required to give a statement of the course of management and cropping during the two years previous to the commencement of the rotation, embracing the period of competition; to render a detailed account of the whole system of management as regards cattle and sheep tillage, manure, produce, expenses and proceeds during the rotation, with the value of the land and stock at the commencement and conclusion of the rotation. Upon the propriety of offering prizes or medals, or both, for the best ploughing and the best performance in any other branches of agricultural labour, as sheep-shearing, hedging and ditching, drilling grain, rick-making, thatching, &c., improvement in which may be most needed in any district; such prizes or medals to be given in the year in which the society may meet in that district; general good conduct to be taken into consideration in awarding the prizes."

Mr. J. Oakley, of Frindsbury, near Rochester, addressed the following communication to the President and Council:—

"To this society the farmers of England looked for assistance on points beyond their reach, and also beyond the means of their local associations; and being aware the situations you now occupy with the Society are possessed by you on account of your individual desire to promote the welfare of the agricultural world, I have ventured to address you on a subject which concerns every farmer and every grazier of the United Kingdom, and which I feel sure will receive the consideration at your hands it deserves. The following remarks will directly apply to sheep, but the principle will embrace all animals that convert vegetable into animal food. You are well aware that every farmer has his own opinion as to which description of sheep will produce him the greatest profit, which must be interpreted here as that sum of money left after the sheep have paid for their food consumed, out of the amount produced by their wool and mutton. In every county the farmers using short or long-woolled sheep, as the case may be, are divided in their opinions as to which are the best kinds of their respective sorts, and they look to you to determine the question for them. Different soils require various descriptions of animals, and on different soils this experiment requires a trial, and in climates as well. And as some animals of the same age and kind consume more food than others of the same age and kind, the value of the food consumed tested by weight, compared with the value of the produce realised tested by the same power, would produce results, if conducted under your management, that might be depended on by all, and which would enable the best sorts for the different districts to be stated without fear of contradiction, and to the satisfaction of the most prejudiced. As this experiment would embrace numerous lots of sheep and other animals in many situations, the attendant expenses could be met by no agricultural association but the Agricultural Society; I have therefore addressed you on the subject, and beg to be excused for the liberty I have taken."—Mr. T. Umbers, of Weppenbury, in Warwickshire, addressed the following communication to the President and Council:—"There are established in almost every county in England, Agricultural Societies for the exhibition of live stock, and I believe it is admitted that great good arises from them. I think that as there are great varieties of soil and variation of climate, so there may be selected various sorts of animals best adapted respectively to them. The Smithfield Club Cattle Show is the grand emporium at Christmas, where meet the best animals of their respective kinds in competition. The important question to which it is my object to draw your attention is a practical test of the comparative value of animals. It is no unfrequent occurrence amongst breeders of two or more distinct sorts of animals, to make matches, and show publicly: the one defeats the others; but who can now tell whether the animals which lose might not be the most valuable for general purposes? Large animals, be their kind what it may, are generally preferred by the majority; and provided the weight produced be greater, after compensating for the value of food consumed, they are preferable. I know persons who occupy similar soils, located within a few miles, breeding four different kinds of cattle; and it is quite clear that these cannot all be the best calculated for the situation. Our great aim, if I mistake not, should be to cause the surface of England to be covered with the best stock of their kinds, for the purpose of feeding the population at the cheapest rate. I look upon this question to be of greater importance to the breeders and feeders of stock, and to the community at large, than any of those subjects that remain to occupy the attention of the Agricultural Society. I feel persuaded that, with practical data, based upon such authority as that of this society, we should see the weight of shambles' meat increased, and consequently the price to the consumers reduced, at the same time paying the producers better. However strong may now be the bias of any of us, as breeders in favour of the sort of cattle or stock we may keep, we should, from motives peculiar to our individual interest, abandon those which have been proved inferior, and persevere only with those which have been ascertained to be superior. Mr. Pusey communicated three papers for the Journal, by Earl Spencer, on the improvements which have taken place in West Norfolk; by Sir R. Peel on draining, subsoil ploughing, and Potato culture; and by Col. Le Couteur on his Jersey Trench Plough. Mr. Kimberley presented specimens of Sunflower oil, and a new kind of economical oil-cake for cattle; and Mr. S. Brittain, jun., a copy of the "Farmer's Herald," published by Mr. Evans, of Chester.

MISCELLANEOUS.

Fulham Oaks.—The magnificent sub-evergreen Oak, growing in the nursery of Messrs. Whitley and Osborn, at Fulham, and known as the Quercus Cerris fulhamensis, was supposed to be a seedling tree, and the original one of the variety; but, about two years since, it emitted a small twig an inch above the ground, proving that it had been grafted, or budded on one of the native species. It is a free-growing tree, and not so much planted as it deserves to be. The Quercus Cerris Lucombeana crispa, of the Fulham Nursery, is another desirable variety of the Turkey Oak, being an evergreen, and by no means a slow grower. —*W. K.*

The Model Farm at the Confluence of the Niger and the Chadda.—Those who have taken an interest in the Niger Expedition are aware that the establishment and cultivation of "a model farm" constituted, from the very first, one of the objects to which the attention of the friends of African civilization was most strongly directed. In "The Friend of Africa" we find an account of the proceedings in relation to this object, of which the following is an abstract:—The Attah, or King of Iddah, assented to the proposal made to him by the government commissioners to dispose of a portion of his territory, the selection of which he agreed to leave to themselves. When opposite to the point of junction of the Niger and Chadda, attention was directed to a low hill with extensive plains on either side of it. The appearance of this spot, called Mount Stirling, was inviting, and upon examination the soil was found equal, and that of the plains little inferior, to that already cultivated by the natives. Here, accordingly, Mr. Carr, the superintendent, resolved that the intended farm should be formed, and on the morning of the 14th of September the frame-work of a farm-house was landed. Mr. Carr and his assistants landed with a quantity of provisions, and implements suitable for agricultural purposes. Captain Trotter further supplied them with a tent to serve as a place of temporary abode, until the farm-house should be erected. On the 17th, all necessary preparations having been made for commencing operations, Mr. Carr finally left the *Wilberforce*, and took up his abode at the farm. His conduct on this interesting occasion we leave him to describe in his own words. "Before retiring to rest, I called all my people around me, and returned thanks to Almighty God for his infinite goodness in having preserved us to be the means of commencing so important an undertaking as that of introducing improved agriculture and Christian principles into Central Africa. I hoped they would use their utmost exertions to co-operate with me in fulfilling the duties imposed on us all, reminding them that most of them had already felt the horrors of slavery, from which they were redeemed by British arms, and brought to enjoy the blessings of liberty and Christianity.' Early on the following morning (the 18th), Mr. Carr commenced the work of levelling the ground, digging a trench around the tent, and placing under its shelter such articles as must have sustained damage if too long exposed in the open air. At the same time his carpenters, natives of Sierra Leone, were employed in assorting the various pieces composing the wooden frame of the house; a work of some perplexity, owing to unavoidable injuries which the packages had received in landing. While these operations were in progress, a number of native young men made their appearance, and stood gazing with astonishment at the strange spectacle before them. One of them was taken into the superintendent's employ as porter, and four others were set to work at a place overgrown with rank grass and brushwood. These they quickly commenced to clear away, exerting themselves vigorously and well, cutting down the bush, and pulling up the long grass by the root. 'Thus,' says Mr. Carr, "I obtained, on the morrow after my sleeping here, one native porter, and four native labourers, to work for wages, which at once proved the fallacy of the assertion, that these people will not work without coercion.' On Monday and Tuesday (the 20th and 21st), the settlement continued to make steady progress, and Mr. Carr was enabled to fix the rate of wages to the satisfaction of all employed, viz., 100 cowries for a day's labour, that is, from six in the morning to six in the evening, allowing one hour for breakfast and two for dinner—eighty cowries when the labour commenced after breakfast, and so on in proportion.—In a few days he had as many hands as he could give employment to, not only men, but women and boys also. Of their readiness to obey his orders, he bears the very highest testimony, and adds, that he had been the means of saving some families from starvation and death. This last particular is explained by the following interesting facts. The labourers had travelled from a town in the interior, which had been sacked and burnt by a hostile nation (probably the Filátahs). For some time previously to the settlement at Mount Stirling they had been supported by the generosity of the inhabitants of Pandaiki, a village in the immediate neighbourhood of the Confluence; but this source of supply soon failing them, they were literally in a state of starvation when Mr. Carr and his companions made their appearance. Besides this, they had contracted heavy debts to some of the people amongst whom they had taken refuge, and were threatened with being sold as slaves if they did not quickly satisfy their creditors. Of the favourable change produced in their health and circumstances by Mr. Carr's opportune interference, the following extract from his journal affords evidence not a little gratifying :—'At first I objected to employ them, seeing them nothing but skin and bone. I soon found, however, that they worked well, and in a short time I had not only the satisfaction to find them getting fat, but to hear from themselves that they had nearly completed the payment of their debts. They said it was the Good Spirit that had sent me to relieve them.' In a few days the farm-house was built, but it proved far from secure against the violence of tropical tornados. On the night of the 27th it was so seriously damaged by a furious gust, that Mr. Carr determined to inclose it with a strong stone wall, the materials for which, with the exception of lime for mortar, abounded in the neighbourhood. In order to supply the deficiency, he made a visit to an old chief who lived at no great distance, hoping to learn from him the method of preparing the cement used by the natives in the construction of their buildings. In this excursion he appears to have attained his object, as we find him on the following day engaged upon the wall, while a number of natives were employed in making and carrying cement. On the 1st of October, Mr. Carr, whose health had been for some time past in a precarious state, experienced a decided attack of fever. Unhappily the medicine-chest intended for the use of the settlement had fallen into the water in getting it ashore. The consequence was, that although the bottles reached their destination, the labels had been washed away, and the various medicines could no longer be distinguished. In these circumstances they became of but little service, with the exception of one or two of a plain and simple nature. To the timely use of these, however, it is probable that the superintendent owed his life. On the return of the *Albert* he embarked on board of her, his condition being such as to require an immediate change to a healthier climate. Within less than a month after landing at Fernando Po, he had recovered, and resolved to return to his duties at the farm. In a letter dated 'Fernando Po, October 24th,' immediately before setting out, he says, 'I have proposed to Captain Trotter to hire a small vessel which belongs to a gentleman here, in order to my return to the farm. The hire of this boat will be 16*l*. I have left the head overseer (a black man) in charge of the farm during my absence. I had above eight acres of land cleared for planting cotton, and I hope by this time part of it is planted. The natives, when I left, were working very well. The greatest number that I employed in one day was thirty-four. They were quite satisfied with their rate of wages. I found provisions abundant and cheap. I fixed the price of some of them, viz.: 1 cwt. of yams, 400 cowries; 1 sheep, 1,000 do.; 1 goat, 1,000 do.; 1 fowl, 100 do.; ducks, 150 to 200 do.; eggs, 60 do. per dozen.' "—We may add that the fruit-trees sent out by the Horticultural Society arrived safely; but Mr. Ansell, the gardener, having been attacked by fever two days after landing at the farm, we have no information as to their fate.

Uncommon Heat in May.—Among other instances of premature summer heats, we find that the year 1807 produced one. On the 24th and 25th of May in that year, the thermometer was about 85° in these parts.—On May 16th, 1808, it was again an early excess of heat; thermometer 86° at Ipswich.—On May 26th, 1811, and near that time, it was very nearly as hot; but the month of May 1833 was, perhaps, the most remarkable for continued heat and brightness. On the 4th, 12th, 14th, 15th, 16th, 17th, and 25th of that month, the temperature was extremely high; and on the 16th and 17th I noted it at 84° and 85·5° respectively. This weather was brought in by a gale at S.S.W. on 2d, just like that of April 25th, 1841. —*Meteorological Journal.*

GARDEN MEMORANDA.

Hampton Court Forcing Gardens.—The large early Vinery looks more like the latter end of March than the 1st of February. A fine crop of black Hambro' Grapes is changing colour in all parts of the house, and several bunches next the fire end are fit for table. This Vinery has been forced for a number of years, but never was known to be so early before; it appears that the latter end of last September the Vines which were then exposed to the weather made a regular and sudden push, their eyes swelling and being ready to burst, so that Mr. Tyrrell found it was too late to have them cut, but ordered the sashes to be put on the house, and had it regularly forced, deferring the pruning till the leaves expanded sufficiently to take the sap and prevent bleeding. The Pines look tolerably well; a number of them have shown fruit. The early Cherry-house is in full blossom and promising. —*From a Correspondent, Feb. 1st.*

R. Gunter, Esq., Kensington.—The most remarkable feature here is some Pines, which were planted out in the open soil of a pit last March, as suckers; they were potted in September, and are now nearly all throwing up their fruit. They are in the most perfect health, and out of 300 plants in one pit, that have been thus treated, we did not observe one that would not fruit. In other pits heated by hot water, beds of light earth have been made in the centre, and Strawberries are planted in them for forcing. Whether this will succeed as well as the old system of growing them in pots, remains yet to be tested.—*Feb. 7th.*

Lee's Nursery, Hammersmith.—In a short time the Heaths here will be gay; a few are in flower, among which are Vernix, with orange wax-like flowers; pubescens minor, with numerous small purplish rose blossoms, and colorans, with white tubes changing to pink as they die off. In company with the Heaths were many Epacrises, and Corræa speciosa, whose flowers though rather dingy in colour are valuable at this season. In a stove, Crinum erubescens had developed a fine head of its dark crimson and white flowers, and near it stood a specimen of Clívia nóbilis, which, from want of light, was much paler than usual. Læ'lia anceps, with its beautiful lilac and violet blossoms, enlivened the Orchidaceous house; and the singular growth of many Cacti renders the house devoted to them always interesting. Among the latter was a large specimen of Cactus monstrosus, presenting a most grotesque appearance; and several fine plants of Céreus senilis, from two to three feet high, hoary as it were with age, formed a singular contrast to the round Echinocacti.—*February 7th.*

CALENDAR OF OPERATIONS *for the ensuing Week.*

As the return of frost and snow has most likely prevented the sowing and planting recommended in last week's Calendar from being performed, advantage must be taken of the first favourable weather and condition of the soil to follow out the directions there given; bearing in mind, however, that the success of very early sowings in the open ground cannot always be calculated upon, as it is dependent in a great measure upon the state of the weather at the time the young plants appear above ground, and during the earlier stages of their growth: all main crops should, therefore, be deferred till the middle or the end of next month. At the same time, as it is highly desirable that no hiatus should occur in supplying the table, these early sowings ought never to be omitted, always choosing for that purpose the driest and warmest situation the garden affords.

Whenever bad weather occurs to prevent out-door business from being carried on with advantage, house-work, as the potting, training and cleaning of plants, the tying and dressing of fruit-trees in forcing-houses, and similar jobs, should be resorted to. In fine weather such work might often be suffered to stand over for a time without doing any harm; and by a little judicious contrivance of this kind, considerable time could be saved in places (and such are too numerous) where the gardener is kept short-handed.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

Pinery.—Upon the first certain indications of the rising of the flower-stem of any fruiting plants, water must be more liberally given at the root, but take care not to overdo it. Young fruit that do not swell off well immediately after flowering may generally be improved by taking the plants out of the pots, carefully removing all the exhausted soil, and repotting them in turfy loam enriched with good manure. These should, if practicable, be kept very close and warm till they have made new roots. For the general stock, the temperature should remain as formerly recommended.

Vinery.—Those who have Grapes far enough advanced to show which are the likeliest berries, which will be when they have reached the size of large shot, should thin them without loss of time, leaving in preference those that are largest and outermost on the bunches. Much valuable sap is often wasted by following the rule generally given in books, to "thin out the berries when they are the size of Peas." Vines ought never to be suffered to exhaust their strength in the production of useless parts, such as fruit not intended to remain till mature, shoots not wanted for bearing wood, and unstopped laterals. Where there is a large consumption of early Grapes, another set of Vines should now be brought forward.

Peach-house.—Those trees to which heat was applied about the middle of last month will now be in blossom, partially if not wholly, and the night temperature ought not to exceed 50°. In bright sunshine the house may be permitted to rise to 70°, but air should be given every day, more or less. For a succession crop to ripen in August, another house should be shut up about this time.

Cherry-house.—If the fruit is all set, which will be the case when forcing was begun early in December, it can be seen whether the crop is greater than the trees have strength to mature perfectly; if so, thin out with a scissors all deformed and short-stalked fruit. The trees should now be frequently, but not roughly, syringed, and liquid manure occasionally given to the roots. Until the stones are formed, a temperature from 50° to 55° will be safer than a greater heat, and every day fresh air must be admitted.

Fig-house.—During the ensuing fortnight the artificial heat should be progressively raised to 55°, and the trees syringed every morning, or twice a day in fine weather. Water also at the roots if required, always using tepid water.

Cucumbers and Melons.—In ridging out Melons, raise the plants well up, and in subsequent earthings let the surface of the soil be a few inches lower than that round the stem of the plant, that moisture may not lodge there, which is a principal cause of canker. One plant is sufficient for a moderate-sized light; but if the pit or frame be wide, two may be put in, not, however, close together. Leave space for an adequate depth of soil (20in. at least), which should be good turfy, but unmanured, loam. For Cucumbers similar soil, mixed with a third part of leaf-mould, is equal to anything. Keep up a good heat in the beds, but take care not to admit the stinking steam from raw dung linings.

Kidney-Beans will continue longer in bearing as the season advances; therefore once in four weeks will be often enough to sow. Always pinch off the first shoot above the first pair of leaves, which will cause the plants to branch; and as they grow they should be supported by short brushy sticks, and not allowed to hang about in all directions.

Sea-Kale.—Keep up a constant succession. Very little heat is necessary to start it at this time of year. The same also of Asparagus.

Peas and Beans which have been raised in heat must be freely exposed to air and light; they merely require protection from frost now.

Out-door Department.

If the weather be fine, any sowings omitted last week should be brought up. In addition sow on an open quarter two or three sorts of Peas, to succeed those sown on the south borders. For this purpose there are perhaps none better than the Green Imperial (by some called Blue Imperial), Knight's Dwarf Green Marrow, and the Milford Marrow. This last is a fine large Pea, and comes into use a fortnight sooner than any of the tall-growing Marrows, but it does not continue so long in bearing, and the Peas sooner become hard.

Beans should also be sown in a similar situation. The green kinds are generally preferred, because they look best when cooked.

Cabbages.—Sow a little seed of some early sort, and likewise of the red, in a warm corner; and if the weather is open, a plantation should be made of autumn-sown plants from the nursery-beds.

Savoys grow large when sown early; therefore a little seed might be put in.

Parsley sown now will be found useful when the autumn crop begins to fail.

Carrots.—Sow a few rows of Early Horn in a warm place, to come in for use before the principal crop.

Garlic and Shallots.—If these were not planted in autumn, it must now be done. They are less liable to be attacked by the grub on newly-trenched ground.

Orchard.—Open dwarf Apple and Pear trees will require pruning and regulating. In pruning such trees the knife ought not to be too liberally used, but the branches allowed to be well feathered with young spray. Trees are sometimes pruned till they produce nothing but shoots. Wall Pear-trees that have become sterile might be restored to fertility by taking them up and replanting them, laying the roots nearly in a horizontal position, near the surface of the border, which had better be previously trenched.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

Stove.—Keep the temperature of the Orchidaceous-house a little higher now, particularly during the day—say 70° for the warmest house, and 60° for that which contains the kinds from Mexico and Guatemala. Dendróbiums may now be expected to flower in great beauty.

Greenhouse and Conservatory.—Examine the soil about the roots of Heaths, as it is likely to be dried at bottom by the fires which have been recently necessary, while at the same time the top may appear moist. In such a case, numerous small holes should be made through the mass, to admit the water to the bottom of the ball, otherwise the first sunny day will most likely destroy the plants. Give air liberally in fine days, and close early, in preference to making fires.

Pits and Frames.—Bulbs of O'xalis, I'xia, Tritónia, and similar plants, which have been kept dry through the winter, should now be potted; and by varying the planting they may be made to flower at different seasons. Some bulbs of Tigrídia may also be potted, to flower early. Dahlias for propagating should now be placed in heat. Pot tubers of Marvel of Peru.

Out-door Department.

The late partial remission of frost has possibly tempted some choice bulbs and tubers to show themselves, in which case they had better be protected from the changeable weather by hoops and mats, or some other available covering. Prune and nail Jasmines, Honeysuckles, and all other climbers.

NURSERY AND FOREST DEPARTMENT.

Nursery.—Continue to put seeds of forest-trees into the ground at favourable opportunities, sowing those kinds first which require the longest time to vegetate. All seedling plants that are large enough should be transplanted in rows.

Forest and Coppice Woods.—When the ground is in an unfit condition for planting, pruning should be proceeded with. All timber is much better in quality when cut previously to the rising of the sap; therefore felling ought to be finished as soon as possible.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending Feb. 10, 1842, as observed at the Horticultural Garden, Chiswick.

Feb.	Barometer.		Thermometer.			Wind.	Rain.
	Max.	Min.	Max.	Min.	Mean.		
Friday 4	30.439	30.351	42	30	36.0	E.	
Saturday 5	30.267	30.177	42	27	34.5	E.	
Sunday 6	30.109	29.892	38	26	32.0	E.	.06
Monday 7	29.786	29.697	40	30	35.0	E.	.11
Tuesday 8	29.816	29.786	46	28	37.0	E.	.06
Wednesday 9	29.795	29.518	51	43	47.0	S.	
Thursday 10	29.986	29.895	51	41	46.0	S.	
Average	30.028	29.901	44.3	32.1	38.2		.23

Feb. 4. Hazy in the morning; light haze and calm; slight frost.
5. Hazy; cloudy; overcast; slight fog at night.
6. Dry haze; very fine; clear.
7. Sleet in very broad flakes, instantaneously melting on touching the ground; hazy; overcast at night.
8. Foggy; exceedingly damp; mild with fog at night.
9. Very lightly overcast; fine with sun; evening clear and mild.
10. Mild with slight haze; densely overcast at night.

State of the Weather at Chiswick during the last 15 years, for the ensuing Week ending Feb. 19, 1842.

Feb.	Aver. Highest Temp.	Aver. Lowest Temp.	Mean Temp	No. of Years in which it Rained.	Greatest quantity of Rain.	Prevailing Winds.							
						N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.

The highest temperature during the above period occurred on the 16th, in 1831, and 16th and 17th in 1837—thermometer 58°; and the coldest on the 13th in 1838—thermometer 14°.

REPORT ON COVENT GARDEN MARKET.

For the week ending Feb. 11th, 1842.

Generally speaking the market has not much altered since our last Report; the supplies have been well kept up, and trade has been rather brisker. *Fruit.*—The remarks made on Pines in our last Report apply equally to this. A few hothouse Grapes are offered; Spanish continue scarce. Apples are plentiful; Nonpareils are worth from 5*s*. to 20*s*., and Ribston Pippins from 5*s*. to 10*s*. per bushel according to the quality. Many excellent samples of Pears are offered, among which are some Easter Beurrés and Passe Colmars. Pummeloes and Shaddocks are abundant. A few Cucumbers continue to be brought. *Vegetables.*—Cabbages and Savoys are plentiful. White Broccoli is rather scarce. Kindey-Beans have not been as plentiful as usual at this season. The supplies of Asparagus and Seakale have increased, and consequently the prices have fallen during the week. Lettuces, Endive, and other kinds of salading are indifferent; and the same may be said of most of the samples of Celery. There is an abundant supply of excellent Rhubarb. Mushrooms are not plentiful. *Flowers.*—The cut flowers have included many beautiful exotics, and among them were handsome specimens of Combretum purpúreum.

PRICES, SATURDAY, FEB. 12, 1842.—FRUITS:—

Apples, Kitchen, per bushel, 3s to 5s 6d
— Dessert, per bushel, 3s 6d to 14s
Pears, dessert, per half-sieve, 4s to 16s
Pine Apple, per lb. 5s to 8s
Grapes, Spanish, per lb., 1s to 1s 6d
— Portugal, per lb., 2s to 4s
Oranges, per doz., 9d to 2s
— per 100, 3s to 14s
— Bitter, per 100, 6s to 16s
Lemons, per doz. 1s to 2s
— per 100, 6s to 12s

Almonds, per peck, 7s
Sweet Almonds, per pound, 3s
Chesnuts, per peck, 5s to 10s
Walnuts, per bushel, 16s to 24s
Filberts, English, per 100 lbs. 130s
Nuts, per bushel—
— Brazil, 20s
— Spanish, 16s
— Barcelona, 20s
— Cobbs, 14s

VEGETABLES.

Savoys, per dozen, 6d to 1s
Cabbage, White, per dozen, 1s to 3s
— Red, for pickling, 2s to 4s
Cabbage Plants, per doz., 2s to 4s
Brussels Sprouts, p. hf. sve., 1s 6d to 2s 6d
Broccoli, White, p. bunch, 2s to 4s
— Cape, 2s to 3s
— Brown, 2s to 2s 6d
Turnip Tops, per bushel, 1s to 1s 6d
Kidney Beans, forced, per 100, 5s
Potatoes, per ton, 55s to 80s
— per cwt. 3s to 4s
— per bushel, 2s to 2s 6d
— Kidney, per bush. 2s to 2s 6d
Artichokes, Jerusalem, pr half sieve, 9d to 1s 6d
Turnips, pr. doz. bunches, 1s 6d to 3s
Carrots, per doz. bunches, 3s to 5s
Parsneps, per dozen, 6d to 1s 3d
Red Beet, per dozen, 9d to 1s 6d
Scorzonera, per bundle, 1s to 1s 3d
Salsafy, per bundle, 1s to 1s 3d
Horse Radish, per bundle, 1s to 5s
Radish, p. doz. hands (24 to 30 each) 2s 6d
Spinach, per sieve, 4s
— per half sieve, 2s 6d
Leeks, per dozen bunches, 1s
Garlic, per lb., 8d

Shallots, per lb., 1s
Onions, per bushel, 2s to 3s 6d
— for pick., per hf.-sieve, 3s 6d
— Green, per doz. bunches, 3s to 4s
— Spanish, per dozen, 2s to 6s
Asparagus, per 100, large, 5s to 8s
— Second or Middling, 3s 6d to 4s
— Sprue, or Small, 2s 6d to 3s 6d
Sea-kale, best, per punnet, 2s 6d to 4s
— Seconds, 1s to 2s
Lettuce, Cabbage, p. hf. sve., 2s
— Cos, per score, 2s
Endive, per score, 2s to 4s
Celery, Red, p. bdle (12 to 15) 6d to 1s 6d
— White, per bundle, 6d to 1s 3d
Small Salads, per punnet, 3d
Watercress, p. dz. small bunch, 6d to 8d
Parsley, per half sieve, 2s to 4s
— per dozen bunches, 4s
Tarragon, per dozen bunches, 4s
Fennel, per dozen bunches, 3s to 6s
Thyme, per doz. bunches, 2s
Sage, per doz. bunches, 3s
Mint, per doz. bunches, 4s to 6s
Savory, per dozen bunches, 8s
Rhubarb Stalks, per bundle, 9d to 2s
Mushrooms, per pottle, 1s 6d to 2s
Truffles, per pound, 2s to 8s

Notices to Correspondents.

WILL any of our correspondents favour us with their *experience* in growing the Mango in this country?

THE Publisher will be happy to give 1s. each for Nos. 9, 38, 44, and 51.

Ilex.—Your present collection of Pears is capable of being greatly enriched, even in a latitude not far remote from 37°, especially as your Peaches ripen on the open walls; and if your soil and subsoil are of that warm nature which characterises various localities along the banks of the Dee, then the following varieties of Pears, duly sheltered, may be expected to succeed as Standards:—

Dunmore
Hessel
Fondante d'Automne
Seckle
Flemish Beauty
Louise Bonne (of Jersey)
Aston Town
Marie Louise
Beurré Bosc
Althorp Crassane

Beurré Diel
Winter Crassane
Hacon's Incomparable
Winter Nelis
Thompson's
Passe Colmar
Knight's Monarch
Ne plus Meuris
Easter Beurré
Beurré Rance

L. H.—You had better add the following four Pears to your collection:—Passe Colmar, Glout Morceau, Ne plus Meuris, and Easter Beurré.

J. M.—We know nothing of the Royal Albert Grape.

Col. Mason.—The Jasmine that you brought from Genoa under the name of Jasminum Grand Duco, is J. Sambac.

J. M., Stamford Hill.—The Orchidaceous plant is Catasetum tridentatum, and the other is a species of Eurýbia, from New Holland.

A Constant Reader.—Six of the best sorts of Dessert Pears for Standards are the Dunmore, Marie Louise, Hacon's Incomparable, Passe Colmar, Knight's Monarch, and Beurré Rance; and six very fine Dessert Apples are the Ribston Pippin, Court of Wick, Pearson's Plate, Golden Harvey, Scarlet Nonpareil, and Court-pendu Plat.

H. K. M.—"Lindley's School Botany" for a beginner; to be succeeded by the same author's "Natural System of Botany" and "Ladies' Botany."

J. K.—We have given the names of the best Pelargoniums and Chrysanthemums in former Numbers, to which we must beg you to refer. If you attentively study the Calendar of Mr. Paxton, published last year, or that by Mr. Whiting, now in progress, or the papers by Mr. Appleby, you will find all the information you ought to want about forcing. The Louise Bonne (of Jersey) succeeds in your northern climate, and is one of the many that ripen between the Jargonelle and Swan's-egg; but neither this nor any other variety will remain fit for use during the whole of the above interval. The Mayduke will be well succeeded by the Elton Cherry; and the Royale Hâtive Plum will ripen on an east aspect.

G. Turner.—Chicory is a plant which is forced in the dark for salading, and then resembles Endive, but is much more bitter. We do not know what Thistle you mean.

We cannot answer *Alba* or *A Scribe at Woodend* about the price of the "Book of the Farm."

A Constant Subscriber requires a long answer, which he shall have next week.

X. X. X.—Your Rhododendron is not Nobleanum punctatum róseum, but one of the numerous varieties allied to Russellianum.

W. J. is answered in the leading article of to-day.

J. Goode.—Nitrate of soda should be sown dry at the rate of 1½ cwt. per acre, taking care that none touches the leaves of the plants.

W. H. C.—You will find lists of the best Pinks by referring to pp. 400 and 672, (1841.)

Agricola.—You will find lists of the best Carnations and Picotees at pp. 585 and 601, and of Pinks at pp. 400 and 672, (1841.)

T. McF.—We never publish nonsense if we know it. Write common sense, and we will give you the best advice we can.

W. A.—Your very highly-coloured oblate Apple is not known; it most resembles the Scarlet Crofton. The statement about the Oak is perfectly correct, and the fact is not so uncommon as you suppose; as we shall show you in a leading article soon.

Adam.—We are proud of your good opinion, and wish we could meet your views. It would, however, be a long story to explain the difficulties that beset the plan you recommend. Rely upon it the fault lies with the folding your paper. As the *Chronicle* is printed by steam, the copies must be all alike as to margin. The best time to cut down Rhododendrons is now.

G. H.—Your plan is a good one. We will make use of it some day

J. W.—We have not seen the paragraph you allude to, but would recommend you not to depart from the general practice of growing all your Dahlias in a generous compost. Those that are inclined to be coarse, as Lee's Bloomsbury, Beauty of the Plain, Dowager Lady Cooper, &c., should not be thinned out, as that would tend to increase their coarseness; but by allowing them to have free growth, part of the nourishment that would go to the flowers is diverted to other purposes, and the blooms are consequently finer in quality.

Philo-Bauhi.—We do not believe that good wine can be produced from Grapes that do not ripen perfectly, and would therefore recommend the true Black Burgundy and Miller's Burgundy, which, if at all favourably situated, will ripen well in the southern parts of Britain.

Agricola.—There is little difference between the early and late kinds of Cauliflower, as everything depends on the quality of the sort, the time of sowing, and the soil and situation, for succession; either the Asiatic or Leyden varieties, if sown at different seasons, will always give a good succession both early and late.

A. H.—Pinus longifólia is not hardy, and will only live out-of-doors, without protection, in Cornwall or Devonshire. P. Chilghoza is certainly much hardier than P. longifólia in a seedling state; but whether it is sufficiently hardy to stand a severe winter unprotected remains to be tested; the plants are too small to try yet.

W. H. A. asks, with reference to the recommendation of giving plenty of heat and air at the time of Grapes changing colour, what degree of temperature is recommended, and also if by plenty of air, both top and front ventilation are to be understood, thereby causing a current?—We reply that the temperature for Grapes at that stage should not be lower than 75°, and may range between that and 85°. As to a moderate current of air, it is not objectionable if at its ingress its temperature were the same as that of the house, or nearly so; but as this uniformity can rarely happen, it is advisable, whilst giving abundance of air, to avoid draughts.

A Buteonian, being anxious to compete for prizes at Dahlia Shows, must procure the following sorts, which are the best flowers for his purpose; possessing these, his success will depend upon his own skill. Those marked with a * are new and valuable flowers for showing:

White.
Lewisham Rival
*Wildman's Bianca

White Grounds, edged with Lilac, Rose, or Crimson.
Spary's Beauty of the Plain
Davis's Maid of Bath
Whale's Phenomenon
Brown's Bridesmaid
Headley's Penelope
*Catleugh's Lady Ann Murray
Dodds' Queen of Sarum

Yellow and Buff shaded.
Widnall's Argo
Cox's Defiance
Ansell's Unique
*Dodds' Yellow
Pamplin's Bloomsbury
Nicholas Nickleby
*Widnall's Princess Royal, bright buff tipped
Fowler's Duchess of Richmond

Rose.
Catleugh's Eclipse
Neville's Hope
Wheeler's Maria
Dodds' Grace Darling
Spary's Admirable

Lilac and Rosy Lilac.
Widnall's Queen
Countess of Pembroke
Jackson's Lady Cooper
Queen of Beauties
*Jeffries' Lady Harland

Scarlet and Red.
Lee's Bloomsbury
Widnall's Eclipse
Cozens' Scarlet Defiance
Catleugh's Tournament
Girling's Danecroft Rival
*Hedley's Phœnix

Crimson, Purple, &c.
Whale's President of the West
Lyme's Springfield Rival
Low's Conservative
Holmes's Andrew Hofer
Low's Le Grand Baudin
Cormack's Pickwick
Church's Burnham Hero
Keynes' Constancy
Ansell's Rouge et Noir
Girling's Suffolk Hero
Begbie's Metella
Stein's Highgate Rival
Stanford's Egyptian Prince
Widnall's Ne plus Ultra
Do. Conductor
Ward's Euclid
Sorrell's Essex Rival
*Spary's Conqueror of the Plain
*Ansell's Marquis of Camden
Girling's Indispensable

απιος.—The following Roses will succeed against a trellis with a north aspect, if the situation is not damp. Much depends on the height of the trellis. If high, the following may be taken:—

Boursault, red
Champneyana, blush
Rose de Lisle, blush with dark centre
Marie Leonida, white
Rosa ruga, blush
Rosa Blairii, rosy purple
Jaune Desprez, buff
Wells' Noisette

—If the trellis is low, then plant the following:—

Common China, blush
Indica sanguinea, dark red
White China
Watts' China, deep rose
Microphylla, blush with dark centre
Charles X., rosy purple

—The following deciduous flowering shrubs are handsome and easily procured, and they will produce a succession of flowers:—

Ribes sanguíneum
Do. aúreum
Pæónia Moutan
Cratægus, different species
Bérberis sinensis
Prunus japónica
Calycanthus flóridus
Colutea cruenta
Cýtisus purpúreus
Do. Laburnum
Do. multiflorus
Daphne Mezereon
Philadelphus Gordonianus
Deútzia scabra
Euónymus latifólius
Hibiscus syriacus
Lonicéra tatárica
Magnólia conspícua
Do. purpúrea
Amelánchier botryápium
Spiræa ariæfólia
Do. bella
Do. grandiflora
Pyrus spectábilis
Cydónia japónica
Robínia híspida
Spártium multiflorum
Syringa pérsica
Viburnum ópulus

These, with a few Garden and China Roses, will produce a good effect.

A Young Cottage Gardener.—We do not think Sálvia fulgens could be pegged down in a bed with much advantage, as the lateral branches are readily torn from the main stem, and could hardly be pulled down in a direction contrary to their growth. The lowermost branches might perhaps be trained along the ground. Plants of the yellow Calceolaria raised from seed this spring will most likely flower in the autumn, if they are repotted several times, and grown in rich soil. Hollyhock may be sown in light soil in the border, in April; when the young plants come up, they should be thinned out, and the rest may be left till the autumn, or the following spring, when they may be removed to the situation where they are to flower. It will be necessary for you to make up a bed of light rich earth for the Anemone seed, in any situation not very damp, and thin the young plants out when they come up. We do not think you will be able to procure the Volume of the *Gardeners' Chronicle* for 1841; we have not one left.

J. Hamerton.—Dr. Madden's Prize Essay on the Effects of Drainage is printed in the "Quarterly Journal of Agriculture."

C. B. t. and a *Townsman* will find an excellent selection of Roses popularly described by Mr. Rivers at p. 581, (1841).

Ignoramus.—Your Carnation seed may be sown in a bed out of doors in the early part of April; the soil should be rich loam, mixed with a little sandy peat and rotten manure; the surface should be finely pulverised, and the bed raised somewhat above the level of the adjoining ground. The seed may be scattered broadcast over the bed, and afterwards lightly pressed in with the back of a rake. Orchis seed will not grow. We think all evidence goes to show that the club in Broccoli is exclusively caused by insects. If you have any *proof* to the contrary, we shall be glad to receive it.

Lampyris.—It is our intention, as soon as we have space, to publish some articles on the art of drawing and colouring flowers. Glendinning's Treatise on Pines is one of the best. Your Clerodendron is covered with some parasitic fungus, probably arising from the dampness of the house where it is growing, and from insufficient ventilation.

Tyro.—The plant that you found in the shrubbery is Antirrhinum speciosum, and No. 2 is Mesembryánthemum barbatum. The others it is not possible to name from the small pieces sent.

S. S.—It is nonsense to say that Melons cannot be grown by fire-heat; but they ought to have bottom-heat. The reason why flues prevent the growth of Melons is, that they render the air too dry: the remedy for that inconvenience is, evaporating pans placed over the flues, and kept well supplied with water. With such a pit as yours we should have no fear of success, if the bed on which the Melons are grown was raised above the level of the ground, so as to be hollow, and allow the heated air of the pit to warm the earth. Next week we hope to give a plan of Mr. Green's Melon-pit.

A Townsman.—We will publish your letter, for the chance of some one suggesting a mode of satisfying your desires; but we have little hope of success. At least, we hardly see how the plan of deferring the flowering of spring flowers is to be accomplished except by the old method of an icehouse.

Cryptogamia.—Kennédya monophylla is a Hardenbérgia; K. splendens we do not know: the rest are right.

Totty wishes for information respecting the time and manner of blanching Buda Kale. The following communication from J. Wedgwood, Esq., is published in the Horticultural Transactions, First series, vol. 4, p. 570; and the process therein detailed may be immediately commenced by those wishing to practise it. "I have been trying an experiment with Buda Kale, which has answered completely: this is, blanching it as you do Sea-kale, by turning a pot over it, and letting it remain covered till it is quite blanched. When cut and dressed in that state, it is excellent; and one advantage will be that the same plant will furnish two cuttings, for the sprouts are even more delicate than the original heart of the plant. I used no dung to force it; but this might be applied with great advantage; and I think it would be an excellent substitute for Sea-kale." As *Totty* says, his plants are like the common garden Kale; he must endeavour to procure seed of the true sort, and console himself for the loss of a season. Others may profit from the notice.

Essex.—You may insert several Walnuts where you wish to raise a tree without transplanting, to the depth of two inches, and when the plants come up leave the best one. There must be some chemical principle in the soil that proves inimical to Apple-trees, otherwise they ought to have succeeded better than they are stated to have done after loosening the soil to the depth of three feet, and mixing it with manure and lime-rubbish. We are aware that there is soil in Essex that becomes quite red by burning, and that in such Apples do not thrive; yet Oaks and coniferous trees grow exceedingly well in it.

W. H. H.—To grow and bloom English and Spanish Irises the following directions must be attended to:—About August prepare a bed two feet deep, the soil of which must be composed of equal parts of rich loam, sandy peat, and either well-rotted dung or leaf-mould, all well incorporated together. The beginning of September, plant the bulbs about three inches deep, placing a little fine sand round each, and afterwards cover and level the surface; nothing else will be required except stirring the surface of the soil in the spring. The Irises will bloom about the middle of June, and the seeds will ripen in the beginning of August; when, if it is required, the bulbs should be taken up; but it must be observed that when they are removed they seldom flower well the following season, and therefore should not be replanted more than once in five or six years. When the bulbs are taken up, they should be placed in dry sand for about a month, and afterwards planted in the manner before mentioned. Seeds of Irises should be sown in drills in September, in light sandy soil; they will come up the following spring; but the young bulbs should remain for two or three years before they are removed. The best way to treat the Persian Iris is to place the roots, in October, in pots filled with a mixture of either sandy loam well drained, and leaf-mould, or sandy peat and well-rotted dung, and set them in some dry pit for the winter, and give but little water until the spring; and when they begin to show their blooms plant them in the open bed. If this is carefully done, they will be gay during April and the beginning of May; but they must be protected from the spring frost when in bloom, or they will not last long in flower. Persian Irises are tender, and will not survive the winter in the open border unless the situation is dry, for they suffer more from the effects of damp than cold. They may also be grown like Hyacinths in glasses filled with water in the windows of sitting-rooms, and are desirable for such a situation, as two or three plants will scent a room. They also succeed in pure sand, if the roots are strong. The roots must be taken up in the open beds every season, and either potted or preserved in sand during the winter; but if not potted before the spring, they become exhausted, and do not flower well; whereas, if planted in the open bed in autumn they are almost sure to perish.

C.—You are much too fastidious when you complain of our allowing "Punch's Valentines" to be advertised. If you will buy the book, you will find them great fun, written in good taste, and fit for the perusal of *everybody*: besides which, they are illustrated by the cleverest woodcuts possible.

W. J. H.—Cobbett's Locust-tree is the common Acacia, Robínia Pseud-acácia. An account of it will be found in Loudon's "Arboretum Britannicum," and in Mr. Selby's "British Forest-trees." There is no difference *whatever* between Cobbett's Locust-tree and the common Acacia. This tree will grow in any land that is well drained, but does not like stagnant water.

We are unable to inform *R. D.* what insect it is that he complains of; but if he will watch its progress and forward some fresh leaves to Mr. Curtis in the spring, he may probably be able to give him a satisfactory answer.

An Amateur.—We prefer the small edition of "English Botany" to the large one. "Tuberose" next week.

A Lover of Justice.—How can you suppose we can interfere with people's private affairs? Do you imagine you have a right to quarrel with a man because he will not give you the wages you want? Surely a master has a right to judge for himself what he will pay either for a man or a horse; if he will not pay a fair price he will get a bad horse, and that is his own loss.

T. S. N.—Pinus excelsa is like a Weymouth Pine; P. Gerardiana, more like a Stone Pine: both are fine things.

P. P.—"Tripe de Roche" is a Lichen, found wild in this country. It will form a subject for another article on "Familiar Botany," which will now be continued every second or third week.

A Constant Reader's advertisement can be inserted upon payment of 4s.

L. I. E.—Celeriac is turnip-rooted Celery, the Celeri-rave of the French. The seed, which may be obtained from any respectable seedsman, should be sown from the end of February to the end of March in light rich soil, in a hotbed; when the young plants are an inch or two high, they should be pricked out an inch apart on another hotbed. In June they should be planted into a flat bed about 15 inches apart; they must be freely supplied with water, and be but little earthed up.

Olitor Stocktonensis.—Allen's Victory of Suffolk Cucumber and Allen's Victory are the same. You may put netting over your Apricot trees in the course of this month; and if you think the blossoms and fruit require more protection than a single net will afford, add another, or a third; though we think that one will be enough.

A Subscriber is answered thus by Mr. Green:—"The temperature that I grow Calceolarias in at this season ranges from 50° to 55° of Fahrenheit, giving as much air as the weather will permit, early in the day, and closing the house early in the afternoon. If a succession of blooming plants is required, such plants should be kept on a shelf near the glass in a common greenhouse; such plants will bloom in July and August. In every other respect I treat my plants the same as Mr. Catleugh, as described at page 341 of 1841.

As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

THE new Government measure in reference to the amendment and modification of the Corn-laws, which has been so long expected by the country, was submitted to the House of Commons by Sir R. Peel on Wednesday. Like the existing law, it is founded on the principle of protection to the agriculturist; but it admits that the present scale of duties is excessive, and calculated to lead to capricious fluctuations. The main feature of the new measure is an adherence to the sliding scale, and to the system of averages; the alterations proposed being simply a new adjustment and reduction of the scale, and an extension of the range of the returns for the averages, so as to include all such towns in England as have a corn market, and may be considered proper to be added to the list. The more minute details are given as copiously as our limits will allow under our Parliamentary News; the discussion on the principle of the measure will begin on Monday, on which day Lord J. Russell has given notice that he will move a resolution affirming the inexpediency of adhering to a sliding scale. The attention of Parliament has been so much absorbed by the Corn-law question, that little beyond the usual routine business, and a few unimportant motions, has been transacted. Two new bills have been introduced—one by Mr. Gladstone, on the Colonial Import Duties; and the other by Mr. Emerson Tennent, respecting copyright in works of design.

By the arrival of the overland mail, we have received intelligence of great importance from India and China. The Indian news is of a more disastrous character than any which has been received for many years: an insurrection has broken out in Affghanistan; Sir Alexander Burnes and several other officers have been massacred in the very presence of Shah Soojah; and the few troops which succeeded in making good their retreat were obliged to cut their way through an overwhelming force. The rebellion first broke out at Cabul, and spread with a rapidity which denotes the existence of a powerful confederacy, to the remotest quarters of the country. At the date of the last advices, Ghuznee was besieged by the insurgents; the detachments in the Kohistan had been dispersed, and two of their officers murdered. No offensive movement could be taken until reinforcements had arrived, which the continuance of winter would render extremely difficult, and great anxiety consequently prevailed in Bombay for the safety of the remaining troops.—The news from China continues to be satisfactory; the expedition has again taken possession of Chusan, without much opposition; the large city of Ningpoo has since surrendered, and considerable quantities of arms and ammunition, together with the Government stores of grain, have been captured by our troops. The Chinese have not yet proposed any terms of accommodation; and it is believed that Sir Henry Pottinger intends to proceed to Teensing and Pekin, as soon as the season will permit.—Our European news also is unusually interesting. In Portugal a chartist insurrection has broken out at Oporto; Signor Costa Cabral, the Minister of Justice, together with the military commander and civil governor of that city, have formed themselves into a provisional government for the purpose of promoting the restoration of Don Pedro's Charter, which was proclaimed on the 27th ult. The Duke of Terceira has signified his disinclination to take any hostile step against the movement; and although it is strongly resisted by the Government, it is believed that it will extend to Lisbon. Rumours of a change of Ministry are abroad, and the whole country appears to be in a state of complete disorganisation.—Our intelligence from Spain mentions that a combined Christino and Carlist outbreak, which is said to be actively organising on the French frontier, is daily anticipated. The Chamber of Deputies have held a secret sitting, chiefly in reference to this subject; and papers are said to have been discovered which leave no doubt of the existence of the scheme. The discussions on the address are not yet concluded; but in spite of their protracted length they present few points of interest. The new ordinances respecting the communications with Rome continue to produce much excitement in the Church, and have already led to the resignation of three archbishops, which the Government have refused to accept.—In France the main point of interest to English readers is the general belief that, in consequence of the division of the Chambers in regard to the Right of Search, the Ministers will be unable to ratify the Convention of the five great Powers for the more effectual suppression of the Slave Trade. —From the United States we learn that a violent debate has occurred in Congress on the seizure of the "Creole," and that a resolution calling for information respecting what it terms the "insult to the American flag," has been unanimously carried.

Home News.

COURT.—Her Majesty, Prince Albert, and the Prince of Wales are well. The Princess Royal is said to be suffering slightly from the effects of teething, which has rendered it advisable to try a change of air, and Brighton has consequently been recommended. On Saturday the Queen held a Court at Buckingham Palace for the reception of addresses from both Houses of Parliament, after which her Majesty left town and returned to Windsor Castle. On Thursday her Majesty, accompanied by Prince Albert, the Prince of Wales, and the Princess Royal, left Windsor for Brighton, where the Court will continue a short time. Lady Jocelyn has succeeded Lady Lyttelton as the Lady-in-Waiting.

The Queen Dowager.—The reports of the health of her Majesty the Queen Dowager continue to be of a favourable character. Her Majesty has received several visits from members of the Royal Family during the week, but has not ventured to leave Marlborough-house. It is stated that it is not her Majesty's intention to reside again at Sudbury-hall; and that the furniture belonging to her Majesty will shortly be removed to Bushy or Marlborough-house.

The Liturgy.—At a Privy Council held by her Majesty on the 2d inst., it was ordered that the form of prayer for the members of the Royal Family used in the Church, both at morning and evening prayers, in the Litany, and all other parts of the Church service, should be altered as follows:—Her Majesty the Queen, Adelaide the Queen Dowager, the Prince Albert, Albert Prince of Wales, and all the Royal Family."

Parliamentary Movements.—Sir Howard Douglas has been elected without opposition for the borough of Liverpool.—Mr. George Arkwright has been elected for the borough of Leominster without a contest, Mr. Nicholson, who had stated his intention of opposing him, having withdrawn on the day of nomination.—It is reported that no new writ will at present be moved for the borough of Southampton, in the room of Lord Bruce, now Earl of Elgin, as it is said that his Lordship has given notice of legally trying the question whether or not, under the existing laws, a member of the House of Commons vacates his seat on succeeding to a Scotch peerage.—The election at Taunton has terminated in the return of Mr. Colebrook, the Liberal candidate, the numbers at the close of the poll being for Mr. Colebrook, 382; for Mr. Hall, 334; majority 48.

The Revenue.—A parliamentary paper was issued on Wednesday by order of the House of Commons: the first part contains the balance sheet of the net public income and expenditure of the country for the year ended the 5th Jan., 1842, from which it appears that the excess of expenditure over income was 2,101,369*l.* 2*s.* 1*d.*; the net income being 48,084,359*l.* 18*s.* 4*d.*, and the expenditure 50,185,729*l.* 0*s.* 5*d.* The second part gives an account of the balance of public money, and shows that the balances in the Exchequer on the 5th Jan., 1841, were 3,858,465*l.* 19*s.* 9½*d.*, and that the balances on the 5th Jan., 1842, were 3,653,810*l.* 13*s.* 8½*d.*

Foreign.

FRANCE.—The Journals contain little intelligence of domestic interest, and are occupied almost exclusively with comments on the affairs of this country. The Queen's Speech on opening Parliament is generally the subject of discussion; more particularly that paragraph in it which refers to the treaty entered into by the Five Great Powers, for the more effectual suppression of the Slave trade. The Paris prints appear to regard the passage in her Majesty's Speech as so confidently assuming that the treaty will be ratified, that they again repeat all the arguments lately used in debating the question in the Chamber of Deputies, and it is generally asserted that Ministers dare not advise the ratification of the treaty. The most important comments on this subject, are those of the "Journal des Débats," which also seems to infer that M. Guizot will be unable to ratify this treaty. "We do not hesitate to state," says that journal, "that the spirit, if not the text of the parliamentary system, requires that the opinion of the majority be respected, and it is not to be concealed that the Chamber has clearly declared itself against the ratification of the treaty in its actual tenor. We have very strong reasons to believe that the King's Government will deem it more proper on this occasion not to make use of the prerogative which the Charter exclusively attributes to the Royal power."

The Chambers.—In the sitting of the Chamber of Deputies on Thursday, the 3d inst., the following unusual incident took place:—M. Sauzet, the President, read a letter of M. Dussolier's, a member of the Chamber, in which the latter referred to an allegation he had made a few days before at the Tribune, that a sum of 500f., given by Government to the charities at Nontron (Dordogne), under the impression that the municipality had declared in favour of the census, had been subsequently withdrawn, because the Ministry found that it had voted against its legality. M. Dussolier then stated that upon further inquiry he ascertained that his assertion had been unfounded; and he thought it was his duty to withdraw the statement he had advanced. In taking this course, he was following the dictates of his conscience; but after the debates that had ensued from his assertions, he felt it to be his duty to resign his post as Deputy. This letter produced a great sensation, and a number of Deputies cried out "No, no." The President then observed that he perfectly comprehended the feeling of the Chamber, and he should propose the insertion of M. Dussolier's letter in the minutes, and that a copy should be sent to the Minister of the Interior. M. Dupin agreed with the President's suggestion; but moved that in the minutes mention should be made of the spontaneous feeling of the Chamber on the letter of M. Dussolier. This incident suspended the sitting for some time, the Deputies crowding round M. Dussolier and the Minister of the Intêrior. In connexion with this public withdrawal of a charge brought by the Opposition against the Ministry, the journals add that it turns out that M. Isambert, who at a previous sitting read a private letter at the tribune, noticed in our last, had perused the communication referred to, while he was at the Ministry of Justice, talking with his cousin, who is Secretary-General of that department, and that the latter being called out of the room for a moment to speak to the Minister, M. Isambert during his absence took up the private communication in question and read it. Three propositions—one by M. Ganneron relative to the functionaries, another by M. Ducos relative to electoral reform, and the third by M. Golberg relative to the publication of an official report of the debates by the Chamber itself—were read on Saturday, and ordered to be discussed on Thursday, in the order specified.

Railroads.—It is stated that the Ministry is in great difficulty about the railroad questions, from the contrariety of interests between the northern and southern departments, and the anxiety of every department to be particularly favoured. In the Chamber of Deputies on Monday, the Minister of Public Works read the Government plan for the railroads. The lines proposed to be executed immediately, at the expense of the State, are those between Paris and Brussels, by Lille, with branches to Calais, Avignon, and Marseilles—and Elle, Paris to Nantes, by Tours and Orleans, Chalons and Dijon, to Strasburg.

The Press.—The late prosecutions of the journals and the heavy sentences inflicted on them appear to have intimidated the printers; the "Quotidienne" appeared on Saturday with two blank columns, the editor stating that the printer had refused to publish the leading article entitled "the Heresies of M. Hebert." In order to understand this it is perhaps necessary for the English reader to be informed that the majority of the French newspapers are printed at public printing offices. In the Chamber of Deputies on Monday, Baron Chapneys, a Deputy of the Extreme Left, gave notice of a motion for a Bill tending to except printers from the responsibility of articles published in journals, thus leaving the responsible publisher alone liable.

SPAIN.—Our intelligence from Madrid consists almost exclusively of reports of the continued discussion in the Chamber, on the address to the Regent. On the 28th ult. the adjourned debate was resumed on the second paragraph relative to the foreign policy of the Cabinet. The first speaker, Don Joaquin Maria Lopez made a violent attack on the King of the French. He spoke of the war of independence, of the invasion of 1823, and of the Carlist war. The prolongation of the latter he attributed to the conduct of the French Government in favouring Don Carlos, while he affirmed that the October insurrection was concocted in Paris. "At this very moment," concluded Señor Lopez, "there is a conspiracy against us in Paris; the hostility of France is notorious, and it ought to be made known to all the world." The speech of Señor Lopez, who was several times interrupted and reprimanded, not only by the President, but by the majority of the Chamber, and also M. Olozaga, whom he had attacked for placing himself at the head of the Opposition after being the Ambassador at Paris, had created considerable sensation. On the 29th Count de las Narvas resumed the debate, opposing the Ministry, to whom Señor Gonzales replied. The second paragraph then passed, as did also the third, relative to the treaties with the South American Republics. On the following day the discussion was commenced on the fourth paragraph, upon the subject of the insurrection of the 7th Oct., when Señor Mata moved an amendment, in which the Ministry was more strongly censured than in the project of the commission. The amendment, however, was rejected by the Chamber. M. Lujan then proposed another amendment, which, by a slight alteration in the wording of the paragraph, conveyed a direct expression of approbation on the course pursued by Government during the events of October, and which, after a warm debate, was ordered to be taken into consideration by a majority of 84 votes against 55. A spirited debate on this amendment ensued, which lasted two days, and terminated on the 1st inst., by its being adopted by a majority of 85 to 50. After this approval of the policy of Government, the question of the Barcelona state of siege was considered; but the discussion on this subject, which still continued, presents as yet no feature of interest. A secret sitting of the Deputies took place on the 30th ult., which is said to have had reference to the affairs of Portugal, and to certain precautionary measures to be adopted in expectation of a combined Carlist and Christino insurrection in the ensuing spring, which, the journals state, is actively organising on the French frontier. It is stated that the resignation of the Archbishop of Toledo, in consequence of the late ordinances respecting the communications with Rome, which both the Regent and M. Alonzo had refused to accept, had been followed by those of the Archbishop of Valencia and M. Ortigosa, not only as Archbishop of Burgos, but also as Governor of the diocese of Malaga. Señor Porsent had arrived in Madrid, with the view, it was said, to induce the Regent to allow Don Francisco de Paulo and his family, now at Burgos, to reside in the capital; but it was not known what success had attended his mission. Señor Salamanca left Madrid on the 28th for London, bearer, it is stated, of the requisite credits for effecting the capitalisation of the debt, and paying the first dividends. It is said that a regular steam communication is about to be established between the port of La Teste, near Bordeaux, and that of Corunna, as well as the principal intermediate ports. Subsequent intelligence informs us that the debate on the fourth paragraph of the Address still continues, but without offering any feature of interest. The "Eco del Comercio" announces the arrest of a certain Baron Pelichez, a Frenchman, and the seizure of his papers, which were said to contain revelations of importance and proofs of a deeply-schemed conspiracy against the liberties of the country. The other journals, however, contain no details relative to this affair.

PORTUGAL.—By the usual weekly steamer, arrived at Falmouth on Sunday, we have news from Portugal to the 31st ult. It brings the important intelligence from Oporto that the Minister of Justice, Costa Cabral, together with the military commander and administrator-general of that city, had formed themselves into a provisional government, in the name of the Queen, for the avowed purpose of promoting the restoration of Don Pedro's Charter, which was proclaimed at Oporto, in the presence of the authorities, the municipal chamber, the troops in garrison, &c., on the 27th ult., and the news transmitted by telegraph to Lisbon the same morning. It had also become known there that the military commanders in the provinces of Minho and Tras-os-Montes had adhered to the movement. Everything was still quiet at Lisbon; but the opinion seemed gaining strength, that the Charter would ultimately be proclaimed there.

Up to the date of our advices, however, Government had appeared determined to resist the change. Costa Cabral and the civil governor of Oporto had been dismissed. A royal proclamation had been issued against the movement, and a majority of the deputies in Lisbon had protested against it. It appears, however, that 22 deputies, among whom were three colonels, commanding regiments in the garrison, had refused to sign the protest. The Duke of Terceira had also signified his disinclination to take any hostile step against the re-establishment of the Charter; and the senators, assembled for the same purpose as the deputies, had broken up without any result, notwithstanding the strong declaration of the Duke of Palmella against the revolt. There were rumours of a change of ministry. The Duke of Palmella and Viscount Sa da Bandeira had been at the palace, and a coalition was talked of, but up to the hour of the mail's leaving nothing positive on the subject was known. A meeting of the general officers in Lisbon had been summoned at the palace, at which they were addressed by the King in a moderate speech, stating that the Queen relied on their obedience, and wished that nothing in the least degree illegal should take place. The Pope's Nuncio had not yet been presented to the Queen, which was attributed to some undue demands on his part.

Germany.—The German papers contain no intelligence of political interest. Private letters of the 28th ult. state that the Germanic Diet was about to take into consideration the affairs of Luxemburg, and more especially the system that it would seem was about to be introduced there for suppressing the German language. This adoption of the French system in a Germanic province, the Diet intended to resist.—The journals of the 4th inst. mention the official announcement in the Baden Chamber of Deputies on that day of the marriage of the Princess Alexandrina, daughter of the Grand Duke, to the Hereditary Prince of Saxe Coburg. The "Augsburg Gazette" informs us that in reply to the protest of the Porte against the establishment of a Protestant bishop at Jerusalem, the Prussian Government had stated that the Porte ought to address itself to England, since it was the English Government that nominated and salaried the bishop, the Prussian Cabinet having only acceded to the matter by supplying a sum of money. This proceeding had been regarded as very unsatisfactory; and it was generally considered that the English and Prussian Governments were about, in this instance, to give up the matter, leaving it to the decision of the Porte. The reply of the English Cabinet, it is added, was anxiously looked for by the Catholic powers. We learn from the same authority that the growing intimacy between Prussia and England becomes daily the subject of increasing interest; and that although the number of resident English in Berlin is not great, a church has lately been erected, in which English service is performed, and which is also attended by many inhabitants of the capital.—We learn from Weimar that in the course of this month a collection is to be made in all the Protestant churches in the Prussian Rhenish provinces, for the purpose of founding at Jerusalem an hospital for poor Protestant travellers, and also for a school. Both these institutions, it is said, are to be connected with the Protestant bishop's see lately established at Jerusalem. Similar collections, it is added, are to be made for the same purpose, by the king's command, in the other provinces of the Prussian monarchy.—On the 1st inst. the Princess Albert was safely delivered of a daughter. The Princess and the infant were doing perfectly well. Prince Albert immediately sent his Aide-de-camp, Major Count Von Westorp, to Belgium, to convey this agreeable news to the King, as soon as his Majesty should land from England. The journals publish the following table of the increase of the population in the capitals of the German states, between 1821 and 1841:—Vienna, from 273,242 to 357,927; Berlin, from 192,217 to 315,541; Munich, from 60,024 to 106,351; Dresden, from 52,000 to 80,989; Hanover, from 24,000 to 29,000; Stutgard, from 27,600 to 42,217; Carlsruhe, from 16,021 to 23,484; Cassel, from 23,692 to 31,349; Darmstadt, from 15,450 to 29,007; and Weimar, from 8,917 to 11,485.

Belgium.—A royal ordonnance has been published fixing at 10,000 men the levy for the militia in 1842, assigning the number to be furnished by each province according to its population. It appears that the entire population of the kingdom is 4,066,347. The royal carriages were sent on the 4th inst. to Ostend, whither the King also proceeded to receive his Majesty the King of Prussia, who arrived about seven on the following morning. The two monarchs afterwards proceeded together to the palace of Lacken.

Holland.—The journals state that the King has suddenly consented to ratify the treaty for the junction of Luxemburg with the German Customs' Union; and that M. de Rochussen carried this ratification to the King of Prussia at London. The following, it adds, are the terms of the ratification:—"The treaty is concluded for a year. If, at the end of that year, the King Grand Duke thinks fit to rescind the engagement, he shall not have the power of making a treaty on another side under a delay of four years from the date of renunciation."

Switzerland.—The journals of the 4th inst. contradict the reported attack on the Convent of the Great St. Bernard by robbers, noticed in our last.

Italy.—"The Diario di Roma" of the 25th ult. announces that the Pope, in the Secret Consistory of the 24th ult., proclaimed the following Cardinals:—Order of Deacons: Mgr. Massimo, Prefect of the Apostolic Palace. Order of Priests: Mgr. Acton and Mgr. Vanniscelli, Vice-Chamberlain and Director-General of the Police. His Holiness also created and proclaimed Cardinals of the Order of Priests, Mgr. Prince Celestin de Schwartzemberg and Mgr. Corsi, Auditor of the Rota. On the same day the five new cardinals received the berretta from the hands of the Pope; and the sacred college, the diplomatic body, the prelacy, the commanders of the civic guard and the troops of the line, and the nobility of Rome, went to offer their congratulations. Cardinal Acton is a younger son of the late Minister at Naples, and is related to one of the oldest families in Shropshire. His eminence was educated at Magdalen College, Cambridge; he is the youngest cardinal, and has long lived at Rome with his mother, Lady Acton.

Russia.—Private accounts from St. Petersburgh of the 22nd ult. state that Count Pahlen will not return as Ambassador to Paris, and that the Emperor has resolved for the future to have no more Ambassadors to the European powers, but simply Ministers Plenipotentiary charged with a special mission. These accounts add, that M. de Boutenieff was expected to arrange the difference as to etiquette between the French and Russian Cabinets, which had arisen from the former, and not from the latter, it being denied that Count Pahlen's recal arose from political motives.—The ukase lately issued in St. Petersburgh for the reduction of the army, noticed in our last, the first disarming measure taken in Russia for many years past, has been followed by another ordonnance of the Emperor for the reduction of the church and monastic property of both Catholics and Greeks in the empire, and their union with the domains of the state, in compensation for which the clergy and monks are to have a moderate salary allowed them. The large estates which in the western provinces of the empire, and more particularly in Poland, belong to the clergy and monastic institutions, are in future to belong to the state, and the ecclesiastics, who till now derived their revenues from them, are to be dependent for their support upon the Emperor.

Sweden.—Accounts received from Stockholm of the 24th ult. inform us that the great manufactory of cotton yarn of Messrs. Bergmann and Bohnstedt, in that city, has been destroyed by fire. Considering that several hundred workmen were thereby thrown out of employment, the King immediately called the Council of State, to signify that on this occasion Government would, if necessary, intervene to assist so many sufferers. The Governor of Stockholm was then applied to for information: he, however, declared that one of the owners had assured him that they did not intend to apply for any assistance to Government.

Greece.—Private letters from Athens dated the 20th ult. announce that a change of Ministry was confidently spoken of, and that it was generally asserted that the Greek Ambassador at London would be appointed President of the Council.—A murder had taken place in Athens of a M. Negropont, a merchant, for many years established at Manchester, which caused a great sensation in the city. The circumstances connected with it, however, are not given.

Turkey.—The Overland Mail, which arrived on Monday, brings no intelligence of any interest either from Constantinople or Alexandria. Private letters from the Turkish frontiers of the 22d ult. state that the Servian senate had unanimously resolved to reject the demand made by the Porte for 500,000 piastres indemnity for the expenses incurred for the emigrants. A senator declared in the Chamber, that although grieved that an affair of money should occasion new difficulties between Servia and the Porte, he would rather put himself at the head of the people to combat than yield to so unjust a claim.—Private correspondence from Constantinople, dated the 17th ult., states that a note had been addressed by M. de Bourqueney, the French Ambassador in that capital, to the Porte, the object of which was to impress upon the Turkish Government the necessity for moderation in their negotiations with the Greek Government; to recommend lenient measures towards the Maronites of Syria; and to declare at the same time that any armed demonstration against Tunis would be considered as an act of hostility against France. The answer of the Porte, it is said, was perfectly evasive, every dangerous topic being avoided; but a general disarming of the fleet appears to have been the consequence. Beyrout letters state that the Druses expected that a Turkish Governor would be appointed in Lebanon.

India.—By the overland mail, which arrived in town by express on Monday, we have received intelligence from the several Presidencies of India—from Calcutta to Dec. 22, and Bombay, Jan. 1. The news thus brought, as far as Affghanistan is concerned, is of a disastrous and melancholy character. The following is an outline of the untoward events which have occurred in that part of our Indian possessions since the date of our last intelligence. It will be remembered that we were then informed that, in consequence of certain reductions made in the tribute paid to the Eastern Ghilzie tribes, for keeping open the passes between Cabul and Jellalabad, the people rose and took possession of those passes; and that thereupon Gen. Sale's brigade, which had been under orders for the provinces, was sent out to drive them from their position, and to re-open the communication. This, however, seems to have been an arduous duty, and attended with serious loss on our side. The brigade fought its way to Gundamuck, much harassed by the enemy from the high ground on either side of the passes, and after 18 days, during which our men were almost incessantly engaged, they reached the above place, much reduced and exhausted, and thence, after further annoyances from the enemy, moved upon Jellalabad. Here, though Gen. Sale had afterwards several times been attacked, he had succeeded on every occasion in vanquishing the insurgents; had procured supplies of food; and though badly off for ammunition, there appeared little doubt, according to the last advices, that he would be able to hold out till the relief expected from Peshawar should reach him. In the mean time, whilst Gen. Sale's force was at Gundamuck, on the 2d Nov., a serious insurrection broke out at Cabul, which appears to have been so wholly unexpected, that letters written on the preceding day by the Envoy and Minister speak of affairs being in a prosperous condition, and everything quiet and peaceful in the capital. Sir W. H. Macnaghten himself was about to leave Cabul at the very time of the outbreak, to proceed to Bombay, to assume the governorship of that presidency. No particulars of the attack on the city have been received, and it is therefore not known in what manner, whether by stratagem or regular assault, the insurgents gained possession of it. It seems, however, that the first manifestation of the popular anger consisted in a determined assault on a party of British officers, who were then leaving the Durbar. Sir A. Burnes, his brother, Lieut. C. Burnes, and Lieut. Broadfoot, of the European Regiment, were massacred; and another officer, Lieut. Sturt, of the Engineers, cut down in the very presence of Shah Soojah himself. The whole city was soon up in arms, the bazaars were plundered, the houses of our officers ransacked and their property destroyed, the Treasury pillaged, and other depredations committed in the town, whilst another large party, chiefly Kuzzilbashes, it is said, attacked the British cantonments, situated about two miles from the town. The rebels are said to have declared one of Shah Zemaun's sons king; but whether the outbreak originated in the intrigues of this party, or whether it was a religious movement having for its end the extermination of the British, does not appear to be clearly known. There appears no doubt, however, that the rebellion was of a very serious character, for the whole population were up in arms, and the British troops being divided—a portion of them in the cantonments, a portion of them in the Balah Hissar—and the enemy holding the town, which lies between these two positions, our forces could make but little stand against the insurgents. The rebellion, at the date of the last advices received from Cabul—for, although the communications generally have been interrupted, one or two Cossids had made good their way to Peshawar—had raged during 17 days, but the force of it was still unbroken. The British troops were weak, and the enemy very numerous. Several engagements had taken place, and our troops had distinguished themselves on various occasions, but to little purpose. It seems that the enemy, unfortunately, at an early stage, got possession of the Commissariat godowns; for although two horse artillery guns had been sent to their defence, the ammunition had failed, and the stores were captured. Two of the Shah's guns were also taken by the enemy, and turned against our troops, and one of our magazines destroyed. On the 18th Nov., the date of the latest intelligence, the insurrection, in spite of a partial victory achieved by the British a few days before, was at its height, and, though there seemed at one time some little hope of the Ghilzie portion of the confederacy being brought over, affairs were still wearing a very serious aspect. The rebellion had not been confined to this movement at Cabul, but had spread into the Kohistan, where a detachment of Goorkhas, stationed at Cherekair, have been cut up, and two officers, Lieutenants Wheeler and Maule, murdered by the enemy. A party of invalids who were proceeding from Ghuznie, under the command of Capt. Woodburn, have also been massacred, with their leader; and Ghuznie itself, which is fortunately strongly garrisoned and well provisioned, is reported to be in a state of siege. Reinforcements were stated to be badly wanted, and no offensive movement could be undertaken without them. When these, however, could reach, it was impossible to say, as the regiments which had left Candahar had only made three marches. The snow was some feet deep on the ground in all the higher parts, while the whole country was up in arms and every tenable post manned by hundreds of the enemy. The accounts which we have received of this serious insurrection are confused and unconnected; but there appears to be no reason to doubt the truth of the above statement of facts; and up to the latest advices, the general position of affairs in this territory, so recently subjected to British sway, excited great and general anxiety for further information.—The intelligence from the other parts of India is on the whole satisfactory. Tharawaddy still remained peaceably at Rangoon, superintending the fortification of a new town which his workmen had built, and constructing a flotilla of gun-boats. A plenipotentiary had arrived at Moulmein from Rangoon, to assure the British authorities that the King had no warlike designs.

China.—The intelligence received by the overland mail from China is important, and continues to be satisfactory. The dates of our accounts are from Ningpoo to the 20th Oct., from Chusan to the 25th of that month, from Amoy to the 5th Nov., and from Macao to the 15th Nov. The expedition had sailed northwards from Amoy on the 1st Sept., and on the 1st of the ensuing month, Chusan, which had been very strongly fortified by the Chinese, was re-occupied without any serious opposition, and Ningpoo, a city described as two thirds the size of Canton, surrendered immediately afterwards without resistance. The loss of the Chinese, both at Chusan and Chinhae, is stated to have been considerable; that of the British very small, considering the extensive nature of the operations, and the determined opposition offered. Large collections of ordnance, matchlocks, swords, and other weapons of war, and great quantities of ammunition, were captured, together with the whole of the Government stores of grain. The utmost tranquillity prevailed at Amoy; but at Canton, although the trade was proceeding quietly, an impression seemed to prevail that further hostile measures would be necessary, and the conditions on which business was carried on were unfavourable to the British merchants. Hong Kong had been pronounced by a medical committee as "utterly unfit for the residence of English troops." A Canton paper states that expectations had been entertained by the English authorities, that the Chinese Government was about to make some overtures. None, however, had, at the latest date, been made; and it was then believed that the Plenipotentiary, finding that the demonstrations already made had not led to any terms of accommodation, had applied for further reinforcements, with the view of proceeding next season to Teensin and Peking; and the general impression appeared to be, that until the Court becomes alarmed from the prosecution of hostilities in the neighbourhood of the capital itself, there can be little hope of any amicable settlement.

Persia.—From the Bombay papers, brought by the Overland Mail, we learn that the Schah having conceded all the demands made by Sir J. M'Neil, preliminary to the restoration of friendly relations between Persia and Great Britain, it had been resolved by the Indian Government immediately to evacuate the island of Karrack; and it is added that a steam-frigate and other vessels were immediately to proceed to the Persian Gulf to convey the troops to Bombay.

United States.—By the packet ship Southerner, which arrived at Liverpool on Sunday night, we have papers from New York to the 13th ult. A violent debate on the question of the Creole had taken place in Congress on the 10th ult., in which Mr. Calhoun proposed a resolution, calling for information in regard to the case of murder and mutiny on board that vessel, and asking what steps the Executive had taken in reference to the transaction, having for its object the punishment of the guilty, the redress of the wrong done to American citizens, and the insult offered to the American flag. On the 11th the resolution was taken up for consideration. Some debate having arisen on the proposal of an amendment to substitute "persons" for "slaves," Mr. Calhoun condemned publications which had applauded and justified the mutiny and murder, the tendency and object of which, he said, were to fortify the pretensions of Great Britain in hostility to the rights of the United States. He warned the South to awaken from their lethargy, and to guard against combinations ever menacing their institutions. Several gentlemen having delivered their sentiments on the subject, Mr. Clay rose to deliver his. He had, he said, witnessed the occurrence on board the Creole with deep regret, because it added infinitely to existing difficulties with Great Britain. A case had occurred, in which by mutiny and murder a vessel was thrown in the power of Great Britain—were they to give up the murderers, or to indemnify the United States or not? If not, then Americans were denied the freedom of their own coasting trade, and no vessels could sail from one port to another in the Southern Atlantic border without incurring the risk of seizure. He hoped that Great Britain would see the necessity of doing America justice in this case. Mr. Calhoun's resolution was adopted unanimously. —The latest advices from Washington state, that the Bankrupt Act would not be repealed "at present." A draught, drawn by Mr. Everett, the American Minister at the Court of St. James's, for 12,000 dollars, negotiated in London, had been protested at Washington for non-payment, the department having nothing to offer but treasury notes, and not feeling at liberty to pay them except at par. Resolutions were before the Legislature of the State of New York strongly condemning the doctrine of repudiation of debts, as sanctioned and acted upon by several States. The Legislature of Pennsylvania had also agreed to resolutions strongly condemnatory of the repudiation doctrine.

Parliament.

HOUSE OF LORDS.

Saturday.—Their lordships assembled at half-past eleven for the purpose of going up with the address to her Majesty. The Lord Chancellor took his seat upon the woolsack in his state robes; and those of the Peers who are officers or members of yeomanry corps wore their uniforms. At a quarter past twelve the names of the Peers were called over by Mr. Pulman, the Deputy Usher of the Black Rod, and their lordships proceeded in state to Buckingham Palace.

Monday.—The Marquis of Normanby, with a view, he said, to redeem the pledge he gave last year, moved for leave to bring in two Bills—one for regulating buildings, and the other for the improvement of boroughs. Both Bills were respectively read a first time, and the second reading fixed for Thursday.

The Lord Chancellor read her Majesty's answer to their lordships' address, which was in the following words:—"My Lords—this affectionate and loyal address gives me the purest satisfaction. I thank you for it sincerely, as well for your congratulations on the birth of the Prince my son, as for the regard which you express on this occasion for my person and Government. My wish is, and ever will be, to promote the prosperity and happiness of my faithful people."

Lord Colville then read Prince Albert's reply to the address from the House:—"My Lords—This instance of your kind attention to me, and your loyal affection to the Queen, calls for my hearty thanks. The happiness and prosperity of this great kingdom, to which this event more closely unites me, will always have my earnest wishes and my earnest prayer." It was ordered that both answers be entered on the minutes.

The Duke of Wellington suggested to Lord Monteagle the propriety of postponing the motion of which he had given notice, on the subject of the late Exchequer bill fraud, until the result of the inquiries already instituted should be in the hands of noble Lords. His Grace said that it would also be advisable to see what course might be taken in the other House of Parliament, to which the cognisance of such matters especially belonged.

Lord Monteagle observed that his motion stood for the 17th, and not the 7th; and that he would be determined in bringing it on upon the former day or not by what might be suggested by the noble Duke. His only object had been to submit the question as early as possible to the consideration of their lordships.

In answer to questions by the Marquis of Clanricarde,

The Duke of Wellington stated that a Bill was forthwith to be brought into the House of Commons to remedy the inconveniences resulting from the late decision of the Judges in Ireland, relating to the marriages between Episcopalians and Presbyterians. Whether the measure should be prospective or not was still under the consideration of Government.

Tuesday.—Viscount Duncannon moved for certain returns relative to the appointments and removals of stipendiary magistrates in Ireland.

The Marquis of Normanby moved for a return of the names of all magistrates of boroughs in Great Britain on the 1st Feb., 1841, and the names and dates of all subsequently appointed.

The Appropriation Act Amendment Bill was brought up from the Commons, and, on the motion of the Duke of Wellington, read a first time. The House was then occupied for some time with a conversation upon some Anti-Corn-law petitions, presented by Lord Brougham, Lord Melbourne, and the Marquis of Lansdowne; but there was no novelty in the topics introduced.

Lord Monteagle moved for copies of the appointments of Mr. Percival and Mr. Eden as Assistant-Comptrollers of the Exchequer Bill Office.

Lord Clifford (of Chudleigh) put some questions to the President of the Board of Control in reference to Portuguese missionaries in India. Lord Fitzgerald promised an answer as as soon as he should have carefully read the despatches that had that day reached him.

Thursday.—The Marquis of Normanby moved the second reading of the Borough Improvement Bill. He stated, that having more leisure now than when in office, he had taken the opportunity of personally inspecting some of the most densely-crowded and poorest districts of the metropolis; and he would ask such noble Lords as opposed his measure for improving such districts, to visit those places themselves, and form their own judgments. The noble Lord said he had visited crowded districts in Whitechapel and Bethnal Green; and that in the latter there were 75,000 persons living in all degrees of wretchedness, 50,000 of whom resided where there was no drainage of any kind.

The Marquis of Salisbury, while admitting the necessity of some measure to promote better drainage, was disposed to oppose this measure, as he thought it would have a tendency to increase the cost of buildings in poor vicinities, and thereby to raise rents. In Manchester, he said, no fewer than 15,000 persons lived in cellars; and, as one of the provisions of the bill went to abolish the use of these places as human habitations, what was to become of these 15,000 individuals?

The Duke of Wellington said that having supported the Bill before, he should feel it his duty to support it on the present occasion. The bill was then read a second time, without a division. Several petitions were presented, after which the Duke of Wellington moved the second reading of the Appropriation Acts Amendment Bill. Two Appropriation Acts, he said, were necessarily passed in the year 1841, in consequence of which some little confusion had occurred, and the third object of this bill was to save expense, and make one account instead of two. After some observations from Lord Monteagle, the bill was read a second time and ordered to be committed on Friday.

HOUSE OF COMMONS.

Saturday.—The Speaker took the chair soon after twelve, when Lord Stanley, who, like the other ministers present, wore the usual official uniform, appeared at the bar, and informed the House that as one of the privy councillors who had attended her Majesty, he was commanded to state that the Queen would be pleased to receive the address of the House at one o'clock. The Speaker, followed by the members present, then proceeded in procession to Buckingham-palace.

Monday.—A great many petitions were presented, and notices of motions given; after which the Speaker read the following answer by her Majesty to the address presented by the House:—"Gentlemen—I return you my most hearty thanks for your dutiful and affectionate address. Your congratulations upon the birth of the Prince of Wales are cordially received by me as a proof of your loyal attachment to my person and House. The happiness of my people is the first object of my care, and you may rely on my co-operation in every measure for the promotion of their welfare."

Lord Lincoln then appeared at the bar, and read Prince Albert's reply to the congratulatory address of the House. It ran thus:—"Gentlemen—I return you my warmest thanks for this gratifying instance of your attention to me and of your duty to the Queen. I thank you for your cordial congratulation on the birth of our son, and I beg to assure you that the prosperity of my country is the first object of my wishes."

Mr. S. Wortley asked what was the course intended by Government to be pursued in reference to the Poor-law and to labourers in factories?—Sir J. Graham said that Ministers meant to propose the renewal of the Poor-law Act, with such alterations and amendments as they might think necessary and prudent; and that a measure, originally proposed by Mr. Fox Maule, would be introduced for the purpose of amending the law regulating the employment in factories of young children between the ages of nine and thirteen.

In reply to a question by Capt. Pechell, Sir R. Peel said he must decline entering into any details on the subject of the proposed Bill relating to Ecclesiastical Courts.—To an inquiry by Mr. J. O'Connell, Lord Eliot replied that he feared some evil had arisen from the system pursued in Ireland, of affording support and protection to witnesses in criminal cases; but when the difficulty of procuring evidence in such cases was considered, he saw little chance of being able to forego the existing practice. He would, however, give his most anxious attention to the subject.—Mr. C. Buller inquired what were the intentions of Government with respect to the judicial department of the Privy Council.—Sir R. Peel replied, that it was not the intention of Government to propose the appointment of a new judicial officer. It was hoped that the Vice-Chancellors might be able to devote more of their time to assisting in the judicial department of the Privy Council, and that, with the present system, the accumulation of arrears might be diminished.

In answer to a question by Mr. Hawes, Sir R. Inglis stated that it was his intention to call attention to the question of church extension in the course of the present session. Several other unimportant questions were asked and answered, after which Mr. Wallace, pursuant to notice, proceeded to call attention to the resolution of the House prohibiting debate on the presentation of petitions. The hon. Member concluded his speech by moving that the resolution in question be rescinded. —Sir R. Inglis showed the physical impossibility of doing anything else but discuss petitions, if discussion were again permitted, as the number of petitions during the last two years had averaged 17,000.—Mr. Roebuck spoke in favour of the motion, as consistent with ancient practice; and Mr. Brotherton opposed it, on the ground taken by Sir R. Inglis. Mr. O'Connell thought the subject was a proper one for the consideration of a committee.—Sir R. Peel could see no alternative between a relaxation and an adherence to the rule. The practice of discussion on the presentation of petitions, instead of being an ancient one, as contended by Mr. Roebuck, was of comparatively modern date, and he believed it to be the opinion of the country that the time of the House was too much occupied in mere debating, to the prevention of the progress of legislative business.—Mr. Wakley praised the conduct of the House of Lords in respect to petitions, as contrasted with that of the House of Commons.—After a few remarks from Sir W. James and Sir V. Blake, the House divided, and Mr. Wallace's motion was rejected by 237 to 50. The only other matter of public importance was the introduction of Mr. E. Tennent's bill respecting copyright in works of design. The House having resolved into a committee, leave was given to bring in the bill, after a few remarks from Dr. Bowring and Mr. Mark Philips.

Tuesday.—After the House had gone through some business of minor importance, Lord Palmerston inquired of Sir R. Peel whether the treaty of the Five Powers for the suppression of the Slave Trade had undergone any material alterations, and whether any of the ratifications had been exchanged? Sir R. Peel answered both questions in the negative, and said that the time for the exchange of the ratifications would not expire until the 20th.

Sir R. Peel, on a question from Mr. Berkeley, declared his intention of making a financial statement as soon as the most immediately urgent votes of supply should have been taken. This postponement was with reference not at all to his own personal convenience, but solely to the public interest.

Lord Stanley obtained leave to introduce a bill for altering the distribution of the ecclesiastical establishments in the West Indies, where the circumstances of the last few years, he said, had much increased the demand for spiritual instruction. The Bishop of Barbadoes, who had now served sixteen years, had claimed the benefit of the act, of being allowed to retire on a pension; and it was now proposed to divide the diocese of Barbadoes and the Leeward Islands into three dioceses, and so to re-distribute the sums now allotted to the bishops and archdeacons, &c., that without any additional expense to the country, the great object of more effective ecclesiastical supervision would be obtained.

The House having resolved itself into committee on colonial import duties, Mr. Gladstone stated that the measure he had to introduce was substantially the same with that which had last year been proposed by Mr. Labouchere, and generally welcomed. He did not, however, regret that Mr. Labouchere's measure had been unsuccessful, because it gave the colonists time to prepare for changes which, they must now be aware, were generally sanctioned by Parliament. In adopting the principles laid down by Mr. Labouchere, he was not aware that any changes which might have been made in the details, as adopted by the present Government, would have any other effect than that of extending the application of those principles. After dwelling on the importance and necessity of the change proposed to be made, Mr. Gladstone read at length the series of resolutions, repealing the whole duties, and establishing the proposed new ones; and then read the schedules of duties, as divided into classes, with the different rates proposed to be levied.

Mr. Labouchere expressed his satisfaction at the measure of Government, admitting that the alterations it had undergone since he himself had brought it forward last year were improvements. After the advantages bestowed on the East Indies, it was but common justice to give this relief to the West. He felt, too, that this measure greatly advanced another object of the late Ministers—the reform of the duties levied in this country on colonial produce, especially sugar and coffee. If the present scheme were resisted, he would gladly aid in combating any opposition to it.—Mr. G. Palmer desired to reserve his opinion.

Lord J. Russell objected only to that part of the plan which went to introduce a duty upon corn imported from the United States into the Canadas. The consequence, he thought, would be the formation of a Canadian free-trade party, which it would be difficult to deal with. As to the rest, he was glad to see the assent of the present Ministers to the policy of their predecessors.

Sir R. Peel desired that no premature inferences as to the commercial policy of Ministers might be drawn from their adoption of this measure, which they were as fully prepared to support last year as now. After some further conversation the resolutions were agreed to, and the House resumed.

Mr. Gladstone then moved for leave to bring in a bill for the regulation of railways. He did not, he said, propose to license the drivers, a class of officers which of late had much improved; but he would ask for a grant of power to the Board of Trade to postpone the opening of railways not sufficiently prepared—to enforce the production of returns of accidents—to close the gates on roads crossed by railways—to refer certain classes of disputes—to check branch communications by individuals—and to take land for widening embankments.—The provisions of the measure were discussed by several Members. Sir R. Peel disapproved of any minute interference by Government. It would, he thought, relax the caution of the companies, who would then feel the responsibility to be removed from themselves.—Mr. Labouchere concurred in the general principle of non-interference; and leave was then given to introduce the bill.

Mr. Wallace moved, pursuant to notice, that an address be presented to the Queen, praying her Majesty to institute an inquiry into the nature and extent of the destitution existing in Paisley and its neighbourhood.

Sir J. Graham deeply lamented the distress in Paisley, which, he was sorry to say, had not been at all exaggerated; but, at the same time, he hoped the present motion might be withdrawn, as tending to excite hopes that could not by possibility be realised. If it were persisted in, he should be obliged, however reluctantly, to give it his opposition. After a debate of some length, in the course of which Lord Stanley stated that no general plan of emigration was contemplated by Government, Mr. Wallace consented to withdraw his motion.

Mr. Godson requested leave to bring in a bill for the protection of copyright, which was granted after a few words from Mr. Wakley.

Leave was given to the Attorney-General to introduce two bills—one for amending the Municipal Regulation Act, which subjects corporation lessees to penalties on becoming Common Councilmen; the other, for allowing a writ of error in cases of *mandamus*.

Upon the motion of Sir G. Clerk, the House went into Committee of Supply. An irregular discussion followed, introduced by Mr. Wakley, on the subject of the framing of Royal speeches; after which the resolution, that a supply be granted to her Majesty, was agreed to. The House having resumed, the report of the committee was brought up, and ordered to be read on Wednesday.

Wednesday.—The House presented an animated appearance from the time of the Speaker's taking the chair, there being a very full attendance of Members, and the galleries appropriated to the use of strangers being crowded with persons anxious to hear the proposed plan of Government respecting the Corn-laws. After the presentation of a great number of petitions on this subject, and the transaction of some unimportant business, Sir R. Peel rose at 5 o'clock, amidst the most profound silence, to bring forward, according to notice, the Ministerial plan for altering the Corn-laws; and the Speaker having left the chair, the House resolved itself into committee under the presidency of Mr. Greene. Sir R. Peel's statement occupied nearly three hours in delivery: after some preliminary observations as to the paramount importance of the subject, and the spirit and temper with which it should be entered on, and after admitting the existing distresses throughout the country, he disclaimed the hope of effecting for the present any material mitigation of them. Nor were they, he said, in his judgment at all attributable to the working of the Corn-laws. Still he saw no reason to despair of the resources of the country. They had been depressed of late by a variety of concurrent but temporary causes; by the excessive credits afforded from joint-stock banks, whose directors were connected with the manufacturing interests, and the consequent increase of buildings and other establishments for manufacturing purposes; by the derangement of the monetary affairs of the United States; by the interruption of our amicable relations with China; and by the uncertain state of European politics, under the late alarms of war. But, whatever might be the extension of our foreign commerce, there might, and often would be found, co-existing with general prosperity severe distress in particular districts. A new invention in machinery might at any time displace the labour of hundreds of hands, as in the case of the hand-loom weavers. This hard condition was inseparable from the state of a manufacturing country; and the existence of great privation and suffering in particular quarters was therefore no impeachment of any commercial system, and formed no reason for any attempt to check the improvement of that mechanical power which had proved so important a source of strength to this country. There was, he said, too great a tendency to despond on any temporary check to commercial advance—on any decline of one year's commerce as compared with that of the year immediately preceding. But alternations of prosperity and depression had occurred in all periods of our commercial history. The right hon. Baronet then entered into some statistical accounts showing the variation in the exports of the country for several years past, and said that from the evidence he had procured on the subject, he could not charge the Corn-laws with the present depression of trade. With respect to these laws there were various opinions. One party, he believed a small one, was adverse to all change. Others would hear of no change, but a total repeal, making their comparisons between the cheapness of food in this and some other countries. The true question, however, he thought, was not what might be the price of food in any country, but what was the command which its people possessed of the necessaries and enjoyments of life. He then proceeded to show, from the evidence given by Dr. Bowring before the committee on import duties, that the English consume, per head, very much more of all the necessaries of life (the only items at all excepted being butter and tobacco) than the inhabitants of Prussia, where grain scarcely exceeds half the English price. In Belgium, also, though corn was cheaper than in England, he showed by statistical details that the working man had less command over the enjoyments of life than here. He was persuaded that a total repeal of the Corn-laws, instead of mitigating the present distress, would superadd to it severe disappointment. Another portion of the house, he said, desired, not a total repeal, but a fixed duty. He had anxiously reconsidered the subject, and had he come to a conclusion that his former objections to a fixed duty were ill-founded, he hoped he should not have wanted the moral courage to change his course. But he did not think it possible to devise such a fixed duty for average years as would suit every year. He was not prepared to admit that this country could not raise a sufficient supply for her own population. He should therefore propose, in conformity with the principle of the existing law, a variable duty, rising and falling inversely as the price of corn in the home market. To the present scale there were these objections: that it was injurious to the consumer, by keeping up prices; to the agriculturists, by inducing them to withhold their corn until they were at last defeated by the low duty; to the revenue, because it was thus at the low duty that the chief part of the importation came in; and to the dealer, whose arrangements were defeated by the suddenness of the fluctuations. Much injury, too, was sustained by the farmers (especially in the north of England, where the harvests are late) from the season of the year at which the foreign corn was poured in. This happened chiefly about September, just as the farmer was thrashing out his corn to meet his rent. There was much difficulty, however, in making an alteration in the duties upon the principle of just protection, the adequacy of any given protection depending much upon varying circumstances. For the last three years the average price of wheat had been 56*s.* 11*d.*, a higher price than any one would wish to see continued. He believed that from 54*s.* to 58*s.* would be a fair range for the oscillation of prices, leaving an average of 56*s.* Government would now propose a maximum duty of 20*s.* when the price should be under 51*s.*; a duty of 19*s.* when the price should reach 51*s.*; a stationary duty of 18*s.* at the prices of 52*s.*, 53*s.*, and 54*s.*; then a fall of one shilling for every shilling of advance in price up to 66*s.*; and then a stationary duty of 6*s.* at the prices of 66*s.*, 67*s.*, and 68*s.*; at the price of 69*s.*, a duty of 5*s.*, and a further fall of one shilling for each shilling of advance in price up to 74*s.*, at which point the duty should wholly cease. This scale would remove the temptation to fraudulent combinations for the fabrication of averages. He should also propose that the averages continue to be taken as at present, but that the range be widened, by adding other towns in England and Wales to the 150 from which returns are now obtained; and that the collecting of the returns should devolve on the officers of excise in the respective towns. Upon this alteration in the sliding scale he should chiefly rely for checking the unjust tampering with the averages, by removing the temptation for so doing. Sir R. Peel then explained the detail of the duties intended to affect other kinds of grain, and proceeded to observe that the proposed reductions of duty on these as well as on wheat, though very considerable, were not greater than he deemed compatible with that just protection to the agricultural interests, which he still proposed to retain, not for the sake of any particular class, but for the general welfare of all classes. It was fitting to impose such a restriction on the importation of foreign corn as would countervail any especial burdens borne by the agriculturist; and it was legitimate to pay some small tax upon produce, for the purpose of insuring a home growth, and guarding against a total dependence on foreign supply; since it was only in years of scarcity that the country ought to look for assistance from foreign countries. This, then, was the proposal of Government; and it was made at a time when there was no alarming amount of foreign corn available to the supply of this country, and when, notwithstanding some attempts to create excitement, there was a general disposition to view with calmness and moderation a proposal for adjustment.

Lord J. Russell desired to have a list of the towns from which it was proposed to take the averages; which list Sir R. Peel promised to lay before the House on Friday.—Mr. Cobden, in a few sentences, denounced the plan as a measure contrived for the benefit of the landed aristocracy; after which the chairman reported progress.

Thursday.—Earl Jermyn appeared at the bar, and acquainted the House that her Majesty had given directions that the estimates and returns named in the address voted by the House should be prepared, and presented with as little delay as possible.

In reply to a question from Mr. Shaw relating to railroads in Ireland, Lord Eliot said that certain plans had been submitted to Government, but they had not determined upon any one. He also stated, as his own impression, that Government would not be disposed to sanction any outlay of the public money for such a purpose, or be responsible for any amount that might be so applied.

In reply to a question from Lord J. Russell, Lord Eliot said that the number of stipendiary magistrates reduced in Ireland was eight.—Lord J. Russell gave notice that on Monday he should move a resolution that in any contemplated alteration of the Corn-laws it would be unadvisable to adopt the principle of a sliding scale.—Mr. Villiers gave notice that he should take the sense of the House as to the propriety of the imposition of any duty whatever on the importation of corn or food.

Sir R. Peel said that with respect to the relations existing between the State of Texas and this country, he had now to say that of the three treaties—the treaty of commerce, the treaty of debt, and the treaty referring to slavery—two of them had received the sanction of the senate of Texas, but the treaty respecting the slave trade, not having arrived before the senate had broken up, it had not received its sanction; and, therefore, neither of the treaties had been ratified, as it was desirable they should be ratified simultaneously.

On the motion of Dr. Bowring, it was ordered that copies be laid before the House of all communications addressed from Bolton to the Home-office, during the late recess, on the subject of the report of Mr. Mott, who had been sent down last autumn specially to investigate the extent of distress in that town.—Lord J. Manners, having personally visited Bolton, and witnessed the condition of the inhabitants, bore testimony to the fact of the distressed condition of the people, and hoped that some measure of relief would be devised.

Mr. Brotherton brought forward his motion, that no opposed business be discussed in the House after twelve o'clock at night, unless a hundred members were present.—The motion was opposed by Sir R. Peel, and negatived on a division by a majority of 200 to 26.—Mr. Ewart asked whether it was the intention of the Commissioners of Woods and Forests to throw open Richmond and Kew Parks to the public.—The Earl of Lincoln replied that there was no intention of making any alteration with regard to those parks.

Several returns relating to the public expenditure were ordered, on the motion of Mr. W. Williams.

Lord J. Russell moved for copies of the letters accompanying the resignations of the late Lord Chief Justice of the Court of Queen's Bench in Ireland and the late Lord President of the Court of Session in Scotland. An impression, he said, prevailed that they had withheld their resignations until the political party to which they were attached had come into power; and as such an idea was calculated to diminish the respect due to the independence and integrity of the bench, he wished to have it set at rest by the production of the correspondence.—Sir J. Graham, in resisting the motion, attacked the conduct of the late Whig ministry, and accused them of having tampered with the judges both in Scotland and in Ireland, by entering into negotiations to effect the retirement of particular individuals. He alluded particularly to the cases of Lord Corehouse and Lord Plunkett.—Sir F. Maule supported, and the Lord Advocate opposed the motion.

Mr. O'Connell, who had been appealed to by Sir J. Graham, for his testimony to the merits of Lord Chief Justice Bushe, declared that he considered him to have been amongst the foremost men at the Irish bar—an admirable orator, an excellent lawyer, and an accomplished gentleman. But he had become the mere wreck of what he was; and he thought there was no doubt that he had lingered on the bench when incapacitated for his duties, until his political friends came into power. Lord J. Russell, he considered, was quite justified in bringing forward his motion on the ground of constitutional jealousy, and care for the integrity and independence of the bench.—Mr. Shaw said that Lord Chief Justice Bushe, after the summer circuit of last year, when for the first time he felt himself unequal to his duties, had declared his intention to take his seat for the last time in the then next term, without reference to what might be the political character of the Government then to hold office. If report spoke true, it was by the late ministry that overtures were made, not only to Lord Plunkett but to Lord Chief Justice Bushe himself, and to Judge Johnston. And certainly under no Government had there been such a clearance of public offices.

Mr. Wakley said, that in looking over the list of notices, he had marked this particular notice of Lord J. Russell's with the word "suicide," thinking he himself might be wanted as coroner. He trusted that in the future appointments to the bench the politics of the candidates would not be the consideration.

Sir R. Peel was glad to have the opportunity of justifying his own conduct as to judicial appointments. He had placed Mr. Cranstoun on the bench in Scotland without reference to political claims. The appointment of Mr. Cresswell to the English bench had been universally approved. When two Vice-Chancellors were to be appointed, the first offer had been made to Lord Cottenham. That noble Lord was not to be blamed for declining the office in his particular position; but at least Government had shown itself anxious not to forego the chance of obtaining his valuable services for the Court of Chancery. The present ministers had neither solicited Lord Chief Justice Bushe's resignation of his office since their own accession, nor his retention of it under the Government preceding. Equally pure had been the arrangements for the retirement of Lord President Hope, and for the appointment of his son as his successor. The right hon. Baronet proceeded to say that Mr. Wakley had stated that when he came to the notice of the noble Lord, he marked the word "suicide" against it. Notwithstanding all the horror which the crime of suicide was calculated to inspire, there were sometimes circumstances connected with it, such as those in the case of Curtius, which in some measure entitled it to sympathy, when it was committed with a view to promote great public interests. To that species of sympathy, and to all the praise which such conduct was calculated to excite, the noble Lord who brought forward the present motion was entitled. The noble Lord, in his zealous and anxious desire to support the constitutional appointment of the judges, having failed to establish a case against others, with an heroic devotion seldom paralleled, sacrificed himself by the exposure which he made of the practices of his own party.

Lord J. Russell, in reply, contended that both the retired judges had been conscious of their infirmities long before their resignations. He defended the arrangement for the secession of Lord Plunkett, who, he thought, had held his office too long, and reminded the House that the succeeding Chancellor, Lord Campbell, had agreed to take that office without a pension. He could not but retain his opinion, that the resignations in this instance had been managed for the purpose of favouring a particular party.—The House then divided, and the motion was negatived by a majority of 148 to 75.

Friday.—Mr. Christopher gave notice that he intended to propose a higher scale of duty on foreign corn than that of Government, and Lord J. Russell stated the exact terms of his motion for Monday. Mr. Fox Maule moved for a return specifying in what jury cases the Lord President had presided, and in what cases other judges had performed his duties. On a division, it was negatived by a majority of 26.

CITY.

Money Market, Friday.—Consols closed at 89⅛ to ¼; the price for the account, 89¼ to ⅜; Three per Cents. Reduced, 89⅝; New Three and a Half per Cents. 98½; India Stock, 244 to 245; Bank Stock, 168.

Metropolis and its Vicinity.

Metropolitan Improvements.—It is said to be in contemplation to widen and improve the streets and lanes in the neighbourhood of Shadwell and Wapping on the completion of the Thames Tunnel, which may be soon expected. It seems that the approaches to the Tunnel on the north side are narrow and inconvenient; the streets being often obstructed and rendered impassable by the carts and waggons proceeding to and from the wharfs and dock warehouses; and it is thought that when the thoroughfare under the Thames is opened, there will be a great increase of vehicles and passengers, and consequently a greater necessity for widening the narrow streets in the neighbourhood, particularly the great thoroughfares, High-street, Shadwell, and High-street, Wapping; in the latter of which there is only room in many places for one vehicle to pass.—An order has recently been issued by the Commissioners of Woods and Forests for the formation of a gravel footpath across Hyde Park, extending from the gate opening into the Bayswater-road, by Albany-street to Apsley House. This is expected to be a great accommodation to the inhabitants living in that part of the town, in the vicinity of St. John's Church, Paddington, which has become within the last few years greatly populated. The path is to be nine feet in width, and a large quantity of gravel is already lying along the whole line across the park, ready to be formed into the road in question.

Public Meetings.—A public meeting has been held at Lambeth, consisting principally of tradesmen, for the purpose of presenting a silver snuff-box to Mr. Allen, the superintendent of the works at the new Houses of Parliament. Mr. Downey, lighterman, was called to the chair, and stated that the testimonial of respect which they had met to present to Mr. Allen was not given from interested motives, such as being connected with the firm of Grissell and Peto, which they were not; but was given as a mark of respect for the integrity and firmness displayed by him during the protracted strike of the masons.—On Wednesday the Committee of Merchants and Bankers, appointed to consider the best means of testifying the public feeling towards the proprietors and conductors of "The Times," for their conduct in the case of Bogle *v.* Lawson, assembled at the Mansion-house to adopt resolutions with respect to the disposal of the money subscribed. The Lord Mayor in the chair. Mr. Hughes, the hon. secretary, reported the amount of subscriptions to the present time to be 2,612*l.* 14*s.* Several letters were read, among which was one from Mr. Ashurst, the solicitor employed by the Committee, declining any pecuniary recompense for his services. After several plans for the disposal of the funds in hand had been suggested, and after a long and desultory conversation, the following resolutions were ultimately adopted: "1. That, with the permission of the Gresham Committee, a tablet, not exceeding 100 guineas in value, with a suitable inscription, be placed in the Royal Exchange; and that a similar tablet, not exceeding 50 guineas in value, be placed in some conspicuous part of 'The Times' printing establishment. 2. That the surplus of the fund raised be invested in Government securities, in the names of the following trustees: the Lord Mayor, the Bishop of London, the Governor of the Bank of England, and the Chamberlain of London, all for the time being, the dividends to be applied to the support of two scholarships, to be called 'The Times Scholarships.' 3. That 'The Times' scholarships be established in connexion with Christ's Hospital and the City of London School, for the benefit of pupils proceeding from those institutions respectively to the Universities of Oxford and Cambridge. 4. That Christ's Hospital and the City of London School be required to place in their respective institutions a tablet commemorative of the establishment of such scholarships."

Anti-Corn-law Conference.—On Wednesday, the delegates of the Anti-Corn-law Conference, at present assembled in London, collected in a body, to the number of 600, and walked in procession to the House of Commons; only 100, however, succeeded in gaining admittance. Those who had gained admission waited till the close of Sir R. Peel's speech, and then adjourned to Brown's Coffee-house, where after a long deliberation they came to the conclusion that they ought to express their opinion as follows:—"That, in the opinion of this meeting, the measure just announced by her Majesty's Government, on the subject of the Corn-laws, so far from holding out the slightest prospect of any relief of the distress of the country, is an insult to a patient and suffering people; and the deputies view such a proposal as an indication that the landed aristocracy of this country are destitute of all sympathy for the poor, and are resolved, if permitted by an outraged people, to persist in a course of selfish policy, which will involve the destruction of every interest in the country." This resolution was adopted unanimously. The meeting then adjourned, and re-assembled at nine in the evening, when the deputies again took into consideration the course which should be pursued in the present state of the question, and unanimously adopted a variety of resolutions, again recording their emphatic condemnation of the proposition of Government on the subject of the Corn-laws, that evening announced in the House of Commons, and their solemn protest against it as "a total denial of the just demand of the people of this country, and as evincing a determination to perpetuate an oppressive and unrighteous system, together with all the essential evils which have hitherto resulted from the operation of the existing Corn-laws." Resolutions were also passed, calling on all the Anti-Corn-law associations throughout the Kingdom "to take measures for expressing, without delay, in every constitutional manner, their hostility to the proposed measure, and their fixed and unalterable determination not to relax in their exertions until a measure of complete justice is obtained."

British Museum.—On Saturday, a young man was examined before one of the magistrates, charged by Sir Henry Ellis with stealing a valuable book, from the library of the British Museum. It appeared that on the previous day the prisoner entered the reading-room, with a regular order, and after consulting the catalogue, requested an inspection of Garrick's Collection of Old Plays of the year 1605, valued at 200 guineas, which was handed to him by one of the assistant librarians. Shortly afterwards the young man and the book were missed; and a messenger was despatched to his lodgings, where it was ascertained that he was an articled clerk to a firm in Essex-street, Strand, in whose chambers he was found with the book, which he was then reading. He at once gave it up without hesitation, and expressed his willingness to go before Sir H. Ellis, who, notwithstanding the prisoner's explanation satisfied him that he had no felonious intention, considered it his duty to refer the matter to a magistrate. The prisoner declared that he had taken the book through ignorance of the rules of the institution; and several respectable witnesses, who appeared in his behalf, were of that opinion. The magistrate discharged the prisoner, but told him he had had a narrow escape. A person, he said, was at present undergoing an imprisonment of twelve months for a similar offence. The magistrate added that an application ought to be made to Parliament about the British Museum, and he hoped that a clause would be introduced into the Act, making it a highly penal offence against any one removing from the institution property so valuable. Sir Henry said he should certainly draw the attention of the Legislature to so important a subject, and he trusted the present inquiry would have its effect on all visitors to the Museum.

Thames Tunnel.—It is said that the contract for the erection of the circular staircases for foot passengers in the Thames tunnel, and also the carriage-ways, has been taken, and will be commenced forthwith. The labours of Sir Isambard Brunel, as regards the tunnel itself, are completed; the key brick of the last inch on the Middlesex side was inserted by the King of Prussia, on his Majesty's visit last week, and the workmen have for the last month passed under the river from Rotherhithe to Wapping, as well as many visitors, by special orders from the Directors and Secretary. It appears, however, to be shortly intended to close the tunnel for a few weeks, to prevent any interruptions to the operations of the workmen while forming the circular staircases; and about the second or third week in April the tunnel, it is said, will be finally opened to the public, who will be enabled to pass from one side of the river to the other on payment of a small toll, which has not yet been fixed. The shield has been removed in compartments, and is now lying on the wharf adjoining the shaft on the Middlesex side. It is computed that about 3,000 passengers cross the ferry daily, between Wapping and Rotherhithe, in the small boats, and the number of persons who will avail themselves of the new line of communication under water when the tunnel is opened is expected to be greatly increased. The arches are said to be very dry, and since both ends of the tunnel have been opened, and the workmen have been enabled to enter both shafts, the ventilation has been improved, and the comforts of the visitors, who were formerly inconvenienced by the confined atmosphere of the place, are much increased.

Fires.—On Saturday, a serious fire broke out on the premises of Mr. Bowra, hatter, Gracechurch-street, and before it was discovered had gained such an ascendancy that it was with difficulty got under, and not before the interior of the building was entirely destroyed. The neighbouring premises were also much damaged.—On Saturday morning considerable alarm was created in the neighbourhood of Lambeth and Vauxhall, by a report that the extensive distillery belonging to Messrs. Hodges, situate near the Archbishop of Canterbury's Palace, was on fire. Fortunately, however, by the timely discovery of the fire and the speedy arrival of numerous engines, the flames were got under before they had communicated to the inflammable materials contained on the premises; or the consequences, it is thought, would have been very serious. It is not known how the fire originated.—On Saturday, a fire broke out in Artillery-court, Finsbury-square, on some premises occupied as a store by the Hon. Artillery Company. It commenced on the ground-floor, which was destroyed, together with the first-floor, in which was a quantity of leather and other stores, valued at nearly 2,000*l.* On the same day a fire broke out at the St. James's Hotel, in Jermyn-street. It appears that on the previous night, one of the chimneys took fire, at which several engines attended, but the firemen were refused admittance. Shortly afterwards the attics and roof were found to be on fire, owing, it is stated, to some of the timber running into the chimney. On the return of the engines, however, the flames were soon subdued.—In the evening of the same day two other fires occurred, occasioned, it is said, by the foulness of the chimneys, one at the residence of the Duke of Cleveland, St. James's-square, and the other at the residence of Sir F. Burdett, Bart., M.P., St. James's-place; but several engines were soon in attendance, and the fires were without difficulty extinguished.—On Monday a serious fire occurred at the Crown public-house, Rupert-street, Whitechapel. It seems that before it was discovered the flames had increased to such an extent, that the inmates with difficulty saved themselves by escaping over the roof. The fire was ultimately confined to the house, which, however, was entirely destroyed. It is supposed to have been occasioned by an escape of gas.

Accident and Inquest.—An inquest has been held on the two persons killed by the falling of the houses in Charles-street, Drury-lane, noticed in our last. A witness stated that for several days previous to the accident, all the poor in the parish were employed in taking away the woodwork of the houses, which no one owned, and he thought they had fallen in on account of so much of the woodwork at their foundation having been stolen. Had the houses fallen in on the previous day, witness thought forty persons would probably have been killed, so large a number were then engaged in carrying away the wood. The beadle of the parish said that the houses had been condemned last May by a court-leet jury, and, acting under their precept, the churchwardens and overseers gave notice to the supposed owners, either to pull down the houses or place them in a safe state by repairing them. Their notice not having been attended to, the parish authorities caused the houses to be pulled down to the first floor, and in that state they might have securely remained for a long time if they had been let alone. In summing up, the coroner observed that the parish could do no more than they had done to make the houses secure, as far as regarded the public. They had not contemplated the robberies of wood which had afterwards taken place, and it was evident that the accident took place in consequence of the wood having been feloniously taken away. If a man in the act of committing a felony caused loss of life he would be guilty of murder, but in the present case there were so many persons feloniously engaged that it would be impossible to bring the causing of the fatal occurrence home to any particular person. Verdict, "Accidental death."

Provincial News.

Brighton.—On Thursday considerable excitement and bustle prevailed in this town, on the occasion of the arrival of her Majesty and the Court from Windsor, for whose reception great preparations have for some time been making. Great numbers of persons assembled along the line of road through which the Royal *cortège* was expected to pass; all the shops were closed at an early hour, and the whole town presented a gay and animated appearance. A numerous deputation, consisting of the borough members, the magistrates and other gentlemen, assembled at the north gate of the pavilion, and took up their station to welcome her Majesty and Prince Albert. The Royal standard and the town colours were also brought to the spot, and at the same time a detachment of the 2d Scotch Greys, accompanied by their bands, arrived, and lined the road from the Palace, the band taking up their station at the entrance, and playing several airs. Her Majesty, accompanied by Prince Albert, and followed by five other carriages, containing the Prince of Wales, the Princess Royal, and the several members of the Court, arrived about three in the afternoon; they were received with loud cheers and every demonstration of attachment and respect; the crowds that thronged the line, greeting the Royal party by the waving of hats and handkerchiefs. Her Majesty and Prince Albert, who looked well, repeatedly bowed to the multitude. The numerous spectators were also gratified with a sight of the Princess Royal and the Prince of Wales, their nurses holding them up to the windows of the carriages as they passed up the line; they were also loudly cheered. Detachments of the 11th Hussars escorted the party the whole distance; and as her Majesty approached the Pavilion the band struck up the national anthem, and the guns both at the Royal battery and the Chain pier fired a salute. The Royal party having entered the palace, the crowds at once separated. There was a general illumination throughout the town in the evening, and other manifestations of joy in honour of the event.—Information was received in this town on Monday, that a serious fire had broken out at a farm-house near the Hassocks station on the London and Brighton Railway, and consumed a barn containing a quantity of corn, together with the farm-house. It appears that the fire was first discovered about midnight by some railway labourers, who found that the house was in flames. They succeeded with some difficulty in alarming the inmates, and the tenant of the farm, Mr. Avard, was aroused from sleep, whilst his curtains were actually in flames, just in time to make his escape. It is supposed to be the act of an incendiary, and the son of Mr. Avard has been apprehended on suspicion of being concerned in the act.—On Tuesday one of the horses in the mail between this town and London suddenly dropped down dead, whereby the coach was upset. There were no passengers; the coachman, however, was seriously injured, but the guard escaped with only a few bruises.

Birmingham.—A local paper, the "Advertiser," informs us that the loyalty of the inhabitants of this town was manifested in a singular manner on the day of the christening of the Prince of Wales, at the parish-church, where upwards of a hundred christenings took place, the majority of the names of the males being either Edward Albert or Albert Edward.

Chelmsford.—A few nights since the Rodney public-house, at Little Baddow, in this county, was forcibly entered by three men, who proceeded up stairs to the landlady's bedroom, and, having demanded her money, took all she had, after which they remained for some time regaling themselves with spirits and biscuits, and smoking cigars. Information of the robbery having been communicated to one of the rural police, he went in pursuit, and found two railroad navigators at a public-house in Hazeleigh, answering the description given of the thieves. He contrived to put a pair of handcuffs on one of the wrists of each prisoner, and then set out with them on foot for this town, but had not proceeded far when they forced him into a ploughed field, at the same time commencing a determined attack upon him, and, it is thought, would have succeeded in murdering him but for the assistance of two men who happened to come up at the time. After a desperate resistance, the prisoners were again secured, and have since been lodged in the jail.

Chichester.—On Saturday night a serious fire broke out at a farm belonging to Mr. Cripps, at Ditchling, in this county. It continued with great violence for some time, and destroyed a barn, two ricks of wheat and oats, and afterwards communicated to the dwelling-house, which, notwithstanding every exertion was made by a large body of labourers, was totally consumed. The fire is supposed to have been caused by an incendiary.

Chippenham.—The following highway robbery has been committed in the parish of Corsham, near this place, within the last few days, and has excited some alarm in the neighbourhood, from the circumstance of its having been effected in the high road, and in open day. It seems that a man named Tylee, waywarden of Corsham, was proceeding to overlook the men in his employ, and pay them their wages, when he was stopped by four men, having the appearance of railway labourers, who knocked him down, and robbed him of his watch and all the money he had about him. Several men have been apprehended on suspicion by the police, and taken before the magistrates, but Tylee was unable to swear to them, and they were therefore again liberated.

Deal.—On Monday, seven men were brought on shore to appear before the magistrates, for refusing to go the voyage, or to navigate their ship farther than the Downs, and were committed to the treadmill for thirty-one days. The following day four more were taken also before the authorities; but as the men manifested contrition, the captain refused to prosecute the charge. This practice is said to be frequent among the lower class of seamen, who, after getting an advance of two months' pay, and working their vessels into the Downs, refuse to go any farther. In such cases, it seems, the captain is bound by Act of Parliament to bring them before the nearest magisterial court, which happens to be in this town, on which all the expense necessarily falls.

Glossop.—A serious fire has occurred in the cotton-mill occupied by Messrs. Wright and Hudson, spinners and weavers. It was first discovered by a person casually passing by about midnight; but the inhabitants of the neighbourhood being all asleep, it was some time before any assistance could be procured; and by the time the engines arrived, the fire had gained so great an ascendency that they were insufficient to arrest the progress of the flames; and in a short time the entire mill, with its machinery, worth, it is said, 2000*l.*, was entirely destroyed.

Manchester.—At a recent meeting of the town-council, instructions were given to proceed against a young man named J. P. Parker, late clerk in Mr. Heron's office, for embezzling a sum of money with which he had been intrusted, amounting to about 50*l.* The young man was apprehended, and has been brought up for examination before the magistrates, when it appeared that sums of money had been intrusted to him to pay counsel's fees, which he had applied to his own purposes. There being some difficulty, however, in proving the facts, the prisoner was ultimately liberated, on finding securities to answer the charge at the assizes.

Newport (Isle of Wight).—On Saturday this town was thrown into considerable excitement by the sudden announcement of the stoppage of the bank of Messrs. Kirkpatrick and Co., which created the greater surprise, as there had been no previous run upon it. It is feared that this failure will be productive of serious consequences to many in the neighbourhood, the principal circulation of the bank being in this town and Ryde. In order to prevent the consequences of the panic occasioned by this event, a notice has been posted, signed by a great number of the principal landowners, merchants, and tradesmen of the neighbourhood, expressing their confidence in the banking establishment of Sir R. Bassett and Co., the other bank in the town, and their willingness to take their notes as cash. This measure, it was hoped, would restore confidence; but at present the public appear to be so alarmed that they will be content with nothing but gold or Bank of England notes. Messrs. Kirkpatrick and Co.'s liabilities in Cowes do not, it is said, exceed six thousand pounds, but they are thought to be heavy in other parts of the island.

Norwich.—On Saturday evening, as Mr. John Alsebrooke, jun., of Worthing, was returning from this city, he was stopped by four or five men about a mile and a half from St. Augustine's gates, on the Drayton-road. Two men seized the horse, and the others took from him a valuable gold watch. They then cut the reins of the horse, and threatened to murder him with their knives. Finding, however, that no cash was to be had, they abused him, and striking the horse, set him off at a gallop, with Mr. Alsebrooke in the gig, with no power to stop or direct the animal. Fortunately no further injury occurred. No trace of the robbers has been discovered.

Portsmouth.—On Thursday Lord Ashburton embarked on board the "Warspite" frigate, at Spithead. He left the harbour between two and three in the afternoon, accompanied by Lord John Hay, in the Admiral's tender, and was saluted by the forts with nineteen guns as he passed. When he arrived on board the "Warspite" the yards were manned, and he was received with another salute of nineteen guns, shortly after which the frigate got under weigh, and proceeded on her voyage to the United States.

Sunderland.—On Saturday one of the steam tugs employed in this harbour was detected in an attempt to land a large quantity of smuggled goods. It seems that one of the tide-surveyors went alongside her about day-break; and on attempting to board her, the crew put on her steam, and set her off at a rapid pace, the customs' boat pursuing her to the high part of the harbour. The steamer had just towed out to sea a Dutch vessel, from which it appears she had taken on board and brought back into the harbour six casks with foreign brandy and two with tobacco, for the purpose of defrauding the revenue, those articles having been, it is alleged, taken out as bonded stores. The tide-surveyor was unable to reach the steamer; but the casks were stove in and thrown overboard, and picked up by the customs' boat. The master of the steamer has been taken before the magistrates, and committed to jail, and the steamer has been arrested.

Truro.—A few days since the following accident happened at North Towan Mine in this county. A young man, named Mitchell, working in the mine, asked a man near him if he had ever seen any person climb up by the capstan rope. The man replied, No, nor did he wish it. Mitchell then said that he should see him do it, and proceeded to ascend, suspending himself by the legs, head downwards, directly over the engine-shaft. On endeavouring, however, to regain his proper position, he slipped his hand and was precipitated to the bottom of the shaft, in which there were five fathoms of water, and, though taken up in a few minutes, he was found to be quite dead.

Weymouth.—On Tuesday a French fishing-boat, of about 15 tons, from Cherbourg, was boarded in this harbour by the chief mate of a revenue steamer; and on removing the ballast it was discovered that an ingenious contrivance had been effected for carrying contraband spirits, upwards of 60 gallons of pure spirits of French brandy being found contained in 20 leaden tanks, connected with each other by a small lead pipe. These tanks, it seems, were placed between the floors, above which, to prevent suspicion, was a false keelson floored over, so as to form the vessel's ceiling, her build and depth of keel assisting in the disguise. To draw off the spirits a small tin tube spirit pump was introduced, which could be worked without any noise, and in a short space of time the whole drawn off. The tin pump was found concealed at the bottom of a fishing net. The boat, as well as the spirits, were conveyed to the stores of Her Majesty's Customs.

Windsor.—On Tuesday Lieut. B. Proctor, of the Royal Horse Guards, narrowly escaped a serious accident. It seems that as he was driving from the cavalry barracks with his servant in a gig, on turning out of the barrack-gate into the road leading to the town, his horse took fright, and ran the chaise up a steep bank. Mr. Proctor and his servant threw themselves out, which prevented the carriage from being turned over upon them; but Mr. Proctor lost his hold of the reins, and the horse started off towards the town at a great rate, and was not stopped until he had reached the middle of Peascod-street, when fortunately it was ascertained that, although he had passed through a crowded neighbourhood at a rapid pace, no injury had occurred to any one. The horse was unhurt, and the vehicle but slightly damaged.

Railways.—We learn from the "Railway Magazine" that the following are the receipts of the railways for last week:—Blackwall, 563*l.*; Hull and Selby, 694*l.*; Manchester and Birmingham, 306*l.*; Eastern Counties, 641*l.*; Birmingham, 12,988; Northern and Eastern, 839*l.*; South-Western, 3,445*l.*; North Midland, 3,727*l.*; Midland Counties, 2,156*l.*; Great Western, 10,475*l.*; York and North Midland, 1,281*l.*; and Birmingham and Gloucester, 1,477*l.*—On Wednesday, the half-yearly meeting of the proprietors of the Eastern Counties Railway was held, A. Bosanquet, Esq., in the chair. The report stated that the works were progressing, and the whole line to Colchester would be completed by the autumn of the present year. During the winter the works stood well, except the embankment between Romford and Brentwood, which had caused much trouble and inconvenience. From the traffic account it appeared that the total receipts for the half-year ending the 4th of January amounted to 22,551*l.*, which was an increase of 7,016*l.* over the former half-year. By the valuation of the engine and carriage stock of the company, the depreciation was only 352*l.* for the half-year. The net profit-balance for the half-year was 11,207*l.*, which, with the net profit on the 4th of July last, gives 9*s.* per share dividend, being about 5 per cent. on the present price of these shares, which is more than was anticipated, as at present not 18 miles of the whole line are opened for traffic. The directors reminded the proprietors that there were now 56,000 of the company's shares and 56,000 of their debentures, yielding jointly (at 33*l.* 6*s.* 8*d.* for each share and each debenture) a capital of 1,866,666*l.*, and in the hands of solvent proprietors, while 8,000 shares paid, and 8,000 debentures were forfeited and to be issued, and in the hands of the company; also that the capital required for entire completion of the railway, the stations, and the whole of the working stock, is 2,300,000*l.* To provide a further sum of 300,000*l.* for completing the enterprise, the directors proposed to issue new shares, rateably to all the share and debenture holders, at the price of 8*l.* 6*s.* 8*d.* each, for a similar share to those now existing, to be payable by instalments, in which case the 16,000 shares and debentures would not be issued without the sanction of a general meeting. The directors hoped that the Thames Haven Railway might become a useful tributary to their railway. The total receipts to the 4th of January were 1,888,242*l.* 4*s.* 11*d.*, and the total expenditure 1,847,929*l.* 19*s.* 2*d.*, leaving a balance of 40,312*l.* 5*s.* 9*d.* The report after some discussion was adopted. A proprietor spoke of the evil consequences of the truck system adopted by some of the contractors at Colchester, when the chairman replied, that it was forbidden by a clause in the contract, but he was sorry to say the law was so inefficient that parties guilty of it could not be punished. On Thursday a serious accident occurred on the London and Brighton Railway, to a man named Lewes, a policeman in the employ of the company. It appears that he was on duty on the line, about a mile and a half from the station at Croydon, when he observed the approach of the down train, and, hearing the noise of a train coming up the line, he made the usual signals, and, as soon as he saw the signals were observed, attempted to cross over the rails. Before, however, he could reach the other side he was struck by the engine of the up-train and knocked down, and the wheels of the engine passed over him, and so seriously injured him, that, though not killed on the spot, no hopes are entertained of his recovery. It does not appear that any blame is attributable to the engine driver.

IRELAND.

Dublin.—Their Excellencies the Earl and Countess de Grey gave their first state ball for the season on the 3rd inst. It was numerously attended, nearly 900 of the nobility and gentry, it is said, being present.—The vacant bishopric of Ossory has been conferred on the Dean of Cork, the Reverend Doctor O'Brien. — The convict Delahunt was executed on Saturday, in the presence of a great assemblage of persons, who evidenced their abhorrence of the crime for which he suffered, by loud cries of execration. Before his execution, the prisoner made a full confession of the circumstances under which the crime was perpetrated, which were of a revolting character; and said, that the hope of getting again into the pay of the Castle was his strong motive for committing the deed; that he thought he could fix it on some one in the course of time, and if he had succeeded, he did not know that he might not have done a similar deed again.—The weekly meeting of the Repeal Association was held on Monday, the Rev. Mr. Groves in the chair. The meeting, which was thinly attended, was addressed by Messrs. Reynolds, Steele, &c., on the customary topics. Mr. Steele commented in severe terms on the inactivity of the Repeal Wardens throughout the country, and moved that extracts from the Lord Mayor's reply to Earl Shrewsbury be extensively circulated, in order to stimulate them to renewed exertion. The sum of 40*l.* was announced as the Repeal rent from Waterford.

Drogheda.—The convict Delahunt, who was executed on Saturday, had been suspected of having been implicated in the murder of a man named Dolan, in this town, under circumstances of great atrocity. He, however, denied it in his last confession, and it appears that a man named James M'Daniel has been committed to gaol under suspicious circumstances connected with the murder. A warrant, it seems, had been out against him for some time past, on hearing which he surrendered himself to the police authorities in Belfast, who forwarded him to this place.

Limerick.—On the night of the 3rd inst., the mail, while on its way from this town to Dublin, was attacked, and several shots fired at the guard, in the neighbourhood of Moneygull, near Lord Bloomfield's demesne. The guard was conveyed into the village, where he lies in a precarious state, several slugs having been extracted from various parts of his body. The assassin escaped in the darkness of the night, and has not since been traced.

SCOTLAND.

Edinburgh.—An accident of a serious nature has occurred on the railway between this city and Glasgow. It appears that the line being now completed, short pleasure-trips have taken place at both ends, and two of these were undertaken on the same day, without previous concert. The consequence was, that one train, on approaching Glasgow, came violently into collision with another train, a short distance from the terminus, by which several persons were seriously injured; and though none were killed on the spot, it is thought doubtful whether one, if not more, of the passengers will not lose their lives in consequence of the injuries received.

Paisley.—On Monday, a letter was received in this town from Windsor, acknowledging the receipt of the shawls sent to Court by the Queen's command, noticed in a previous Number. Her Majesty, it is said, expressed much gratification on witnessing such beautiful specimens of manufacture, and made a selection from the several parcels. As an indication that the choice of her Majesty will not be without its effects, it is stated that applications, both from Glasgow and Edinburgh, have been received during the week for shawls of the Queen's choice.

THEATRICALS.

DRURY-LANE.—On Saturday, Handel's opera of "Acis and Galatea" was produced at this theatre, with extraordinary success. It was got up with great completeness, the different parts being well supported, and the scenery and fittings up of the stage having been elaborately prepared. The curtain fell amid loud and general applause; and Mr. Macready, being first called for, was received with long-continued cheers, and announced the piece for repetition. Miss Romer and Miss Horton, who distinguished themselves during the performance, were also called for, and well received.—On Monday, after the second performance of "Acis and Galatea," a new comedy was produced, entitled "The Prisoner of War," which was also successful.

COVENT-GARDEN.—On Monday a new comedy in five acts, entitled "The Irish Heiress," by Mr. Bourcicault, the author of "London Assurance," was produced at this theatre. The following is a brief outline of the plot:—*Sir William Stanmore* (Mr. G. Vandenhoff), a young spendthrift, who has dissipated what worldly goods he has inherited of his equally wasteful forefathers, has been indebted to the demise of a kinsman for his title and sundry estates annexed to it. His mother, it appears, has locked up in a cabinet a packet of letters proving him not to be the son of her husband. In selling off the goods to raise money, these letters fall into the hands of a knavish lawyer, *Mr. Supple* (Mr. Cooper), who in his youth had deceived a Frenchwoman by an invalid marriage, and had by her a daughter, whom he rears in the Highlands, where she is deceived into a fictitious marriage by the illegitimate *Stanmore.* Being in Scotland, however, the illegality of the marriage is avoided by the fact of avowal there by the parties. This discovery counteracts the designs of the pseudo-baronet upon his cousin, *Miss Merion* (Madame Vestris), the heiress to the property; and this, with the mutual jealousies of her old guardian, *Lord William Davenant* (Mr. Farren), and his young wife (Mrs. Nisbett), caused by the expedient of *Percy Ardent's* (Mr. C. Mathews) letter to *Miss Merion* being handed to the one, and the forsaken wife's letter to *Sir William Stanmore* being handed to the other, constitutes the plot of the piece. The performers sustained their parts well, particularly Mr. Farren, who was much applauded. The scenery throughout was in the best taste; and some portions of it elicited considerable approbation. The curtain fell amid general cheers, and the piece was announced by Mr. Farren for repetition.

Miscellaneous.

The Affghan Insurrection.—The Bombay papers in giving the details of the unfortunate events that have taken place in Affghanistan, relate several extraordinary instances of personal gallantry, and some adventures which, from their daring character, would, if not so authenticated, bear the appearance of romance. Our space will not allow of our giving at length the details of all these, but the perusal of the following may be interesting to our readers:—At Peshboolak, Capt. Ferris, with a detachment of 250 men, held out in a weak fort for some days against repeated attacks of from 2,000 to 3,000 men, and having at last only 25 rounds of ammunition in pouch, he, with six other officers and the men, having been refused terms by the Affghans, came to the resolution of cutting their way through the enemy, and, having placed the two ladies within their square (Mrs. Ferris and her sister), effected their retreat, providentially unharmed, although desperately attacked on all sides, and exposed to some severe fighting, to the stronghold of a friendly chief, who sent them to Peshawur by mountain paths before unknown disguised as natives, the ladies riding mountain ponies as Affghan women; but the insurrection had produced so strong an influence among his people, that the chief had great difficulty in preventing their attacking Capt. Ferris and his party. The following are also the details of the circumstances connected with the fate of Capt. Woodburn, alluded to under our Foreign news:—He had proceeded from Ghuznee with about 130 men, going on leave and sick details, and having been severely annoyed on the march, the second from Ghuznee, he got into a fort, but of which he was not allowed to occupy the bastions. At night a party tried to get in, but were refused admittance, and on this the insurgents on the bastions opened a cross fire on the doomed party, which becoming very severe, Capt. Woodburn made a sally in two divisions, one led by himself and the other by a native officer, drove the enemy back from the gate, and strove to fight his way on. However, he was quickly surrounded by 4,000 or 5,000 men, it is said, and fell dead by a shot, the rest of his men being cut to pieces. The other party, under the Native officer, hearing of his fate, retired towards Ghuznee, fighting all the while their ammunition lasted. The Native officer was however shot, and in the end only five or six men reached Ghuznee to tell the melancholy tale. Even after the remnant had gained a pass leading to the city, where some of the native soldiers, in the British service, were stationed for its protection, they were fired upon by these traitors, who killed some twenty of them, telling them that the whole country was up in arms from Cabul downwards, and that not a life would be spared.

New Corn-Law.—The following is a tabular statement of the scale of duties on foreign grain proposed in Sir R. Peel's speech:—

WHEAT.—RATES OF DUTY.

Price.	Proposed New Sliding Scale.	Present Sliding. Scale.
73s.	1s.	1s.
72s.	2s.	2s. 8d.

The duty on colonial wheat is to be 5s. when the price of British wheat in the market is 55s.

The Tirhetta Bazaar of Calcutta.—A correspondent of "The Times" gives an interesting description of this bazaar, considered the largest market in the world, from which the following are extracts:—"It is supplied with almost every necessary article of food that is to be met with throughout India. The ground upon which it stands comprehends an area of upwards of four square acres, and is situate in the centre of Calcutta. A scrupulous classification as to the different branches of trade is observed in this market; the stalls of the butchers who retail beef, veal, mutton, pork, &c., being all separately arranged, a distinction arising out of the difference of "caste." The usual price for a sirloin of prime beef, weighing about 18lb., is two rupees (4s.), and that of a hind quarter of choice fat mutton, one rupee (2s.) The poultry and wild-fowl markets are also separate; in the former may be noticed some thousands of live fowls of all sizes, besides turkeys, capons, ducks, geese, and pigeons. Sixteen good-sized chickens are to be had for one rupee, whilst pigeons are sold at 1d. per pair. The wild-fowl department contains almost every species of live duck and teal, besides snipe, moor-hens, and plovers; a couple of wild ducks may be purchased for four annas (6d.), whilst fresh eggs are procurable at eight for a penny. The fish-market is well supplied every morning from the salt-water lake, and is very cheap, being the only meat indulged in by the Hindoos. The vegetable market is furnished abundantly with potatoes, sweet ditto, artichokes, Jerusalem ditto, turnips, carrots, cauliflowers, asparagus, peas, French beans, lettuces, cucumbers, onions, celery, and a variety of small salading. Fruit is in profusion. Pine-apples are sold at the rate of two for a penny, mangoes 2s. per hundred, and custard apples, rare ditto, guavahs, shuttocks, oranges, lechees (a delicious fruit resembling the Frontignac grape), besides numerous other horticultural delicacies, at equally moderate prices. The butter and milk bazaar is on an extensive scale, the native demand for these commodities being very great. Here are also the rice, grain, spice, and sweetmeat markets, all separated from one another. About a quarter of an hour before sunrise some thousands of natives of all classes may be observed moving from every quarter of the town of Calcutta towards the bazaar, from the turbaned Mogul to the close-shorn bare-headed Cooly; and in this spot are to be met with persons of numerous nations, all of them purchasing the necessaries and luxuries of life—English, French, Dutch, Americans, Portuguese, Danes, Swedes Norwegians, Turks, Persians, Arabs, Chinese, Japanese Siamese, Malays, Jews, Parsees, Armenians, Greeks, &c., all of them attired in their national costumes, whilst the incongruous expressions of the countless varieties of caste among the Hindoos renders the Tirhetta Bazaar, altogether, to the inquisitive beholder, one of the most interesting marts for business in the world. The whole business of the market, which commences before daybreak, is over by nine in the morning.

Law.

VICE-CHANCELLOR'S COURT.—*Campbell* v. *Scott.*—A motion on behalf of Mr. Campbell, the poet, for an injunction to restrain Messrs. Scott and Geary, the booksellers of Charterhouse-square, from selling any more copies of the second volume of a work called "The Book of the Poets, containing the Modern Poets of the 19th Century," on the ground of piracy. His Honour said that the *prima facie* right to an injunction was quite clear, as whole poems had been taken bodily as they stand, with copious extracts from others. This could not be regarded as an abridgement. And he could not think the defendant's work could be considered as a book of criticism when he compared its extent with the space occupied by the general disquisition. That there was *injuria*, therefore, was clearly shown. The only question was, whether there was such a *dammum* as to induce the court to interfere. A party himself was, generally speaking, the best judge of the injury he was likely to sustain: but the safest rule was to follow the literal right, and of course to put the party on proof of the amount of *damnum*. He should, therefore, grant the injunction, with liberty for Mr. Campbell to bring such action as he should be advised, and for either party to apply to the court.

Helps v. *Wood.*—*Corporation of Gloucester* v. *Wood.*—These are cases arising out of the codicil, or paper purporting to be a codicil, to the will of the late Mr. Wood, of Gloucester. The present applications were upon motions that the amount of the legacies which purported to be given by the codicil might be paid into court by the executors, and secured pending litigation. By arrangement it was settled that orders should be taken for the payment into court of two sums, amounting to about 70,000*l.* in one suit, and 140,000*l.* in the other.

Salkeld v. *Johnson.*—This was a suit for the tithes in the parish of Crosby-upon-Eden, in the county of Cumberland, and the principal ground of defence was, that the claim of the vicar was barred by the statute commonly called Lord Tenterden's Act.—The Vice-Chancellor, in delivering judgment, thought that the act, the preamble of which stated that it was expedient to shorten the time of prescription in *modus decimandi* in certain cases, could not be construed to apply to cases where the expiration of no length of time would amount to a defence to the right of the church tithes, and where, consequently, there was no time to be shortened. His Honour stated the law with respect to prescription, as it existed before Lord Tenterden's Act, and the effect which the Legislature must be supposed to have intended that the act should produce, and said that to give the act the construction which had been contended for by the defendant would be to hold that the Legislature intended by a side-wind, without any intimation of such an object, to sweep away a large part of the revenues of the church.

ROLLS COURT.—*Wilkins* v. *Wood.*—The plaintiff was the tenant of a portion of the real estates of the late James Wood, of Gloucester. The defendants had applied to him for payment of the rent. This he stated his willingness to pay, provided they would consent to its being paid into the Bank of England with the privity of the accountant general; but the defendants refused to concede, and brought an action against him to recover the amount, upon which the present bill was filed, and it was now asked that the plaintiff might be at liberty to pay the amount of his rent into court, and that an injunction might be granted to restrain the defendants from any further proceedings against him. Lord Langdale made the order.

COURT OF QUEEN'S BENCH.—*Cooper* v. *Blick.*—An action by a gentleman who had been connected with "Aris's Birmingham Gazette," to recover from the defendant, the proprietor of that paper, one quarter of a year's salary. The declaration alleged that the plaintiff had been engaged on the paper "to act as editor and reporter at a certain salary, to wit, at the salary of 400*l.* a year." Defendant paid 37*l.* 10*s.* into court; and at the trial at the Warwickshire Assizes the question was as to the amount to which the plaintiff was entitled, the defendant contending that it was only 150*l.* a-year. A verdict was at that time taken for the plaintiff, subject to a motion to increase the amount according to the view which the court should take of the effect of the *videlicet* in the declaration. A rule had since been obtained for the purpose of entering the verdict for an increased sum. The court now decided that the rule must be discharged.

The Queen v. *Chapman and another.*—A rule calling upon the defendants as printers and publishers of the "Sunday Times," to show cause why a criminal information should not be filed against them for a libel upon Mr. Grove, the police magistrate of Greenwich. An outline of the circumstances of this case has been given in a previous Number. The court decided that the rule might be discharged by the defendant upon payment of costs; but unless the costs were paid, the rule would be made absolute.

Coyle v. *Bradburn.*—The plaintiff in this case is the widow of a Capt. Coyle, who composed one of the British Auxiliary Legion, and who died in the service of the Queen of Spain. The plaintiff obtained from the St. Sebastian Commissioner a certificate declaring her to be entitled to 141*l.* 1*s.* from the Spanish Government. The defendant is a person who undertook to act as an agent in the settlement of the claims in question, and in that capacity had received the certificate, advancing on it 35*l.* odd, and subsequently selling it for the same sum. The present action was brought to recover the instrument, or its present value. The jury were of opinion that the defendant had not authority to sell the document, and found a verdict for the plaintiff for 87*l.* odd, being the present value of the certificate, minus the sum which had been actually paid by the defendant to the plaintiff.

Somers v. *Wheeler.*—An action of trespass and false imprisonment. The plaintiff was a person who frequently attended auctions, and got his living as a general dealer. The defendant was an auctioneer, and the circumstances out of which the action arose were these:—The defendant was engaged in selling some goods, furniture, and books, when the plaintiff came into the room, and made some biddings. The defendant, who had had some difference with him on a previous occasion, refused to take his biddings: on which the plaintiff said that if his biddings were not taken, he would not suffer the sale to go on. Some words ensued between the parties, and finally the defendant sent for a police-constable, and the plaintiff was, at the defendant's desire, taken into custody. It appeared that the plaintiff had offered to pay for the lots for which he made biddings, and that, in most instances, the purchasers of books did pay for the books knocked down to them.—Verdict for the plaintiff: damages 1*s.*

Lennett v. *Chaffer and Another.*—This was an issue to try the validity of an execution, issued by the plaintiff (a creditor of Mr. Hamlet, the jeweller, of Sydney's-court, Leicester-square) against the goods of his debtor, as opposed to the validity of a fiat of bankruptcy issued against Hamlet. A verdict was taken for the plaintiff, subject to revision by the court above.

BAIL COURT.—*Veitch* v. *Russell.*—An action brought by a physician to recover the sum of 157*l.*, being the amount of his fees for attending the brother of the defendant. For the defence it was urged that a nonsuit must be entered against the plaintiff, on the ground that a physician could not recover his fees; that no right of action existed; that there was no original contract; and that there was nothing on which a contract could be founded.—The jury returned a verdict for the defendant.

Pratt v. *Horlock.*—An action brought to recover the sum of 60 guineas, the value of two fancy dresses, which were furnished to the defendant by Messrs. Pratt, of Bond-street, for the Eglintoun tournament in 1839; and also to recover 19 guineas for the hire of an encampment. The dresses were delivered at Eglintoun. It did not appear that any price for the dresses had been agreed upon, but that prices of different dresses had been posted up in the plaintiff's shop. On behalf of the defendant it was urged that the charges were exorbitant, and that the dresses had not been delivered to the defendant, as he was not at Eglintoun. No evidence was given of the hiring of the camp. The jury found for the plaintiff, for 63*l.* 15*s.* 6*d.*

COURT OF COMMON PLEAS.—*Spencer* v. *Handley.*—An action brought by the plaintiff, as the representative of a Mr. Robinson, to recover 300*l.*, the amount of a bond given by a Dr. Earl, of whom the defendant was the executor. The jury found a verdict for the plaintiff, for the amount of the bond, with interest.

Doyle v. *O'Dogherty.*—An action for libel brought by Sir John Milley Doyle, K.C.B., against the defendant, formerly a captain in the British army, and more recently a major in the service of the Queen of Portugal during the civil war in that country. It appears that the defendant had written a letter to the plaintiff reflecting on his character, in consequence of which the plaintiff applied for, and obtained from the Court of Queen's Bench, a rule *nisi* for a criminal information against Major O'Doherty, upon the ground that the letter was intended to provoke him to commit a breach of the peace. In the affidavits filed in support of this rule, the plaintiff deposed, that he had been informed, and believed, that the defendant had been dismissed the British service, by a court martial, under circumstances which would, in the opinion of officers and gentlemen, disentitle Major O'Doherty to attention in regard to any appeal of honour. In showing cause against the rule for a criminal information, an affidavit of the defendant was relied upon, in which he replied to this attack by stating that in his judgment it ill became Sir J. Doyle to make any allusion whatever to the said court-martial, because Sir J. Doyle was himself ignominiously dismissed the service of his Imperial Majesty Don Pedro, upon the complaint of his fellow-officers, who refused to sit down at the same table with him, in consequence of his having submitted to severe personal chastisement at the hands of Gen. Bacon on several occasions without resenting it. This constituted the libel for which the present action was brought. After hearing the counsel on both sides, the judge directed the jury to find their verdict for the defendant, upon the plea of not guilty, and for the plaintiff upon the plea of justification, the defendant's counsel offering no evidence upon that issue.

Kilpatrick v. *The Great Western Railway Company.*—An action brought by the plaintiff to recover compensation in damages from the defendants for false imprisonment, and the value of certain clothes, which he alleged they had caused to be taken from him. The defendants pleaded—first, not guilty; and, secondly, that the plaintiff had been guilty of felony, and that the imprisonment arose in consequence of an arrest on that charge. The jury found a verdict for the defendants on the two first issues, and for the plaintiff on the third, holding that he had not been guilty of felony.

COURT OF EXCHEQUER.—*The Attorney-General* v. *Shepherd.*—An information against the defendant, who is a maltster, carrying on business in the county of Suffolk, for making malt without giving due notice of such intention to the excise officers of the district, in contravention of the excise laws. It appeared that the defendant had intimated his intention of beginning business to an officer, but added that he was disappointed in the farmers not sending him barley. Upon searching the defendant's premises, however, sixteen bushels of malt, which had been recently made, were found, the defendant himself being at this time at Ipswich, attending the assizes. The jury returned a verdict for the Crown, to secure payment of penalty of 200*l.*

Marshall v. *Bickerton.*—An action of trespass. The circumstances of the case were uninteresting, the whole affair appearing to have arisen out of a misunderstanding. The jury found a verdict for the defendant.

Bristow v. *Needham.*—An action of assumpsit to recover the sum of 25,000*l.* lent by the plaintiff to the defendant, at the request of the latter. The jury returned a verdict for the plaintiff for 22,350*l.* less 750*l.*, which latter amount the plaintiff had pleaded as a set-off in another action brought against him by the defendant.

The Commissioners of the Land-tax for the City of London v. *the Commissioners of the Land tax for the Parish of St. Saviour, Southwark.*—This was a feigned issue directed by this court between the above-named bodies, in order to ascertain whether certain premises, situated at the south foot of London-bridge, and well known as Fenning's wharf, were or were not in the city of London. The jury, by the direction of the judge, found a verdict for the plaintiffs, it being left to the defendants to apply to the court above hereafter.

Luckie v. *Huntingtower.*—An action for a bill of exchange for 1000*l.*, to which the defendant had pleaded several matters, such as fraud, want of consideration, and infancy, the issues raised by which were cast upon him. There being no defence offered to the plaintiff's case, a verdict passed as a matter of course for 1000*l.* upon proof of the defendant's handwriting to the bill in question.

Perry and another v. *Mitchell.*—An action brought by the patentees of the steel-pens, in Red Lion-square, against the defendant, who is a steel-pen manufacturer residing at Birmingham, to recover damages for the infringement of two separate patents. Verdict for defendant.

MARK LANE, FRIDAY, FEB. 11th.—At the Market this morning the factors held free Wheat at higher prices, but the buyers were not disposed to pay an advance, yet there were purchasers at Monday's quotations.—There did not appear to be any transactions in bonded.—Barley, Peas, and Beans remain unaltered in value, and Oats are a slow sale at Monday's currency.

25 to 1 agst	Belle Dame (taken)	

The whole of the Duke of Cleveland's thorough-bred horses will be sold at Raby Castle, on Saturday, the 26th inst.

GAZETTE OF THE WEEK.

INSOLVENT.—Henry Morland Jeens, Uley, Gloucestershire, clothier.

BANKRUPTCIES SUPERSEDED.—Samuel Shingler, Liverpool, linen-draper—George Winder, Hackney-road, jeweller.

BANKRUPTS.—Richard Littledyke, Brudenell place, New North-road, linendraper—Luke Whitby, Green Dragon-yard, Whitechapel, builder—Morris Schlesinger and Michael S. Schlesinger, Basinghall street, City, merchants—John Woodcock, Stratford, Essex, builder—William Vale, Oxford-street, Middlesex, laceman—George Thompson and James Forbes, Crutched friars, corn factors—Joseph Miller and George Craddock, Stockton on Tees, Durham, patent sailcloth and rope manufacturers—John Bowers, Chipstead, Kent, grocer—Charles A. Cantor, Montague-street, Montague-square, Middlesex, merchant—Georgiana Gifford, Parson's-green, Fulham, schoolmistress—Edward Halliley, Leeds, Yorkshire, cloth-manufacturer—John Higgins and James Maunock, Dukinfield, Cheshire, engineers—John Gibbs, Great Yarmouth, Norfolk, tavern keeper—William Bowes, Wimslow, Cheshire, cotton spinner—John R. Willoughby, York, builder—William Robins, Stone, Staffordshire, ironmonger—Richard Waters, Newport, Monmouthshire, iron manufacturer—John Protheroe, jun., Bristol, iron merchant—Joseph Greenwell and Stephen Greenwell, Shadford Mill, Durham, millers—Richard Blackmore and John Craven, Wakefield, Yorkshire, corn millers—Thomas Appleyard, Northowram, Halifax, Yorkshire, stone merchant—Charles Caswall, Woburn-place, Russell-square, lodging-house keeper—John M. Gipps, Howland street, Tottenham-court-road, wine merchant—John Fielding and Thomas Fielding, Blackburn, joiners—Singer E. Hide, Broadwater, Sussex, builder—G. Hallett, Ryde, Isle of Wight, draper—James Kirkpatrick, Newport, Isle of Wight, banker—Edmund Warne, Lisle-street, St. Anne, Westminster, carpenter—Henry A. Babel, Lindfield, Sussex, maltster—Henry Brayne, Nine-elms, Battersea, coal merchant—Thomas Beal, Sandwich, Kent, corn factor—Edmund Manning and Cornelius C. Manning, Aldgate, drapers.

SCOTCH SEQUESTRATIONS.—Messrs. Lloyd and Douglas, Leith, merchants—James M'Millan, Greenock, shipbuilder—James Murdoch, Carbieston Byers, Coylton, grain merchant—R. Lizars, Linlithgow, glue-manufacturer—Daniel Campbell, Glasgow, spirit dealer—William Thomson, Edinburgh, baker—Dugald Sinclair, Glasgow, hotel-keeper—William Wylie, North Leckaway, Forfarshire—John Young, Edinburgh, bootmaker.

BIRTHS.—On the 1st inst., at Woolwich, the lady of W. Denne, Esq., surgeon, of a son—On the 4th inst., at Oak-lawn, Weybridge, the lady of H. Kendall, Esq., of a son—On the 4th inst., at 40, Aldersgate-street, Mrs. E. Herring of a daughter—On the 5th inst., at Lower Tulse-hill, Mrs. R. Milburn, of a son.

MARRIED.—On the 5th inst., at St. Ann's, Limehouse, G. E. Bird, Esq., of Clifton, to Eliza Loyd, second daughter of J. Fitzgerald, Esq., Stepney—On the 8th inst., at Halifax, Yorkshire, S. L. Curlewis, Esq., of Tilba-Tilba, New South Wales, to Maria Anne, daughter of the late Mr. J. Collins, and niece to S. Hall, Esq., of Halifax—On Tuesday his Highness Prince N. Esterhazy to Lady Sarah Villiers, daughter of the Earl and Countess of Jersey.

DIED.—In October last, at Aloubka, in the Crimea, Dr. J. Prout, of Odessa—At Bombay, on the 1st ult., Capt. A. Young, aged 33—On the 7th inst., at Bungay, the Rev. T. Bewicke, aged 78—On the 8th inst., at his residence, Acre-lane, Brixton, E. M. Noble, Esq., aged 68—On the 8th inst., at Eltham, after a few hours' illness, Sarah, wife of R. Mills, Esq., of the Six Clerks' Office—On the 9th inst., Mr. R. Stone, of Panton-street, Haymarket, aged 49.

INDEX OF THE PRINCIPAL HORTICULTURAL SUBJECTS IN No. 6.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the OFFICE, 3, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, February 12, 1842.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.
THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.
No. 8.—1842. SATURDAY, FEBRUARY 19. PRICE 6*d*.

HORTICULTURAL SOCIETY OF LONDON.

EXHIBITIONS AT THE GARDEN for the year 1842.—The Exhibitions will take place in the months of May, June, and July, upon Saturdays, under the following regulations.

EXHIBITORS.

All persons, whether Fellows of the Society or not, will be at liberty to send subjects for exhibition.

DELIVERY OF OBJECTS FOR EXHIBITION.

Exhibitors are earnestly requested to notify in writing, previously to the day of meeting, what plants they intend to supply, in order that due provision may be made for the proper distribution of the specimens, &c. on the exhibition tables. The best places will be secured for those who comply with this request.

As it is necessary that the judges should proceed to consider the respective merits of the exhibitions by 10 a. m., and as it is absolutely indispensable that the tables should be arranged by that time, it has been determined that no subject for exhibition shall be admitted into the Garden after half-past 8 o'clock in the morning; and if the owners of any locked-up boxes, or other cases, should not be in the Exhibition-tent at the said hour, such cases or boxes must be excluded from competition for medals.

All specimens, whether of fruit or flowers, will remain untouched until after 6 o'clock, when they will be delivered into the hands of the Exhibitors, who are most particularly requested not to give away their cut flowers in the tents, as much confusion has been found to arise from that practice.

ADMISSION OF EXHIBITORS.

Exhibitors, or other persons required to assist in bringing in the objects for exhibition, will be admitted before half-past 8 in the morning at the Carter's-yard entrance gate.

Every principal exhibitor of subjects for which medals are specifically offered will be furnished with one pass-ticket, which is not transferable, for which he is requested to apply before 10 o'clock, at which hour the Garden will be cleared of all persons not officially detained there.

Exhibitors may re-enter the Garden after 1 o'clock, when they will be required to give up their pass-tickets at the Carter's-yard gate.

FLOWER-STANDS.

No box or stand shall exceed eight inches in height at the back, or eighteen inches in depth from front to back. The lids of all boxes must either be loose or made to unhinge. No box with a fixed lid will, on any pretence, be allowed to stand upon the tables. If a box not constructed of the dimensions above given is sent in, it may be placed on the tables, if there is room for it, but it is liable to exclusion.

MEDALS AND REWARDS.

The Society distributes the following Medals and Rewards; namely,

		£	s.	d.
C.	The Certificate . . . . value	0	10	0
SB.	Silver Banksian Medal	1	0	0
SK.	Silver Knightian ditto	1	5	0
LS.	Large Silver ditto	1	15	0
SG.	Large Silver Gilt ditto	4	0	0
GB.	Gold Banksian ditto	7	0	0
GK.	Gold Knightian ditto	10	0	0
LG.	Large Gold ditto	20	0	0

Exhibitors to whom any of these shall be awarded can exchange them one for another, or may receive their value in money, or in plate. If within one month after the Third Exhibition of the year no intimation shall have been received from an exhibitor of the manner in which he desires his medals to be disposed of, all the medals due to him will be prepared and transmitted to him through the usual public conveyances, without further notice.

In case an exhibitor shall receive a first prize in any one letter, he shall not be entitled to receive any other medal in the same letter.

SUBJECTS OF EXHIBITION.

These will be divided into Classes, as explained further on.

No articles not of horticultural produce will be allowed to be placed upon the tables.

Exhibitors will do well to make themselves acquainted with the arrangements described in the following list, as they will in all cases be required to sign a declaration stating under what letter their plants are to be shown; and they are particularly requested to take notice, that if errors in the awards of the judges should occur, in consequence of mistakes on the part of exhibitors in filling up such declarations, the Society cannot undertake to rectify such errors afterwards.

To enable the officers of the Society to attach names to the objects exhibited, it is requested that correct lists may be delivered to the clerk as soon as the exhibitor reaches the Garden.

CLASS I.—Flowers for which Nurserymen and Private Growers exhibit independently of each other.

A. Greenhouse Azaleas, to be shown in numbers not exceeding 12, GB, LS, SK.
B. Carnations, in pans of 24 blooms, LS, SK, SB.
C. Picotees, in pans of 24 blooms, LS, SK, SB.
D. Pinks, in pans of 24 blooms, SK, SB.
E. Cape Heaths, in collections of 20 species, GK, SG, LS, SK.
F. Cape Heaths, in collections of six species, GB, LS, SK.—N.B. No person who shows in E will be allowed to exhibit also in F.
G. Exotic Orchidaceæ, in collections of not fewer than six species, GB, LS, SK.
H. Exotic Orchidaceæ, in single specimens, LS, SK, SB.
I. Pelargoniums, in collections of 12 varieties, in pots, not exceeding 12 to a cast, GB, LS, SK, SB.
K. Pelargoniums, in collections of six varieties, in pots, not exceeding eight to a cast, SG, LS, SB.
L. Rhododendrons, in pots, not fewer than 12 plants, in 12 varieties, LS, SK, SB.
M. Moss Roses, SK, SB.
N. Common Garden Roses, exclusive of all Chinese or Chinese Hybrids, LS, SB, SK.
O. Chinese or Hybrid Roses, such as Bourbon, Noisette, Tea-scented, and similar varieties, LS, SB, SK.—N.B. No exhibitor of Roses can be allowed to occupy more than 15 ft. run of tables for all his Roses, which, being double, is equal to 30 ft. of boxes. If any Exhibitor gains the first medals in M, N, and in O, he will be entitled to a Gold Banksian medal instead of the three Silver ones.
P. Stove or Greenhouse Plants, in collections of from 50 to 60 plants, GK, GB, SG, LS.
Q. Stove or Greenhouse Plants, in collections of from 15 to 20 plants. GB, LS, SK.
R. Stove or Greenhouse Plants, in collections of six distinct species, LS, SK.—N.B. Persons exhibiting in P and Q will not be allowed to compete in R also.
S. Herbaceous Calceolarias, in sixes, LS, SK, SB.
T. Shrubby Calceolarias, in sixes, LS, SK, SB.

CLASS II.—Flowers, for which all persons are admitted to equal competition:—

U. Collections of Stove or Greenhouse Climbers, GK, CB, LS, SK.—N.B. The Gold Knightian medal is not to be awarded for fewer than 12 distinct kinds.
V. Tall Cacti in flower, LS, SK.
W. Single specimens of Ornamental Plants LS, SK, SB, C.
X. Miscellaneous Flowers, SK, SB, C.—N.B. Cockscombs, Hydrangeas, and cut flowers are altogether excluded from prizes.
Y. Seedling Florists' Flowers, SK, SB, C.—N.B. Every seedling must be shown singly, and must be marked with the name it is to bear. The same seedling cannot gain a prize more than once in the season. Pelargoniums are to be shown in single trusses, with a single leaf, so far below the flowers as not to support them; and they are not to be dressed with cotton or wool, or any similar substance, but must be shown exactly as they grow on the bush.

CLASS III.—Fruit, for which market-gardeners, or persons in the habit of regularly supplying the market, and private growers, exhibit independently of each other.—N.B. All Fruit must be ripe and well-coloured; if the contrary, it will be disqualified.

Z. Miscellaneous collections of Fruit, consisting of at least three different kinds, Peaches and Nectarines being considered as only one kind, GK, GB, LS.—N.B. Cucumbers Tomatoes, Gourds, and similar kitchen-garden produce, are excluded from this letter.
AA. Grapes, SG, LS, SK, SB.
BB. Pine-apples, SG, LS, SK, SB.
CC. Peaches or Nectarines, in dishes of six specimens, SK, SB.
DD. Miscellaneous Fruit, SK, SB, C.

JUDGES.

The Judges have the power of increasing or diminishing the number and value of the Silver Medals offered by the Society for particular objects, and also of conferring Silver Medals or Certificates in cases not contemplated in these regulations, if they think it necessary to do so.

The Judges are also required to bear in mind that the Society's Medals are offered, less for new and curious objects, than for fine specimens of Horticultural skill, the design of the Council in instituting these meetings being not so much to encourage the Collector, as to reward the skilful Gardener: they are also not to make any award in cases where the objects exhibited do not appear worthy of a Medal; otherwise a bad single exhibition may obtain a prize, merely because there is no better exhibition of the same class to oppose it.

AN HORTICULTURAL EXHIBITION will be held on a Grand Scale in the Grounds of the Yorkshire Philosophical Society, YORK, on Thursday, August 4th, 1842.

MYATT'S VICTORIA RHUBARB.

J. AND W. MYATT having a good Stock of Strong Roots raised by offsets from the original Seedling, can supply them at 10*l*. per hundred.—N. B. As various spurious sorts have been sold and are now selling under the name of "Myatt's Victoria," purchasers would do well to require them warranted. —Manor Farm, Deptford, Oct. 23, 1841.

ARAUCARIA IMBRICATA—Fine strong Plants one year from seed.—The most noble, hardy, and splendid ORNAMENTAL EVERGREEN TREES ever introduced into the British empire are now selling at Messrs. W. and F. YOUELL'S NURSERY, GREAT YARMOUTH, at 3*l*. 3*s*. per dozen, or 25*l*. per 100. Specimens may be seen, and orders taken at their Agents', Messrs. Flanagan and Co., No. 9, Mansion-house-street; and at Messrs. Gibbs and Co's., Seedsmen, Piccadilly, London.

JAMES MAY begs to inform all growers of PANSIES, that his new Descriptive List of Pansies, with a List of FUCHSIAS, may be had on application as below; at the same time he begs to call particular attention to his genuine imported German STOCKS, ASTERS, and ZINNIAS, in great variety.

N.B.—A large collection of fine Show Pansies, including many of last year's new varieties. 30 fine strong Plants for 21*s*., package included; all parcels delivered free in London.

Pansy Nursery, Edmonton.

STANDARD ROSES.—A consignment of 1000 of the choicest varieties ever offered to public competition has been intrusted to PROTHEROE and MORRIS, for Sale at the Auction-Mart the first week in March. This selection consists of Hybrids, Bourbons, Perpetuals, Tea-scented, Provence, and others, both Standards and Dwarfs, of varieties too numerous to mention, and of rare and diversified beauty. The day of sale will be duly announced.

NURSERY STOCK at JOHN CATTELL'S, WESTERHAM, KENT:—

10,000 Common Laurels, 2 to 4 feet.
10,000 Spruce Fir, do.
100,000 Seedling Spanish Chesnut.
10,000 Gooseberries and Currants.

The Gooseberries consist of 40 named varieties, including the largest and most esteemed.

Also an extensive Stock of Lilacs, Laburnums, Gueldres Roses, Hollies, Sweet Briar, a [illegible] Green and Variegated Box.

J. C. respectfully informs the Public, that nearly the whole of the above stock is about to be taken up for transplanting, and will be offered in large or small quantities, at very moderate and cheap prices.

WOODLANDS NURSERY, MARESFIELD, NEAR UCKFIELD, SUSSEX.

WILLIAM WOOD and SON have the pleasure of offering to their numerous Friends and the Public, the undermentioned Roses, all warranted most splendid Varieties, at the following reduced prices:—

	Per doz.		Per 100.
Fine Standard Roses	30*s*.	or	10*l*. 0*s*.
Half-standard, ditto	12*s*.	,,	5*l*. 0*s*.
Fine Half-standard ditto . . .	18*s*.	,,	6*l*. 0*s*.
Extra Fine, Half-standard ditto . .	24*s*.	,,	7*l*. 10*s*.
Fine Dwarf Roses	12*s*.	,,	3*l*. 15*s*.
Extra Fine Dwarf ditto	18*s*.	,,	5*l*. 0*s*.
Climbing ditto, very strong .	9*s*. to 12*s*.	,,	2*l*. 10*s*.

W. W. and Son also beg to recommend the present season, as well adapted for transplanting Roses. Plants will be presented GRATIS with each order. Amateurs are still invited to apply for Rose Catalogues, and Lists of general Nursery Stock.—Woodlands, Feb. 9th,

---

J. KERNAN begs to inform his Friends that he has now completed his selection of FLOWER-SEEDS, among which will be found every novelty worthy of cultivation recently introduced, as well as the seeds from first-rate collections of Calceolarias, Mimulus, Ipomœas, Gloxinia rubra, Stocks, Asters, Balsams, Zinnias, Thunbergias, &c. &c.; as also all the better and more esteemed Vegetable Seeds: Grainge's Early White Broccoli, Mercer's Cauliflower, Brussels Sprouts (foreign seed), Seymour's superb Giant Celery; Kerrison's Hothouse, Syon House, Roman Emperor, Horticultural, and Windsor prize Cucumbers; as well as Seeds of the very choicest Melons, all the better early and succession Peas, principally saved by the most select growers, who supply this unequalled market.—4, Great Russell-street, Covent Garden.

All the better kinds of Agricultural Grasses, separate or mixed. Selected Field Turnips, Winter and Spring Tares, Ash-leaved and Early Frame Potatoes, New Globe Mangold Wurzel, &c. &c., Mats, and Mushroom Spawn; Pruning and Budding Knives.

WANTED, about forty miles from London, as DAIRY-MAID, a steady Single Woman, who understands her business, and will not object to take part of the Housework, and assist in the Laundry, and can work well at her needle. Address A.Z., Post-office, Maidstone.

WANTED, a GARDENER and COOK, in a small family in the country; the Gardener to undertake a small kitchen-garden, with Cucumber and Melon Pits, and a small Conservatory, and to live in a cottage with garden near his work; a married man preferred. The Cook to be of middle age, sufficiently qualified, and both to have such a character as to warrant confidence being placed in them.—Letters addressed to F. X. X. P., prepaid, to Mr. Roberts, news-agent, Pimlico—the "Shrewsbury Chronicle" Office, Shrewsbury—or to No. 135, Whitechapel, Liverpool, stating particulars, will have due attention.

WANTED by a young Man, who has been for some time in one of the first Establishments in Belgium, a Situation as PROPAGATOR. He perfectly understands the Propagation of Camellias, Rhododendrons, Azaleas, &c., and can, if required, undertake the management of Pines, and general forcing. A situation near London would be preferred. Address by letter, post paid, to A.Z., Gardeners' Chronicle Office, 3, Charles-street, Covent Garden.

TO THE NOBILITY AND GENTRY.

JAMES MACDONALD, upwards of seven years Gardener to Sir Rowland Hill, Bart., M.P., Hawkstone Park, Salop, and at present conducting the Horticultural department at Dr. Kay's Normal School, Battersea, will in a short time be disengaged, and is therefore ready to treat with any lady or gentleman who may require the services of a thorough practical man in that capacity. References as above, and all letters addressed to James Macdonald, 3, Church-street, Battersea, Surrey, or Messrs. Dickson, Chester, will be immediately attended to.

TO PARENTS and GUARDIANS.—A LADY, who intends remaining some months at BRIGHTON for the benefit of her children, would be happy to TAKE CHARGE OF A LITTLE GIRL OR BOY REQUIRING SEA AIR, and whose friends may not find it convenient to remain with them.

References can be given either in Brighton or London.

For further particulars, apply by letter (prepaid) to Y. Z., care of Mr. Gates, organ-builder, 19, Norfolk-square, Brighton.

H. HAMMOND begs to return thanks to his numerous friends and the Public for their liberal orders for his new White Cape Broccoli, as advertised in the *Chronicle* of Oct. 16; and to inform those that are not supplied with that valuable article that he has a few packets left which can be had of Messrs. Flanagan, Seedsmen, Mansion-House Street, London, who know the stock.—Mundford Nursery, Feb. 10.

FINE SEEDLING PANSIES.

J. HENCHMAN begs to inform cultivators of the PANSY, that he has now ready for delivery healthy young Plants of Twelve Superior Seedlings, including the "Prince of Wales," at 42*s*. the collection. These varieties will be found of superior merit in point of shape, size, and colour.

J. H. can also supply the choicest of last year's varieties, by all growers, at from 18*s*. to 30*s*. per dozen. 25 good named show-flowers, including many of last year's varieties, for 1*l*.

A few packets of seed at 2*s*. 6*d*. and 5*s*. each.

A plant or two sent gratis for carriage.

N.B. A remittance requested from unknown correspondents.

Edmonton, near London, Feb. 19, 1842.

THE MOSCOW QUEEN PINE.

J. WILMOT, Isleworth, has a Stock of this very superior Variety to dispose of at 10*s*. 6*d*. each, strong Succession Plants; smaller do., 7*s*. 6*d*. And as the season is coming on, they can be forwarded without pots any distance (package included), by a Post-office order being remitted to his Forcing Establishment, Isleworth.

ONE HUNDRED AND FIFTY SHEPPARD'S "LAURA" PANSY, strong plant, price 5*s*.; Sheppard's "Princess" Pansy, 7*s*. 6*d*. Also, a fine large Scarlet Seedling Ribes—Sheppard's Ribes Grandiflora, price 3*s*. 6*d*. May be had immediately of James Sheppard, Nursery, Seedsman, and Florist, Winchester; or of Messrs. Warner and Co., 28, Cornhill, London.

PINE PLANTS.

W. DAVIS, Gardener, Green-street, Marlborough-road, Chelsea, has several hundred Fruiting and Succession Pine Plants to dispose of, principally Ripley Queens. Warranted perfectly clean and healthy.

UNION-ROAD NURSERIES, PLYMOUTH.

W. E. RENDLE begs to inform the Trade that he has a large Stock of FINE BEDDED LAUREL, from 9 inches to 2 feet high, at such prices as would be highly advantageous to the purchaser.

Fine Maiden Peaches and Nectarines, Seedling Larch, Scotch Spruce, Oaks, &c. at the lowest trade prices.—Feb. 16, 1842.

IMPORTANT to PLANTERS, AGRICULTURISTS, &c.—PURDIE and MERRILEES (Successors to Thomas Cleghorn and Co.), WHOLESALE NURSERYMEN, SEEDSMEN, and FLORISTS, STANWELL LODGE, BONNINGTON, LEITH, beg to inform the Public that they have on hand a large stock of fine two-years' transplanted LARCH, 1½ to 2 feet high, at unusually low prices, samples of which may be had on application. P. and M. also recommend their attention to their choice collection of HYBRID RHODODENDRONS, CAMELLIAS, HEATHS, &c., many of which are at present coming into bloom.

TURNIP SEEDS.—P. and M. have also on hand a fine stock of Skirving's and Laing's new Purple-top Swedish Turnip Seed, with all other approved varieties, of their own saving, warranted genuine; priced Catalogues of which may be had on application.

HOT-WATER APPARATUS, upon the most improved and economical principles, for Horticultural and other Buildings.—STEPHENSON and CO., Agents for the Old Park Iron-works, and Manufacturers, 61, Gracechurch street, London, annex the following list of prices of Hot-water Pipes of the best description, to assist persons desirous of adopting this mode of heating in their calculations of the probable expense, and respectfully solicit an opportunity of tendering their price for the completion of any work required. Socket-pipe for Hot Water, of two, three, and four inches diameter, at 2*s*. 3*d*., 3*s*. 2*d*., and 4*s*. 3*d*. per yard. Ditto, with Troughs for Orchidaceous-houses, three and four inches diameter, at 4*s*. 9*d*. and 6*s*. 9*d*. per yard.

The much-approved Conical Boilers made of strong plate-copper, and which require no furnace or setting in brickwork, from 5*l*. 5*s*. upwards. Also, every other description of Boilers of the most approved construction. Further particulars may be obtained at the Warehouses, Gracechurch-street, where also may be seen a variety of patterns of Iron and Strained-wire Fencing, Hurdles, Brass and Iron Bedsteads, &c. &c.

WARNER & WARNER, SEEDSMEN, 28, CORNHILL, LONDON, beg respectfully to call the attention of their Friends and the Public to their List of New and Choice Flower Seeds inserted in "HARRISON'S FLORICULTURAL CABINET" for the present Month, and for March, embracing all that is new and rare, and worthy of cultivation, among which will be found:—

BRACHYCOME IBERIDIFOLIA, at 2s. 6d. per packet.
GERANIUM, from fine varieties, 1s. to 2s. 6d. ditto.
HEARTSEASE, from the best kinds, 1s. to 2s. 6d. ditto.

And the following at 1s. per packet:

Alstrœmerias, of sorts
Anagallis, ditto
Asters, imported German, mixed colours
Auricula
Calceolaria, shrubby and herbaceous
Carnation, from stage flowers
Cinerarias
Clintonia pulchella
Centaurea americana
Dahlia, from choice varieties
[illegible], new varieties
Ipomœa rubro cærulea
Ipomœa Quamoclit
Ipomopsis
Lobelias
Lupinus Hartwegii
Mimulus
Pentstemons
Petunia
Phlox Drummondii
Picotee, imported
Pink, from a choice collection
Primulas
Ranunculus, saved from superb varieties
Schizanthus
Stocks, imported German, mixed colours
Verbenas
Zinnia elegans—&c. &c.

Also a few choice Vegetable Seeds, including the following kinds of Frame Cucumber, at 1s. per packet:—BARNES' Man of Kent, Farmer Allen's Victory of Suffolk, Walker's Improved Manchester, Weedon's Superb, Windsor Prize, Prize Fighter, and Perkins' Victoria. Greave's Prince Albert Melon, 1s. per packet. Lake's New Superb White Roman Broccoli, and Metcalf's New Pink Cape ditto, at 1s. per packet. Imported Brussels Sprouts, &c. &c.

Martin's superior Frame Potatoes, 3s. per peck. New Bokhara Clover, 1s. per packet. Myatt's British Queen Strawberries, 5l. per hundred; Myatt's Eliza ditto, 1l. per hundred; Myatt's Victoria Rhubarbs, 2s. each. Seymour's Superb White Solid Celery, 2s. 6d. per packet.

General Catalogues can be had on application.

Cornhill, Feb. 4, 1842.

SLATE CISTERNS, SHELVES, TROUGHS, &c., for Horticultural purposes.—EDWARD BECK, Manufacturer, Isleworth, near Brentford. Orders, Working Drawings, &c., forwarded by post, will receive due attention.

*** Slate Edgings for Flower Borders, &c.

HEATING BY HOT WATER, WITH THE CIRCULATION OF ATMOSPHERIC AIR.

J. WEEKS & CO., Architects, &c., Gloucester-place, King's-road, Chelsea, Hothouse Builders, and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER; see the 3rd and 37th Numbers of the *Gardeners' Chronicle*.

References may be had, and their works seen, at Mr. Perry's Nursery, Banbury; Mr. Green's, Lower Cheam; Messrs. Henderson's, Pine-apple Nursery; Messrs. Rollisson's Nursery, Tooting; Mr. Knight's Exotic Nursery, Chelsea; Messrs. Low's, Clapton Nursery; Mr. Catleugh's Nursery, Chelsea; Mr. Gaines's Nursery, Battersea; Mr. Buck's, Portland Nursery; Mr. Young's, Milford Nursery; Mr. Smith's Nursery, Dalston; Mr. Woodroff's Nursery, Kensall Green; Mr. Hopgood's Nursery, Bayswater; Mr. Willmer's Nursery, Chelsea; and at most of the Nobility and Gentlemen's Seats in the country.

Every particular to be had at their Horticultural Manufactory, Gloucester place, Chelsea, near Sloane-square.

ECONOMIC LIFE ASSURANCE SOCIETY, No. 34, BRIDGE STREET, BLACKFRIARS, LONDON. Established 1823. Empowered by Act of Parliament, 3 William IV.

LOWER RATES OF PREMIUM THAN THOSE OF ANY OTHER OFFICE, that entitle the assured *to participate in the profits*, as follows:—

Age.	15	20	25	30	35	40	45	50
Annual Premium per cent.	1 10 8	1 14 7	1 19 6	2 4 3	2 10 11	2 19 9	3 11 9	4 8 0

The BONUS declared in 1834 amounted upon an average to 16l. per cent. on the premiums then paid; and in 1839 a second BONUS was awarded, amounting on the average to 31l. per cent. on the premiums paid during the preceding five years.

No extra charge for residence in any part of Europe, nor for proceeding (in a decked, sailing, or steam-vessel) from any one Port thereof to another during peace, to Assurers not being seafaring men by profession. Licenses are granted to go to any part of the world upon terms proportionate to the risks.

Policies on the lives of persons dying by suicide, duelling, or by the hands of justice are not void as respects the interests of parties to whom they may have been legally assigned.

Assurances may be effected on any and every day.

By order of the Board of Directors,
CAMPBELL JAMES DOWNER, Secretary.

ANNUITIES.—In the AUSTRALASIAN, COLONIAL and GENERAL LIFE ASSURANCE and ANNUITY COMPANY, Annuitants participate in the Profits of the Company, and receive a rate of ANNUITY much more favourable than can be granted by any Company making its investments wholly in England. The Company is enabled securely to grant these favourable terms from the advantage it possesses of investing a portion of its Funds at a high rate of Interest.

DIRECTORS.

Edward Barnard, Esq., F.R.S.
Henry Buckle, Esq.
John Henry Capper, Esq.
Gideon Colquhoun, jun., Esq.
John Edwardes Lyall, Esq.
C. E. Mangles, Esq.
J. B. Montefiore, Esq.
J. H. Ravenshaw, Esq.
Capt. Sir Jas. Stirling, R.N.
William Walker, Esq.

SOLICITORS.—Messrs. Swain, Stevens, and Co.

Prospectuses, with Tables, Forms of Proposal for the purchase of an Annuity or for making an Assurance, and every information, may be obtained by application at the Office of the Company, No. 126, Bishopsgate-street, City.

By order of the Board, CHRISTOPHER COUSINS, Accountant.

PATENT ASPHALTE PROTECTING MATERIAL.—Extract from *Gardeners' Chronicle*, Dec. 25, 1841, p. 843.—"In the midst of frost it will not be unseasonable to warn all our Readers of the great importance of preventing their more tender Plants that may have been frozen from being thawed suddenly by the sun. All Gardeners know how often Peas frozen below a south wall are killed, and that if any contrivance to prevent their being suddenly thawed is made use of, they recover. What is true of Peas is, to a great extent, true of other things. A few weeks ago we had a severe frost, 16°; at that time young Araucarias exposed to the south died, while others within a few yards, but screened from the sun by stone, did not suffer at all. We may remark by the way that CROGGON'S ASPHALTE ROOFING forms a most excellent material for such screens." In page 8 of same Journal, Jan. 1, 1842, is fully described the purposes to which it is applied by the Royal Horticultural Society. Being a non-conductor it effectually protects from heat or cold.—THOMAS JOHN CROGGON, 8, Ingram-court, Fenchurch-street, London.

THE CONICAL HOT-WATER BOILERS invented by J. ROGERS, Esq., may be obtained to any size of JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pineapple-place; Mr. Knight's, King's road, Chelsea; Messrs. Veitch and Son's, Exeter; and at the Gardens of the Horticultural Society of London.

HENRY SPARE acknowledges with heartfelt gratitude the following CONTRIBUTIONS, but for which himself and family must have suffered the greatest distress and privation. He is also deeply impressed with the kindness of his late Noble Employer towards his two eldest children; and he begs to add and return his special thanks to Mr. Loudon for his gratuitous and prompt appeal on his behalf, to the Editors of the *Gardeners' Chronicle* and *Gardeners' Gazette* for their notice of his case, to Mr. Munro and the other gentleman who kindly received and forwarded the various sums collected to himself, and to Mr. Kernan, who has been most zealous and indefatigable, and has truly proved himself a Gardeners' friend.

H. S. will feel thankful to be informed of contributions omitted or delayed (if any), which shall then be acknowledged in a future Number.—*Isleworth, Feb. 17th*, 1842.

FOR SALE, at MRS. LAMBERT'S, ACTON-ON-THE-HILL, a variety of PLANTS, VINES, &c.; together with about 40ft. of HOT and GREEN-HOUSES; also a SMALL GREENHOUSE. All in good order.—Apply to A. RUSSELL, the gardener, on the premises.

Publishing Monthly, with Four coloured Engravings,
Price 2s. 6d.

PAXTON'S MAGAZINE OF BOTANY. The Number for FEBRUARY contains beautifully-coloured figures of *Cattleya Aclandiæ*, *Brugmansia floribunda*, *Mahonia aquifolium*, and *Loasa Pentlandica*, with the history and directions for the culture of each: also comprehensive Papers on the science of Gardening, including the phenomena of impregnation and germination in the seed of plants; the Culture of Gesnera rupestris; on Arranging and Planting Specimens in Conservatories; the Propagation of Tropæolum tricolorum; Notices of Plants figured in the floral periodicals for December and January, and of those flowering in the suburban nurseries; with a copious Calendar of Operations for the month.

This work comprises, monthly, four admirably-coloured plates, and twenty-four pages of interesting and useful letter-press. The admirers of flowers are requested to observe—

1. That all the drawings are taken from nature, and are consequently made from plants which have flowered in Britain.
2. That, with few exceptions, they are all done by one artist, whose abilities are of the highest order, and who travels himself to the places where the plants are in flower.
3. That they are lithographed on zinc by the same individual, and, being coloured in a superior manner, have all the spirit and elegance, and much of the finish, of the original drawing.
4. That about one-half of the drawings are from plants which have never before been figured in this country, the rest representing the most popular novelties, as well as the more neglected, though sometimes far handsomer, old species; the majority being such as can be cultivated by every one possessing a flower-border and a greenhouse or frame.

It may, in conclusion, be safely asserted that, both for the beauty of its embellishments, and the utility of its contents, this work is well adapted to the wants of all who delight in gardening; and as the improved system of having the plates lithographed commences with this Number, and as it is intended that each volume shall now be perfect in itself, the present is a desirable opportunity for those who wish to become subscribers.

London: W. S. Orr and Co., Paternoster-row.

TAIT'S EDINBURGH MAGAZINE is published monthly, Price One Shilling; or 12s. for a whole year. A New Volume commences with the January Number.

Each Number of Tait's Magazine contains as much letter-press, by a number of the ablest writers of the day, as at the rate charged for New Novels would cost 17s. 6d. Each Volume would, at the same rate, cost *Ten Guineas*, instead of *Twelve Shillings*.

Only about a fourth or fifth of each Number is devoted to Politics; the rest to what Leigh Hunt called "those admirable Summaries of New Books," Original Tales, &c.

William Tait, Edinburgh; Simpkin, Marshall, & Co., London.

Now ready, post 8vo., price 8s., cloth, with Maps and Plates,

NEW ZEALAND, SOUTH AUSTRALIA, and NEW SOUTH WALES; a Record of recent Travels in these Colonies, with especial reference to Emigration, and the advantageous employment of labour and capital.

By R. G. JAMESON, Esq.

"Mr. Jameson is an intelligent and unprejudiced observer, and has made good use of his faculties."—*Spectator.*

Smith, Elder and Co., 65, Cornhill.

SMITH on the GROWTH of CUCUMBERS and MELONS, conjointly with Asparagus, Mushrooms, Rhubarb, &c. Fourth Edition; price 4s. 6d.

"Our opinion is, that his mode is excellent."—*Loudon's Gardener's Magazine.*

"If the directions be followed there will be no disappointment."—*Floricultural Cabinet.*

*** Orchidaceous plants are cultivated on this system with great success.

London: Simpkin, Marshall, and Co.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their manufactory.

SCREENS for PROTECTING TREES in Blossom and Fruit from injuries by Wasps and Flies, and for Shading Hothouses and Conservatories, Pines and Melons, Tulip Beds, &c. &c.

N. HULME, PARADISE GREEN, KNUTSFORD, CHESHIRE, manufactures the following articles:—CANVAS NETTING, of three different textures, at 5d.; of a stronger quality, at 7d.; and of Yarn doubled, at 8d. per square yard. WOOLLEN NETTING, of different sorts, at 5d., 7d., and 10d. per square yard. The above articles are made from one to four yards in width, as may suit the purchasers.—N. H. has for many years had the honour to supply the Nobility, Gentry, and others in various parts of the Kingdom with the above articles, and has had the happiness to give general satisfaction.

N.B.—Patterns, with the prices annexed, sent (if desired) to any persons wishing to become purchasers.

MESSRS. PROTHEROE and MORRIS will submit to public competition, at the Auction-Mart, Bartholomew-Lane, on Thursday, 24th Feb., 1842, and following day, at Twelve o'clock, about 200 DOUBLE and SINGLE CAMELLIAS, amongst which will be found fine specimens, well furnished with bloom-buds, of Double White, Striped, Reticulata, Conspicua, Punctata, Triumphans, &c. Also a fine collection of AMERICAN PLANTS, comprising Hybrid Rhododendrons, Azaleas, Kalmias, Ledums, &c. About 400 STANDARD and DWARF ROSES, which will include all the leading varieties; choice DAHLIAS (in dry Roots), &c.—May be viewed the morning of each sale. Catalogues may be had at the Mart, and of the Auctioneers Leytonstone.

Handsomely bound in cloth, with 93 Wood Engravings, price 6s.6d.
ILLUSTRATIONS OF THE BIBLE, AND CONFIRMATIONS OF SACRED HISTORY, from the Monuments of Egypt. By W. C. TAYLOR, LL.D.
From the British Magazine.—"This is an elegant and well-executed little book, on a most interesting subject."
London: Tilt and Bogue, Fleet-street.

The Gardeners' Chronicle.

SATURDAY, FEBRUARY 19, 1842.

MEETINGS IN THE ENSUING WEEK.

Tuesday	Zoological	8½ P.M.
Wednesday	Geological	8½ P.M.
	Medico-Botanical	8 P.M.
Saturday	Royal Botanic	4 P.M.

THE Botanical Garden at Kew was once the pride of England and the envy of Europe. It was a centre into which all the rare plants obtained from foreign countries by the enterprise of our navigators, or the zeal of our merchants, were collected. Under the care of the Aitons, and with the assistance of a Solander, a Dryander, a Banks, and a Bauer, it became a Botanical Garden worthy the regal name it was permitted to bear. But it gradually sunk in the estimation of the world; a character of exclusiveness and illiberality attached to it, not without justice; and public distrust being seconded by Government neglect, it fell into such a state of decay, that when a few years since it was reported on officially, it was little better than a crowd of neglected ugly houses, containing some fine specimens of hardy trees, and a forest of nameless plants, the value of which could hardly be estimated, except by the eye of science.

Under such circumstances, it is not surprising that gentlemen should have been found, even connected with Government, anxious to break up an establishment which cost the Crown above £2,000 a-year for its maintenance, and the Woods and Forests as large a sum annually, on an average, for repairs; and accordingly an attempt to dismantle it was made in 1840. It, however, failed, owing to the resistance made to the project by those who considered the facility with which the Garden might be rendered efficient, and the improbability of its ever being replaced if once abandoned. When, therefore, it was found that the country would not tolerate the destruction of the Royal Botanic Garden, it was wisely determined at once to place it under the charge of some gentleman eminent for his scientific acquirements, and to render it effective as a public Botanical establishment. Happily it was found possible to engage for this purpose the services of Sir William Jackson Hooker, at that time Regius Professor of Botany at Glasgow, and the effects of so fortunate a selection are already most striking. After the lapse of only a few months, the Garden is assuming quite a new appearance. Already some of the useless old boundary walls have disappeared, and four acres of pleasure-ground have been added to the Garden; the more ruinous houses are disappearing, or have been altered; new ones are in progress of construction, others are under consideration; walks have been turned, thickets of worthless bushes destroyed; and it must be evident to all who visit the place, that the well-directed energy of Sir William Hooker, assisted by a judicious liberality on the part of the Commissioners of Woods and Forests, will speedily place Kew where it ought to be, and once was, at the head of the Botanical establishments of Europe. Travellers will no longer refuse to gather seeds for this national establishment, under the conviction that to send them there is to consign them to destruction; private individuals will not hold aloof because what they give is neglected, and nothing can be had in return; and Government will have a Garden to which, and its officer, it can on all occasions refer for such information connected with Colonial or other public purposes, as a garden can supply. We have ourselves seen the changes which are going on at Kew—we have studied their effect—and we sincerely congratulate the country upon its renovation.

ALTHOUGH we may not be able at present to state with confidence in what way saline substances act as manures, there can be no sort of doubt that they are generally beneficial in this respect. We do not speak of the evidence produced by farmers, but by gardeners. Of these salts, nitrate of soda, from its low price, has been most extensively employed, and our readers will be glad to know something more about it.

Nitrate of soda, like common salt (muriate of soda) will destroy the leaves of the plants on which it falls, even if very much diluted, and therefore should never be applied overhead, unless in a dry state. It will also entirely kill many kinds of plants, if given in undue quantity; but so will yeast, pigeons' dung, guano, and many other energetic manures; although some plants, like Sea-kale, seem able to consume any quantity of it: we have known a pound of it given in one dose to a Sea-kale plant without injurious consequences.

Farmers find from one to two hundredweight per acre a good dressing for their land; and therefore this quantity may be regarded for the present as a safe proportion for ordinary crops. When used on a smaller scale, we are much in want of information as to its proper proportion if mixed with water. The following, however, seem to be ascertained facts: Six ounces in four gallons of water suits Lettuces and Celery, as has been shown by Mr. Wedgewood. Others have found 1 lb. in 12 gallons a safe quantity for Dahlias. Strawberries are much improved by it in the proportion of an ounce to the gallon. In other cases, Onions are reported to have been much improved by water holding the nitrate of soda in solution in the proportion of one pound to eight gallons. Independently of these cases, Mr. Rivers has pointed out its extremely active effects on Coniferous plants, applied as a top-dressing at the rate of 160 lbs. per acre.

About its action under favourable circumstances there can be no doubt. Mr. Rivers found his Fir-trees changing from yellow to deep green in a fortnight from the time of the application. We have seen similar effects upon common shrubs in a worn-out gravelly soil; and the rapidity with which the crops to which it has been applied acquired a deep green healthy colour is generally spoken of. Sometimes, however, it is stated to produce no effect. This may have been owing to the land on which it has been used already abounding in alkaline matter, so that any further addition has been useless; or it may have arisen from the nitrate having been used at a bad season of the year.

There seems every reason to believe that its effects are the most certain if it is applied when plants are just beginning to grow, at which time it is readily taken up into the system; and that it produces the smallest effects if given to plants in a languid state of growth or at rest. This is, perhaps, owing to the action of rain, which may wash it away from the roots before they can absorb it, if they are at rest, or nearly so; while, on the contrary, it is seized by the roots, if in a state of activity, as soon as it is presented to them. We would, therefore, recommend those who intend to try the effects of nitrate of soda, to apply it to Grass land now; to their shrubberies when the sap is flowing freely, and the young shoots are in the act of lengthening; and to annual or herbaceous plants at whatever season they may be the most freely in vegetation. For most gardening purposes it is more convenient to dissolve it in water; but as a top-dressing for shrubberies, or lawns, or pastures, it must almost of necessity be sown broadcast. In the latter case choice should be made of rainy weather, when the nitrate will be dissolved nearly as soon as it falls upon the soil. Dry weather is, no doubt, the worst period at which to use it.

In conclusion, although nitrate of soda is the most common form in which this alkali is used, we would strongly advise our readers to try the effects of the impure sulphate of soda, called salt-cake, which we have some reason to believe is as useful as the nitrate, and which is certainly much cheaper.

WE regret to announce the death, at a very advanced age, of Mr. Menzies, the Nestor of English botanists, one of the last, if not the very last survivor of Vancouver's voyage. His name appears continually among the discoverers of Botanical novelties at the end of the last century; and to living naturalists his kind and liberal disposition had greatly endeared him.

ON THE CULTURE OF THE CAMELLIA.

THE soil best adapted to the growth of Camellias is a mixture of peat-earth and loam, in nearly equal proportions; where the loam is peculiarly light and sandy, a less quantity of peat is requisite. The earth should be well mixed and passed through a coarse sieve, reserving the detached portions of peat and loam that will not pass the sieve, to fill the bottom of the pots, thereby securing a free drainage—a circumstance indispensable to the success of the plants. The proper season for the general shifting is when the young growth has hardened and the blossom buds for next year can be detected at the extremity of the shoots. After shifting all those that require it, they may be placed in the open air, or retained in the greenhouse, according to the season they are wanted to flower; if kept in the greenhouse, as much air as possible should be admitted, and occasionally sprinkling the foliage will improve the appearance as well as be beneficial to the health of the plants. At all times attention must be paid to watering them properly, the roots being apt to become matted in the pots, so as to render the ball of earth impervious to moisture; hence it is necessary to see that the ball of earth is moistened by the water poured upon it, instead of the web of fibres only. This renders an examination of the roots, or reducing and replanting them, at least once a year, a measure almost indispensable.

At the respective periods of growth and flowering, the plants will require plentiful watering; during the latter, if not regularly supplied, the bloom-buds will infallibly fall off, instead of expanding into flower; at other times, a regular moderate supply is essential. The effect of constant watering may be presumed to diminish or destroy the fertility of the small quantity of earth allotted to each plant; therefore, when the annual repotting occurs, carefully take away as much of the former ball of earth as can be done without injuring or cutting the roots. The Camellia may be considered as a hardy greenhouse plant, requiring only a slight protection in severe weather, like the Myrtle; and if the plants are kept just above the freezing-point, they will succeed much better than when grown in a high temperature. At the time they are making their growth an increase of heat will be advantageous.

The usual methods of propagation are by inarching or grafting and budding on the single red Camellia, cuttings of which are found to strike root more readily than of the double varieties. The cuttings are taken in July and August, or as soon as the young shoots are sufficiently ripe at the base. They are carefully prepared by being cut smoothly over with a sharp knife at a joint, and divested of one or two leaves at the bottom, and then planted firmly about two inches deep, in pots half filled with the Camellia compost before described, and the upper half with fine white sand. They are then well watered and the pots plunged in a tan-bed which gives out a gentle warmth, and kept closely shaded for three or four months, by which time short fibres, or a callus from which they afterwards diverge, are produced. When sufficiently rooted to bear removal they are potted singly in small pots, the sand being then carefully removed; the pots should be well drained and filled with the Camellia compost, with the addition of a little white sand. They are afterwards to be sprinkled with water, and placed in a close frame or pit until they begin to root afresh, and by degrees exposed to the air. The succeeding season they may be potted in the same soil as the other Camellias and similarly treated, and many of the plants will then have attained sufficient size and strength for inarching or budding, and all of them by the following season. The best time for inarching is early in the spring, just before the plants begin to grow, and for budding as soon as the new wood is sufficiently ripened, but it may be done at almost any season of the year.

The following is a selection of some of the most desirable varieties:—

White.

Double White
Single do.
Allnúttii
Alba semiduplex
Anemoniflora alba
Candidissima
Candor
Ebúrnea
Fimbriata
Haylóckii
Hume's Blush or Buff
Imbricata alba
Myrtifólia alba or Álbicans
Nobilíssima
Ochroleuca

White, Striped, and Spotted.

Albertus
Colvillii
— striata
Delicatíssima
Fortúita
Gray's Invincible
King
Pompone
Punctata major
Picturata
Press's Eclipse
Spofforthiana
Sabiniana
Swéetii
Tricolor

Rose-coloured.

Coronata
Elata
Élegans
Fórdii
Flórida

Myrtifólia
Pæoniflora
Párksii
Palmérii
Rosa sinensis
Rósea (Le Blanc's)
Rose Warratah
Sasanqua rósea
Triumphans
Vandésia rósea
Wóodsii

Red and Crimson.

Althæiflora
Beáleii
Chandlérii
Concinna
Corallina
Conspícua
Decora
Exímia
Francofurtensis
Imbricata
Lefevriana
Minuta
Róssii
Reticulata
Regalis
Speciosa
Splendens
Warratah

Rose, Red, and Crimson striped.

Dorsétii
Donkelaerii
Gilesiana
Párksii
Queen Victoria or Pressleyii
Striped or variegated
Serratifólia

[We have been avoured with the above communication by Messrs. Chandler and Son, of Vauxhall.]

ON THE TREATMENT OF ROSES IN POTS.

I OBSERVED your directions for the treatment of China and other Roses from pits in p. 73, which I fear will occasion the destruction of many if followed. I have had some experience in these matters, and have invariably found that Roses subjected to close heat after being packed, or even after being recently potted (unless the cuttings have been raised in heat), have damped off, their roots becoming black and rotten. The present great demand for new Roses gives occasion for many small plants to be sent out, and these, if not treated with great care, often die and give disappointment to the purchaser. The following directions for managing all such Roses, as Bourbons, China, Tea-scented, Hybrid perpetual, and Noisettes—in short, all Roses grown on their own roots, and sent out in small pots—may perhaps be acceptable to some of your readers:—I will suppose Roses of this description received in October or during the winter months in their pots tied over with moss as usual in packing: if intended for planting in the borders in spring (they are very liable to be killed by the winter, if planted out in autumn), they should be carefully cleared from the moss and the mould, or the surface of the pots should be stirred; they may be plunged in sawdust or old tan in a brick pit or garden frame, but never put the glasses over them in mild weather, not even during slight frosts; in severe frost only will they be necessary. About the end of April they will have made some little growth, and they may then be planted out with safety; the great object is to keep them in a backward state; if at all confined and covered by glass, their shoots become elongated and weak, they then bear transplanting badly and often die.

If they are received at the before-mentioned season, and are intended for blooming in the greenhouse, or for forcing, they should be taken from their pots, their balls of earth loosened and reduced to a small extent and then repotted into pots a size larger than those in which they are received; light sandy loam and well-rotted dung or leaf-mould in equal parts is the best compost that can be used; if they have been grown in pure peat they should be potted in the same description of mould, or the peat shaken clear from their roots before potting into the above compost, as they do not strike readily into loam from the ball of peat; they may then be placed in an airy greenhouse as near the glass as possible. In a few days after being potted they should have an abundant watering; if intended for blooming in the greenhouse, they may remain there till the end of summer; they should be syringed in sunny weather twice a day, morning and evening, with soft water, and occasionally fumigated with tobacco, to kill the aphides, which always infest roses under glass. If intended for forcing they should be removed from the greenhouse to the forcing-house early in January; let them have a gentle heat from 50 to 60° in cloudy weather, admitting but very little air, and that with great caution, during hot sunshine, as the spring advances. Syringing twice a day will be necessary: this not only gives health and vigour to the plants, but also serves to keep off the red spiders, which are so apt to ensconce themselves snugly on the under surface of the leaves. Thus far I have given instructions as to the management of pot Roses, received in autumn and winter; those received in April, May, and during the summer months, in a growing state, should immediately after being unpacked be placed in a cold frame; and if sunny weather, shaded a few days, syringing them occasionally, or giving them water from a pot with a fine rose. The first three days keep them close, afterwards admit air gradually, taking the lights off at night if still weather and the nights are dewy. In eight or ten days they may be planted out without any risk of their being checked in their growth. Some little variation is required in the treatment of plants received out of pots, with their balls of earth enveloped in moss; these have been grown in pots, but have been taken out for convenience of packing. If in spring or summer they should be placed in the cold frame with the moss tied round them as they are received, treating them the same as if they were in pots; the moss must be removed when they are planted out. Plants received in autumn out of pots in moss should be immediately potted and plunged as before directed. I have found the treatment here recommended invariably successful with Roses received in small pots on their own roots; for such only is it intended. Without these precautions they are exceedingly apt to die after being packed in a close basket for a few days.—*T. Rivers, jun.*

RAISING FERNS FROM SEED.

A correspondent in a former Number of the *Chronicle* having requested information on the subject of raising Ferns from seed, I beg to recommend to him the following particulars of a method which I have practised for several years with tolerable success.

In the first place, let him procure a number of small octagon-shaped hand-glasses about six inches in diameter (more or less, according to the size of the pots he intends to sow the seeds in), the side walls of each being high enough to admit a pot to stand underneath without touching the glass. These glasses may be made by any glazier, the frame being the common lead used in lattice-windows; they will cost about half-a-crown each.

Having procured the glasses and the corresponding sized pots, the latter are to be about half filled with well-broken potsherds, the finest at top; then fill to within half an inch of the rim with heath-mould sifted through a fine sieve. Level the surface of the mould, and water it freely with a very fine rose (the holes in which should be only large enough to admit the point of a small pin); let the pot stand a few minutes till the water is absorbed, and then carry it to a dry part of the house. Place the papers containing the Fern-seed for a minute or two on the flue, or some other place where they will become thoroughly dry. Write the name of the Fern on a label, and place it in the centre of the pot; then open the paper and carefully dust the spores (seed) over the surface of the moist earth, taking care not to sow too thick. The pot may then be placed in a shady place, on a level surface of wood or stone, to prevent the intrusion of worms, and covered with the hand-glass.

The period necessary for the germination of Ferns differs in different species: some will require six weeks, and some even more; and if during that time the surface of the earth in the pots should appear dry, a very slight watering must be given with the fine rose. It will be necessary to examine the surface of the earth frequently with a pocket microscope, in order to discover any mouldiness or minute Algæ that may appear; such appearances indicate that too much water has been used, and in that case the glasses should be taken off for a short time, and the pots removed to the full light. If, after this, the mouldiness or Algæ continue to spread, a knife may be introduced between the pot and the earth, and the latter slightly raised up so as to allow the moisture to drain off.

The first or primary frond of a Fern is usually, though not uniformly, kidney-shaped, with a deep sinus on one side, from which the second or perfect frond is produced. When these first fronds of the seedlings have increased so far in breadth that the position of the sinus can be distinguished, they will be able to bear the gradual admission of air, by the tilting up of the glasses. As the seedlings acquire strength, they may be removed from the shade to places where they will have more light; but they must not be exposed to the full sun in summer, as long as they are under the hand-glass. In winter, however, when the sun is less powerful, all those seedlings that have perfected or nearly perfected their first fronds may be exposed to the full light; this will prevent the spreading of mouldiness, which the moist atmosphere under the glasses is so apt to produce at this season of the year.

When it happens that, from too thick sowing, the seedlings are much crowded, they should be thinned out carefully with the point of a penknife, taking patches of from six to a dozen plants, and transferring them to another pot, prepared in all respects as if for sowing spores. In planting these, a slight depression should be made with the point of the penknife on the surface of the mould in the new pot, and the patch inserted, taking care not to cover any part of the plants with the earth. They may stand about a quarter of an inch from patch to patch; and when the operation is completed, water the seedlings and place the pot under the glass.

These transplanted seedlings will frequently succeed better than those in the seed-pots; indeed with very slow growing seedlings it is frequently advisable to transfer the whole to another pot, as they will generally root better in the fresh than in the old earth.

When the seedlings have fully developed their perfect fronds (and not till then), the glasses may be withdrawn; the pot with the seedlings should then be placed in a perfectly shaded place, and more frequently supplied with water. They may remain in the seed-pots until three or four fronds are produced, when it will be advisable to shift them into other pots and place them at wider distances.

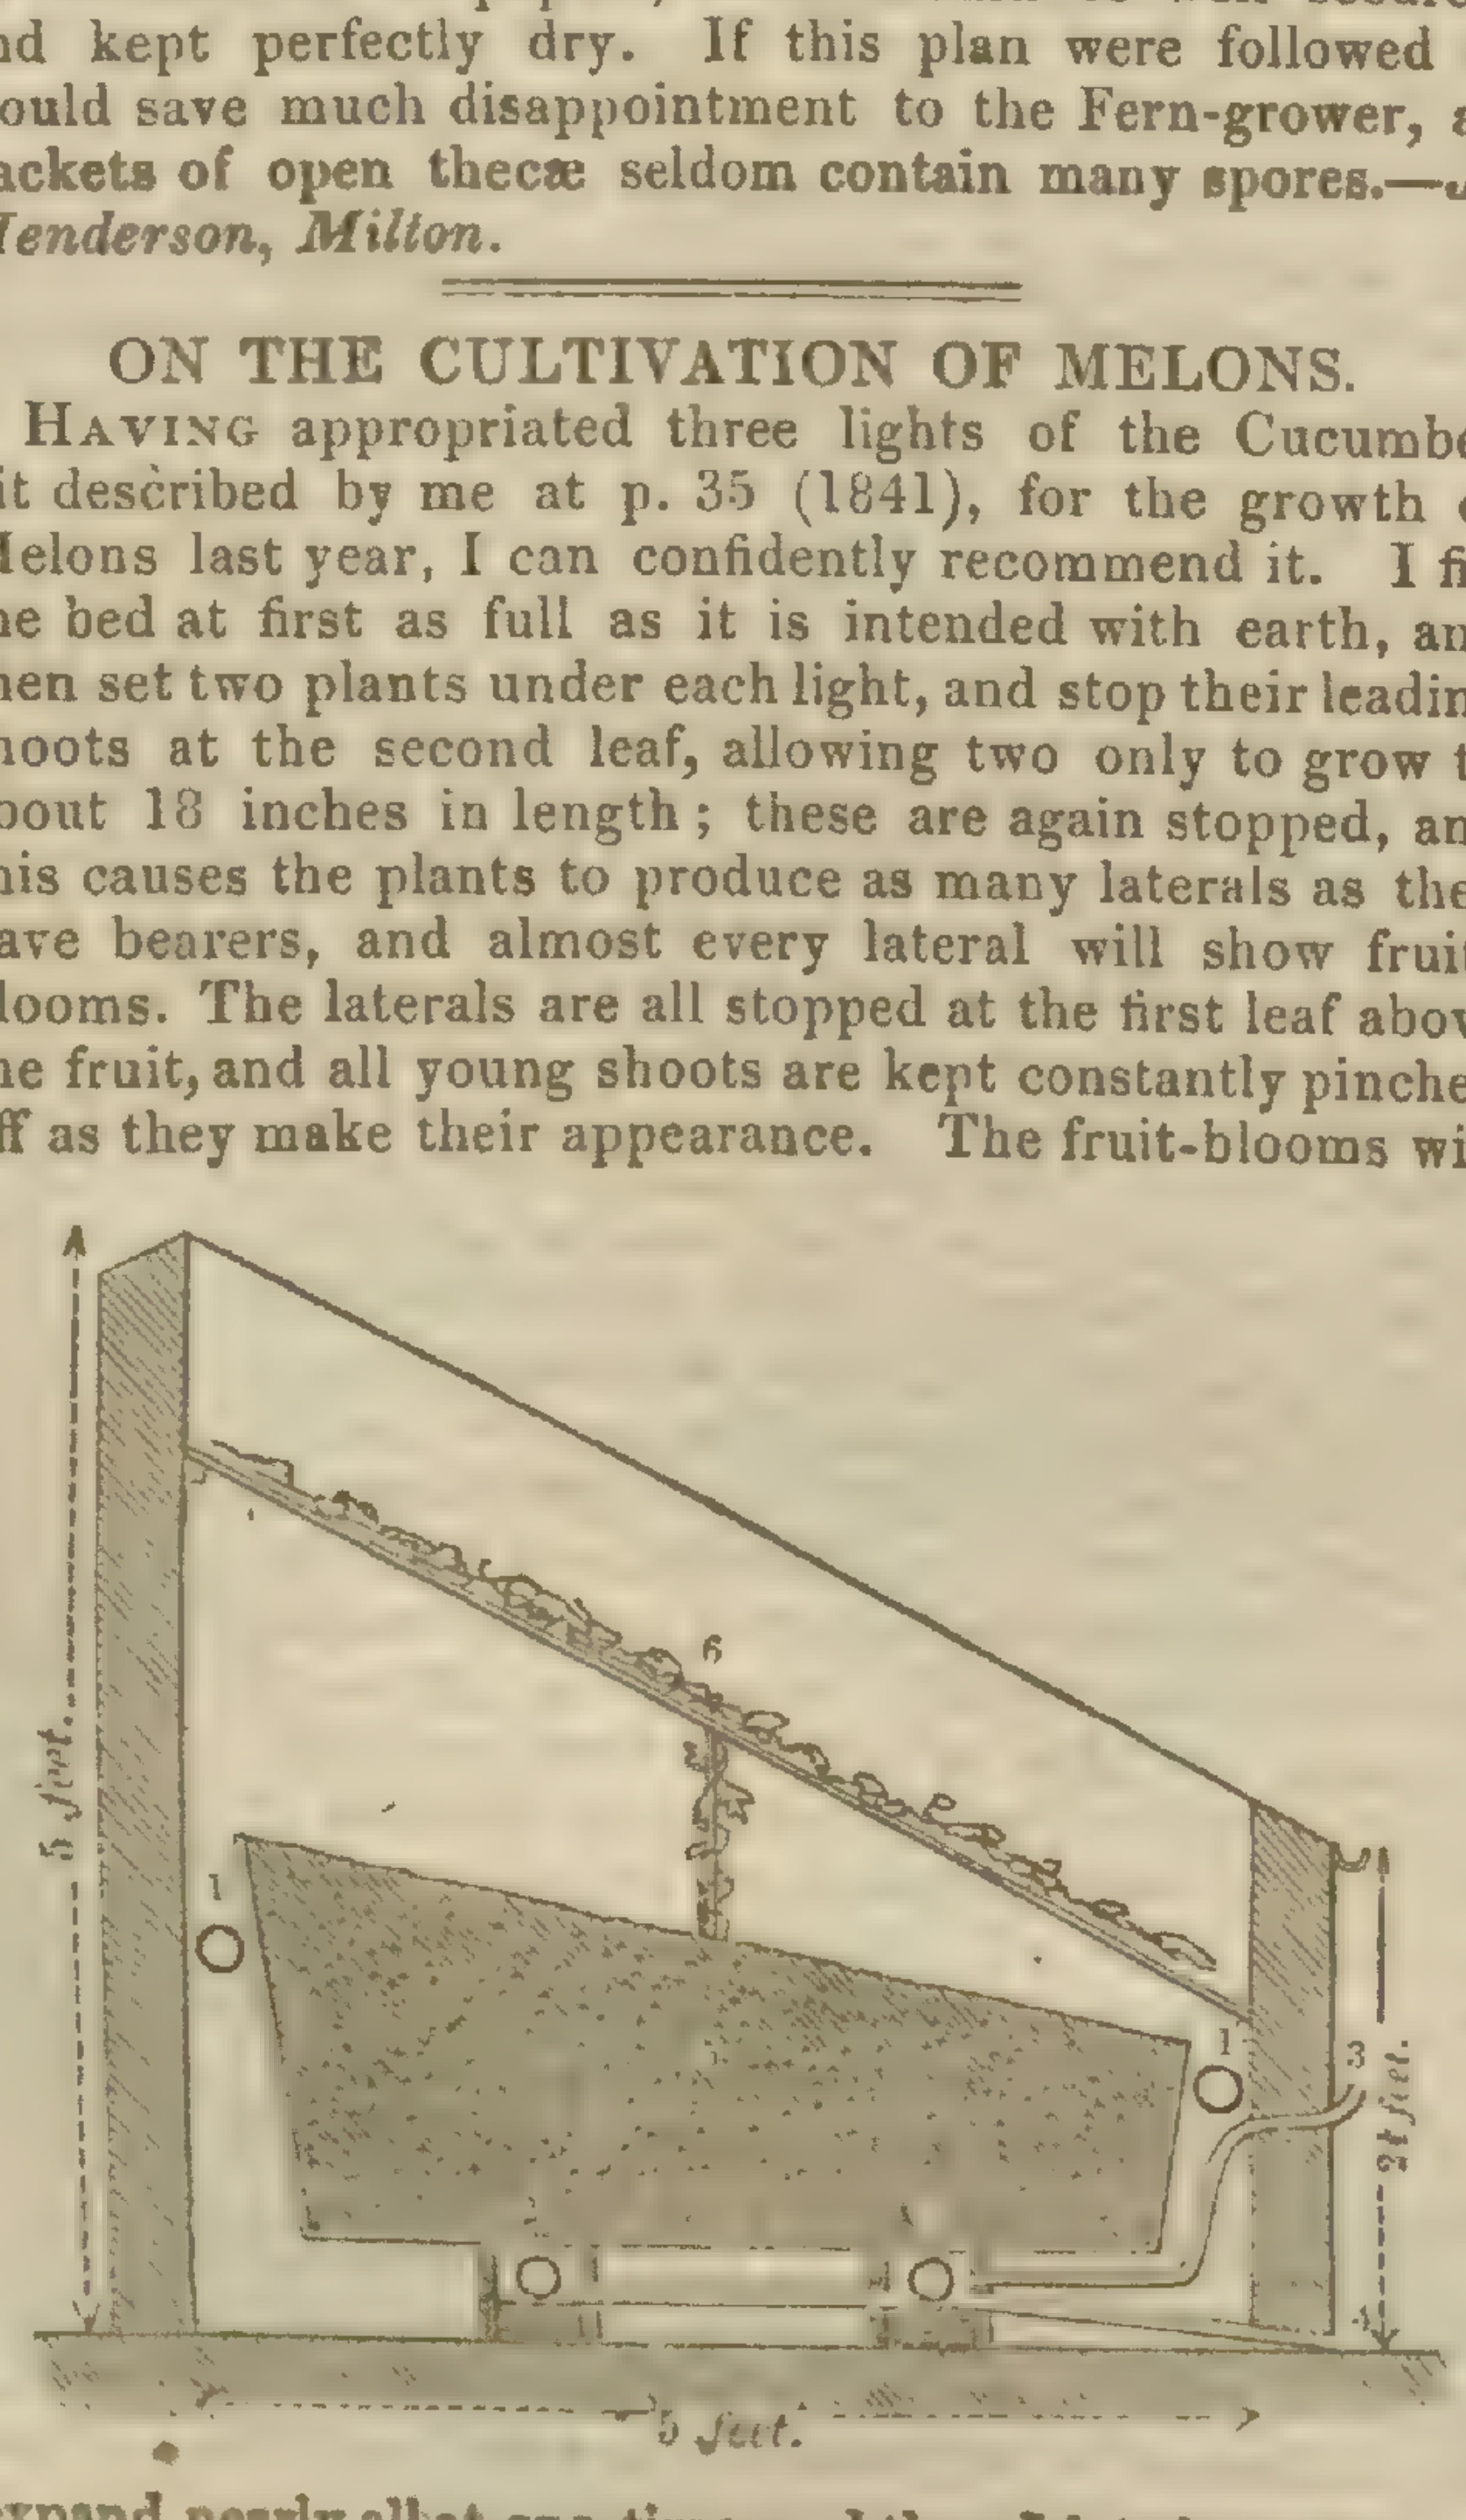
Many Ferns grow very slowly while in the state of primary frond, and require many months before their perfect fronds are developed. It is chiefly for these slow-growers that glasses are required. Others, such as most of the Gymnogrammas, some species of Nephrodium, Pteris, &c., come up readily in open pots; but with those which require from nine to eighteeen months to produce their second fronds, glasses are indispensable. I would, however, recommend that with all spores not collected from your own plants, glasses should be used, as affording by far the greatest certainty of success.

In raising Ferns from seed under glasses, much of the success will depend on the judicious application of water while the seedlings are in the primary state, so delicate is their structure at this time, consisting nearly throughout of a single stratum of cells, that any considerable advance to excess either of dryness or moistness is equally injurious. If the water which is not absorbed by the seedlings does not pass freely through the earth, minute Fungi or Algæ will be generated, and some of these are so destructive that the extent of their progress may at once be traced by the death of the seedlings. Proper attention must, therefore, be given to the keeping up of a medium state of humidity, and that state will be better understood by observation than by any direction that can be given.

Great care must also be taken not to allow worms to get into the pots, as they will in a very short time destroy the whole crop. The only way to get rid of these pests, is to place the pot with the glass over it on a tolerably hot flue, or some other well-heated surface, when the heat ascending through the earth in the pot will drive the worms out. It may not be amiss to observe here that in collecting spores for reproduction, it is better to select a frond on which the thecæ (seed vessels) have not opened. If they have changed to a brown colour, and one or two have opened, they will be in the best possible state for transmission to a distance; portions of the frond should then be inclosed in the papers, which should be well secured and kept perfectly dry. If this plan were followed it would save much disappointment to the Fern-grower, as packets of open thecæ seldom contain many spores.—*J. Henderson, Milton.*

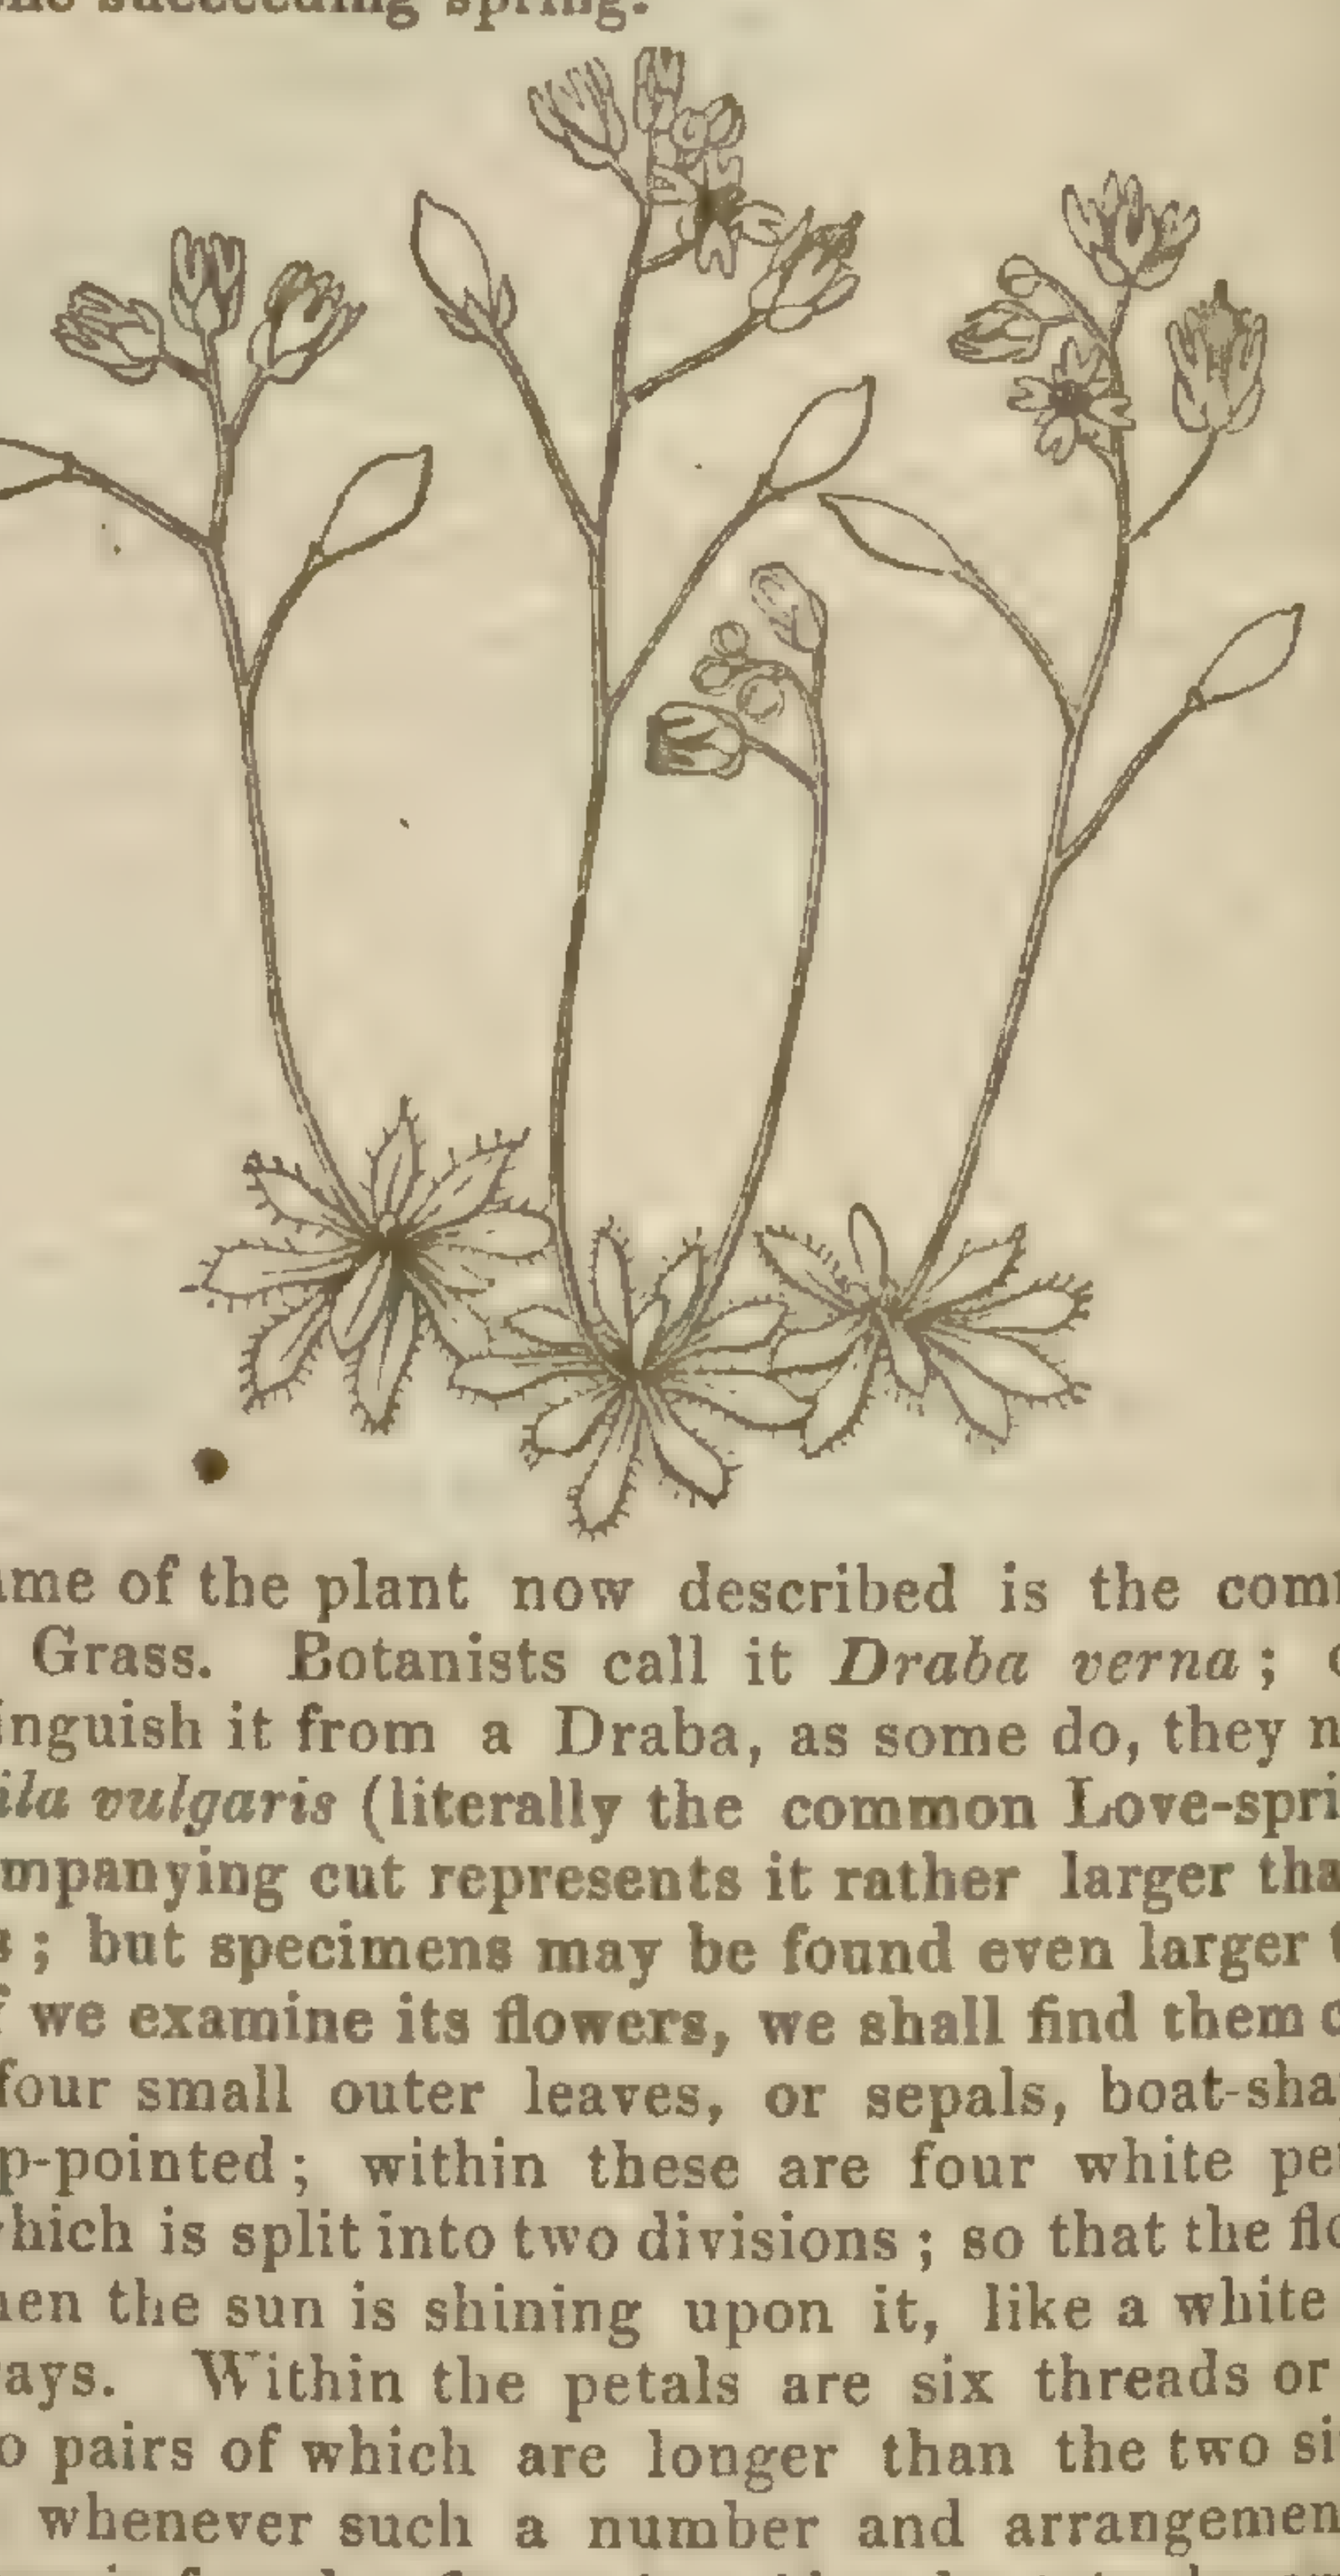
ON THE CULTIVATION OF MELONS.

Having appropriated three lights of the Cucumber pit described by me at p. 35 (1841), for the growth of Melons last year, I can confidently recommend it. I fill the bed at first as full as it is intended with earth, and then set two plants under each light, and stop their leading shoots at the second leaf, allowing two only to grow to about 18 inches in length; these are again stopped, and this causes the plants to produce as many laterals as they have bearers, and almost every lateral will show fruit-blooms. The laterals are all stopped at the first leaf above the fruit, and all young shoots are kept constantly pinched off as they make their appearance. The fruit-blooms will expand nearly all at one time, and then I let the water out of the troughs, and keep a higher temperature. When the young fruit are about the size of pigeons' eggs, I thin them out, leaving only 5 or 6 on a plant; fill the troughs again with water, giving the plants at the same time a goo supply at the roots, and occasionally a sprinkling over the leaves, when the lights are closed for the night. I train the vines on a trellis similarly to Cucumbers. The kinds that I generally grow are the scarlet and green flesh, and the Canteloupe. In 1841 I cut the first fruit the 2d May, and exhibited 8 others at the first May exhibition, at the gardens of the London Horticultural Society; these gained the first prize, and were considered to be good-sized, and of excellent flavour. The flavour is gained by allowing the troughs to become dry during the ripening season. A great improvement in these pits would be to have the pipes so arranged as to be able to shut out, or partly so, the heat from any of the compartments that might be wanted for other purposes, and this can easily be effected by Mess. Weekes' plan, described in p. 597 (1841), and also by one of their atmospheric air pipes in the front of each compartment. The annexed figure represents a section of the pit described at p. 35 (1841). 1, 1 are the flow pipes; 2, 2, the return pipes and the water troughs; 3, the pipe to fill the troughs; 4, the pipe by which the water is let out of the troughs; 5, the bed for the plants; and 6, the trellis on which the shoots are trained.—*John Green, gr. to Sir E. Antrobus, Bart., Lower Cheam.*



FAMILIAR BOTANY.—No. II.

The Common Whitlow Grass.—Even now, on the top of walls on the south side of plantations, and in warm situations, there is a little plant, with tiny, sharp-pointed, hairy leaves, which is beginning to peep forth, endeavouring to rival the Snowdrop and Crocus. It is, however, a harbinger of spring which none but the botanist regards; for although its petals are white as the driven snow, and its sepals like twin emeralds enclosing them, yet all is so small as to escape the notice of the heedless crowd. At present, its diminutive stem is hidden among the leaves, which stand round it, and cover it over, protecting it from the chill of night until the flowers are strong and full-grown; as soon as they are ready to unfold, it rises to the height of two or three inches, divides into a few slender arms, opens its blossoms, in a few weeks ripens its fruit —yes, its fruit—for it bears fruit as perfect as that of an Apple or a Peach, although so small—and then it falls beneath the dry winds and hot sun and perishes; but its seeds lie quietly amidst the moss and earth they fall on, and when the sun moderates his power, and the evenings of autumn become damp, these minute bodies sprout forth and grow into new plants, which will be ready to flower early in the succeeding spring.



The name of the plant now described is the common Whitlow Grass. Botanists call it *Draba verna*; or if they distinguish it from a Draba, as some do, they name it *Eróphila vulgaris* (literally the common Love-spring). The accompanying cut represents it rather larger than it usually is; but specimens may be found even larger than these. If we examine its flowers, we shall find them composed of four small outer leaves, or sepals, boat-shaped, and sharp-pointed; within these are four white petals, each of which is split into two divisions; so that the flower looks, when the sun is shining upon it, like a white star of eight rays. Within the petals are six threads or stamens, two pairs of which are longer than the two single stamens; whenever such a number and arrangement of the stamens is found, a flower is said to be tetradynamous (that is to say, composed of four forces or powers, each pair of stamens being regarded as one force, and each single stamen as one force also).

As to the fruit of this plant, to which allusion was just made, it is a small oval thin case, which, when ripe, drops into two pieces (or valves), and allows some minute seeds to fall out. It is not, indeed, like what are commonly called fruits, because it is not fit to eat; but in the language of botanists everything is fruit which contains seed; and although we speak of the fruit of one plant and the seed-vessel of another, yet, in fact, those expressions both have the same meaning.

If the leaves of the Whitlow Grass are chewed, they will be found hot, like Mustard or Cress. In reality, although so very different in appearance, our Draba is a near relation of those common herbs; and so it is of the Radish, the Turnip, the Cabbage, of Honesty, Candytuft, Wallflower, and a hundred others which fill the kitchen-garden or enliven the parterre. The mark by which they are all united is the flowers being tetradynamous, as before explained; in addition to which they always have four sepals and four petals. Such plants form an assemblage which bears the name of Cruciferous, because the four petals resemble a Maltese cross, called in Latin crux;

they are also styled the Brassicaceous order, from Brassica, the Latin name of the Cabbage and the Cabbage tribe.* We shall in time become acquainted with many more of the same race.—*R. E.*

ON THE PRODUCTION OF NEW POTATOES.

Several persons have expressed a desire to know how they can obtain new Potatoes during the winter and spring months without the aid of forcing or glass.

In the *Gardeners' Chronicle* for Jan. 15th, 1842, mention is made of a Potato from Messrs. Chapman, of Brentford; and from that notice, one would be led to suppose that the production of new Potatoes during winter was owing to some peculiarity in the kind; while again, according to Messrs. Chapman's circular, it seems more depends on the manner of preparing the sets, &c. It is also stated in the circular that these Potatoes possess the following advantages: that those who grow them can have new Potatoes from November to June, as fine in flavour and as handsome in appearance as can be obtained at any other season; that not an inch of glass is required to force them, and that no more trouble is necessary than in growing an ordinary crop. But I think it should have been added that this method of procuring new Potatoes for winter and spring use is an old practice, of which an excellent account was given in the "Gardener's Magazine," by Mr. Saul, of Castle Hill, Devonshire, in August 1840, and which at once shows that it neither depends on the particular sort of Potato, nor on any way of preparing the sets, but simply on retarding the old Potatoes, and by planting them at a later season than ordinary.

This plan is practised by several market-gardeners, who grow them for the London market, especially by some in Devonshire and Cornwall; and their produce is frequently sent to the London market during February and March, in what is termed four-pounds baskets, which are generally sold at the rate of 6d. per pound. The following extract from the "Gardener's Magazine" will at once explain the system:—

"To have the new Potatoes ready for use in October, they should be planted about the middle of July; for the principal crop, for winter use, the first week in August is the best time. They should be planted on a good rich border (the drier the better), in rows 2½ ft. apart, and about 1 foot from plant to plant. It is necessary to place the rows a good distance apart, in order to insure good foliage by freely admitting the rays of the sun, as well as a good circulation of air; as the quantity as well as quality of the crop depends much upon a proper attention to this point; and it probably might be better attained by placing the rows still further apart.

"Potatoes planted in the above way, in August, will be ready for the table in November, and will continue good from that time till April, when it is easy to have a succession from those planted in the spring. The only extra trouble attending upon Potatoes when planted at this season (August), is to cover them in winter with leaves, or any other material which will keep out the frost.

"When Potatoes are thus managed, any person may insure a supply through the winter of almost as good a quality as those grown during the summer months; the only difference is, that those planted for the winter are rather more waxy (and particularly so if the situation is damp) than those raised during the summer.

"It is also necessary, Mr. Saul says, that the Potatoes intended for the autumn planting should be of a late kind and kept in a cool situation till the season of planting, and also as clear as possible from sprouts during the summer. Much, however, depends (as regards the sorts) on the situation and soil, as if the latter is stiff and the former cold an early kind is best suited; but if the situation is a warm one and the soil light and dry, plant a late sort."—*George Gordon.*

THE AMATEUR'S GARDEN.—No. VIII.

There are many lovers of flowers who do not possess dung frames and tan pits to force Roses, Lilacs, Hyacinths, Lily of the Valley, and such things as are generally seen in bloom during the winter and spring months. But there are other flowers, equally beautiful, which are within the reach of all who have a small greenhouse or pit to grow them in. The Rose, the beautiful emblem of England, is almost universally regarded as the most lovely of all flowers; and although such persons cannot have the common garden kinds in flower at this season, yet they may easily have the Chinese and tea-scented varieties. All that is required, is simply to strike the cuttings in the autumn or early in the spring, and grow them strong in pots throughout the summer, at the same time taking care to pick out the flower-buds as soon as they appear. By this treatment they will not exhaust themselves, and will send out flowers in a warm greenhouse or sitting-room, from January to May. Camellias may also be made to bloom freely in January and February, without forcing; this is done by keeping them in a warm greenhouse from the time they begin to grow until they ripen their wood and form their flower-buds. There are also several varieties of Cineraria, particularly Waterhouseana and splendida, which flower profusely all the winter, and make the greenhouse quite gay. These plants form a quantity of suckers or side shoots, which can be taken off with roots, and potted in any free soil; they require very little care during the summer and autumn, and begin to flower in November and December.

But amongst all our winter greenhouse flowers, none are more beautiful than the Chinese Primrose. It reminds us of our pretty Oxlips and Cowslips, and common Primroses, which are so beautiful in the woods in early summer. The single white and pink varieties of this plant ripen seeds in abundance every spring, particularly if a few plants, from which seeds are wanted, are placed in a warm situation. Those varieties having fringed edges are generally considered the most beautiful, and, therefore, they should always be chosen, and the seed gathered from them; it may be sown any time from July to September, and as more may vegetate than are wanted, the thick hairy-leaved plants ought to be selected and potted, as they are more likely to produce fringed flowers than the others. Seed from fringed plants generally produces both plain and fringed kinds. Two very beautiful double varieties are now in many collections, but these are multiplied by cuttings, and are, therefore, not likely to be so common as the single ones. The latter should be raised from seed every year, and never kept beyond the second season. In potting, use rich free soil, and sink the plants a little deeper at every shifting. Several other plants might be recommended for winter flowering, such as Heaths and Epacrises for example; but many persons, unless they have good houses, cannot succeed with them.

Dahlia roots should now be potted and put into heat if cuttings are wanted from them; preparations should be made for propagating tender summer flowering plants, and the digging of all beds and borders, except where herbaceous plants are, should be finished if not done already. —*R. F.*

HOME CORRESPONDENCE.

Shakspeare's Foresting.—Under this head your correspondent 'A.' reverts (at p. 38) to Shakspeare's familiarity with rural affairs, and asks what is the precise meaning of the following passage in "Troilus and Cressida:"—

"As knots, by the confluence of meeting sap,
Infect the sound Pine, and divert his grain
Tortive and errant from his course of growth."

It gave me much pleasure to see our friend again disporting himself in the pleasant fields of Shakspeare's genius, and I have looked to see whether he did not intend to answer his own question, which he is so well able to do, and which he has done in a former instance. If he has already done this, and you find in your portfolio any commentary of your correspondent unravelling the knotty point he has discovered, pray give it precedence of the one I here offer you, or suppress it altogether. It would be idle to say the "commentators" on Shakspeare have not done much to illustrate the obscurity of their author, much in the restoration of the original and true reading, and still more for a critical and just appreciation of his excellences. It is true also that in many instances their ignorance of the natural phenomena with which he was familiar, and of the material things which presented themselves to his mind, illustrative of his moral conceptions, has led them into error, and it as often happens that the habit of referring to obscure originals and recondite sources of information leads them astray from the true path of induction, where it is plain and superficial; for in this, as in many other cases, while we are groping for truth at the bottom of the well, we often overlook her at the top. "A." will not suspect me of a disposition to include him in this latter too learned category; he has himself placed a bar to this supposition, in the conjecture that the author "intended to explain some popular notion, or some phenomenon which had come under the poet's own observation." The speech of Agamemnon of which the passage in question forms a part possesses all the imaginative redundancy of Shakspeare's style, where figure follows figure, and one noble image is scarcely comprehended by the mind of the hearer before another is presented to it.

"Princes,
What grief has set the jaundice on your cheeks?"
"The ample proposition that hope makes
In all designs begun on earth below,
Fails in the promised largeness; checks and disasters
Grow in the veins of actions highest rear'd;
As knots," &c.

In the short space of eight lines here are half as many distinct illustrations of the speaker's sentiments, from moral or material objects, all highly appropriate to the teeming imagination of the anxious Greek. The consideration of the "checks and disasters that grow in the veins of actions" suggests the idea of the knots in timber-trees. Now, I believe that instead of carrying him to the forest, Shakspeare's thoughts immediately transported him to the carpenter's shop, and that the appearances so often seen on a fresh-planed deal-board suggested the idea of the knotted Pine. When the Pine is left to prune itself, its lower branches die and break off, and the stumps remain, and are covered over by new wood cut into planks; these trees show in their most central parts their dead, or, more properly, partly decayed stumps, which are sometimes loose and fall out, but more frequently are held in their places by the surrounding ligneous substance, forming what the carpenters call "doated" (dotted?) timber. These knots in their original condition of stumps of branches produce a swell in the trunk, and around them the successive layers of new wood are deposited, a section of which presents exactly the tortuous appearance spoken of by the poet. The cross-grain of these knots and their surrounding parts is abundantly proved by its operation on the carpenter's tools, and the wavy lines and eddying courses of the layers of wood about these spots suggest the additional thought of confluent sap. By the infection of the sound Pine, the author means no more than its tainted nature—its deterioration as good workable timber. I may add that in Shakspeare's days, when less paint or no paint at all was used in domestic architecture, these "infected" deal-boards would everywhere present themselves, and he need hardly to have gone so far as the timber-yard for his illustration. He chooses the Pine too because every one must have observed that no other timber presents the appearance in question in such marked characters. — P. S. A friend better versed in etymology and verbal criticism than myself suggests that the term dotted or doated timber used by our carpenters and woodmen refers rather to the age and decayed nature of the knots, or of the timber generally. I dare say he is right, and that it is one of the good old Anglo-Saxon words still to be found amongst the commonalty, used in its true and original acceptation. We may follow this out another day.—*P. P.*—[What Shakspeare meant was, I conceive, this: as the descending fibres from the leaf and leaf-buds (had they to encounter no knots to obstruct and make them to grow "tortive and errant," which he has so naturally described,) would have gone straight down in direct lines, so would the Grecians have accomplished their meditated conquest in less time, as he (Agamemnon) thought, had matters gone on in a straightforward course, as was anticipated when they were first planned. Probably Shakspeare had in view something of the tortive and errant growth of wood when obstructed by branches or knots, when he was writing of the "unwedgeable and gnarled Oak" of England, in *Measure for Measure*, Act. ii., sc. ii.—*W. Billington.*]

Oxalis crenata.—I see the shoots of this plant recommended for tarts. It is well to remind your readers of delicate stomachs that the acid is, I believe, oxalic acid (and so, I believe, is the acid of Rhubarb), and with many produces derangement. I recollect Dr. Prout saying he considered a large tart of Rhubarb to contain enough of acid to kill a very delicate patient. I think you might give a classification of the different acids of fruits, showing that their comparative wholesomeness depends on the acid they contain. I believe tartaric acid is considered the one which most generally agrees with delicate persons, and hence the fact that Grapes are in general found the most wholesome fruit.—*Totty.* [We fear that the composition of fruits is as yet too little known to enable us to fulfil *Totty's* request. Oxalis crenata, as well as most of the species of Rheum, do certainly contain oxalic acid; but the quantity which plants contain of such acids is variable, depending upon the weather and a variety of different causes. It must be remembered, too, that constitutions vary greatly, and that a scale of wholesomeness of fruits would not be applicable to all. *Totty's* suggestion shall not be forgotten, and, if possible, shall be acted on.]

Transplanting Firs.—Although the answers of your correspondents vary as to the best time of transplanting Hollies, I am well content to have led to the discussion, and I think all must admit that the discussion has led to good. The same observation applies to ice-houses. I now wish to learn what is the experience of your readers as regards the transplanting large Fir-trees, such as spruce and Scotch Firs. I am very desirous of supplying the place of some large trees, ten or twelve years old, that have been destroyed, and should be glad to know if any one has any experience on this subject, as to size, time of planting, &c.—*Totty.*

Edgings.—Many plants for walks in shady places have been recommended as edgings, but only a few of them are suitable. Tussilago alpina, however, makes a nice compact edging; and I have also seen Erinus alpinus form a beautiful edging in a shady situation, and it is remarkable for its beauty late in the spring.—*J. R., Northampton.*

Country Shows.—In page 830 (1841) there is an article by Mr. Beck soliciting a correspondence on the subject of uniting those small horticultural societies which are contiguous to each other into one body, so as to enable them to hire a place suitable for the exhibition of plants, &c., and award exhibitors prizes somewhat equal to their merits. As your correspondent justly remarks, these societies as they now are have much to contend with; and I fear that, unless the managers of them bestir themselves and act with that unanimity which ought to exist in such associations, many of them must ultimately cease to exist. Mr. Beck suggests a union of the Windsor, Sunbury, and Staines societies, and that they should hold their meetings at the latter place. I would, instead of recommending Sunbury to join Staines, advise its committee to endeavour to arrange with those of Kingston, Teddington, Wandsworth, &c.; and that they should hold their meetings at Richmond. If arrangements could be entered into with Mr. Ellis for his large concert-rooms at the Castle Hotel, surely the most fastidious could have no plea on the ground of want of respectability and accommodation for withholding their patronage. It may be asked by those who have an interest in these societies as they are at present conducted, why I, as an anonymous correspondent, should endeavour to prevail upon the gentlemen forming their committees, to concentrate them at Richmond. Should there be any such, I would tell them the rooms I have mentioned are, for such a purpose, second to few, if any, in Britain: Richmond is a place of fashionable resort, and the town and vicinity are more thickly peopled by those likely to support such an institution than any other with which I am acquainted. I think all would be glad to see a provincial society established near London of such a character as would enable the exhibitors to attend without the entailment of a dinner, as at present is too frequently the case where shows are held at second and third-rate public-houses.—*J. B. L.*

On Transplanting Evergreens.—The best time to transplant Evergreens is, in England, from the middle to the end of April; and in Scotland, from the 1st to the middle of May. The many opportunities which I have had of witnessing as well as conducting such operations, enables me to come to this conclusion. When there is time to make preparation for transplanting large Evergreens, it will be found advantageous to cut the roots with a spade from a foot to 16 inches from the stem, and dig a trench a foot wide, and sufficiently deep to allow of cutting below the roots. The trench should be made in the beginning of May, and remain open for ten days.—*Clereinch.*

---

* Lindley's Elements of Botany, p. 97.

Edgings.—Mr. Caie's information respecting Edgings is no improvement; for who would use Myosotis arvensis, an annual plant, as a substitute for turf-edgings—or any of the Cerastiums (Mouse-ear Chickweed), instead of Box, when they could get other plants that would answer better?—*Clereinch.*

Govénia lagenóphora.—I have grown this very strong Orchidaceous plant by treating it as a swamp plant in very sandy peat. Having filled a 24 with about two inches of crocks, I place over them a layer of spongy peat for two or three inches more, and then fill it up with nearly equal quantities of sharp sand and heath-mould, so that the surface is nearly all sand. Place it near the light, in a cool part of the stove, about 60 deg., and keep it very wet as long as it continues growing. It generally flowers in April or May. Its roots run very near the surface, apparently delighting in air and moisture. With me it has been removed to the greenhouse after flowering, and kept quite dry in the stove from Oct. to Feb.—*J. R.*

Planting Trees on Clay Soil.—I believe no one fond of gardening suffers from a cold stiff clay more than I do; when I attempt to dig a hole to plant a tree, the very insertion of the spade puddles the sides, and I make a water-holding dish; and even the most careful draining is unavailing. As I am planting a new orchard, I got the soil and turf from an old hedge, and determined to dig no holes at all, only to chop up the top of the grass, and plant the trees above ground, heaping round the roots the soil imported from the old hedge; thus, at all events for some time, being certain that I shall not want draining; and as regards the summer and spring droughts, I must water and mulch; all which I am content to do so long as I keep away from the clay. But, alas! there is nothing new under the sun; whilst I was contemplating a very original communication to your Paper on this subject, my old workman, to whom I was explaining my intentions, said, "I understand old Mr. — always planted his Apples so, and he had the best orchard hereabouts—I helped him plant one forty years ago!" However, though this be no discovery, the hint may be of use to some of your readers who may live on the London blue clay.—*Totty.*

Effects of different Stocks upon the Quality of Fruit.—Having seen in several of the late Numbers of the *Gardeners' Chronicle* observations on the effect of stocks upon the quality of the fruit, wherein I believe you to be in error, I beg to offer my experience and observations on the subject, as they may be of service to some cultivators of fruit-trees. In one place you say, the stock has very little or no effect upon the quality or size of the fruit, and that it only occasions the tree to bear sooner when grafted on some kinds than on others; and in another place you observe, that it only gives the fruit a higher colour if grafted on Paradise stocks. Many years ago I budded a Bergamot and a Swan's-egg Pear upon a Jargonelle on a south wall. I was surprised to find them produce fruit nearly as large again as I had ever seen the kinds bear before on any tree or aspect, and the flavour was much improved; I could not have believed it had I not experienced and seen it myself. I have known and seen Apples grafted upon the old English Codlin, Gennet Moil, and other Apple stocks, increased by burr knots, having a tendency to emit roots at the joints above the ground; I have several varieties of these on which I am trying experiments. The effects on the Apples worked upon these stocks which I have seen were similar to the Pears I have mentioned; the King of the Pippins was one, and the best judge of Apples would not have conceived it to be the same when grafted on one of these stocks (a Burr knot), as when on a Crab stock, the former being so much larger and better in every respect than the latter. I have seen the Orange Pearmain and others worked on the English Codlin, and besides improving their flavour and size it also made them more prolific. I have budded Jargonelle and other Pears on the common Hawthorn and Mountain Ash, on which they took freely; the Pears on the Hawthorn have borne fruit three years, but the fruit is not half the common size and scarcely eatable, being harsh and gritty, and having a hard core; the effect produced was that it bore in about three or four years from the working: my stocks of Hawthorn were young shoots in the garden hedge. The Pears on the Mountain Ash have not yet borne any fruit, as the stocks were younger; therefore I can say nothing as to the size or flavour, but I have done working upon such stocks, as I expect no better fruit from the Mountain Ash than I have had from the Hawthorn; and, indeed, the graft appears not to thrive so well on the former as on the latter. The conclusion I have come to is this—that independent of the improved size and flavour upon such stocks as the above-mentioned, I think a harsh, tart Apple will be much improved in flavour if grafted upon a stock of a milder sort, and a soft vapid one on a Crab, and a late austere Apple double-worked upon a luscious early Apple would be improved both in flavour and earliness. The same will apply to Pears, as the late or gritty Pears might be much improved in flavour and time of ripening by double-working on the Jargonelle and other early buttery or melting Pears. But these observations are not offered from experience; I have budded Peaches and Nectarines on the Moorpark Apricot, which greatly improved them in size and flavour. Would not, then, some of the late Peaches be much improved and come earlier into season by being worked upon Apricots; and Apples, Pears, and other fruits be retarded in their time of ripening, and otherwise altered by working upon later stocks?—*W. Billington, Underhill.*—[If an article at p. 307 of the *Chronicle* for last year is referred to it will be seen that much of this has been anticipated by ourselves.]

Sulphuric Acid and Bone-dust.—As to the question by *Rusticus*, in your last Paper, about applying acids to bones, in the experiments by Mr. Fleming, of Barrochan, near Paisley, as narrated in the Appendix to Professor Johnston's Lectures, Mr. F. found that bones mixed with sulphuric acid, and applied to a crop of Oats in peat-soil, produced much more effect than where the bones were applied without acid. Professor Liebig has advised the using of vitriol with the bones. The phosphate of lime, which is much needed for grain, is not soluble in water. There is a superfluity of phosphoric acid in the bones themselves; and the phosphoric acid found in all soils, and the acetic acid given off from the roots of trees, with the slow but long-continued action of the carbonic acid on the soil, may be sufficient when the bones are applied to Turnips, where the phosphates are not so much needed, and the gelatine of the bones is likely to be the most beneficial; but when applied to grain crops, the mixture of vitriol will be useful for immediate effect.—*R. Lymburn, Kilmarnock.*

Gooseberry Caterpillars.—"W. J." writes that some years ago, the Gooseberry bushes in the garden of J. Wedgewood, Esq., were very much injured by caterpillars, and in order to destroy them some Foxgloves were boiled, and the liquor strained from them mixed with pure water; when it had cooled, it was thrown over the bushes in the form of fine rain by means of a syringe, and the following day all the caterpillars were lying dead under the bushes.

Vegetable Cookery.—Mr. Paxton, in his late valuable Cottage-garden Calendar, tells us under this head, Carrots are usually boiled with salt beef and pork; surely it is considered better cooking to put Carrots and Parsneps in fresh water without any other thing to preserve their flavour and sweetness.—*W. Mason.* [Mr. Paxton's advice was to the *cottager* only.]

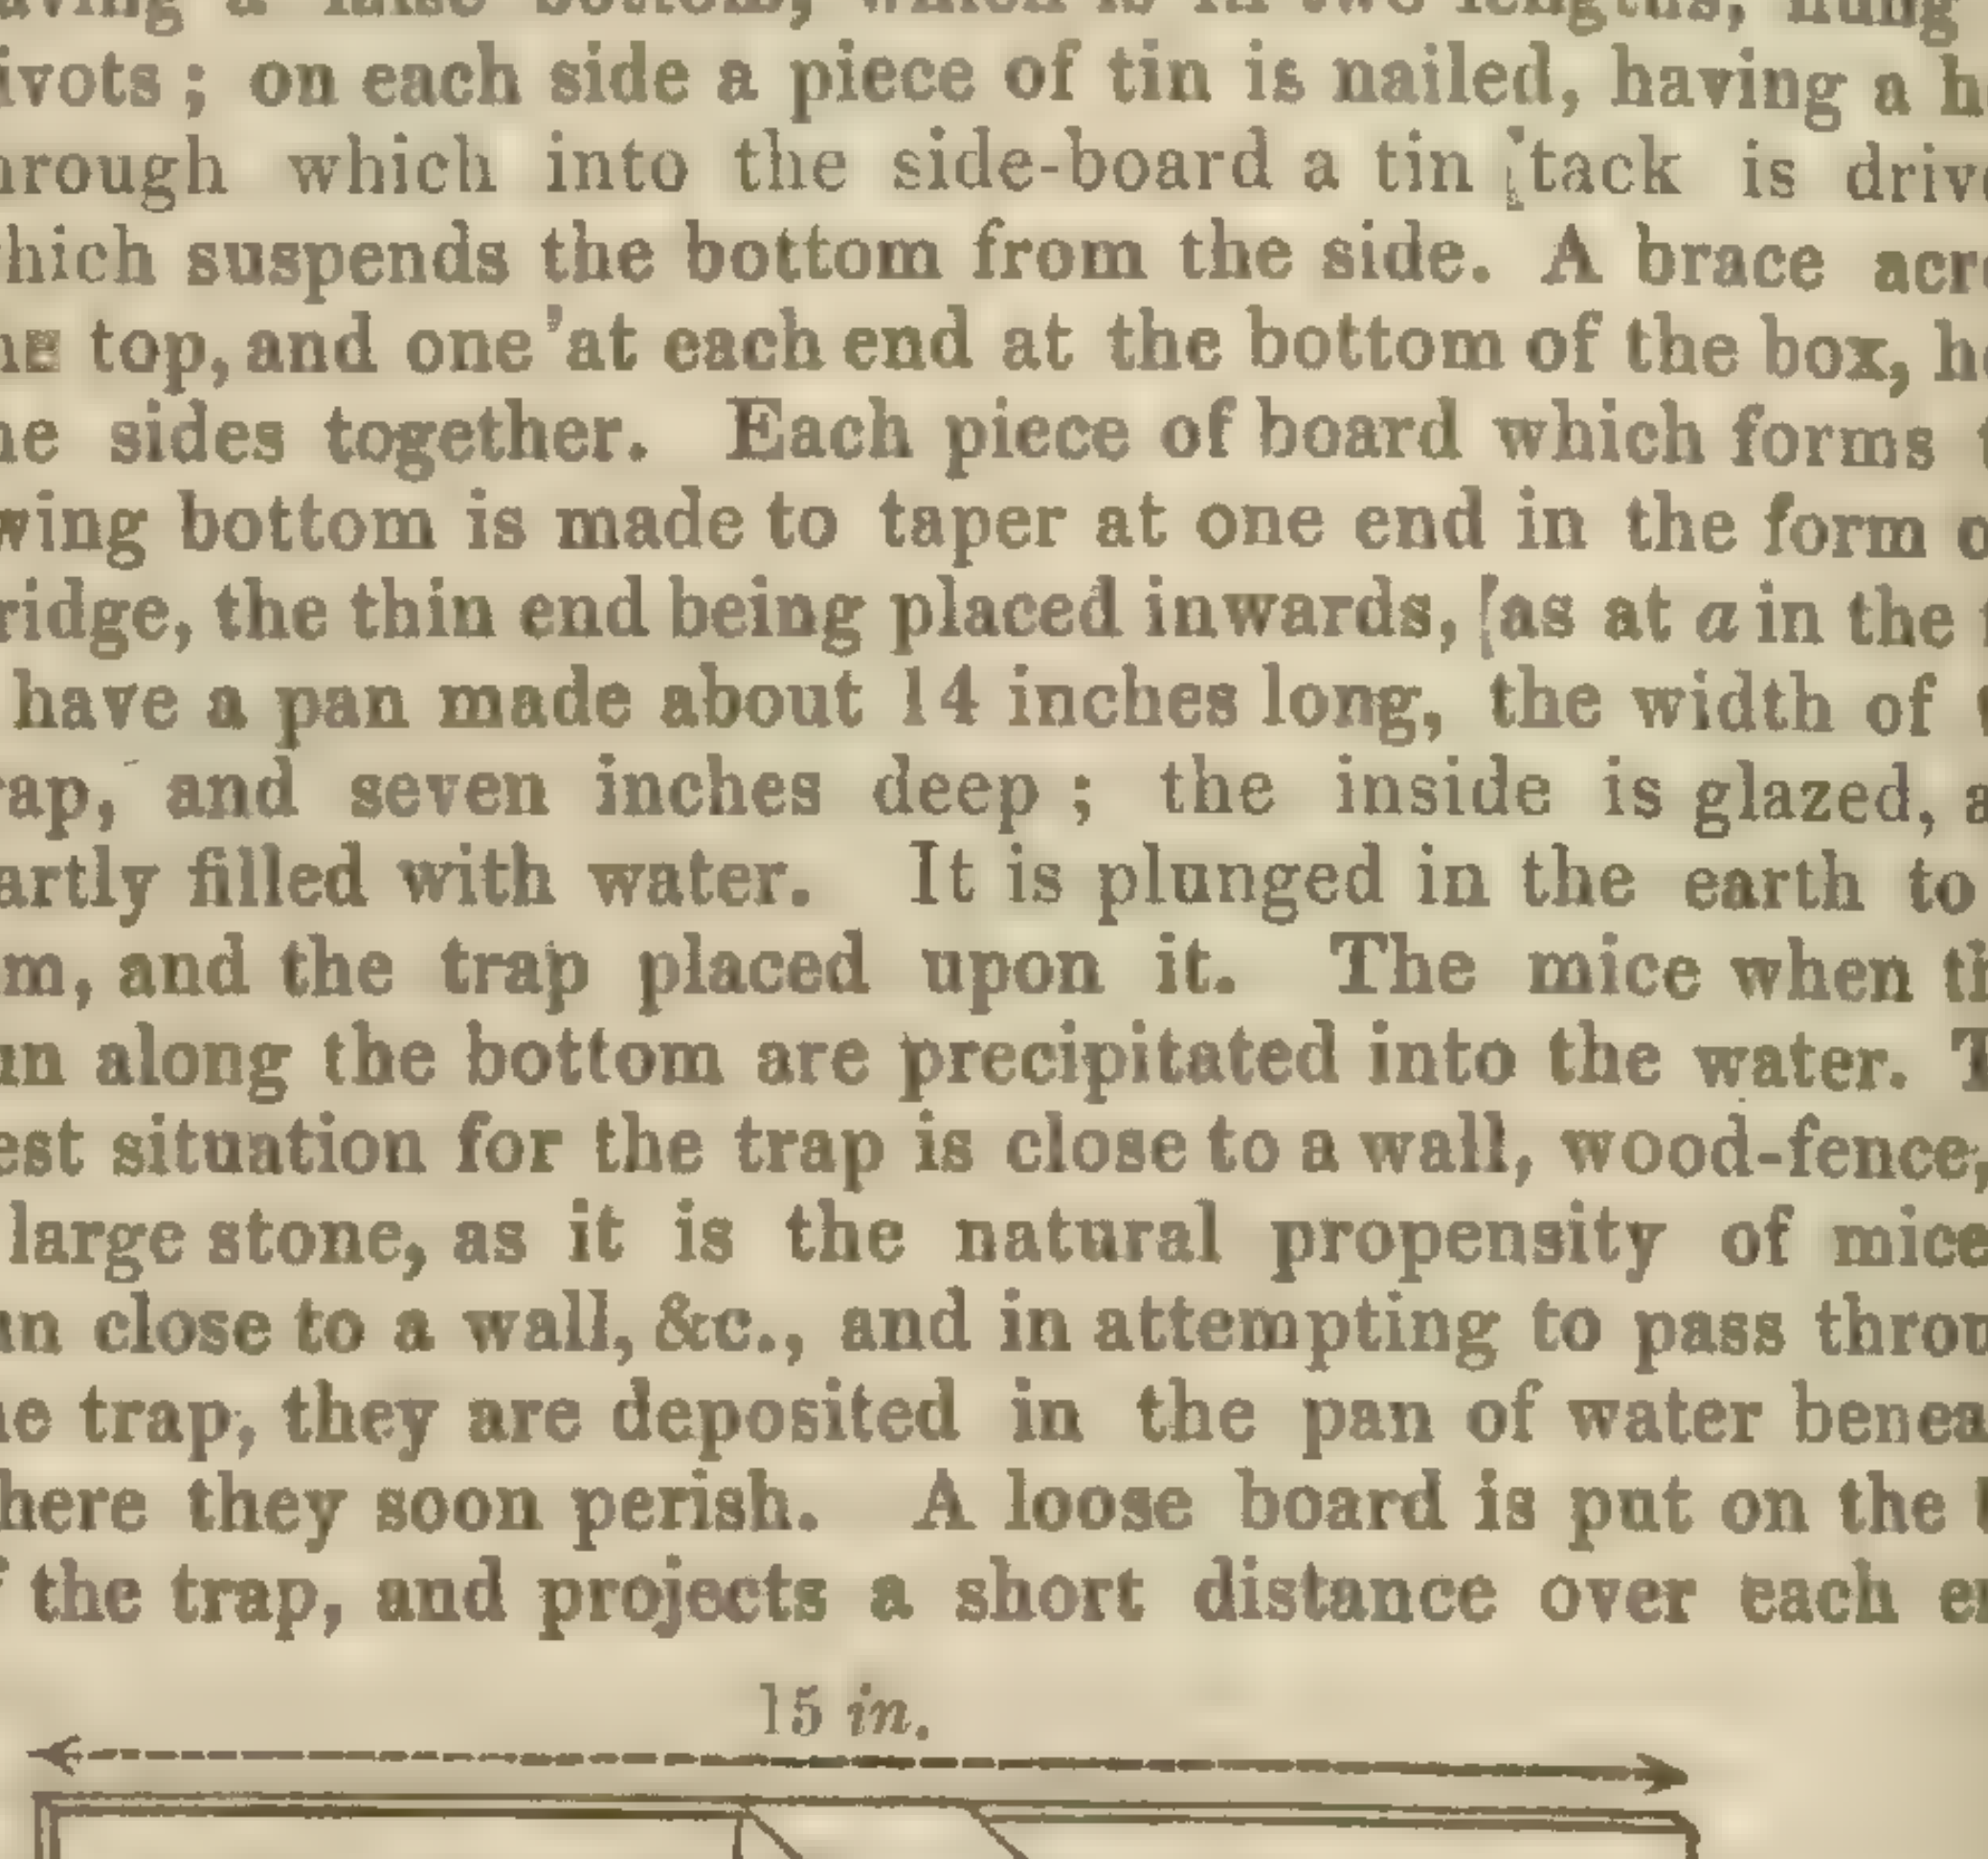
Genus Citrus.—A novelty has broken in upon us: swallows and cuckoos are, in some cases, we find, admitted fit inmates of an orangery—and upon the same principle I suppose that guano is considered an acquisition by the farmer. I feel greatly obliged for your correspondent with many letters' notice of the incumbrance we have entailed upon the *Gardeners' Chronicle* by our correspondence. But people who live in glass houses must not throw stones.—*W. Mason.*

Law of Gardens; Overhanging Trees.—As trees become the frequent source of dispute between neighbours, upon questions to whom they or their produce belong, and when they may be cut if overhanging the land of another, I trust a few explanatory remarks upon the point, at this season, will not be considered ill-timed, more especially as it may be the means of preventing some of your numerous readers from committing any act which might entail upon them the expense and annoyance of an action of trespass. It has been observed by a gentleman of high legal attainments, that although the law on the present subject is well defined by the French code, yet it is not so distinctly laid down in our own; and after a very careful search of the books, I certainly coincide with this opinion; the authorities, nevertheless, are very meagre indeed. The result, however, of the older cases, cited in "Viner's Abridgement" is, that if the branches of a neighbour's trees overhang a party's land, he is justified in entering on the lands of his neighbour, and cutting off such branches; and although it is a general rule before an individual can abate a private nuisance, not of commission, but of mere omission, there must be a previous request on the party himself to do it, 2 B. and C. 302; yet it seems there is a solitary exception in the case of trees overhanging a public road, or the private property of the person who cuts them, for it was observed by Best, Chief Justice, in the case of the Earl of Lonsdale *v.* Nelson, "that the permitting the branches of a tree to extend beyond the soil of the owner, is a most unequivocal act of negligence, which distinguishes it from most of the other cases that have occurred; and that a party, under such circumstances, would be perfectly justified in abating the nuisance, even without notice." Notwithstanding the foregoing authority, I would always recommend in every instance, where practicable, that a notice should be given prior to entering upon the land of another and cutting his trees. The few following questions, respecting the right of property in trees, appear to me the principal ones likely to occur in our daily intercourse with each other; and I shall, therefore, merely enumerate them, without entering very deeply into the subject, which would extend my communication to a useless and almost interminable length. It has been held, that if a tree grows in A.'s close and roots in B.'s, yet the body of the main part of the tree being in the soil of A., all the residue of the tree belongs to him also, Roll. Rep. 141; but if it grows in a hedge which divides the lands of A. and B., and the roots took nourishment of both their lands, it was adjudged they are tenants in common of it, Ibid. 355. And it seems clear that if fruit falls from a tree into another's grounds the owner may go in and take it, per Doderidge, Justice, in the case of Millen *v.* Fandry.—*C. K.*

Celeriac and Rampion.—As the discovery of a new and valuable property in an old edible vegetable cannot be of much less value than the discovery of a new one, I offer the following to the notice of your readers:—I got some of the large Turnip-rooted Celery seed from Paris, and desirous of giving it full time to grow, I sowed it in a hotbed early in January, and afterwards in due course pricked it out, and planted it in the expectation of getting a crop of the roots, but I was disappointed; the plants all ran up to seed-stalks: at first, as they appeared to run, I drew them up, and threw them away; but as I drew up some of the last and largest, one of the stalks broke off short, and having a solid heart or pith, I peeled and ate it, and to my surprise I found it to be as delightfully crisp and deliciously flavoured as the finest blanched Celery; thus when too late I discovered its value to be that of furnishing delicious Celery for salads two or three months earlier than the common Celery can be grown and blanched; not being aware that the Celeriac of this country was the same, I have been some time without it. It is probable, also, that many of your readers may not be aware that the Campanula called the Rampion affords a green that is most excellent, eaten raw as a salad, or boiled as Spinach, and the root makes an excellent substitute for Walnuts.—*S. T. V.*

Rhubarb.—For some years past I have grown my Rhubarb in chimney-pots; by placing a pot over the crown of the plants early in the spring, the leaves are not only made to grow more rapidly, but the stalks are drawn up so much longer as to furnish double the quantity in weight, and the flavour is much superior to that grown in an exposed manner; it is more delicate, and free from the medicinal taste. Perhaps an equally efficient protector might be made by bending one of Croggon's pieces of asphalte covering of 5ft. 6in. long and 32in. wide, and fixing it to a stake; it would be less expensive, and less liable to loss by breakage.—*S. T. V.*

Mouse-trap.—I have used the following kind of mouse-trap for several years, and have seen none better when placed in a good situation. It consists of a box, with two sides, open at the ends, 15 inches long and 4½ inches wide, having a false bottom, which is in two lengths, hung by pivots; on each side a piece of tin is nailed, having a hole through which into the side-board a tin tack is driven, which suspends the bottom from the side. A brace across the top, and one at each end at the bottom of the box, hold the sides together. Each piece of board which forms the swing bottom is made to taper at one end in the form of a bridge, the thin end being placed inwards, [as at *a* in the fig. I have a pan made about 14 inches long, the width of the trap, and seven inches deep; the inside is glazed, and partly filled with water. It is plunged in the earth to its rim, and the trap placed upon it. The mice when they run along the bottom are precipitated into the water. The best situation for the trap is close to a wall, wood-fence, or a large stone, as it is the natural propensity of mice to run close to a wall, &c., and in attempting to pass through the trap, they are deposited in the pan of water beneath, where they soon perish. A loose board is put on the top of the trap, and projects a short distance over each end.



I have caught by this means a whole family of nine in a night. All the attention required, after being properly set, is to see that it acts well, and to empty the pans occasionally of the vermin caught. Any carpenter can make the trap, and any potter the pan. I place traps of this description in different parts of the garden, where they are most wanted, and I am sure not to have a pea touched throughout the winter.—*Joseph Wells, Gardener, Redleaf.*

Leonotis Leonurus.—"P. W. J." states that in reference to the remarks of "J." in p. 85, on his paper on the cultivation of Leonotis Leonurus, in p. 4, he did not say it required any particular temperature, but that the thermometer occasionally stood at 120° in the heat of the day in the house where it was placed.

Bees.—"A young bee-keeper" says, that he has been feeding a hive of bees according to the modes recommended by Dr. Bevan in his book on the Honey-bee (edition 1838), first in the trough mentioned in p. 199, and subsequently in that described in p. 200, invented by Dr. Dunbar. He was induced to try the latter from finding that a number of bees fell into the grooves of the former, and were unable to extricate themselves. He gave his bees a good supply of syrup early in December, in Dr. Dunbar's vessel, and did not disturb them again till six days ago, when on taking off the straw cover, he found many lying dead on the top of the float; these he removed, and this morning (Feb. 11) found thirty-seven more dead on the float, and he will be glad to know how this destruction of bees is to be guarded against.

Planting.—In the winter of 1834, I planted a border of trees and shrubs, about a hundred yards in length, to shelter a cottage I was building from the adjoining turnpike road. The trees were principally Huntingdon Elms, and at the time of being planted were about as thick as a man's thumb; several of these trees are now twenty-six inches in circumference at a foot and a half from the ground. The land was trenched, and Potatoes were thinly planted amongst the trees during the first three years without manure; it has since been kept well hoed, and occasionally forked over. I mention this in confirmation of the justice of your recommendation of trenching previously to planting trees.—*G. J. T.*

To grow Grapes in Pots.—In places where there is no early vinery, Grapes in pots are invaluable. To obtain them, I select some well-ripened shoots, and cut them into lengths of about an inch, leaving the wood at the base of the eye the longest. I plant the eyes singly in 60-pots filled with a mixture of loam, leaf-mould, and road-sand, and plunge them in coal ashes till wanted. About the beginning of January I bring them into a temperature of 50 degrees, and keep them in it till the eyes have produced shoots with three or four leaves, when they may be shifted into 48 or 32-pots, and subjected to a stronger heat, such as that of a Pinery, where they must be placed near the glass. When the roots are near the outside of the pots, the shoots are thinned and stopped, cutting the weakest ones the farthest back. A short time after this, when the pots are well filled with roots, the plants are repotted without disturbing the roots, and when they require another shift they are cut back to within 10 or 12 eyes of the point where they were previously stopped. This system of potting and stopping is pursued till the plants are set in their fruiting pots, and when the wood is well ripened, they are plunged in the full sun, and afterwards placed under a north wall, in order to let them rest. After this they are pruned to the required length, and taken to a sheltered situation, from whence they may be placed in moderate heat as wanted, caution being observed in watering them till the buds have broken. By this method I have now Vines showing fruit within 6 inches of the pot.—*J. B.*

The Redstart.—One great enjoyment I have in my garden is found in the birds that frequent it. I have holes in my wall purposely fitted for the occupation of these charming little visitors, and I never allow a nest to be disturbed. What if they do take a little of our fruit?—they repay us with their song, and oblige us infinitely by the destruction of insects and their larvæ. Even the poor persecuted sparrow lends us a helping hand in clearing the caterpillar for the food of its young. Many are the interesting facts that might be contributed by gardeners if they would but learn to look on the feathered creation with an eye of love instead of the usual bitter hostility. In the year 1835 a pair of redstarts built in my garden upon the ground in an inverted garden-pot, their only entrance through the hole. Just after the young (7) were hatched, my cat killed the hen. The cock continued his attentions, and it was a touching sight to witness his exertions to procure them food, particularly at the time when ready to fly, a time delayed considerably from the difficulty the young found in making their exit. They accomplished it at last, to the great delight of the poor widower. Here was an instructive example. May its relation induce others to communicate facts of a similar kind which they may have observed!—*E. Beck, Slate Works, Isleworth.*—[We wish most sincerely that it may. Some simple papers on the ornithology of our gardens might be very entertaining, if confined to the habits of birds, and the services they render us.]

PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

Feb. 15.—W. H. Pepys, Esq. in the chair. Grafts of the following fruits were distributed:—Royal Hâtive Plum, an excellent purple variety resembling the Reine Claude Violette, but it ripens earlier and has downy shoots: Knight's large green drying Plum, a kind as large as the Washington, and higher flavoured; it also dries like a Prune: Büttner's October Morello Cherry, a variety that retains its leaves much later than any other Cherry; the fruit may also be gathered from a standard in October, and probably much later if grown against a wall: and Hacon's Incomparable Pear, one of the best hardy varieties; the fruit is middle-sized, handsome, and very rich and buttery. It was announced that a new Part of the Transactions would be ready for delivery in about a fortnight. Mrs. Lawrence exhibited a fine specimen of Dendróbium nóbile, bearing a profusion of beautiful flowers, much more highly coloured than usual. In company with this was one called D. Wallíchii, apparently only a variety, with smaller and less brilliant flowers. With these were handsome specimens of the Black-anthered and Willmore's Heath, Bilbérgia bromeliæfólia, with several crimson spikes, and Clívia nóbilis; a Knightian medal was awarded for the D. nóbile. From J. Allnutt, Esq. was a specimen of Caméllia Doncklaérii, with several of its handsome flowers in high perfection: with this was a plant of C. reticulata, and a box containing cut flowers of several excellent varieties. A certificate was awarded to Mr. Edmonds, gr. to the Duke of Devonshire, for a specimen of Miltónia Russelliana, with several fine spikes of flowers, which however, probably from their being produced at this season, were not properly expanded. Mr. Gaines exhibited a seedling Cinerária, named Prince of Wales; its colour was bright crimson purple. From Mr. Bissett, gardener to T. Williams, Esq., were three handsome Enville Pine Apples, weighing respectively 3lbs. 12 oz., 3lbs. 7 oz., and 3lbs. 1 oz.; a certificate was awarded for them. W. H. Pepys, Esq., exhibited some Glout-morceau Pears in excellent condition; they had been preserved on railed shelves, between layers of straw in a fruit-room, kept close. Mr. Charlwood exhibited some preserved Tomato Figs, described in the present volume at p. 95. Mr. Chapman sent a sample of his "new" spring Potato, which although old, possesses the quality of a new one. From C. B. Warner, Esq., there was a "Portable Horticultural Water Engine." The peculiarities of this instrument are a portable telescope branch, by which plants in an elevated position may be watered without difficulty, and a valve by which the stream of water can be instantly shut off. Among the plants from the garden was Odontoglossum pulchellum, with a spike of lovely white flowers as fragrant as Violets; this kind succeeds perfectly in a house where the temperature is moderate;—Bifrenária aurantíaca, with orange and brown blossoms; Oncídium leucochilum, remarkable for its beautiful lip; a Maxillária, somewhat like aromatica, but not quite so sweet; Dendróbium nóbile and cucullatum; and the curious Mormodes lineatum. The cut flowers were two varieties of Chimonanthus, and Gesnera longifólia, a kind newly imported from Guatemala, which grows perfectly well if treated like a Gloxínia.

LINNEAN SOCIETY.

Feb. 15.—Robert Brown, Esq., in the chair. This being the evening appointed for the election of a librarian in the room of the late Professor Don, the interest evinced on the occasion was attested by an unusually large attendance of Fellows. There were two candidates for the vacant office—Dr. Lemann, M.D., Fellow of the Royal College of Physicians, and a Fellow of the Society, and Mr. Kippist, the assistant. This election has for some time excited very considerable interest, as it was known that the Fellows of the Society were nearly equally divided on the question. On the one hand, Dr. Lemann was well known for his scientific acquirements and honourable standing in the medical profession: whilst, on the other hand, Mr. Kippist was only known for his obliging disposition, and as a useful servant to the Society. Messrs. Bentham and Yarrell were appointed scrutineers. At 9 o'clock the poll was closed, and the President announced that the numbers were—For Mr. Kippist, 87; for Dr. Lemann, 69. Although the latter gentleman was defeated, he has the consolation of knowing that he had the sanction of the Bishop of Norwich, the President, and Professor Henslow, who were absent, and the votes of Mr. Robert Brown, Sir J. Barrow, Rev. Mr. Barlow, Mr. Barnard, Mr. Bentham, Mr. De La Beche, Dr. Boott, Mr. Bennett the Secretary, Mr. Curtis, Mr. Children, Sir A. Crichton, Dr. Fitton, Professor Grant, Sir W. Hooker, Dr. Lankester, Professor Lindley, Mr. Loddiges, Mr. Miers, Mr. Murchison, Mr. Ogilby, Professor Owen, Professor Royle, Sir G. Staunton, Sir James South, Mr. C. Stokes, Mr. Edward Solly, and many other well-known friends of science.

MICROSCOPICAL SOCIETY.

Feb. 10th.—Professor Lindley, president, in the chair. Prof. Rymer Jones, of King's College, London, and three others were elected fellows. A paper was read by Mr. White upon the species of Xanthídia occurring in flint. The author minutely described 12 supposed species distinguished by the number and termination of their tentacula, and illustrated them by highly-magnified figures. At the conclusion of the paper the author invited the attention of artists employed in making drawings of microscopical objects, to the necessity of forming their ideas of the structure to be represented, from a consideration and comparison of numerous individuals, out of which a perfect specimen might be constructed. This he regarded as a better method of proceeding than by attempting to delineate from single individuals mutilated and distorted, whatever accuracy might be brought to such a task. An interesting discussion followed, in which Prof. Owen and Mr. Bowerbank took part. The members then proceeded to examine the admirable achromatic microscope made for the society by Mr. Powell.

Ipswich Cucumber Society.—The first show took place at the Mechanics' Lecture-room, on Feb. 8th, but was not so large as expected, as several Cucumber-growers who had entered did not exhibit; one had not entered properly, and two brace arrived too late—a circumstance much regretted by the committee. The great attraction of the day was Mr. Mills's brace of fruit, which won the first prize cup. After the show about twenty of the members dined together. The Secretary stated that the funds would enable the Society to offer several good prizes in May next.

THE JUDGES' DESCRIPTION OF THE SPECIMENS EXHIBITED FEBRUARY 8th, 1842.

SAML. GIRLING, WM. GOLDING, EDW. KERRIDGE, *Judges.*

THOS. WILD, *Hon. Secretary.*

AGRICULTURAL SOCIETY.

Feb. 9th.—H. Handley, Esq., president, in the chair. Sixty-five gentlemen were elected. The Duke of Richmond, chairman of the General Bristol Committee, laid before the council the final report of the committee on the subject of the general regulations for exhibitors at the show, and the distribution of the prizes for agricultural implements to be awarded at the meeting at Bristol; and this report was adopted by the council.—Several gentlemen requested to become subscribers to the cheap edition of Mr. Main's paper on cottage gardening; and the council decided that the copies should be supplied at the rate of one penny each, in order to ensure a wide distribution of the work among the cottagers throughout the kingdom.—S. Solly, Esq., F.R.S., expressed his willingness to translate for the society numerous interesting extracts on agricultural topics from a Swedish work on rural economy in his possession; a proposition which the council acceded to.—J. Benett, Esq., M.P., and T. Ferris, Esq., presented their report of results obtained on their farms in Wiltshire, in the model experiment on the growth of Swedish turnips. J. Sybray, Esq., of Snitterton Hall, near Bakewell, presented the results of his experience in the use of lime, and his management of farm horses.—J. Ellis, Esq., of Barming, Kent, informed the council of the invariable prevention of smut in wheat, which had for 30 years, and on a farm of from 200 to 350 acres, attended his scalding the blackest wheat in boiling water, and afterwards drying it with lime: the wheat placed on a colander, or in a basket, being immersed in boiling water for a few seconds, just long enough to completely wet it, then immediately dipped in cold water; and afterwards dried with lime, mixed with the other wheat, and sown. By this means the wheat was always found to be cured of smut, while the vegetating principle was uninjured; great care being taken that the water was boiling, and the wheat taken out of the water as soon as completely wetted. Mr. Ellis tried an experiment on a bushel of the blackest wheat he could procure, which he divided into sixteen equal parts, sowing them all on the same day, but with different treatment. The result at harvest was, that the wheat sown without preparation produced 33 black ears out of every 100, while that dipped in the boiling water and limed had not a black ear in several thousands which were examined.—Communications were received from Mr. Gabell of Hollyfield, on the propriety of ringing bulls, with a yard and half of chain attached; from Mr. Glencross, on sheep-yards; and from Mr. Fox, transmitting the reports of the Huntingdonshire Agricultural Society. Mr. Hyett presented a copy of his Lecture delivered before the Painswick Farmers' Club, "On the Chemical Effects of particular Manures on particular Crops;" and Professor Johnston, a copy of his Letter to the Marquis of Northampton, on the question, "What can be done for English Agriculture?"

FLORICULTURAL SOCIETY.

Feb. 15.—Mr. Shears in the chair. Mr. Keynes was elected. It was agreed that a lecture or paper on some subject connected with Floriculture should be read on the first Tuesday in the month, and that a discussion on it should take place at the next meeting. The following gentlemen having consented to give either a lecture or a paper at the undermentioned meetings, votes of thanks were given them; viz.—March 1st, Mr. Dickson on the Auricula; April 5th, Mr. Groom on the Tulip; and May 3d, Mr. Fox on the Pelargonium. This resolution, if carried out to its fullest extent, will, we think, raise the character of the Society higher in public estimation, and be the means of introducing many improvements into the science of Floriculture.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

FU'CHSIA RA'DICANS. Rooting Fuchsia. (*Greenhouse Shrub.*) Onagráceæ. Octándria Monogýnia.—"A long trailing perennial shrub, the stems of which, much branched, attain a length of twenty feet and upwards: these main stems are about half an inch in diameter, of a pale brown colour, and rough from the irregular splitting of the several coats of bark: the younger branches are purplish and smooth, and those which are floriferous present generally smaller leaves. The nodose axils of the branches, after the second year, throw out many stoloniferous shoots, which frequently take root upon the trees on which the plant clings for support. The root consists of a mass of long slender fibrils, closely matted together. The leaves, sometimes opposite, often three or four in each axil, are elliptic, roundish at base, with an acuminate apex, three inches long by one and a half broad, obsoletely denticulate, quite glabrous, except beneath on each side of the midrib, where a little pubescence is seen. The petiole is half an inch long, fleshy, terete, channelled above, glabrous, and purplish red, which colour also shows itself on the thickened midrib and the under part of the young leaves. The stipules are interpetiolar, with a very acute reflected deciduous apex, and at the base forming thickened glands, which give a remarkably nodose appearance to the axils. The flowers, equal in number to the leaves in each axil, and about two inches in length, are pendulous upon slender reddish peduncles of the same length. The calyx is of a bright scarlet; the tubular part, which is about equal in length to the lobes, is slightly contracted in the middle, where the petals and stamens are inserted, quite glabrous outside, but slightly pubescent within, the upper half being funnel-shaped. The border, which is much expanded, is divided into four equal, rather fleshy, lanceolate segments, suddenly acute at the apex. The petals, convolutely embracing the stamens, are cuneate, of a deep purple colour, and almost wholly enclosed within the tubular part of the calyx. The stamens, of a deep red colour, are filiform, and of considerable length; four being somewhat longer than the calycine segments, the other alternate four being of still greater length. The style is filiform, somewhat longer than the stamens: the exserted portion is deep red, polished and glabrous; that within the calycine tube is paler, and rather pubescent. The stigma is red, polished, clavate, with a four-lobed apex. The berry is ovate, of a deep reddish purple. I was greatly struck with this beautiful species when I first met with it in the Organ Mountains in 1829, clinging in long festoons from a very tall tree, and exhibiting abundance of its brilliant flowers. It was also collected by Mr. Gardner, when he first botanised in the same range; and on my last visit to those mountains I planted a cutting, which I succeeded in bringing home, and which, although nearly four years old, has only now shown its first blossom. The main stem has attained a length of eighteen feet, and it has many accessory branches of nearly equal length; the older stems throughout their entire length exhibit at each axil the peculiar stoloniform shoots shown in the drawing, and these are sometimes observed also in the internodes bursting through the bark. It appears to me quite a novel species, approaching F. affinis of St. Hilaire, but differing in the proportions of its calyx, and in its general habit, in which last respect it bears a greater approximation to F. apétala, and F. simplicicaúlis, of R. and P. whose branches are represented as having similar radicant shoots. From its handsome flowers, and trailing habit, this species is likely to become a favourite ornament in greenhouses, where it will flourish well; for though its native place is just within the tropics, it grows at an elevation of 3,000 feet, where it experiences during the nights of the Brazilian winter in those regions a temperature frequently as low as 35° to 40° Fah."—The foregoing account is by J. Miers, Esq., who introduced this remarkable species to this country. Although a native of Brazil, it seems to succeed perfectly in the greenhouse or conservatory. It is a free grower, and requires much the same treatment as the other Fuchsias in cultivation. It has a pendent trailing habit, and if planted in the border of the conservatory and trained to a pillar or stake would look well, particularly if it flowers freely. From its habits however, and general appearance we should have feared that it would not have turned out such a free bloomer as the others, had it not already flowered on small plants at Birmingham. It strikes easily from cuttings.—*Bot. Reg.*

MISCELLANEOUS.

The Acacia.—We understand that a work on the growth, qualities, and uses of this forest tree is about to appear from the pen of Mr. Withers, of Holt, a planter of great experience, and the author of several important memoirs on foresting.

Animal Weather Prophets.—Spiders generally alter their webs once in twenty-four hours; and a rule has been deduced from this by an attentive observer of these natural prognostics, whereby to foretel the coming change. If they thus alter their web between six and seven in the evening, there will be a fine night; if in the morning, a fine day; if they work during rain, expect fine weather; and the more active and busy the spider is, the finer will be the weather. If spiders' webs (gossamer) fly in the autumn, with a south wind, expect an east wind and fine weather. If garden spiders break off and destroy their webs, and creep away, expect continued rain and showery weather.—The leech also possesses the peculiar property of indicating approaching changes of the weather in a most eminent degree. In fair and frosty weather it remains motionless and rolled up in a spiral form at the bottom of the vessel; previous, however, to rain or snow, it will creep to the top, where, should the rain be heavy, or of long continuance, it will remain for a considerable time,—if trifling, it will descend. Should the rain or snow be accompanied with wind, it will dart about with great velocity, and seldom cease its evolutions until it blows hard. If a storm of thunder or lightning be approaching, it will be exceedingly agitated, and express its feelings in violent convulsive starts at the top of the glass. It is remarkable, that however fine and serene the weather may be, and to our senses no indication of a coming change, either from the sky, the barometer, or any other cause, yet, if the leech shifts its position, or moves about sluggishly, the coincident results will undoubtedly occur within twenty-six hours.—*Meteorological Journal.*

GARDEN MEMORANDA.

Bicton, the seat of Lord Rolle.—The beautiful Doryanthes excelsa is growing with the greatest luxuriance in the Palm-house, and will, no doubt, bloom finely during next summer; and in a cold pit there is Martýnia fragrans, with many of its finely-scented flowers in perfection. The grounds and houses are well sheltered from the wind on all sides by belts of ornamental trees and shrubs placed at sufficient distances to give the whole a light and airy appearance. There is a fine rockery containing a good collection of Alpine plants and Ferns; and in it is a water-pipe so constructed, that by turning some taps the whole may be watered at pleasure when requisite. Here are some remarkably fine old common Laurels, the stems of some of them measuring 5, 6, and 7 feet in circumference: no frost has ever taken the least effect on these ancient specimens. The Arboretum and Pinetum begin here, and extend over between 30 and 40 acres; these form one boundary of the park. A sunk wall of sea-stone upwards of twelve feet deep, substantially built, runs several miles round the park; and the inner fence to keep off the incursions of the deer, with which it abounds, is of strong wrought iron 8 feet high, extending the same distance. All the kinds of Pinus known are here, but the plants are young, as the Pinetum has only been formed a few years. There is a good collection of trees, both native and foreign, and most of them seem to be doing well, so that in a few years the Arboretum will become an interesting object. The Rosary contains a fine collection, and in it there is a remarkable Portugal Laurel, nearly 40 feet high; the stem in several places being 7 feet in circumference: it has a fine bushy top, and rooks build in it On an elevated bank are masses of the finest Hybrid Rhododendrons set well for bloom. A lake is also here, about which quantities of beautiful foreign aquatic birds sport; and in connexion with this is an extensive menagerie and aviary. In front of the mansion there is another lake many acres in extent; this is a beautiful sheet of water, affording a harbour for hundreds of birds. A model of a frigate is floating about, and forms a pretty object from the house. There is a lofty stone tower built on an elevated spot in the plantations, commanding a fine view of the sea and surrounding country; and in another part of the park, on an eminence, there is a neat stone obelisk of considerable height. Through the plantations and the Arboretum is a drive which extends many miles, and Rhododendrons are growing on each side of it. The kitchen-garden is near the mansion, and consists of about two acres within walls: it is in the best keeping, and the wall-trees are all in fine bearing condition. There are excellent ranges of pits and frames, a Pine stove, sheds, and in fact every convenience.—*J. R. S.*

Mr. Beck's, Isleworth.—We visited this place to see specimens of slate, which Mr. Beck manufactures on a large scale, and applies to Horticultural purposes. There are two small greenhouses, one with a span-roof, filled with a collection of seedling Pelargoniums, saved from the best new kinds; they are in high health and extremely interesting. The other house contains some fine new plants of the same class, trained so as to form beautiful specimens all round, and not one-sided, as these things are commonly grown. Slate shelves are used in these houses, and seem to answer the purpose extremely well; some of the slates are eight feet long and four feet wide, and when about an inch in thickness are very strong. We also observed some long narrow slate, like planks, which would answer well where small shelves were required: these of course need no painting, and with ordinary care would last a very long time. Mr. Beck also uses this material for the bottom of frames, where he has some tender plants, and by laying it with a slight inclination from the front to the back, the frame is kept perfectly dry during winter, and the plants preserved from damping. He is trying some experiments with small slate-pots, as gardeners generally believe that plants do not thrive when grown in any material which is close and hard. This is merely for his own satisfaction, as he is perfectly aware that small slate-pots would be too expensive to come into general use. Some Calceolarias and Pelargoniums seemed to be doing admirably in these pots, and a fine plant of Erica Linnæoides had been lately put into one of them, but some time must elapse before it will be affected by this treatment. Large tubs of this material, such as Mr. Beck exhibited at a late meeting of the Horticultural Society, the price of which is about 1*l*.15*s*., will be found useful for free-growing plants like Orange-trees. They are made with wheels on the bottom, so that they can be conveniently moved from one place to another, and the sides can be taken to pieces at pleasure by means of screws and nuts. But what we admired most in the construction of the houses, and what we can most confidently recommend to the attention of every one, is the use of slate tanks for the reception of rain-water from the roof of the house. We have heard of persons sinking deep wells at a great expense, to enable them to get water of the worst description—in so far as plants are concerned, and at the same time making gutters and drains to convey the rain down into the bowels of the earth! Mr. Beck—and we trust every other amateur and gardener—knows better how to value rain-water. These tanks are placed under the stages in the most convenient place; in one of the houses the tank holds 360 gals., which is quite sufficient for a small greenhouse. The flower-garden is very tastefully laid out: in front of, or rather at the back of the house, there is a beautiful grass lawn; in the middle of the garden among some trees there is a pretty rockwork, and that part of it farthest from the house contains numerous beds filled with florists' flowers, among which there are some fine kinds of Tulips. These beds are surrounded with edgings, consisting of long narrow pieces of strong slate, which costs about 2d. per foot; and although it would not look well near a grass lawn, yet for beds where convenience is the principal object, and where common bricks are sometimes used, it answers the purpose extremely well. On observing some holes in an old garden-wall, we were informed they were made for some favourite birds which build their nests there every year.—*R. H., Feb.* 11.

Review.

The Quarterly Journal of Meteorology and Physical Science. No. I. Lumley.

Although the variations in weather are of all external things those which interest us most and in the greatest degree affect our personal comfort, and although man must from his creation have been occupied in observing them, yet are we as much in the dark as ever as to the manner of foretelling what the state of the weather will be on a given day: if we can see 12 hours before us, we think we have accomplished something.

It is the object of the Meteorological Society, whose proceedings we now notice, to gather together the data which really exist relating to this intricate subject, and in that way to contribute to the advancement of a branch of knowledge which has been a fruitful source of profit to quacks and impostors. We wish all success to their laudable endeavours. The Number before us contains some interesting matter, from among which we select the following *Observations*, by Mr. Lawson of Hereford, *upon the manner of placing Thermometers.*

"I had often been led to doubt the accuracy of comparative observations between thermometers that were placed at a distance from each other, when the circumstances of their exact positions, as to height from the ground, or distance from the wall, or other localities, were unknown. On conversing with my meteorological friends as to the indications of their thermometers, and the situations they occupied with regard to shade, &c., and often finding the variations or differences between my thermometers and theirs much greater than the circumstances of the day, &c. seemed to warrant, I was led to inquire whether the temperature of the shady places, or places so called, on which the instruments had been fixed, were at all in unison with each other. And I found, on inquiry, that scarcely any two had been observed under exactly similar circumstances, without which unity no deductions can be drawn with any claim to accuracy. Some thermometers faced the North, some the North-east, some the North-west, &c. &c. Some were 3 to 5 feet from the ground; some 10 to 20. Some were embowered; some placed in a box; some sheltered by a high house or wall; some by a low wall, or by palings; some touching a wall, and others distant from it. Some were in an angle of a high building (cool as a cellar); some exposed to the sun's rays during either the morning or the evening. It is plain, therefore, from the above facts, that no comparative deductions can be drawn from instruments so variously situated. I therefore sought for a plan by which thermometers could be similarly placed, and thus enable the meteorologist to draw correct deductions. To obviate these discrepancies I employ a stand or frame, which I have found to answer the purpose well, as it combines the following requisites or excellences:—It can be placed in any eligible spot that may suit the convenience of its owner. Its four sides may face the cardinal points, commanding, therefore, a true North and South aspect. It can be visited on every side, and be free from all surrounding objects. The instruments used can be read off with the greatest facility, and be placed at a known distance from the ground. Those on the South face will have the meridional sun, and those on the North will be always in the shade, in consequence of the projecting wings.

The stand I have in use is thus furnished:—On the South side is placed an index thermometer with a blackened bulb, to show the greatest solar heat of each day. On the Northern face (at the top) is an index thermometer, to show the greatest cold of the night. Immediately below are two thermometers, each degree on which is divided into 5 parts; the bulb of one constantly wetted by a syphon cistern; and beneath these is an index thermometer, which gives the greatest daily heat of the air in the shade. To the top of this stand a rain gauge could be easily and with advantage affixed.

The stand is of deal painted white, and of the most simple construction, and can be formed by any country carpenter. It consists of an oblong trunk, 11 inches by 8 inches, outside measure; to the opposite sides of which are nailed boards at the distance of about three-quarters of an inch, and projecting about six inches from the trunk. Outside these, again, are nailed other thin boards about half an inch distant, and projecting two inches beyond. The shades prevent the sun from heating the interior sides of the boards. A pent board overhangs the night thermometer by about three-quarters of an inch. The legs of the stand are merely the continuation of the sides of the trunk. The boards are loaded, or fixed to the ground, to sustain the force of the wind. The interior is blackened, to prevent strong reflections of light. The stand now offered to the notice of meteorologists has been in use for some months; it is placed in the centre of a gravel-walk, remote from objects liable to reflect or radiate heat; and it combines (or is intended to combine) the following requisites or advantages: and first, it can be employed or used by every meteorologist, wherever residing. It is of a determinate height and size. It can be placed on any open spot that may best suit its owner. It may face North and South, according to the meridian of the place where it is to be used, and in such a situation where reflected heat can be guarded against or allowed for. The thermometers are placed at a known height from the ground, and can be read off with the greatest promptness, so as to prevent or reduce errors arising from the person of the observer being too long in the vicinity of the instruments. It allows the addition of other instruments, such as Daniel's hygrometer, the rain gauge, &c. These instruments will all therefore be used under similar circumstances, and deductions therefrom be more correctly drawn than at present."

CALENDAR OF OPERATIONS *for the ensuing Week.*

As the season for the principal sowings of most garden productions is now approaching, and as this is a matter of paramount importance to every one who has the management of a garden establishment, whether large or small, the young practitioner will do well to refer to the Calendar for the past year, at p. 120, and read with attention the judicious observations there given on this subject. It might here be added, that it is not advisable to be too sparing of seed in sowing early crops of vegetables, the chances being that many plants will be taken off by insects or bad weather; and it is better to have two plants to take out than one to put in. Timely thinning, however, should never be omitted in any case.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

Pinery.—Although usually deferred till next month, the shifting of succession Pine-plants may, where convenient, be proceeded with immediately, without any risk of injury to the plants; on the contrary, some advantages will be gained by forward shifting. In the first place, by being potted two or three weeks earlier, the plants will sooner commence a new growth, and thereby gain time; again, the work being out of hand, will not interfere with the important out-door business which must be attended to next month; and finally, the sun being now less powerful than he will be three or four weeks hence, that close, warm atmosphere so beneficial to recently potted Pine-plants might be attained with less attention to shading. Much difference of opinion exists as to the propriety of disrooting succession plants, many good growers advocating adverse sides of the question. We should shake out those only which are overpotted, soddened with wet, or otherwise in bad condition; and after shortening any diseased roots, and taking off one or two of the lower leaves, put them into comparatively small pots, using plenty of drainage and rough turfy soil. When the roots are perfectly healthy, and in sufficient abundance, we would remove the plants with entire balls into pots just large enough to allow the turfy soil to be pressed between the pot and the roots without injury to the latter. These plants, receiving little or no check, will begin to grow almost immediately; and if found necessary, they may be disrooted at any future stage. Lumps of charcoal may be advantageously used for drainage, with an oyster-shell to cover the hole in the pot. Keep the plants near the glass, and in replunging, only fill up the trenches about half their depth; the remaining bark might be drawn round the pots when the heat begins to decline.

Vinery.—Syringing must be resumed when the fruit is all set. In applying water (which ought never to be colder than the atmosphere of the house), do not use unnecessary force. The unsightly appearance called "rust" on Grapes is in many cases produced by the dashing of a strong stream of water against the tender fruit, or by careless handling in thinning, by which its delicate cuticle is ruptured. Keep this house to 70° at night, and by sun-heat it may rise to 85°, with a sufficiently moist atmosphere.

Peach-house.—In the early house, the removal of such shoots as are not wanted for bearing wood, or to fill up vacancies, should be completed. Thin the blossoms, or even the buds, of weak trees, and give air liberally to those which are in bloom.

Cherry-house.—Keep the foliage of the trees healthy by the timely destruction of insects, or the fruit will be of little value. Give air soon in the day to the trees that are in blossom.

Fig-house.—Follow the directions given last week. Trees in pots must not suffer for want of water, or most likely the loss of the crop will be the result.

Cucumbers and Melons.—The minimum temperature should be 65°, if 73° so much the better, because then fresh air might be more frequently given, which in dung-beds, where, generally, moisture is in excess, is indispensable to the well being of the plants. Plants in houses should often be syringed now.

Rhubarb.—Where there is no other available means, this plant may be readily forced by potting the roots, inverting another pot over the whole, and then stowing them away in any out-of the-way corner of a forcing-house. For this method seedling roots are best, of which several might be put into one large pot.

Sweet Basil, and any other tender herbs that are likely to be wanted before their season in the open air, should be sown in heat. See also to successional sowings of Mustard and Cress.

Out-door Department.

Brussels Sprouts.—Those who are so fortunate as to possess the true sort should try to keep it by saving their own seed, for purchased seed of this useful and excellent vegetable cannot always be depended upon. For this purpose, three or four of the truest plants should be selected and left uncut.

Onions and Red-Beet may also be planted for seed; but, except in the case of a particularly choice sort, it is by no means advisable for a gardener to raise his own vegetable seeds.

Turnips.—Sow every week, as before recommended. The Early Dutch is chosen because it is less liable to run when sown early than most other varieties.

Normandy Cress.—Sow a bed for salading; and likewise a little Chervil and Lamb's Lettuce.

Spinach.—In gathering from the autumn-sown crops, instead of despoiling all the plants of part of their leaves, thin out the plants in the rows, which will greatly improve those that remain. A single row between every two rows of Peas (when these are put in at the usual distances), and sown at the same time, will give a succession throughout the summer.

Potatoes.—A few rows of the Ash-leaved Kidney, or any other favourite early variety, may now be planted in a well-sheltered place. Whole tubers of uniform size are best. If cut sets are used, be sure you do not lay them in large heaps after cutting, or a considerable degree of fermentation will occur, which is one cause of the rot so much complained of.

Orchard.—A small scale-like insect is frequently seen adhering in great numbers to the bark of wall and other Pear and Apple-trees; this is the Coccus conchiformis, a species which is scarcely, if at all, noticed in gardening books. When permitted to remain unmolested, it spreads like a leprosy over the whole surface of the bark, causing the trees to become stunted and unhealthy. Painting the trees all over with some adhesive substance, such as a mixture of lime, soot, and soap-suds, will stifle the insects; or boiling-water sprinkled over the tree will kill all it touches without injury to the tree, if done when it is quite dormant. Fruit-trees of other kinds that yearly suffer from the attacks of red spider or aphis will be greatly benefited by the application of this or a similar wash.

Take off grafts of all kinds before the sap begins to move.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

Stove.—The whole of the plants should now be gone over—repotting, top-dressing, pruning, and staking, where it is necessary. Those which do not require to be shifted should be examined, to see whether the drainage is in good order. The air of the stove ought to be kept more damp as the sun begins to be more powerful. Commence the propagation of stove plants.

Greenhouse.—Give air early on fine days. Some of the Pelargoniums will require to be shifted into their blooming-pots, at which time any shoots that need it should be tied out, so as to make a large and symmetrical head. These and Calceolarias succeed best in a house by themselves, where a higher temperature can be kept than is proper for mixed greenhouse plants.

Pits and Frames.—Sow half-hardy annuals for transplanting in rows on a spent hotbed. Ten-week Stocks to flower early might be sown in pots, half-a-dozen seeds in each; they can then be planted out without a check. Also sow Dahlia seeds in heat. Top-dress Auriculas and Polyanthuses in pots.

Out-door Department.

It will be necessary to proceed with the digging of mixed flower-borders as soon as the permanent bulbs show their foliage above-ground, when robust-growing Asters, Phloxes, and other plants which spread rapidly, should be reduced to a moderate-sized patch, that they may not encroach upon and overpower their more humble neighbours. Where a large mass of any species is required, a piece might be dug out of the centre of the patch, and the hole filled up with good soil. Herbaceous plants that have been raised in nursery beds should be put out directly the borders are dug.

NURSERY AND FOREST DEPARTMENT.

Nursery.—Planting should, if possible, be completed before the drying winds of March commence, and on this account many other things might be suspended for a time. Take off and plant all last year's layers that are sufficiently rooted; and if time can be spared, proceed to put down another crop.

Forest and Coppice Woods.—Planting and pruning must be carried on with all possible despatch. If the planting of light dry soils still remains undone, it will be much better to put it off till autumn.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending Feb. 17, 1842, as observed at the Horticultural Garden, Chiswick.

Feb.	Barometer.		Thermometer.			Wind.	Rain.
	Max.	Min.	Max.	Min.	Mean.		
Friday 11	29.985	29.970	52	47	49.5	S.	.14
Saturday 12	30.065	30.004	54	30	42.0	S.	
Sunday 13	30.180	30.020	52	28	40.0	S.	.04
Monday 14	30.452	30.390	52	37	44.5	S.	
Tuesday 15	30.446	30.424	54	40	47.0	S.W.	
Wednesday 16	30.488	30.416	53	33	43.0	S.W.	
Thursday 17	30.372	30.252	49	25	37.0	S.	
Average	30.284	30.211	52.3	34.3	43.3		.18

Feb. 11. Heavy clouds with brisk south wind; densely overcast; rain at night.
12. Overcast; cloudy; overcast and mild at night.
13. Clear and very fine; overcast; showery; clear.
14. Exceedingly fine throughout; overcast at night.
15. Very fine; cloudy and fine in the evening.
16. Very fine; cloudy.
17. Foggy; cloudy and fine; clear at night; frosty.

The above indicated height of the barometer, whilst the wind was from S. and S.W., is remarkable: instead of being high, it is usually low with wind from those points.

State of the Weather at Chiswick during the last 16 years, for the ensuing Week ending Feb. 26, 1842.

Feb.	Aver. Highest Temp.	Aver. Lowest Temp.	Mean Temp	No. of Years in which it Rained.	Greatest quantity of Rain.	Prevailing Winds.							
						N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.
Sun. 20	45.7	33.7	39.7	9	0.51 in.	1	3	1	3	1	3	5	—
Mon. 21	46.1	33.1	39.6	9	0.30	2	4	2	2	—	2	4	—
Tues. 22	45.0	34.3	39.6	6	0.29	3	3	3	—	—	3	4	—
Wed. 23	45.2	32.3	38.7	6	0.33	2	1	2	1	—	5	2	3
Thurs. 24	46.7	34.9	40.8	8	0.29	—	1	3	2	4	—	3	3

Sat. 26	47.0	36.0	41.5	9	0.46	1	2	3	1	3	1	4	1

The highest temperature during the above period occurred on the 27th, in 1828—thermometer 60°; and the lowest on the 22d and 23d, in 1827—thermometer 20°.

REPORT ON COVENT GARDEN MARKET,

For the Week ending February 18, 1842.

The last few fine days have improved the market a great deal. Many of the articles offered are better in quality, and the supply has somewhat increased. *Fruit:* Pines are not quite so plentiful as they were. A few hothouse Grapes are offered at about 25*s.* per pound. Apples are plentiful; among the kinds we observed some good Ribston and Cockle pippins. Among Pears, Easter Beurré and Beurré Rance are the best; prices have scarcely altered since our last quotations. Pummeloes are abundant at from 6*s.* to 10*s.* per doz., and Shaddocks are offered at from 3*s.* to 6*s.* each. *Vegetables:* Cabbages and Savoys are pretty good. Broccoli is much better than it was last week, and more plentiful. Kidney Beans are scarce, and very small. The supplies of Asparagus and Seakale are larger than they were, and the quality is better. Salading of all kinds is indifferent; in fact good can hardly be obtained. Rhubarb is abundant and excellent; a small quantity of Myatt's Victoria has been offered. Mushrooms are not plentiful. *Flowers:* every day adds to the gaiety of the market in this particular; forced Hyacinths and Narcissus abound, as do many beautiful varieties of cut Camellias.

PRICES, Saturday, Feb. 19, 1842.—FRUITS:—

Apples, Kitchen, per bushel, 3*s* 6*d* to 6*s*
— Dessert, per bushel, 6*s* to 14*s*
Pears, dessert, per half-sieve, 3*s* 6*d* to 16*s*
Pine Apple, per lb. 5*s* to 8*s*
Grapes, Spanish, per lb., 1*s* to 1*s* 6*d*
— Portugal, per lb., 2*s* to 5*s*
Oranges, per doz., 9*d* to 2*s*
— per 100, 3*s* to 14*s*
— Bitter, per 100, 7*s* to 16*s*
Lemons, per doz. 1*s* to 2*s*
— per 100, 6*s* to 14*s*
Almonds, per peck, 7*s*
Sweet Almonds, per pound, 3*s*
Chesnuts, per peck, 5*s* to 10*s*
Walnuts, per bushel, 16*s* to 24*s*
Filberts, English, per 100 lbs. 180*s*
Cobbs, per peck, 3*s* 6*d*
Nuts, per bushel—
— Brazil, 20*s*
— Spanish, 16*s*
— Barcelona, 20*s* to 24*s*

VEGETABLES.

Savoys, per dozen, 6*d* to 1*s* 3*d*
Cabbage, White, per dozen, 1*s* to 3*s*
— Red, for pickling, 2*s* to 4*s*
Cabbage Plants, per doz., 2*s* to 4*s*
Brussels Sprouts, p. hf. sve., 1*s* 6*d* to 2*s* 6*d*
Broccoli, White, p. bunch, 2*s* to 3*s* 6*d*
— Cape, 1*s* to 2*s* 6*d*
— Brown, 1*s* to 1*s* 6*d*
Turnip Tops, per bushel, 6*d* to 1*s*
Kidney Beans, forced, per 100, 3*s* to 4*s*
Potatoes, per ton, 55*s* to 80*s*
— per cwt. 3*s* to 4*s*
— per bushel, 1*s* 6*d* to 2*s* 6*d*
— Kidney, per bush. 2*s* to 2*s* 6*d*
Artichokes, Jerusalem, pr half sieve, 1*s* to 1*s* 3*d*
Turnips, pr. doz. bunches, 2*s* to 3*s*
Carrots, per doz. bunches, 4*s* to 5*s*
Parsneps, per dozen, 6*d* to 1*s* 3*d*
Red Beet, per dozen, 6*d* to 1*s* 6*d*
Scorzonera, per bundle, 1*s* to 1*s* 3*d*
Salsafy, per bundle, 1*s* to 1*s* 3*d*
Horse Radish, per bundle, 1*s* to 5*s*
Radish, per punnet, (6 hands) 6*s*
Spinach, per sieve, 3*s* to 4*s*
Leeks, per dozen bunches, 6*d* to 1*s*
Garlic, per lb., 8*d*
Shallots, per lb., 1*s*
Onions, per bushel, 2*s* to 3*s* 6*d*
— for pick., per hf.-sieve, 3*s* 6*d*
— Green, per doz. bunches, 3*s* to 4*s*
— Spanish, per dozen, 2*s* to 6*s*
Asparagus, per 100, large, 7*s* to 9*s*
— Second or Middling, 3*s* 6*d* to 4*s*
— Sprue, or Small, 3*s* to 3*s* 6*d*
Sea-kale, per punnet, 1*s* to 3*s*
Lettuce, Cabbage, p. hf. sve., 2*s*
— Cos, per score, 1*s* 6*d*
Endive, per score, 2*s* to 4*s*
Celery, Red, p. bdle (12 to 15) 6*d* to 1*s* 6*d*
— White, per bundle, 6*d* to 1*s* 3*d*
Small Salads, per punnet, 3*d*
Corn Salad, per half sieve, 1*s*
Watercress, p. dz. small bunch., 7*d* to 9*d*
Parsley, per half sieve, 2*s* 6*d* to 3*s* 6*d*
Tarragon, per dozen bunches, 4*s*
Fennel, per dozen bunches, 3*s* to 6*s*
Thyme, per doz. bunches, 2*s*
Sage, per doz. bunches, 3*s*
Mint, per doz. bunches, 4*s* to 6*s*
Savory, per dozen bunches, 3*s*
Rhubarb Stalks, per bundle, 6*d* to 1*s* 6*d*
Mushrooms, per pottle, 1*s* 3*d* to 1*s* 9*d*
Truffles, per pound, 2*s* to 3*s*

Notices to Correspondents.

The Publisher will be happy to give 1*s.* each for Nos. 9, 10, 38, and 51.

Shrewsbury can have *more* copies of the "Gardeners' Calendar." If he will forward us a post-office order or money for as many as he wishes, we will send them.

A Subscriber with the present year.—It is doubtful if we shall be able to supply you with a perfect set for last year, as we want Nos. 9, 38, 44, and 51, and are willing to give 1*s.* each for them; we should, therefore, recommend you to send and order them without those Numbers.

If *X. O. P.* wishes to sell his volume for 35*s.* he must advertise it, we cannot for him.

We must crave the indulgence of many correspondents for not inserting their excellent communications, which are only waiting till we can find an opportunity of bringing them forward. May we hope that this general acknowledgment will serve instead of a separate notice of each which remains in hand?

H.—Your plant is the Sweet Gale.

X. Y.—We do not know the proper proportion of nitrate of soda to the water used for Heaths, never having seen it tried for these plants. You must take care in using such a mixture not to pour it overhead, or you will take off all the leaves. A very little will suffice, no doubt. But why not use rain-water? Your place must be very badly provided with tanks to be without rain-water after such weather as we have had for the last six months.

J. Ross.—The best book on Vegetable Physiology for a gardener is "Lindley's Theory of Horticulture."

G. W.—We prefer two-years old Asparagus plants, and see no advantage in taking them younger. In no case should the Asparagus be cut till the roots have become well established.

E. W.—No. It is the best guide we have to the selection of fruits, and may be thoroughly depended upon as far as it goes.

T. G.—It will require more space than we can afford at present to explain all the circumstances which should be attended to in growing Melons. You had better consult some book on practical gardening, or trust to the information in our Calendar. The best sort is the Beechwood Melon. Your fruit cracks in consequence of receiving too much water, and too little sun and air.

Sempervirens Hibernicus.—In cutting Laurels which have become unhealthy, it is best to cut them to about 2ft. from the ground, or to such a height as will preserve their lower leafy shoots. When Evergreens after having been cut down throw out a number of shoots, if you thin them out it should be very moderately. The roots of fruit-trees should not be allowed to penetrate more than 3ft. below the ground. A few simple instructions on the pruning of wall-fruit trees, such as would assist a young gardener, will be found in the Cottage Gardens of last year, and will be continued soon.

Litoralis.—Much obliged for your good opinion. The task you set us is not at all difficult, but much too extensive for the pages of a newspaper. To explain the why and the wherefore of all the changes in botanical nomenclature which are occurring and have occurred for only the last 20 years would occupy an amount of space of which you have no idea. If you will ask for information upon specific points touching this subject, we will answer you with pleasure.

By a Subscriber from the First, some Cottage Dialogues, by D. H. W. (Baisler, Oxford-street, 1840) have been strongly recommended as a book which it is desirable to recommend to cottagers. Upon looking into it, we find it to consist of religious dialogues founded on passages in the Gospels and illustrated occasionally by reference to agricultural pursuits. They have, however, no bearing upon the arts of cultivation, and are therefore beyond our province. We may, however, be permitted to say that they are very simply written, and seem well adapted to the communication of religious sentiments to the poor.

Ll.—It is useless to tease us with complaints of not inserting your letters. We are the judges of what it is proper to print; we will not give insertion to accounts of bad methods of cultivation, or ignorant speculation about the causes of things, when those causes are perfectly well known; and from this ground it is useless to attempt to drive us. Discussion is a mere waste of time, except about doubtful matters. If a man chooses to insist that a Greengage Plum is sour, are we to allow him to say so in our columns? Nonsense.

G. B. K.—The sweet-scented soft Grass, Hieróchloe borealis, is very nutritious but extremely unproductive, and therefore not worth growing. The fertile Meadow Grass, Poa fértilis, is both nutritious and productive. All cattle eat both. The degrees of comparative nutritiousness we regard as more theoretical than practical.

Mr. Ingram's plants are Dendróbium cucullatum and a bad variety of Epacris impressa.

P. Plants.—We cannot for the life of us understand the meaning of your questions.

A Country Amateur.—Where the stamens of a Tulip cannot be removed (being in a friend's bed) and the seed-pod of that flower is dusted with farina from another, it is not likely such hybridising will be effectual. It is very uncertain. The effect of the pollen is not to be judged of with certainty; but it often affects colour.

Primula.—If the seed of the fringed Chinese Primrose is carefully saved from fringed flowers, it will generally, though not always, produce young plants having the same character. We advise you to procure a plant in flower, and save your own seed. For further information we beg to refer you to "The Amateur's Garden" of to-day. Very little is known concerning the effects of Guano manure upon such plants as you mention; but if used in moderation it will not do them any injury. Several respectable farmers give it a high character when applied to grass and corn lands.

An Amateur.—In order to flower the Tuberose in the open air, the bulbs should be started in a frame in spring, and then planted out in a warm sheltered border. The bottom of the border should be filled about a foot deep with rotten dung, and this should be covered over with light sandy loam, in which the bulbs are planted. Success will depend greatly upon having good bulbs, and upon the nature of the season. In a room you must keep them near the window, plant them in the same kind of soil, and give them a liberal supply of water when growing. Both varieties require the same treatment and are alike easily managed, particularly in a greenhouse.

A. W.—Manure-water is of most use to strong-growing plants, such as Chrysanthemums and Pelargoniums. Prímula sinensis may be grown well either with or without manure mixed with the soil; we prefer a loose rich soil made so by adding a portion of leaf-mould or rotten dung. You must recollect that manure acts mechanically on soils, that is, it keeps them open; as well as affords nutriment to the roots of plants, and therefore in certain cases it might be more advantageous to manure the soil than to water with dung-water.

An Original Subscriber.—Water your linings, &c., with the ammoniacal liquor of the gas-works; or mix coal-ashes and coal-tar together for a flooring; or water the bed with lime-water; and you will probably destroy all your slugs.

J. C. L.—Your plant is Catasetum tridentatum. It came well packed.

Cadwallader.—There is no objection to your plan of training fruit-trees upon a trellis over the slate-roofs of your cattle-sheds, provided you can secure the blossoms against spring frosts. Make your preparations, and we will give you a list of trees next week, if you will say in what county you live, and how many trees you require. The best Grapes are the White Sweetwater and the Esperione.

Mr. Facile must excuse us. If he has any objections to make to the paper in question, let him do so civilly, and if we approve of them we will print them. The remarks he has sent us are personal and unjustifiable on the part of an anonymous writer, criticising one whose name is given.

B. F., Enfield.—Your Cyrtopódium seems to be punctatum. Are the sepals spotted? If they are, it is.

Cambrian.—At p. 83 of the present Volume you will find ample directions for raising Coniferous plants from seed. We do not know what Scarlet Indian Corn is. The Palma Christi is in England an annual, and must be raised from seeds every year.

Cactophilos cannot do better than follow the directions given in Mr. Green's paper on Cactaceous plants, in p. 55, for soil, watering, and potting; and for the general management, the instructions contained in the "Cottage Calendar" for the cultivation of flowers in windows.

A Novice.—When land is manured with nitrate of soda, cattle may be allowed to graze upon it as soon as it is dissolved, or even sooner; for it will do them no harm. Take the leaf-mould off your Ixias, and expose the soil to anything except frost and much wet, which must be equally guarded against. Rosa sempervirens if planted now will flower this next summer, if the plants are strong. The species you name will live out-of-doors in summer, but cannot bear frost; they are, however, better treated as greenhouse plants.

A Constant Subscriber.—Polygalaceæ were accidentally omitted in the list of orders given in the new distribution of the vegetable kingdom in the "Elements of Botany;" they should have followed Tremandraceæ. Polygonaceæ were in like manner omitted by oversight; they should stand next Urticaceæ. Ochnaceæ and Xanthoxyleæ follow Rutaceæ; Æsculaceæ, Sapindaceæ; Potaliaceæ, Apocynaceæ; the station of Surianaceæ is given at p. 235. There is no direct sequence of orders from series to series, but as far as it could be obtained they stand in their due relation. You are right in supposing the Albuminous series to form a group analogous to, but independent of the Exalbuminous series.

An Original Subscriber.—The following trees are best suited for planting in boggy land:—Salix alba, Russelliana, pentandra, vitellina, and babylónica; Alnus cordifólia, incana, and glutinosa; and Pópulus dilatata, monilífera, cándicans, alba, and nigra. The following will do tolerably well if the place is not a swamp: Turkey and American Oaks, deciduous Cypress, Tulip-tree, Lime; some of the Maples, Elms, the Beech, and the Quince. The following trees and shrubs may live in sand, but few grow vigorously:—The Tamarix, some of the species of Viburnum, Vaccínium, Spiræa, Sambucus, Salix, Rubus, Ribes, Pinus, Quercus, Pyrus, Heaths, Lonicera, Ligustrum, Hippophae, Euónymus, Cornus, and Atriplex. The following are suitable for a clay soil:—Oaks, Sweet Chestnut, Walnut, Ash, Pear, Thorn, Ailanthus, Arbutus, Berberries, Birch, Robínias, Cypress, Arbor-vitæ, Pine and Firs, Hollies, Portugal and common Laurels, and the Plane. The cheapest and safest way to protect young trees from rabbits is by tying, sufficiently high, round the stems, the tops of the common Gorse or Furze, which will not injure the trunks, and last a considerable time, if properly fastened on with Willows. Gas-tar is injurious to the bark of young trees, and will not at all times prevent their being damaged by rabbits.

L. S. R.—The "Flower-Garden," by M'Intosh, would suit you, we should think. There is an Apple called Coe's Golden Drop. The sketches of pruning are forthcoming. It is the best way to start Dahlias in heat, as they are more sure of growing.

H. L.—Ivery's Victoria, Eclipse, and Grandissima; Henderson's Splendida, Gaines's Victoria Regina, and Waterhouseana are good Cinerarias.

T.—Ammoniacal liquor of the gas-works, diluted with water in the proportion of 1 to 7, will kill Moss on lawns without destroying the Grass.

A Subscriber.—We know nothing of the Muscat Florid Pear.

Clivia.—There is an excellent section of a Melon-pit given in to-day's Number.

F. S., New Hampton.—Your Apple is Dumelow's Seedling.

Isabel.—The best directions for the treatment and cultivation of the Auricula you will find in Dr. Horner's paper on the subject, p. 396 (1841). There is also much useful information in Wakeling's "Florist's Guide," a cheap monthly publication devoted exclusively to florists' flowers, which contains, in addition to directions for their cultivation, correct representations of the newest and best flowers that are raised. What are we to do with the shilling you have sent?

Inquirens.—We should hardly think it advisable to plant much in front of a Peach-wall; the herbaceous perennials should be chiefly low-growing kinds.

A Clerical Amateur.—There are good directions for the cultivation of Clintónia pulchella given at pp. 294 and 325 (1841). Petunias are readily propagated by cuttings planted round the edges of pots filled with light rich earth, composed chiefly of loam and leaf-mould, and plunged in a gentle hotbed. The reason of your cuttings damping off is in consequence of their having been over-watered. From the description you give of your Picotees, we should think that they have been kept too close, and consequently have become drawn. The seeds of Anagallis require to be raised in heat.

Matilda.—From the description you give of your bulbs they appear to be in excellent condition; you must not expect imported bulbs to flower the first year. You must be careful not to pot your Griffínia too deep. You did right to remove the offsets from the bulbs. Pitcarnia bromeliæfólia grows well in a mixture of rich loam and sandy peat; it likes a plentiful supply of water, and should be kept in the stove.

A Subscriber, Bath.—Sálvia prunelloides flowers beautifully if treated like the Scarlet Verbena. Combretum purpúreum is best raised by grafting on its own roots, but it may be increased by cuttings or layers in the usual manner. The sizes of pots are explained fully at p. 296 (1841). We know nothing of the merits of Young's Champion Cucumber.

J. K.—Berberis aquifolium, or Mahonia, as it is wrongly called, may be had in any nursery. Steep calico in hot linseed oil and wax, and it will become waterproof. "Lindley's Elements of Botany" is the book we recommend for the anatomy of plants. As to books that teach how to buy and sell, we know of nothing so good as the book of experience.

X. X. X.—We do not know what has attacked your leaves.

A. B.—The proper ink is usually sold with the zinc labels. We were not aware that variegated Hollies transplant better than common ones.

As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

The ordinary business of Parliament at the commencement of a new session has given way for the moment to the important question of the Corn-laws, and no other measure of striking interest has yet been introduced. The attention of the House of Commons has been occupied during the week with the discussion of the proposed amendments to the new Ministerial measure. On Monday the House proceeded to consider the amendment moved by Lord John Russell, affirming the inexpediency of a sliding scale, and the comparative superiority of a fixed duty. After a long debate, a division took place on Wednesday, when the motion was negatived by a majority of 123 in favour of Ministers. Last night the amendment of Mr. Villiers for a total repeal of the duty was brought under consideration, but the House adjourned without a division. In the House of Lords, a debate has taken place on the subject of the *Creole* slaver, in which all the law Lords unanimously stated their opinion that no law or authority exists by which the Government of this country can comply with the demand of the United States to bring the crew and passengers of that vessel to trial for mutiny and murder, still less to deliver them up, or detain them in custody. We learn from the Ministerial papers that M. Guizot has communicated to Government that the French Cabinet, acting upon the recent debate in the Chambers on the right of search, cannot ratify the treaty entered into by the Five Great Powers for the more effectual suppression of the Slave Trade, without certain guarantees on the part of Great Britain ; and that Lord Aberdeen does not feel it his duty to consent to such stipulations after the great sacrifices already made by this country for the abolition of slavery.

Our intelligence from France announces that the Chambers have been exclusively occupied with the discussions on the propositions for Parliamentary and Electoral Reform. The first measure, having for its object the prevention of paid functionaries, with certain exceptions, from holding seats in the Chamber, was rejected by a majority of eight ; and the motion for extending the right of voting by admitting to the electoral franchise the educated classes, the half-pay officers, and the retired magistrates, who are now disqualified on the score of property, was negatived by a majority of forty-one. This event is said to have been unexpected by all parties, and to have contributed in a great degree to increase the stability and influence of the Ministry.—Our news from Spain is confined almost entirely to the reports of the protracted discussions on the Address, which are not yet concluded. Seven different amendments have been moved, and a strong opposition has been offered to each paragraph ; but notwithstanding this demonstration of opinion, and a numerous list of counter-amendments which have since been moved, it is expected that the Ministry will have a small majority. In regard to the rumoured insurrection for the purpose of overthrowing the present Government, nothing further has yet transpired, beyond the rumour of an alliance between the partisans of Don Carlos and Queen Christina : in our Parliamentary Report it will be seen that Sir Robert Peel has declared his belief that the French Government are not parties to the projected revolution, and at the same time expressed his hope that the Spanish Government will be sufficiently powerful to resist any attempt to overturn the existing Constitution. —From Portugal we learn that great confusion and uncertainty prevails in all classes of society, in consequence of the recent movement at Oporto ; a Provisional Junta has been established in that city, and many of the leading civil and military authorities have given their adhesion to the proclamation of the constitutional charter. The Duke of Palmella has not succeeded in forming an administration, and negotiations have been set on foot on the part of her Majesty, for the purpose of effecting a compromise among the moderate men of both parties.—The disputes between Holland and Prussia in regard to the accession of Luxemburg to the Customs' Union have been satisfactorily arranged, and the treaty has at length been ratified by the two sovereigns.—From the United States we learn that the commercial and financial affairs of the entire country continue to be greatly embarrassed, and that the House of Representatives has had under consideration a petition from Massachusetts, praying for the dissolution of the Union. The existing difficulties have been much increased by the stoppage of the two principal banks of Philadelphia ; and in consequence of the prevailing panic in the commercial circles, the legislatures of several states have determined on enforcing the resumption of specie payments.

Home News.

Court.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal are well, and continue at Brighton. The Queen has taken daily exercise in the town and neighbourhood, both on foot and on horseback. The Prince of Wales and the Princess Royal have also been taken out daily for the benefit of the sea-air. On Wednesday, Prince Albert, accompanied by the Princes of Cobourg, reviewed the Scots Greys on the Downs. Lord Rivers has succeeded the Earl of Morton as Lord in Waiting, and Capt. Meynell, R.N., has succeeded Capt. Duncombe as Groom in Waiting.

Treaty on the Slave Trade.—A Ministerial paper, the *Morning Post*, states on the authority of a communication received from Paris by express, that the ratification of the treaty between the five Great Powers of Europe, for the suppression of the slave trade, which, according to the previous arrangement, was to have been accomplished on this day or Monday next, will be delayed, if not prevented, by the French Government. It adds that "M. Guizot, feeling himself compelled to refuse, for the present, to join, without reserve, in the name of France, in ratifying the treaty in the precise terms in which it has been concluded, proposed certain modifications. In these modifications Lord Aberdeen, it is understood, has declined to acquiesce, being of opinion, that, as a British Minister, he ought not to admit the necessity of any guarantee for the disinterestedness and probity of Great Britain in respect to the abolition of the slave trade, these having been already proved by sacrifices and efforts in that cause, to which neither France nor any other country can produce a parallel."

Parliamentary Movements.—Mr. Jackson, Irish Solicitor-General, has been elected without opposition for the University of Dublin.—Lord Bernard has been elected for the borough of Bandon, in Ireland, without any contest.—Sir Charles Lemon, Bart., has been returned without opposition for West Cornwall.

Exports of British Corn.—According to a return moved for on the 11th inst., by Mr. Gladstone, of the quantities of British corn and grain, and meal and flour, exported in each year, from Great Britain to foreign parts, 1828 to 1841, inclusive, it appears, as regards wheat, that in 1828 there were 26 quarters exported ; in 1829, 95 quarters ; in 1830, 38 ; in 1831, 55 ; in 1832, 165 ; in 1833, 68 ; in 1834, 21 ; in 1835, 132 ; in 1836, 92 ; in 1837, 639 ; in 1838, 1,832 ; in 1839, 1,631 ; in 1840, 2,348 ; and in 1841, 1,355 quarters ; making a total export from Great Britain during the last 14 years of 8,737 quarters of wheat. The total quantities of other grain exported from Great Britain during the same period (from 1828 to 1841) were as follows :—viz., barley, 8,768 quarters ; oats, 103,651 ; rye, 53 ; peas and beans, 20,476 ; and malt, 7,915 quarters.

Post Office.—An order has just been issued from the General Post-office, extending the time for posting letters at the different branch offices until a quarter past six o'clock, P.M. All letters, however, put into the box must, after a quarter before six o'clock, bear an extra penny stamp, over and above the stamp for postage, or they will be detained till the next day's despatch.

Foreign.

France.—*The Chambers.*—The journals are still almost exclusively occupied with reports of the discussions in the Chamber of Deputies. The proposition of M. Ganneron, for Parliamentary Reform, and for preventing paid functionaries, with certain exceptions, from holding seats in the Chamber, gave rise to a long and animated debate, which terminated in the rejection of the proposition by a majority of eight—the numbers being, for it 190 ; against it 198. The closeness of the division, which appears by many of the journals to be regarded as a serious ministerial check, is explained by the circumstance of the leaders of the middle party, MM. Passy and Dufaure, voting the one for, the other against it. The opposition prints observe that independently of 26 placemen, who voted in the majority, five ministers had also given their ballots, so that had those five not been received, the motion would have been lost for the time, and a new ballot rendered necessary, as the rules of the Chamber require that there be not only a clear majority of the members voting, but also one at least above a clear moiety of the members present. On Monday, M. Ducos brought forward his motion for the extension of the right of voting, and for electoral reform. In introducing it, he began by saying, that the Restoration might have saved itself from ruin had it made concessions in time. A former minister of the present King, M. Molé, felt the necessity of concession, and began by the amnesty. But a damp had been thrown on liberal progress by events of foreign policy, which had nothing to do with it. At any rate peace was now assured, and the time was come to take some steps in the way of reform previously to a dissolution. The present proposal was no more than that made by Ministers themselves in 1831, and rejected by chance. The present motion was not an innovation ; it was, on the contrary, going back to old ideas. The educated, but not wealthy classes which it was now proposed to admit to the electoral franchise, and which had been hitherto excluded, were precisely those who had made the revolution of July, or given the impulse to it ; and to continue to exclude them would be as impolitic as unjust. M. Ducos was followed by the Home Minister, M. Duchatel ; who opposed the motion. He alluded to the conduct of the Thiers Ministry, in 1841, in rejecting the project of electoral reform, contending that circumstances had not changed : and proved by returns, that since 1832 the electors had increased in the colleges. M. Dufaure followed, and made a long speech in favour of M. Ducos's motion. He argued that the Chamber and the electoral law sought guarantees for the good and wise choice of electors too exclusively on their fortunes, and that in fairness another kind of guarantee, that of capacity, might be demanded, and should suffice. The half-pay officer, the retired magistrate, were more respected in the provinces than the farmer paying 200f. taxes, and therefore should not be excluded from the vote, which the former enjoyed. The great objection, however, he said, was to granting the electoral franchise to lawyers without business, who were considered to be peculiarly ultra-liberal and turbulent. This he denied ; and maintained that since 1830 the bar, and the Guizot members of it, had been distinguished by decorum and by the absence of petulance. M. Dufaure concluded his speech by quoting an expression of M. Guizot, recommending "the cession of what was just, in order to establish a *fulcrum*, to resist what was unreasonable." Several other deputies spoke at length for and against the motion ; and on Tuesday, M. Billaut, who supported it, bade the Chamber not be intimidated by the idea of the present being a cabinet question. The Ministry, he said, would not resign, however left in a minority. M. Guizot rose to answer this. He took a cursory glance at the condition of the lower classes at the present period, and concluded by declaring that they could not derive any possible benefit from an electoral reform. In the second portion of his speech M. Guizot attacked what he denominated the two factions of Republicans and Legitimists. He announced himself as the inflexible opponent of universal suffrage, which he considered as the deathblow to liberty and democracy ; and declared that universal suffrage would be the most fatal of all the dangers which are now lowering over the United States. He added that in endeavouring to cure this cutaneous disease, with which so many desperate characters are afflicted, the health of the patient was sacrificed. After an animated debate the motion was rejected by the Chamber by a majority of 234 votes against 193 ; a result, it is said, unexpected both by the opposition and the Government. Fifteen of the Legitimists, it is added, voted for the Ministry, on the ground that the *capacités* were hostile to them ; and seven of M. Passy's followers also voted for the Ministry.

The Press.—The proceedings connected with the Press still continue to occupy public attention ; and the journals are much engaged in commenting on the action brought by the "Quotidienne" and the "Mode" newspapers against M. Proux, their printer, for refusing to print in those journals several articles which the latter alleged would subject him to prosecution. On Saturday he refused to sanction the publication of the leading article, for which the editor was obliged to substitute a literary notice. The affair was brought before the Tribunal of Commerce, when the counsel for the editors demanded that the printer should be compelled to print the articles given him by the editor. The President asked the printer whether his refusal, in the case of the "Quotidienne," was not an affair concerted between him and the editor ; but the printer replied that the dispute about it having arisen at three in the morning, the only thing that could be done was to leave the article out. The tribunal ordered the case to be referred for consideration for a fortnight, and directed that the articles not inserted should be submitted to it for inspection. The printer of a Dijon paper, "Le Courrier de la Côte d'Or," having objected to the insertion of a parallel between the Censorship of 1827 and that of 1812, that journal appeared a few days since with two blank columns. M. Lefrançois, responsible editor of the "Dix-neuvieme Siècle," a Paris paper, which had ceased to appear during two months, was sentenced by the Court of Correctional Police, on Saturday, to five months' imprisonment, and 2000f. fine, for publishing that paper without having previously deposited in the Treasury the 100,000f. required as a security. In Riom, the "Gazette d'Auvergne" appears to have attracted the displeasure of Government, and no fewer than four prosecutions, it is said, are to be carried on against it in the course of the session of the assizes commencing on the 15th inst. The "National" lately published an article alleging that the discontent and rancour of the lower classes were now directed, not against the aristocracy, but against the chiefs of the middle class. For this the editor was tried on Monday, and condemned to a year's imprisonment with fine. The editor of the "Gazette de France" has been sentenced to a similar punishment for repeating the article.

The Fleet.—Private letters from Toulon, dated the 10th inst., state that Government is completing the crews of the fleet, which had been greatly diminished from a quantity of men having been sent away ; and that besides the levies ordered in the fifth maritime arrondissement, and which have just been made, the ports of the Atlantic have also sent several. Several vessels had arrived in that port from Brest, having on board sailors for the squadron of the Mediterranean.

Railroads.—The journals state that the Ministry appear determined to give the fullest development to the plan of railroads presented by M. Teste, Minister for Public Works ; that many of the opponents of the measure have been induced to withdraw their opposition, and that at a council held at the Tuileries on Sunday it was determined to apply to the Chamber for the necessary funds to commence the line from Paris to Strasburg immediately. This line is to be connected with the railroad from Paris to Marseilles by Mulhausen, Dijon, Chalons, and Lyons. On the same day, it is added, this fact was almost officially announced, and all the deputies from the eastern departments were informed of it. It is also said, that at the same council the execution of three other lines of railroad was determined on, viz., Bordeaux to Bayonne, Vierzon to Orleans, and Criel to Compiègne. The construction of these lines are to be conceded to public companies, aided by Parliamentary grants.

Public Education.—We learn from the Papers that the amount of the expenses of primary instruction throughout the country during 1840 was 14,775,660f., of which 9,884,420f. were for communal schools, and 1,763,823f. for normal schools. The communes contributed 8,617,378f. towards the total, the departments 4,658,281f., and the state 1,600,000f.

Algeria.—The journals publish the following statement of the number of French troops in the North of Africa at the present time : in the provinces of Algiers and Tittery, 24,780 men ; Oran, 18,940 ; and Constantina, 16,975 : total, 60,695.

Spain.—Our intelligence from Madrid consists almost exclusively of the reports of the discussion in the Chamber of Deputies on the Address, which still continues. On the 4th inst. the debate opened on the 6th paragraph, relative to the state of siege, and seven different amendments were moved by Messrs. Lujay, Posada, Mendizabal, Mata, &c. M. Gonzales, the Minister for Foreign Affairs, justified Government for having declared Barcelona in a state of siege, on the ground of the measure having been regarded as indispensable for the safety of the country. M. Lujan having withdrawn his amendment, M. Posada rose to present his view of the conduct of the Cabinet with respect to Barcelona. He deplored the proclamation of martial law, and condemned it as anti-constitutional ; but he thought that the events at Barcelona rendered it imperative for Government to recur to that measure, it being the only means of re-establishing the reign of the laws and tranquillity in that populous and important city. M. Olozaga followed in defence of the paragraph as drawn up by the committee, contending with great energy that there never existed any necessity to resort to such an extremity ; and Government, he said, was so well aware of the danger and inutility of the measure, that it had not deemed it necessary, notwithstanding the gravity and peril of circumstances, to declare Madrid in a state of siege during the night of the 7th Oct. After some observations in reply by the Minister of Foreign Affairs, and a desultory debate that lasted some time, but was of no interest, the consideration of the amendment of M. Posada was carried by a majority of 72 to 64. On the 5th inst. M. Olero called on the Ministry to inform the Chamber if it had adopted any measures of precaution, in consequence of the movement at Oporto, to insure the tranquillity of the Spanish provinces adjoining the Portuguese frontier. M. Gonzales replied, that such measures being indispensable to tranquillise not only the inhabitants of those provinces, but of the entire monarchy, against which many enemies were conspiring both at home and abroad, Government had lost no time in guarding against such a contingency. M. Olonzo next rose, and invited the Ministry to send arms to the National Guards of Galicia, to enable them to repel any attempts that might be made against liberty in that quarter. M. Almonaci, on his side, declared that he would not grant a single real for diplomatic purposes; "for," said he, "the powers with whom we entertain diplomatic relations, such as England, France, and Portugal, are our enemies." M. Gonzales pronounced this charge against the allies of Spain to be imprudent and unfounded; and after this incident, the Chamber again resumed the discussion on the Address. A variety of amendments continued to be proposed and debated; and on the 8th, a resolution was moved by M. Olozaga, slightly condemnatory of the conduct of Government; on which occasion Ministers declared, that if it was adopted, the Cabinet would resign. M. Olozaga expressed his regret at so extreme a declaration, and a sub-amendment was then proposed, doing away with the expressions of which the Ministers complained; and the question of its being taken into consideration was carried by 73 votes against 64. In consequence of the late events in Portugal, and the account of the plans of the conspirators, Government had taken all necessary measures for preserving the frontiers from disturbance. The Bayonne papers state that several corps of Spanish troops had received orders to march to the frontiers of Portugal. Accounts from the provinces announced that the utmost tranquillity prevailed throughout the kingdom.—Subsequent accounts to the 9th inst. inform us that the debate on the sixth paragraph of the address still continued. A division was expected on the 10th, with a small majority for the Cabinet, but a Ministerial modification was strongly reported.

PORTUGAL.—By the usual weekly steamer we have intelligence from Lisbon to the 7th, and Oporto to the 8th inst. It continues to be of considerable interest. Affairs in the capital are reported to be in a state of confusion and uncertainty. The Ministry, owing to a difference of opinion as to the mode of proceeding with respect to the Oporto movement, had resigned; and the Duke of Palmella had been charged with forming an administration, and had consulted with Viscount Sa da Bandeira, but the demands of the latter were, it is said, such as the Duke would not accede to, and ultimately led to the breaking off of the negotiations. They had not been renewed at the time of the departure of the mail. After the important movement which took place at Oporto on the 27th ult., reported in our last, a Provisional Junta was established in that city; and the first business entered on by it was the nomination of a Committee of Finance, having the public funds at their disposal. The appointment of Baron Ponta de Santa Maria as Commander of the whole of the operative forces, and the organisation of three provisional battalions in Oporto and Villa Nova da Gaix, was the next step. Circulars were then transmitted to the chief civil and military authorities of the kingdom, inviting them to follow the example of Oporto in proclaiming the constitutional charter. Gens. Baron Valloriyo and Baron de Vinhaes, commanders of the 4th and 5th military divisions, acquiesced in their proposals, and marched to Oporto with the forces under their command, where they were met by other bodies of troops who had also entered that city. The administrators or governors of Brago, Vianria, Villa Real, Averio, and Coimbra had also joined their cause, at which latter place a battalion of students of the University, amounting to 400, was immediately raised. The whole of the forces were to concentrate in Oporto. The garrison of Lisbon was said to be generally in favour of the same cause; and there was no force on the way to resist them. M. Sarmenti, the King's aide-de-camp, was at Oporto, on a mission to undeceive the people there as to the Queen's participation in the movement, and also, if possible, to find some mode of compromise, which the moderate portion of the public, it was said, were anxiously looking for. The Senators and Deputies present in Lisbon had been convoked by the Presidents of their respective Chambers, when representations were drawn up to her Majesty, holding forth in strong terms their firm and faithful adherence to the constitution of 1838. These representations were signed by the greater part of the Members of both Chambers. The uncertain and unsettled state of things is represented as a great cause of discouragement both to business and amusement at Lisbon, and the usual gaieties of the carnival were in a manner suspended in the capital; the theatres continuing shut.

GERMANY.—By intelligence from Berlin we learn that the King of Prussia was expected in that capital on the 15th inst. His Majesty had taken cold during his journey, from the effects of which the latest accounts state that he had quite recovered. He passed through Belgium, Holland, and Hanover, on his return to his own dominions. Private accounts from Berlin state, that so many orders for engraved and lithographic portraits of the King had been received from England, that the printsellers were making great profits, and that until fresh copies could be struck off his Majesty's portrait was not to be had for several days. The accounts respecting the health of the Princess Albert and the infant Princess continue to be favourable. The journals inform us that the protest of the Porte against the installation of Bishop Alexander of Jerusalem, said to have been caused by French intrigue, has been withdrawn, in consequence of the united representations of the Prussian and British Cabinets, through Lord Aberdeen, who, it is stated, signified to the Porte, in the course of last month, that it was not the intention of the British Government that the Bishop of Jerusalem should enjoy greater privilege than any other subject of the Queen of Great Britain. Thus the distrust which appears to have been raised in the Sultan's mind by the remonstrances of the Catholic Powers has been removed, and the changes, of which the Bishop's appointment is but the commencement, will, it is thought, proceed. It is reported that Konigsburg is about to be made one of the strongest fortresses in Prussia; a measure which is said to be highly popular, as indicating a greater separation from Russian interests.—The Duke of Modena has sold to the Austrian Government for 540,000 florins (2,350,000 fr.) the fine palace which he possessed at Vienna. This edifice has of late been inhabited by Prince Wasa of Sweden, but his Royal Highness, it is said, intends in future to live principally in Italy, on account of his health. The palace, it is added, is to be used for the offices of the state railroads.—The King of Bavaria has ordered a triumphal arch, similar to the Arch of Constantine at Rome, to be erected in Munich, at the entrance of the Ludwig-strasse. A colossal statue representing Bavaria in a quadrigal car, surrounded with eight allegorical figures, all in bronze, is to be placed on the platform, at the summit of the arch; and medallions and sculptured friezes are to adorn the sides. M. Gœrtner is to be the architect of this monument, and M. Wagner is to undertake the sculptures. —A German paper contains the following information relative to the commercial movement of Cologne during the years 1840 and 1841:—The arrivals and departures of vessels and merchandise are constantly increasing, and the commercial prosperity of Cologne has attained to a very flourishing height—a fact proved by a comparison of the results of the year 1841 with those of the year 1840. In 1840 there arrived by the Rhine, upwards, 1,508 vessels, carrying 1,708,607 quintals of merchandise; and, downwards, 4,776 vessels, carrying 6,465,514 quintals. In 1841 there arrived 1,638 vessels, and 2,079,760 quintals, upwards; and 5,133 vessels, and 1,573,062 quintals, downwards. Thus there appears an increase in 1841 over the arrivals in 1840 of 487 vessels and 468,701 quintals of merchandise. The departnres have increased in the same proportion. In 1840 there departed, upwards, 1,784 vessels, with 682,173 quintals of merchandise; and downwards, 938 vessels, with 321,839 quintals. In 1841 there departed, upwards, 1,927 vessels, with 880,785 quintals; and, downwards, 1,097 vessels, with 396,135 quintals. This shows an increase over the departures of the year 1840 of 284 vessels, and 272,908 quintals of merchandise. The total movement of the arrivals and departures was, in 1840, 9,005 vessels, and 4,178,133 quintals of merchandise; and in 1841, 9,777 vessels, and 4,917,742 quintals. The steam-boat navigation has had a large share in this general movement of the navigation of the Rhine to Cologne. Thus in 1841 there were 3,210 arrivals and departures of steam-vessels, which transported 676,462 quintals of merchandise.

HOLLAND.—Letters from Amsterdam of the 9th inst. bring the important intelligence that the dispute with the Prussian Government relative to the ratification of the treaty uniting Luxemburg to the German Customs Union has been arranged. On the 8th inst., a treaty was concluded at the Hague, for the accession of the Grand Duchy to the Union: and stipulations, it is said, have been made on this occasion which remove the inconvenience which had hindered his Majesty the Grand Duke from ratifying the original treaty concluded on the 8th Aug., 1841. This convention was signed on the one part by the Chancellor of the Grand Duchy, and on the other by the Prussian Envoy at the Court of the Netherlands; and was ratified on the same day by the two sovereigns.

ITALY.—Accounts received from Rome mention the conversion of M. Alphonse Ratisbonne, a wealthy Jew, of Strasburgh, to the Roman Catholic faith, in that city, where he received the sacrament of baptism, confirmation, and the eucharist, on the 31st Jan.—The *Diario di Roma* announces the death, on the 1st inst. of the Princess Carolina Louisa Maria, daughter of the reigning Grand Duke of Mecklenburg Strelitz, in her 24th year. The Infantes Don Juan and Don Ferdinand, sons of Don Carlos, have returned to Rome from Naples.

RUSSIA.—Intelligence received from St. Petersburgh of the 22d ult. announces that the Emperor, by a ukase of the 6th ult., has taken from the Catholic and Greek clergy, as well as from all the convents situate in the northern provinces of the empire, all the cultivated lands which they possessed, a measure which we stated in our last was in contemplation. This property was to be annexed to the national domain, and the clergy of the churches and convents were to obtain an annual provision from the State. Private accounts to the 31st ult. state, that the reduction in the army, ordered on the 4th inst., amounts, according to the stated number to be reduced, to 60,000 men; but, as the corps are now complete, the number to be discharged would be about 42,000, if the greater part of the infantry would not have to be taken to complete the infantry regiments, to 1,000 men per battalion, so that the reduction will, it is thought, not exceed 25,000 men in all. Count Pozzo di Borgo, the celebrated diplomatist, died in Paris on the 15th inst., in the 78th year of his age.

GREECE.—Private letters from Athens, dated the 31st ult., inform us that the King appears little inclined to fulfil the promises which it was said he had made to Sir S. Canning, respecting the differences with Turkey, and which it is feared will not now be adjusted without foreign intervention. M. Mavrocordato, who had been appointed on a mission to Constantinople, had not yet taken his departure; and it was rumoured that his friends had advised him not to proceed on his mission without having previously obtained full powers to act, which, the same accounts add, his Majesty was determined not to concede. —A violent shock of an earthquake was felt at Pyrgos, in the Peloponnesus, on the 31st ult. It lasted four seconds and a half, and was followed by several other shocks, less strong, during the night. The shock, the accounts state, came as if from the island of Zante, but no particulars are given of any damage sustained.

TURKEY.—By the Levant mail we have received intelligence from Constantinople to the 27th ult. Sir Stratford Canning reached that capital on the 21st ult., and had his audience of the Sultan on the 27th. On his Excellency's arrival at the Dardanelles, the honours paid to him are said to have been more than were ever paid before to an ambassador. The nomination of M. Mavrocordato, as Minister of Greece to the Porte, had given satisfaction in Constantinople. The Cabinet, contrary to custom, had held councils during the four days of the Beiram.—The accounts received from Syria were satisfactory. Cassim Bechir, the present Prince of Lebanon, had arrived in a steamer at Constantinople, and would not, it was believed, return to his post, it being the intention of the Sultan to place the Government of the mountains under the immediate direction of the Porte. To that effect it was contemplated to appoint two governors—the one civil, and the other military. The civil administration was to be confided to a council, composed of eight members, four Druses and four Maronites, under the presidency of the governor. Municipal councils, it is said, would also be organised on the same principle, and the military power be vested in Omar Pacha. The march of troops from Asia Minor had been counter-ordered; and forces have been assembled at Erzeroum and in Trebizond.

EGYPT.—The arrival of the Levant mail brings little political intelligence from Alexandria, in consequence of the absence of the Pacha, who was still at Esneh. Private accounts are exclusively occupied with comments on the state of trade, and the commercial regulations of Government, but are uninteresting to the general reader.

WEST INDIES.—We have received intelligence of recent date from these islands; but it is not of great importance. The weather at St. Lucia had been very favourable for the estates; the crop had generally commenced under most advantageous circumstances, the "yield" from the canes being large. The planters had as yet found no difficulty in obtaining a sufficiency of labour, at a reduced rate of wages. In Antigua a slight shock of an earthquake had been felt in December. At Trinidad a numerous meeting of the proprietors of estates had been convened, and resolutions passed invoking the home government to separate and make that colony independent of the government of Barbadoes. The important increase in the production and commerce of that island, and the prominent position it occupied compared with several of the other West India possessions having independent governments, were the chief reasons advanced in support of the request of the colonists.

UNITED STATES.—By the arrival of the Royal mail steamer *Britannia* at Liverpool on Tuesday, we have papers from New York to the 31st ult. The proceedings in Congress are reported to the 28th ult. The senate had, by a vote of 23 to 22, refused to pass the Bankrupt Law Repeal Bill. Mr. Clay voted in the majority on the question; the bill was to come into operation on the 1st inst., the day fixed on its enactment. An extraordinary petition from Massachusetts had been under consideration of the House of Representatives, for the dissolution of the Union. The commercial and financial affairs of the entire country are reported to be in a bad state, owing, in part, to the want of confidence in government. The income of the state did not meet the expenditure, and authority was asked from Congress to resort to Treasury notes. A bill for the issue of five millions of dollars, re-issuable at pleasure, provided that the amount issued does not at any time exceed five millions, had passed both houses. The whole groundwork of credit and currency in Pennsylvania appears to have been destroyed by a panic, arising from want of confidence in the banks. The run upon those of Philadelphia had been very great, and the Girard Bank, and Bank of Philadelphia, had been obliged to close their doors. In Maryland the popular branch had, by a vote of 55 to 15, passed a bill requiring the banks of that state to resume specie payments within twenty days from the passing of the act. In Ohio, also, both branches of the legislature have passed a bill requiring the resumption of specie payments by the banks. New Jersey, in that portion of it connected with New York, had maintained the specie standard, and the legislature, it was believed, would compel the banks of the western portion of the state, bordering on Pennsylvania, to resume on or before the 4th July. The case of Nicholas Biddle and others still engaged the Philadelphia Sessions Court. An application had been made, on the 19th ult., by the Attorney-General and Mr. F. E. Brewster, to send up bills against Nicholas Biddle and others, which they stated they had already prepared. The court refused the application, on the ground that a rule of the court provided that parties should be bound over in all cases to the next term of the court, and that these defendants were entitled to the benefit of that rule. The sequel is not given in the papers. A *habeas corpus* having been taken out for Mr. T. Dunlap, late President of the United States Bank, as well as one for Mr. S. Jaudon, the hearing of the cases was to take place about the 25th ult. The President of the Senate laid before the body, on the 20th ult., a message from the President of the United States, covering a communication from the Department of State, containing the protest of the officers and crew of the American brig Creole, and the correspondence between the American consul at Nassau and the British authorities in relation to that subject, sent in compliance with a resolution offered by Mr. Calhoun on the 11th ult. Lord Morpeth was at Washington, and attended the sittings of Congress almost daily. Mr. Charles Dickens (Boz), who had arrived from England in the United States, had been most flatteringly received. A public dinner was to be given to him at Boston, and he had accepted an invitation to a ball to be held in honour of his visit at the Park Theatre, New York.

Canada.—The intelligence brought by the *Britannia* informs us that Sir C. Bagot had been sworn in at Alwington-house, Kingston, in the presence of the judges, heads of departments, &c., and had assumed the functions of Governor-General of British North America. His Excellency afterwards held a levee, which was numerously attended. After the levee an address was presented to him by the inhabitants of Kingston. The following is a passage from his Excellency's answer:—"I thank you for your promises of support, and I assure you that in the discharge of my duties as Governor-General of British North America, it will be my endeavour to pursue the course which will be most conducive to the welfare of all her Majesty's subjects, and to the permanency of the connexion between this portion of her Majesty's dominions and the mother country."—The Governor-General had issued a proclamation, convoking the provincial parliament for the 22d ult., but *not* for the despatch of public business. It was, however, generally supposed that the legislature would actually meet in March.

Cape of Good Hope.—We have received Cape of Good Hope papers to the 11th Dec. Nothing was known of the intention of Sir G. Napier with respect to the marching of troops for Port Natal, but it was presumed that Capt. Smith would receive immediate orders to advance from the Umgazi camp. The wine-merchants and wine-growers of the Cape were acting in concert in the endeavour to restore their trade by the production of wines of superior quality. The wheat crops throughout the colony were reported as being in a flourishing condition; and it was expected that about 50,000 muids would be exported.

Parliament.

HOUSE OF LORDS.

Monday.—After the presentation of several petitions, the Buildings Regulations Bill, the Boroughs Improvement Bill, and the Appropriation Acts Amendment Bill, were severally read a third time and passed.

In reply to some remarks from Lord Campbell on the recent decision in Ireland affecting the marriages of dissenters, the Lord Chancellor said he had written to the Judges in Ireland to ascertain the grounds of their decision. He had not yet got their answer; but as soon as he did receive it, he should take measures to ascertain what the law really was, so as to make it the foundation for a Bill, whether enacting or declaratory.

Lord Brougham brought the subject of the passengers by the Creole, detained at Nassau by the British authorities, before the House, and contended that the law of England in its present state did not admit of their surrender.

The Earl of Aberdeen said that Government had given the question their most serious and anxious attention, and after taking advantage of all the assistance which they thought desirable on the subject, they had satisfied themselves that, by the laws of this country, there was no machinery or authority for bringing those persons to trial for mutiny and murder, still less for delivering them up, or detaining them in custody. The Secretary of State for the Colonial Department had therefore sent out orders for releasing those persons, unless it should be found that there was some colonial law under which they might be tried.

Lord Denman gave his opinion that there was no law, authority, or machinery existing by which the Secretary of State for the Colonies could deliver up these men to a foreign power, after taking refuge in our dominions; and he declared, on the authority of the most eminent lawyers, that the Secretary of State so delivering up such men to a foreign state would be liable to the danger of an action of damages for false imprisonment, and the still more awful danger of putting a person upon his trial in a case where the punishment was death. It was perfectly clear, he said, that an alien seized in this country for an alleged crime committed in a foreign country might resist his apprehension with force, and if the resistance cost him his life, the seizing party might be arrested for murder, and, if found guilty, executed. It was desirable that an international jurisdiction should be established by treaty; but the existence of the slave-trade stood in the way.

Lord Campbell said that he had always entertained and acted upon the opinion expressed by the noble and learned lord; and Lord Cottenham and the Lord Chancellor also concurred in Lord Denman's statement of the law. Lord Brougham, who stated that Lords Wynford and Abinger had authorised him to express their assent to the same opinion, then withdrew his motion for the production of the correspondence relating to the subject.

Tuesday.—The Royal assent was given to the Appropriation Acts Amendment Bill.

On the presentation of a petition from Hull for the repeal of the corn laws, by the Marquis of Normanby, Lord Brougham declared his opinion, that while the only legitimate object of taxation was revenue, the worst mode of raising a revenue was by a tax on food. He was far from approving a fixed duty on corn, but he did not therefore like a sliding scale. He asked Lord Ripon a question respecting the towns which were proposed to be added to those which now make the returns.

The Earl of Ripon replied that the object in adding those towns was not from any disposition to lessen the averages, and thereby exclude foreign corn, but to obtain the averages in a fairer manner.

The Earl of Radnor considered that the proposed new sliding scale would be more stringent and oppressive than the present law, and he therefore could not understand why the measure had been introduced. Preserved turtle, he said, had been admitted by Government duty free. That was a step in the right direction; and they might, he thought, extend the application of the principle to corn. Some further conversation on these topics followed, but it afforded no points of interest.

Lord Monteagle, in consequence of the absence of the Duke of Wellington, postponed his motion respecting the Exchequer bill fraud from the 18th to the 28th inst.

Thursday.—After the presentation of some petitions for a repeal of the Corn-laws, by the Earl of Minto and Lord Brougham, the Earl of Clancarty moved for returns relative to the appointment of chaplains in workhouses in Ireland, that their lordships might judge of the soundness of the principle which the poor-law commissioners had adopted in making those appointments, and determine whether their practice had been in accordance with the declared intention of the Legislature and the spirit of the constitution.

The Duke of Wellington opposed the motion, on the ground that the noble Lord, from the matters introduced in his speech, ought to have given notice of his intention to move their lordships to lay upon the table a bill to repeal the Irish Poor-law Act. Knowing the difficulty and the delicacy of the subject, he had formerly recommended the noble Earl to leave it in the hands of Government, that some inquiry might be made by the ministers. The noble Lord, however, had thought proper to come there, and though he had stated much for a repeal of the act, he had not made out any ground for his present motion. He did not wish to treat the motion with disrespect, but when he saw that it required not only letters but minutes of conversation, he felt that it could not be complied with, and that the better course was to move the previous question.—The Earl of Clancarty explained.

The Marquis of Normanby wished to say a few words, in consequence of his former official connexion with the working of the Irish Poor-law. He had heard with great satisfaction the manner in which the noble Duke met the proposed motion. The commissioners had delicate and difficult duties to perform, and if the noble Earl had any direct charges to make he ought to bring them forward in that shape, and not in the form of the present motion. The nature of it, considering the sort of information it required, was without precedent.

Lord Brougham had examined the particular terms of the notice, and expressed his determination to vote against it.

The Earl of Clancarty replied, and stated his readiness to withdraw the motion, though, considering the promise privately transmitted from the noble Duke, he was surprised that it was opposed. He had received a note from the noble Duke, stating that he was ready to give any information he required.

The Duke of Wellington said that he had written that note, never dreaming that such information as was now sought would be required. He had only spoken of his individual willingness, and had referred the noble Earl to the Irish Government. When he saw the motion, and especially when he had heard the speech of the noble Earl, he was satisfied that it must be met by the previous question.

The Bishop of Exeter was of opinion that the noble mover had made out a *prima facie* case, and had shown that the interests of the Protestant established church had been disregarded, while those of the Roman Catholic church had been advanced. He understood that in nearly all cases the stipends of the Roman Catholic clergymen attending workhouses were higher than those of the clergymen of the church of England.

Lord Wharncliffe opposed the motion on the ground that it called for information which could not be given.—The Earl of Clancarty then withdrew his motion.

HOUSE OF COMMONS.

Monday.—A considerable number of petitions, chiefly on the subject of the Corn-laws, were presented; and after the transaction of some business of minor importance, the order of the day was moved by Sir R. Peel that the House resolve itself into a committee to consider the laws relating to the importation of foreign corn.

Lord J. Russell said, that in the present position of the subject, with an almost universal assent to the proposition that some alteration was desirable, the cry of "No surrender" was at an end, and the question came to be merely as to the terms of the capitulation. The change, then, should be made on sound principles—should be satisfactory, as far as possible, to the now suffering portion of our community, and should be such as would not probably be soon disturbed again. Trade in general, and particularly the trade in articles of food, was not a fit subject for legislation. It was true that where the agricultural interests bore peculiar burdens, it might be just to give them peculiar protections; but Government was not professing now to act on that principle, but on the principle of making England independent of foreign countries for her supply of food. The noble Lord then proceeded at great length to state the principles on which he considered that Parliament should proceed in dealing with the question. He maintained that we are not independent of foreign nations; that we cannot be; and that it is not essential that we should be. Resting, said his lordship, as we do on commerce and manufacture, we ought to have the produce of the whole world open to us; and with our extensive commerce, the nursery of a formidable navy, we had no occasion to fear the result, under any combination of circumstances. He contended that the duties in the higher part of the proposed scale were prohibitory, and that no measure involving the principle of prohibition could be compatible with the welfare of this commercial country; moreover, besides a prohibitory duty, the plan maintained a system of averages, and no amendment, he considered, of the average system could check those frauds which have hitherto attended it. Another evil was, that the "sliding scale" gave us an irregular instead of a steady supply and demand, and under it we were exposed to a drain of bullion, and a contraction of the currency, in addition to the evil of a deficient harvest at home; thus, by bad legislation, aggravating the difficulties produced by the operation of natural causes. After stating at considerable length his objections to a sliding scale and a system of averages, his Lordship declared that for his own part he was disposed to adopt the principle of a low fixed duty. He thought that some exclusive burdens fell on the agricultural interest; and if, in extending to it any protection which it might fairly require, an odium attached to the proposition of a fixed duty, he was ready to share that odium. His Lordship said there were many and great authorities in favour of a fixed duty, and among others he adduced the names of Huskisson, Malthus, M'Culloch, &c. Lord John then denounced the proposed measure of Sir R. Peel, as involving all the mischief of innovation without the compensation of practical improvement. In attributing the distress to improvements in machinery, joint-stock banks, and over-production, he considered the Right Hon. Baronet had given a very false view of the existing state of things. He did not himself consider that the Corn-laws were the sole cause of our present distress, or that their alteration would immediately relieve it: still he did think that a great relaxation of our Corn-laws was necessary to renovate our trade and commerce. His Lordship concluded by moving the following resolution:—"That this House, considering the evils which have been caused by the present Corn-laws, and especially by the fluctuations of the graduated or sliding scale, is not prepared to adopt the measure of her Majesty's Government, which is founded upon the same principle, and is likely to be attended by similar results."

Mr. Gladstone replied to the noble Lord in a speech of considerable length, defending the proposition of Government, and contending that the scale proposed was superior in all points to a fixed duty. He endeavoured to prove by a comparison of the necessary operation of the proposed measure with that of a fixed duty of eight shillings per quarter, that, in every imaginable state of circumstances, and in reference to our intercourse with every nation, the former is the more advantageous to the interests of this country. With respect to the affirmation of Lord J. Russell, that the 20s. rate of duty was a prohibitory one, he reminded the House that it was only levied when prices indicated an abundant supply at home; and if this were to be regarded as a prohibitory duty, he hoped that we should always have the blessing of one. A uniform protection, he said, could not be given to corn as it could and was to other articles, because at high prices of corn no duty could be maintained; therefore at low prices it was just to give a duty which would be an effectual protection. He trusted that the measure now to be introduced would work a great improvement, without that sort of total revolution which all must deprecate, and which, with reference to this particular subject, had been denounced with peculiar emphasis by Lord Melbourne himself in 1840. Between the opposite extremes of those who thought with the Anti-corn Law Convention and those who thought with the Agricultural Association of Boston, he hoped that the measure of Government was a fair medium; and that it would give relief to consumers, steadiness to prices, an increase to foreign trade, and a general improvement to the condition of the country.

Mr. C. Wood denied the possibility of rendering England independent of foreign supply. The question was merely as to the terms on which foreign supply should be sought—whether under a variable or a fixed duty. For the last ten years, no great quantity of corn had paid more than 10s., therefore any duty much above that must be prohibitory. He recommended a fixed duty as likely to produce a steadier trade. The effect of the present law was to give every advantage to foreigners against ourselves: to give a profit to the holder of foreign corn, and transfer the traffic to the foreign shipper. The distress of large districts called upon the House to increase the means of consumption.—Mr. Liddell considered that the measure proposed by Government was not only acceptable to the agricultural interest, but would satisfy a large portion of the commercial and manufacturing community.

Dr. Bowring referred to the quotations of Sir R. Peel on a former night from his evidence before the Committee on Import Duties, complaining that they had been partially made; and contending that the proportion of comforts enjoyed by English labourers as compared with those of other countries was not so great as the Rt. Hon. Baronet had stated it to be. He did not, he said, advocate the principle of a fixed duty, for he was persuaded that nothing short of a total repeal would now satisfy public opinion. As for the proposed plan of Government, its operation would be more stringent than the existing law. The only solution he considered of this great question which would not be disposed of out of doors as it would be in the House, was, that the bread of the people should not be taxed.

Mr. Ferrand taunted Lord J. Russell with the result of his appeal to the people on the Corn-laws. Lord John, he said, had stated that the hand-writing was on the wall. It had been legible enough; the West Riding had read it, and returned two Conservatives. Mr. Ferrand then attacked the members of the Anti-Corn-law League, whose object he represented as being to increase their own profits by lowering the price of labour: and concluded by an appeal to the landed interests, who, he trusted, would relieve the labouring classes.—On the motion of Sir W. Clay the debate was then adjourned.

Mr. Pemberton obtained leave to bring in a bill to enable H. R. H. the Prince of Wales to grant leases of the possessions of the Duchy of Cornwall, and to enable her Majesty to exercise the powers of his Royal Highness as Duke of Cornwall during his minority. The bill was then brought in and read a first time.

Tuesday.—Several petitions having been presented, the Speaker informed the House that he had received a communication from the agent of the Carlow petitioners, to the effect that the petition against the return of Col. Bruen and Mr. T. Banbury would not be presented.

Lord Stanley, in reply to Sir C. Napier, stated that the places of residence of the three Leeward Islands Bishops would be Barbadoes, Demerara, and Antigua.

In reply to a question from Col. Rawdon, on the subject of Presbyterian marriages in Ireland, Lord Eliot stated that it was the intention of Government to introduce a Bill without delay, legalising the marriages referred to; but that they must take time to consider the prospective measures to be adopted with regard to such marriages for the future.

In reply to questions from Col. Fox, Sir R. Peel said that Government had received no official information of the presence or probable arrival of Cabrera in Paris; but that some reports had reached Government similar to that mentioned by the gallant Colonel, namely, that Cabrera was actually in Paris, or might shortly be expected there. He could not let this opportunity pass without expressing his earnest hope that the Government of Spain, supported as it was by the great body of the Spanish people, would have strength and energy sufficient to resist any revolutionary machinations.

Sir C. Napier having said that it was by no means his wish to insinuate that the present enlightened King of the French would lend himself to any conspiracy of the kind, Sir R. Peel also disclaimed the insinuation that there was the smallest ground for supposing that the French Government would give the slightest countenance to any conspiracy against the Government of Spain.

The Lord Advocate, in reference to a former debate, stated, upon the authority of the Lord Chief Justice Clerk and the Solicitor-General of Scotland, that the late Lord President of the Court of Session had sat in every jury cause at which according to law he ought to preside, with the exception of three causes.

The Corn-law debate was then resumed in committee by Sir W. Clay, who insisted that a sliding scale of duties had been found to disturb the currency, and reproached Sir R. Peel and the Vice-President of the Board of Trade, Mr. Gladstone, with having, in their addresses to the House, omitted this important topic. It was, he said, within the power of Sir R. Peel and his Government to pass their measure, but it was beyond the power of any Government to settle the question by such measures. The people of England had now taken up the subject, and they would settle it in their own way.—Capt. Hamilton expressed the opinion that the Government measure did not afford to the agricultural interest the full protection they had a right to claim: yet still he should vote for it in opposition to the resolution of Lord J. Russell.—Mr. Childers expressed his opinion in favour of a fixed duty.—Capt. Rous supported the measure of the Administration; and Mr. Williams spoke in favour of the resolution of Lord J. Russell.

Mr. Ormsby Gore gave a calculation to show how small a burden per head was imposed on the labouring classes by the existing Corn-law. He read extracts from a letter addressed to him by an operative cotton-printer, purporting that the Corn-laws had nothing to do with the distress of the working people, which was stated to be caused solely by machinery. He regarded the proposal of a fixed duty as a deceitful suggestion.

Mr. Ward made a long speech against the Government measure. Lord J. Russell, he said, had stated on the previous night, that the amount of fixed duty which he would consent to, should be exactly proportioned to the peculiar burdens of the agricultural interest. He (Mr. Ward) intended to take an early opportunity of moving for a committee to inquire what were the nature and amount of those burdens. As to even a fixed duty, the time was fast passing away for its imposition.

Sir E. Knatchbull defended the plan of Government, and contended that Lord J. Russell could never have hoped for the concurrence of the landed interest in his plan of a fixed duty. He declared his own concurrence in the doctrine of a fixed duty, provided it were possible to maintain such a duty in times of scarcity; but it could not be then maintained; and if once removed, it would be gone for ever. He certainly would not himself have concurred in Sir R. Peel's plan if he had not believed it to furnish just and full protection to the landed interests, and security to them for their station in the community. He had felt it his duty, however, to consider this subject with reference to the interests, not of the agriculturists alone, but of all classes; and he was happy to find that his constituents concurred with him, and were prepared to support the plan now proposed.

Mr. Labouchere insisted, in reply to the last speaker, that the object of a Corn-law ought to be, not the maintenance of any particular class, but the advantage of the entire community.

He would be sorry to see injury done to the landed interest; but to him the grand consideration was the welfare of the people at large. The question, he considered, was, whether, in average years, we grow enough for our population? Notwithstanding the great increasing power of agriculture, returns, showing our annual increasing average importations of foreign grain, proved that our population was rapidly outstripping the means of supply. He then quoted an opinion given in 1828 by Lord Stanley, in which that noble lord had expressed his approbation of a fixed duty; and concluded by saying that he did not know whether the policy of Government in other matters was to be more liberal than in this. If it were not, all would be alike delusive; but if it were more liberal, there would be a suspicion that the want of liberality on the Corn-law was owing to the superior power of the parties interested.

Sir J. Graham said, that the agitation of this question had been begun by the late Government, and it then became impossible for their successors to avoid dealing with it. This measure was produced by Ministers as the lowest duty which could be taken consistently with the due protection of the agriculturists. The fixed duty would not have conciliated the parties opposite; to have adopted it, would have been, in Lord J. Russell's language, to disturb without settling. After his own experience, he had no faith in finality, and would never again recommend a concession larger than he thought just, in the hope that it would be conclusive. What he now tendered was, in his opinion, equitable for the consumer on the one hand, and the producer on the other. Lord John, he continued, had himself, in Lord Grey's Government, supported the sliding scale. That scale had been called slippery, but there seemed to be some lubricity even in the fixed duty; for the noble lord himself had proposed on the preceding night to relax it. He next entered into some calculations to show at what prices foreign corn would come into competition with British, and to evince the advantage conferred upon the consumer under the proposed scale; after which he recurred to the inconvenience of the opposite plan, when high prices should call for remission of duties. He then quoted some official reports, setting forth the operation of machinery in producing goods and displacing labour, and concluded by a short recapitulation of his arguments. The debate, on the motion of Mr. C. Buller, was then again adjourned.

Wednesday.—Several petitions were presented, and notices of motions given. The Chancellor of the Exchequer postponed his motion on the Exchequer bill fraud until Tuesday.

In reply to a question from Mr. Evans, Sir J. Graham said that the subject of Local Courts had occupied the attention of Government, and it was their intention to introduce a measure which should provide for the recovery of debts not exceeding fifteen pounds, by local tribunals; and the recovery of debts of that amount would be provided for by quarterly trials.

The adjourned debate was then resumed by Mr. E. Buller, who said he had diligently compared the operation of the present sliding scale with what would probably be the operation of the proposed scale, and he had come to the conscientious conclusion that it would prove but a mitigated mischief.

Sir W. James opposed the resolution of Lord J. Russell, and Mr. Bernal, jun., supported it. Mr. Scott (Roxburghshire) representing a manufacturing as well as an agricultural constituency, considered himself returned to protect both interests, and was happy to say, that by the generality of those who sent him thither, the plan of Government was fully approved. Mr. Hastie contended that the sliding scale had produced very serious effects upon the currency of the country, and had materially injured our trade with the United States. Mr. Christmas supported the Government measure, chiefly in reference to the interests of Ireland.

Mr. Roebuck wished that before the question upon Lord J. Russell's amendment, which respected only the mode of the taxation upon corn, a question should be put as to the fitness of any corn taxation at all. He disclaimed any argument on the religious ground, that of sinfulness in taxing bread; but the manufacturing system, he said, had been created by the war, with the universal consent of the nation; and the population so created then must be maintained now. The working classes, he added, were watching the great experiment now going on with quiet yet intense interest; they were waiting to see which of the two great classes, the landed or the commercial body, had the will or the power to do them justice. Sir R. Peel was lagging behind his age; and if he did not now meet the exigencies of his position with courage and boldness, it would be said of him hereafter that he had failed in the practical sagacity of statesmanship.

Lord Sandon said, that, important as was the commercial element of our greatness, it was not the only element. The people of Liverpool, whom he represented, continued to hold the old-fashioned doctrine that England ought to be independent of foreigners for her supply of food. They considered the present measure to be a most valuable boon.

Lord Worsley could not assent to the proposition of Government, neither could he agree to a fixed duly, as suggested by Lord J. Russell. The great body of those who were now supporting Government had generally led their constituents to expect that they would resist all change in the Corn-laws, and he called on them now to join him in resisting the Government measure.—Mr. Christopher replied to Lord Worsley, and defended the Government measure; and after a few words from Mr. G. Berkeley, who was in favour of a fixed duty,

Sir R. Peel rose and said that he was quite aware that he had to contend with two classes of antagonists—one party led by Lord J. Russell, who supported a fixed duty, and those led by Mr. Villiers, who repudiated all protection. How such parties, however, were made to range themselves under one banner, he was somewhat at a loss to know. He agreed that the object should be the welfare of the whole people; and he had adopted his present measure, because he thought it better for the whole people's welfare than a fixed duty. Lord John himself seemed to be quitting the fixed for the sliding duty, but made his slide all at once, and dropped 8s. in the duty on a rise of 2s. in the price; indeed, he thought that the only difference between them was that the noble Lord would only slide on one leg. The right hon. Baronet proceeded to say that he disclaimed all intention of increasing protection by his proposed alteration of taking the averages, and was quite open to conviction on the subject. Vast pecuniary and social interests, he said, were involved in the consideration of the great question of protection to agriculture; and no sudden alteration, he thought, could be made without producing a revulsion of the most serious character. The right hon. Baronet concluded by saying that Government expected to meet with dissatisfaction in some quarters, but they looked to find their ultimate reward in the approbation of moderate men, and the benefit of all classes of the country.

Lord Palmerston represented the measure as universally dissatisfactory: and the silence with which the first statement of it had been received by the supporters of Government, he considered, was its condemnation. A more liberal measure might not have received support from one quarter, but it would have been compensated by support from other quarters, and such a course would have been ultimately better for the Government as well as the country. On general principles, the noble Lord said he was averse to protection at all; but he was disposed to advocate a fixed duty, not for protection, but for revenue. But a sliding scale, modified as it might be, would neither benefit commerce nor the revenue; while, under a fixed duty, the trade in corn would become a steady and expansive trade.—On the conclusion of Lord Palmerston's speech the House divided; when there appeared—For the original motion, 349; for the amendment, 226. Majority for Ministers, 123.

Mr. Villiers, after a short discussion, obtained leave to postpone his motion for a total repeal of the Corn-laws until Friday. The House then went into committee, and immediately afterwards resumed, when the other orders of the day were disposed of.

Friday.—Mr. Villiers proposed his motion for the abolition of ll duties on foreign corn. He began by reading the petition of the Conference assembled in London, which he considered as no inappropriate introduction to his motion. It was, he said, universally admitted that the present law had worked badly; it had only worked well for dishonest men: and seeing this, he did not despair, at no very distant period, of being able to persuade the house to abandon legislation on it altogether.

Mr. Oswald seconded the motion. After some remarks by Lord Mahon and Mr. Elphinstone, Mr. Heathcote considered that Sir R. Peel had produced stronger arguments for maintaining the present law than for altering it.—Mr. Brotherton opposed the Corn-law, because he considered it essentially unjust; and defended the manufacturers from the attack of Mr. Ferrand, who had said they had made fortunes out of the sinews of workmen.—Sir C. Napier advocated a fixed duty of 8s., and deprecated violent changes, even of a bad law; but expressed his intention of voting for the motion, in which Capt. Berkeley joined.

CITY.

Money Market, Friday.—Consols for money and the account closed at 89¼ to ⅜; Three per Cents. Reduced, 89⅞; Three-and-a-Half per Cents. Reduced, 99½; Long Annuities (expiring Jan. 5, 1860), 12 11-16; India Stock, 246 to 248; Bank Stock, 168½ to 169½; and Exchequer-bills, 23s. to 25s. premium.

Metropolis and its Vicinity.

The Exchequer-bill Forgery. — The report of the commissioners appointed in consequence of the recent discovery of forged Exchequer-bills, to inquire in what manner those securities have been made out and issued, has just been published. It is a voluminous document, and contains, together with the report of the commissioners, the evidence of all the witnesses examined. No new facts, however, of interest are brought to light. The report admits that the frauds of the late senior clerk, Mr. Beaumont Smith, were facilitated by the absence of sufficient internal check, and the incompleteness of general supervision. It states that the sole direction of the quantity of paper to be manufactured and printed, of the plates to be engraved, and the custody of the moulds of the plates—of the press seal and counterfoils, as well as the entire preparation of the Exchequer-bills, were intrusted to the uncontrolled discretion and integrity of the senior clerk of the department in which the bills were prepared, and, during his absence, of his assistant-clerks, unchecked by any regular examination of the stores or of the tradesmen's bills, or by any regular periodical destruction of surplus printed paper, worn-out plates, or counterfoils. As regards the future management of this department, and for prevention of frauds, the commissioners recommend that the plates for the bills should be engraved in a superior style to the present; that the best artists should be employed in the engraving and workmanship of the plates and dies, and of the stamp and seal; and that mechanical means should be used for distinguishing the impressions. They also recommend that the office of issue, that is, the office of the Paymaster, should be removed from Westminster to the vicinity of the Bank of England, so as to afford convenient means of reference in order to test the genuineness of any Exchequer-bill, and that the bills should be countersigned at the office of the Paymaster on receiving them from the office of the Comptroller-General. Suggestions are also made to establish regulations for the management of the business of the office of the receipt of the Exchequer, with a view to the future prevention of forgery and unauthorised issue.

Anti-Corn-law Conference.—A meeting of the delegates of the Anti-Corn-law Conference has been held, for the purpose of taking into consideration the proposed measure of Government on the question of the Corn-laws, and to draw up a mémorial on the subject to the Queen; Mr. Taylor in the chair. The meeting, which lasted two days and terminated on Saturday, was numerously attended. A great many speeches, all condemning the proposed plan of Sir R. Peel, and some of considerable length, were delivered, the most remarkable of which were those by the Chairman, Mr. Villiers, M.P., Mr. O'Connell, and several other members of the House of Commons. The first resolution, which passed unanimously, was—"That the delegates assembled having denounced the corn and provision laws of this country as a national sin, inflicting incalculable suffering upon the industrious classes, and enormous evils on the community at large, pledge themselves, and earnestly recommend the constituency of the United Kingdom, not again to support any member of the House of Commons who does not vote, or any candidate who does not pledge himself to vote, for the total and immediate repeal of this obnoxious law.". The second resolution was—"That this meeting, duly appreciating the efforts of ministers of all denominations to impress the people with the religious bearings of the anti-bread-tax movement, would respectfully suggest that their success would be considerably increased by simultaneous meetings of their people all over the country, and that the standing committees of the various ministerial conferences be requested to take the same into their immediate consideration." The last and principal resolution for which the meeting had been especially convened, was the adoption of a memorial to the Queen to dismiss her Ministers. It stated that the petitioners were "wholly and grievously dissatisfied with the measure proposed by her Majesty's present advisers to the country for a modification of the laws which obstruct the importation of food for the people, a measure which the memorialists view as injurious to the interests of the country, the peace of the nation, and the honour of the Government; and they desired to express their alarm at the consequences likely to arise from the sufferings now endured by the people, and to avow their utter want of confidence in her Majesty's present Ministers, or in any Ministers who shall not propose to Parliament a measure for the total and immediate abolition of the corn and provision laws." The memorial having been unanimously adopted, arrangements were made for its ing presented to her Majesty at Brighton; and the general business of the Conference concluded by the appointment of an Executive Committee, which was to continue its sittings so long as it should consider it needful for the promotion of the object they had in view.

The Tower.—It appears that the number of persons who paid for admission to view the Horse Armoury and the ruins of the small armouries, during the week ending Saturday last, was only 524; the number of visiters during the previous week having been 727. The sale of relics of the fire is still carried on, but it appears to have now lost much of its former interest, and purchasers are not at all so numerous as they were. The new Jewel-office is still without the regalia, which remain in the custody of Messrs. Rundell and Bridge. The reason assigned for its non-transference to the Tower is the damp state of the new Jewel-office; but as fires are daily kept in it, the public, it is expected, will soon have an opportunity of again viewing the regalia.

Marylebone.—On Saturday a meeting of the Marylebone Vestry took place, for the purpose of receiving the report of a committee appointed to consider a bill now before Parliament for giving to London and Westminster a better and cheaper supply of pure and wholesome water. The following is the substance of the report:—The committee state, "that they have investigated and highly approve of the plans of the London and Westminster Water Company; and it being the intention of the company to apply to Parliament this session for an Act of Incorporation, they recommend to the Vestry to support so important a measure, and by every means in their power, in order that an abundant and pure supply of the first necessary of life may be afforded to the inhabitants of this parish. They further recommend that a deputation from the Vestry be appointed to wait upon the Home Secretary, to solicit the support of Government in favour of the company, which, the report proceeds to say, in accordance with Sir R. Peel's prediction in 1839, makes a purer supply the basis of its prospectus, and has proved by extensive experiments, made by order of a committee of the House of Lords, that a large supply of pure water can be obtained at a much cheaper rate than that charged at present. The adoption of the report, which was moved by Mr. Clapp and seconded by Lord Kenyon, was carried unanimously; after which a deputation was nominated to wait upon the Home Secretary, to request the aid of Government in support of the Bill.—On Thursday a numerous meeting was held of the electors of the borough appointed from its various districts, to wait upon Sir B. Hall and Sir C. Napier, the borough members, upon the subject of the window duties. Both the members attended. Mr. Cooke, at great length, proceeded to call their attention to the great injury inflicted upon the middling classes by the impost of window duties, and said the electors wished to impress upon their representatives the necessity of a total repeal. Mr. Potter said it was useless for them to expect that the government of Sir R. Peel would give them any relief, and it had been rumoured that he was about to bring forward as a measure the house tax. He wished the members for the borough, and government, to bear in mind that what the people of this parish did ten years ago they would in a short time be prepared again to adopt, namely, passive resistance to the payment of the taxes. After several other electors had spoken on the subject, Sir B. Hall observed that his opinions upon the subject of a repeal of the window duties were well known, and he should have no hesitation when the ministerial plan of finance was propounded, to move for their entire repeal. Sir C. Napier said that the two great things which involved the country in expense were the maintenance of the army and navy. With regard to the latter he candidly confessed that if the reduction of the window duties would tend to diminish in any way its efficiency, he would not support it. It was ultimately determined that when the question of the finances came before the House of Commons, the entire repeal of the obnoxious duties should be moved by Sir B. Hall.

Mortality of the Metropolis.—The following is the number of deaths, from all causes, registered in the week ending Saturday, the 5th inst.:—Males, 526; females, 499: total, 1,025. Weekly average, 1838-9-40-1,—Males, 467; females, 445.

Metropolitan Improvements.—In the House of Commons, on the 11th inst., it was ordered "that there be prepared copies of all memorials presented to the Lords Commissioners of her Majesty's Treasury by Mr. Wason, relating to the plan of improvement in the parishes of St. John and St. Margaret, Westminster, which was recommended by the Select Committee of the House of Commons on Metropolis Improvement in 1840, and to effect which a certain sum of money was recommended to be allocated by the said committee; and also of any proceedings thereon." Copies also were ordered of any correspondence relating to improvements in the same parishes, between the Dean and Chapter of Westminster with the Commissioners of Woods and Forests, upon the subject of obtaining such sum of money for the benefit of the private property of the Dean and Chapter of Westminster, contrary to the public interests.—The projected Nelson column in Trafalgar-square is not expected to be completed during the present year, owing to the difficulty, it is said, of procuring Haytor granite. It has been suggested to have basins constructed in the square, for the display of public fountains, similar to those on the Place de la Concorde at Paris. A new fountain has been made in Kensington Gardens, at the head of the Serpentine water. The Buckingham Palace conservatories at each end of the garden front of the Palace, which had been in total disuse, have been fitted up and heated for the reception of hothouse plants, which has contributed to the beauty of the garden façade. The proposed Tower Hamlets Park, for which an act of Parliament was obtained by the Commissioners of Woods and Forests last session, will be laid out in the ensuing spring.

Metropolitan Post.—The following is the statement of the number of letters that have passed through the general post of the Metropolis, for the four weeks ending the 12th inst., and the district post for the four weeks ending the 29th ult., compared with the corresponding periods in the years 1839 and 1841 :—

THROUGH THE GENERAL POST.	
Four weeks ending Feb. 12, 1842	5,429,071
Corresponding period of 1841	4,808,082
Ditto as nearly as can be given of 1839 . .	1,543,375
Increase since 1841 on the four weeks' letters	620,989
Ditto 1839 ditto	3,885,696
THROUGH THE DISTRICT POST.	
Four weeks ending Jan. 29, 1842	1,918,556
Corresponding period of 1841	1,818,352
Ditto as nearly as can be given of 1839 . .	1,106,421
Increase since 1841 on the four weeks' letters	100,204
Ditto 1839 ditto	812,135

Accidents.—On Sunday evening as the carriage of Mr. Harland, of Chesterfield-street, May-fair, was proceeding along Hyde-park, the horses took fright near Cumberland-gate, and starting off at great speed, came in contact with the carriage of the Duke of Norfolk, which was coming in an opposite direction. His Grace's vehicle was much damaged by the collision; and the driver of Mr. Harland's carriage was thrown from his seat, and the wheels of the vehicle passed over him, without, however, inflicting any serious injury. The horses in both carriages were also much hurt; but no one excepting the coachman received any injury.—On Wednesday a waggoner in the employment of Mr. Gregory, of Freshgate, Essex, was on his way to town with a waggon heavily laden with vegetables, when he accidentally fell from the shaft, on which he was riding, and both wheels of the vehicle passed over him. He was at once conveyed to the London Hospital, where he died shortly after his admission from the injuries he had received.

Fires.—On Saturday a serious fire broke out in the premises of Messrs. Cassel and Son, tar-manufacturers, in the neighbourhood of the Commercial Docks, which at first created great alarm from the nature of the materials on the premises; but several engines being shortly on the spot, the flames were soon got under, without much injury having been sustained.—On Monday a serious fire occurred at the residence of Mr. Peyton, Kent-terrace, Old Kent-road. All endeavours to save the building were ineffectual, and it was entirely destroyed; so rapid was the progress of the flames, that the inmates with difficulty succeeded in escaping with their lives.—On Thursday a fire broke out in Whitecross-street prison, which at first threatened to be of a serious character, but by prompt assistance the flames were soon extinguished and the mischief confined to the ward where the fire originated. The governor, it is said, has endeavoured to discover the cause of the accident, but without success.

Sheerness.—An accident of a serious nature, whereby several lives were lost, occurred in the river off the pier at this place on Sunday. It appears that a boat, belonging to H.M.S. Hawke, 74, at present lying in the river, had been on shore for provisions, and while on their way back to the ship, the weather being very boisterous, a sudden squall caught the boat's sail, whereby she was upset, and of nine persons in her, consisting of the crew and a warrant-officer's wife, six, including the female, unfortunately perished. The accident occurred within sight of the several men-of-war, whose boats put off to their assistance; but some time having elapsed before they arrived at the spot, they only succeeded in picking up three of the crew, who were in a very exhausted state, but by proper attention were afterwards restored. An inquest has been held, and a lengthened investigation instituted, as to the cause of the accident. Evidence was adduced as to the condition of the boat when discovered, on which some discussion took place in consequence of a report which had been circulated that the boat was rotten; but this was proved to be incorrect. When picked up, the mast was found unshipped from its right position, and the heel of it protruding through the timbers at the bottom of the boat. The seamen who were saved were then examined. They stated that they were all sober at the time of the accident, which they attributed to a sudden gust of wind unshipping the mast while under sail. The jury returned the following verdict:—"That the deceased persons were accidentally drowned in consequence of a boat capsizing, occasioned by the slip of the mast whilst under sail during a heavy squall."

Provincial News.

MEETINGS have been held in several towns and boroughs throughout the Kingdom, more particularly in the manufacturing districts, on the subject of the proposed plan of Government with respect to the Corn-laws. It will, however, be unnecessary to repeat the proceedings at these meetings, which in all have been nearly of the same character as those at the Anti-Corn-law Conference in London, given in another part of our Paper; and which consisted in the adoption of resolutions expressive of the feelings of the persons present in opposition to the plan of Sir R. Peel, and pledging themselves to use every constitutional means for effecting a total repeal of the Corn-laws. In some of the large manufacturing towns, as Manchester, Derby, Leicester, and Rochdale, some excitement appears to have prevailed on the details of the Government measure being made known; and, among other expressions of hostility on the part of the lower classes, Sir R. Peel has, in several places, been paraded about the streets and burnt in effigy. In no instance, however, has there been any disturbance of the public peace.

Berwick.—On Saturday night, a collision took place off this port between a small schooner and the General Steam Navigation Company's ship Monarch, by which the schooner was completely disabled. The Captain of the Monarch rendered prompt assistance to the schooner, and succeeded in taking on board his ship the whole of the crew, consisting of the captain and three men. It does not appear who were to blame, as the cause of this accident; but it is said that the captain of the schooner acknowledges to have seen the lights of the Monarch some time before she was struck, and that when he neared the latter vessel he attempted to put his ship round, but was struck aft before he could succeed in the attempt. The schooner had not sunk when the Monarch left her, but from her shattered condition no hope was left that she would continue long above water.

Birmingham.—A serious fire has occurred on Blower's Hill Farm, at Rowley Regis, near this town, occupied by Mr. Edward Allsop. Several engines, both from this place and Dudley, were soon on the spot; but before they arrived, one rick of wheat was entirely destroyed. There were, it seems, at a short distance from this stack eight more ricks of wheat and other grain, but these were fortunately saved. It is supposed to be the act of an incendiary, from the circumstance of Mr. Allsop having lately rendered himself obnoxious to certain bad characters in the neighbourhood by defending his house against an attempt at robbery; in consequence of which it appears that his property has been on more than one occasion threatened with destruction. Active exertions are taking to discover the authors of the attempt, and there is some prospect of their being soon brought to justice.

Brighton.—The presence of the Court has caused this town to be very full and gay; and during the week, which has been unusually fine, great numbers of persons have frequented the cliffs and promenades to obtain a view of her Majesty and Prince Albert, who have taken daily exercise either on foot through the principal streets and on the pier, or on horseback, or in carriages along the cliffs and neighbouring drives. At the early part of the week the anxiety of persons to obtain a view of the Queen was very great, and occasioned her Majesty, it is said, some inconvenience in consequence of the pressure of the crowds that collected about her wherever she went. So much, indeed, was this the case, that the chief resident director and secretary of the Chain-pier Company waited on the Lord Chamberlain for the purpose of offering the exclusive use of the pier for the Queen's private walk, at any time her Majesty might deem it convenient to walk. Her Majesty, it is said, declined to accept this offer, and desired that her presence might not debar other persons from the privilege of walking there at the same time. Notwithstanding, however, that notices were issued, and every precaution taken to prevent any annoyance to the Queen during her promenade, on Monday morning so great a crowd had collected, that on her Majesty's arriving at the entrance to the Pier the Royal party were compelled to turn round, and take a carriage airing on the Shoreham-road; and even there, it is stated, five or six females pressed so rudely on her Majesty as to call for the interference of the Princes of Coburg. A review of the Scots Greys took place on Wednesday on the Downs, by command of Prince Albert. His Royal Highness, accompanied by the three Princes of Saxe Coburg, Colonel Grey, Colonel Wylde, and some foreign officers, arrived on the ground about half-past one, when the troops went through their exercises and evolutions with great precision, passing and re-passing several times before the royal party. At the conclusion of the review, Prince Albert expressed to the commanding-officer his gratification at the general appearance and evolutions of the regiment, and particularly at the trotting, and desired that this expression of his satisfaction might be intimated to the officers and men. The Princes and their attendants then returned to the Palace. A great number of persons had assembled on the Downs to obtain a view of the royal party, and to witness the review.

Chelmsford.—An extensive fire has taken place on the premises of Col. Brooks, of Harlington House; and although seven engines were soon on the spot, and every exertion was made to arrest the progress of the flames, the fire continued with great violence during the whole night. The consequence was, that the entire range of outbuildings, comprising the farmhouse, the dwelling in the rear of the mansion, the numerous barns, stables, &c., and the left wing of the mansion, were entirely destroyed. A quantity of grain contained in the barns, and three extensive wheat-stacks, with two of hay, were also consumed. The live stock, however, was, by the exertions of a large body of labouring men and neighbours, safely removed from the premises. The origin of the fire is unknown; but it is thought that it arose through some carelessness on the part of the men employed during the day in winnowing wheat in the barn. The process, it seems, was continued after dark, and lanterns having been taken into the barn to enable the men to finish their work, it is supposed that a spark from the light communicated to the contents of the building.

Chard.—An inquest has been held in this town on a young lady, who died suddenly while walking in the street, from rupture of the blood-vessels of the lungs, occasioned by a slight exertion while under the pressure of tight lacing. A surgeon, who made a *post-mortem* examination of the body, stated in evidence that the practice of tight lacing was very injurious, and especially so when, in addition to the lacing, a large bone was placed against the chest. The Jury returned the following verdict: "Died from the rupture of vessels on the lungs;" and added, "The Jury wish to express their opinion, that the rupture of vessels on the lungs of the deceased was occasioned by the undue pressure of tight stays on the chest, and record this opinion as a caution to the public of the injurious tendency of tight lacing."

Exeter.—On Sunday the church at Oakhampton, in this county, was entirely destroyed by fire. It appears that it is situate on a hill, about half a mile from the town; and in less than a quarter of an hour after the congregation had left the church in the forenoon, it was discovered to be in a blaze, near the organ-loft. In half an hour the flames had extended from one end of the building to the other, and the roof soon fell in. The inhabitants were prompt in their attendance, and every effort was used to check the progress of the fire, but it had gained so great an ascendancy before the engines could be brought into efficient service, that nothing but the bare walls and tower remain. The fire is attributed to a stove which has lately been erected in the church, the flue of which passed under and near the organ gallery. Every monument in the building has been destroyed; but though fears were at one time entertained that the bells would be displaced, and perhaps broken, by the fall among the ruins, the tower and its contents were fortunately preserved.

Hanley.—Some extensive depredations in China goods from the Messrs. Ridgway's manufactory in this town have been detected during the past week. The robbery, it seems, was effected at different periods during the last two months, by Titus Rutter, a young man about 18 years of age, who was in the employ of Mr. Ridgway some time since, and who was detected a few days ago upon the premises, by two persons appointed to watch, in consequence of china having been missed. Rutter, it appears, subsequently confessed that he had carried on the plunder for two months, and that he had sold the principal part of the property to Michael M'Cabe, a tailor, living at Burslem, and to a pot-seller and huckster, at Sneyd Green, named Weatherby. He gained access to the premises by means of a false key. The greater portion of the stolen property has been recovered. Rutter has been committed for trial charged with burglary, and M'Cabe and Weatherby with receiving the china, knowing it to have been stolen.

Ipswich.—The local papers mention a serious accident which occurred on Monday to Capt. M'Forlane of this town. It seems that he was driving a carriage through the streets, when some dogs got between the horses' feet, and so frightened them that they became unmanageable, and ultimately upset the carriage. The Misses M'Forlane and the servants escaped with some bruises, but the Captain himself sustained a fracture of the ribs, and the carriage was broken to pieces.

Llanfair.—Considerable excitement has been occasioned in this town and neighbourhood by the commission of a murder of a serious description, the murderer being the brother of deceased. The name of the former is Evan, and the latter Robert Davies. The murderer was a young man of dissolute habits, much addicted to intoxication, and when in this state liable on slight provocation to violent fits of passion. It appears that on the evening in question he had come home in this condition, and having some words with his brother, who was taking his supper, he snatched a knife from the table, and stabbed deceased in the stomach, killing him on the spot, in the presence of his mother and sister. He then made his escape, but was apprehended two days after concealed in a neighbouring haystack, in a state of great exhaustion, having taken no food since the time of the murder. He has been committed to take his trial.

Margate.—A few nights since, the men of one of the preventive stations near this harbour captured a considerable quantity of contraband goods near the Clifton Baths. The leader of the smugglers, a powerful man, known upon the coast as "Long Will," made a determined resistance, but being thrown with violence upon the rocks during the fray, was severely hurt, and made prisoner, together with two of his comrades: the rest of the smugglers, favoured by the darkness of the night, escaped; leaving the whole of the cargo in the hands of the Preventive men.

Newport (Isle of Wight).—It is stated that the failure of the old Bank, noticed in our last, is likely to involve greater numbers than was at first anticipated. The liabilities are now stated to be 100,000*l.* The accounts from Ryde in connexion with this failure are said to be of a serious character: few of the inhabitants appear to have escaped, and the number of notes and deposits in that town is said to amount to between 25,000*l.* and 26,000*l.* At Cowes, also, the amount is stated to be much greater than was at first thought; and the result of this unfortunate occurrence appears to have been generally to paralyse the trade of the island. It is not yet known how much the estate will pay, but it is feared that it will be very little.

Sudbury.—The local papers inform us that the crime of sheep-stealing has been carried on in the neighbourhood of this town, during the present winter, to an unusual and serious extent; there being, it is said, scarcely a farmer in the vicinity who has not lost one or more sheep. A party of the thieves, however, have at length been apprehended. A few nights since, Mr. Freestone, steward to Mr. Pung, of Bulmer, and Mr. Sadler, steward to Mr. Eaton Hall, of Somerton, both owners of land in the parish of Glemsford, having reason to suspect three men, named Lindley, Simpson, and Belchamp, who were straying about in the neighbourhood, determined to watch their proceedings. They consequently procured the assistance of two constables, and secreted themselves in the pathway leading from the farm; and after waiting some time they observed Lindley and Simpson approach, each having the carcase of a sheep upon his shoulder. They succeeded in capturing two out of the three, Belchamp at the time effecting his escape, though he was afterwards taken into custody, and all three have since been committed to take their trial for the offence.

Windsor.—A serious accident occurred a few days since to T. R. Ward, Esq., of Englefield Green, one of the magistrates for Berkshire, while hunting with the fox-hounds in the neighbourhood of Croughton, Northamptonshire, at which place he was on a visit. It appears that while in the act of leaping a hedge from a field into a lane, he shifted his seat at the moment for the purpose of avoiding the projecting branch of a tree, whereby he lost his balance, and fell on the road with great violence. On being taken up, it was discovered that his collar bone was broken, and his arm severely fractured. Mr. Ward, however, was able to return to his seat at Englefield Green, by easy stages, on Saturday, and is now reported to be doing well.

York.—A few days since, while the magistrates for Sedberg, in the West Riding of this county, were occupied in hearing a case of assault, which had excited general interest in the neighbourhood, and had attracted a great number of persons to the Court to hear the examination, the middle portion of the floor of the office gave way, precipitating 150 individuals to a depth of 20 feet. Great alarm and confusion immediately prevailed, and assistance being afforded, the parties were extricated, when it was found that no lives had been lost, though several were so seriously injured that their lives are despaired of. A great number were also more or less bruised. The part of the office upon which the magistrates were sitting was supported by another beam, and did not fall; consequently they did not sustain any injury, although they were much alarmed. Several other persons escaped, who had been sitting upon the window-seats. The first report of the accident produced great alarm and excitement in the town, the consequences having been represented as much more serious than they proved to be.

Railways.—We learn from the "Railway Magazine" that the following are the receipts of the railways for last week:—Brighton, 1,640*l.*; Blackwall, 710*l.*; Manchester and Birmingham, 362*l.*; Eastern Counties, 687*l.*; Birmingham, 14,582*l.*; Manchester and Leeds, 3,832*l.*; Greenwich, 878*l.*; Northern and Eastern, 900*l.*; South-Western, 3,835*l.*; Great North of England, 1,241*l.*; Midland Counties, 2,380*l.*; York and North Midland, 1,314*l.*; and Great Western, 11,563.—The policeman, Lewes, who met with the accident on the London and Brighton Railway, noticed in our last, has since died of the injuries he received, and an inquest having been held, a verdict has been returned of "Accidental death."—The half-yearly general meeting of the proprietors of the London and Birmingham Railway Company has been held at Birmingham, for the purpose of receiving the Directors' report, and for other business. The chairman, George Carr Glyn, Esq., stated that the affairs of the company were such, that they were enabled to declare an excellent dividend on the capital subscribed. After referring to the necessity that would exist, in order to meet the debentures which would become due in July, for a call of 10*l.* on the 25*l.* shares, and a small call on the old 100*l.* shares, he called upon the secretary to read the report, which set forth that the directors had great pleasure in announcing, during the last half-year, an increase in the receipts, a decrease in the expenditure. The traffic account had exceeded that of the corresponding half-year of 1840, to the extent of 23,892*l.* The net profit of the half-year was 227,824*l.*, which, added to the undivided residue balance of the 30th June, 1841, of 4,117*l.*, gave a total of 231,941*l.* applicable to a dividend at the rate of 4*l.* 15*s.* per cent., which would amount to 227,967*l.*, leaving a residue to be carried to the current half-year of 3,973*l.* The directors had also great satisfaction in reporting that the Birmingham and Gloucester Railway had been entirely completed and opened, and that they had leased the Warwick and Leamington Railway at 5 per cent. on the estimated cost, which was not to exceed 130,000*l.* The report was unanimously adopted.—On Monday, the half-yearly meeting of the proprietors of the London and Greenwich Railway was held, Mr. W. Shadbolt in the chair. From the report, it appeared that the new works were progressing. Fifty-six carriages on the line were shortly to be replaced by others of a better construction. The raising of the remaining 50,000*l.*, by the issue of new shares or bonds, was at present delayed. Compared with the former half-year there was a saving in the expenditure of 1,376*l.* 12*s.* 8*d.* The balance of the traffic department was 1,160*l.*, a sum too small to warrant a dividend. The passenger traffic showed a decrease of 41,321, and in amount of 1,635*l.*, compared with the preceding half-year, but the Brighton tolls had increased to 987*l.* 13*s.* 3*d.* The directors, however, looked with confidence to the future, when the Croydon, Brighton, and South-Eastern lines should be in a state of completion. The fares had been reduced to 9*d.* and 6*d.*, but no opinion could at present be formed of the result of the experiment. From the balance sheet it appeared that, up to the 31st Dec., the total cash received had been 966,239*l.* 4*s.* 2*d.*, leaving a balance in hand of 27,353*l.* 4*s.* 4*d.* The receipts for the half-year were 26,137*l.* 5*s.* 4*d.*, in which were the items—passengers, 737,916, and paying 22,524*l.* 11*s.*; Croydon toll, 2,052*l.* 11*s.* 5*d.*; and Brighton, 964*l.* 18*s.* 8*d.* The interest on bonds and shares, and the expenses, reduced the balance to 931*l.* 9*s.* 3*d.* The report having been adopted, a long discussion took place on a resolution, proposed by a proprietor, to compel the directors to be holders of 200 of the old shares as a qualification, but it was eventually withdrawn under the consideration that the directors in future should each qualify to the extent of 100 of the original shares.

IRELAND.

Dublin.—The usual weekly meeting of the Repeal Association was held on Saturday. A letter was read from Mr. O'Connell, stating his intention to leave London on Tuesday, so as to arrive in this city on Wednesday, in order to preside at a meeting of the corporation on that day. The debate on the Corn-laws, Mr. O'Connell added, would consume a week, but he would take care and be back in London in time for the division. The letter then proceeded to comment in severe terms on the proposed plan of Sir R. Peel, and concluded with the following words: "You perceive we allow Irish affairs to abide the great national cause of English distress. Until their own great battle is decided, they have not leisure to think of us. They will awake by and by, and bestow their injustice on us. In the mean time, surely there is no Irishman so stupid as not to see even in the present English agitation a glimpse of that posture of public affairs which may make the friendship of Ireland valuable, and her deliverance, therefore, secure." The letter was inserted on the minutes; after which a communication was read from Brooklyn, New York, enclosing 17*l.* for the association; and another from Liverpool, enclosing 5*l.* The amount of the rent for the week was announced to be 41*l.* 8*s.* 6*d.*

Limerick.—On Saturday, a party of the police of this city succeeded, after a long chase during the preceding night, in arresting three men, who have been identified as principals in the late murder of Mr. Patrick Shine, at Carrigparson, near this place. Rewards amounting to above 600*l.* had been offered by the neighbouring gentry and Government for the apprehension of the assassins.

Sligo.—On the night of the 10th inst., Col. White's agent, Mr. David Cullen, of Carrickfad, within four miles of this town, was shot in his bedroom. The assassin, it seems, fired at him through a chink in the window-shutter, and the ball entering under his shoulder, passed through his body, and was flattened against the opposite wall. It appears that serious doubts are entertained of his recovery. The police were immediately on the spot, but no trace of the author of the attempt has yet been discovered, although Government has offered 100*l.* for the apprehension of the murderer. The occurrence has produced general alarm in this town and neighbourhood.

Waterford.—A memorial has been drawn up by the inhabitants of this city, who held a meeting on the subject, requesting that a daily mail may be established between this port and Bristol, the present post-office communication with Milford-haven being found inadequate. The memorial consists of arguments to show the preference of Waterford to Cork; the advantageous situation of the former, with respect to many important towns in the south of Ireland, is pointed out, as well as its natural qualities as a port compared with those of Cork.

Mayo.—A local paper, the *Constitution*, informs us that a few days since, an old man was found drowned in a bog-hole, in the barony of Tyrawly, with a sheep tied round his neck. It seems that he had been crossing the bog at night, with the sheep, which he had stolen, on his back, and that falling into a bog-hole, he was drowned before he could extricate himself. At the last assizes for this county, deceased, it appears, was arraigned for sheep-stealing, and pleaded guilty, but was allowed to withdraw his plea, and was acquitted, by direction of the judge, a flaw having been discovered in the indictment. After his escape, he again took to the same practices, and at length met his death in the manner above related.

Cork.—The Royal mail steamer *Caledonia*, which sailed from Liverpool on the 4th ult. for Halifax and Boston, put into this harbour on Tuesday, disabled. She had in lat. 49 20, long. 29, encountered very boisterous weather, which lasted for three days, whereby her bulwarks had been carried away, her paddle-boxes stove in, and her decks swept. The rudder was completely twisted, and the damage was so serious that she was unable to proceed on her voyage, and returned to this port to repair. No lives fortunately have been lost.

SCOTLAND.

Edinburgh.—A few days since the first public experiment of the Bude light was made in this city with considerable effect. It was brought into the lantern in front of the premises of Messrs. Smith in Blair-street; and although the ring was only about an inch in diameter, it is said to have illuminated the neighbourhood to a much greater extent than a dozen of the gas jets burning in its vicinity.

Paisley.—It is stated that her Majesty's recent patronage of the manufactures of this town, noticed in previous numbers of this Paper, has already given a considerable stimulus to the trade, particularly in the richer description of goods, which pay best both for the master and the workman. Orders are now almost daily received by several of the first houses, "for goods of the same description as those selected by the Queen;" and as the season advances it is thought that the royal patronage will be found still more advantageous. As regards the kind of goods selected, it seems that they were for the most part of the finest description of India imitation shawls; but that there were also some rich satins, merinos, velvets, and a tartan of a rare and beautiful make.

Miscellaneous.

The Peerage.—The following are the names and ages of some of the oldest Peers. Perhaps there is no public body in the world, with the same limited numbers, which can produce an equal number of men who have attained to such venerable ages:—Abercromby, Lord, 72; Abergavenny, Earl, 87; Ailsa, Marquis, 72; Anglesey, Marquis, 74; Berners, Lord, 80; Besborough, Earl, 84; Bexley, Lord, 76; Bristol, Marquis, 73; Carberry, Lord, 77; Cathcart, Lord, 87; Colville, Lord, 74; Cork, Lord, 75; Delamere, Lord, 75; Dinorben, Lord, 75; Donegal, Marquis, 73; Dorset, Duke, 75; Dynevor, Lord, 77; Ferrers, Earl, 82; Grafton, Duke, 82; Grey, Earl, 77; Gray, Lord, 78; Hamilton, Duke, 75; Harrowby, Earl, 80; Huntley, Marquis, 81; Leitrim, Earl, 74; Limerick, Earl, 84; Lonsdale, Earl, 85; Ludlow, Earl, 84; Lynedoch, Lord, 92; Macclesfield, Earl, 87; Manchester, Duke, 74; Manners, Lord, 86; Maryborough, Lord, 79; Mayo, Earl, 76; Middleton, Lord, 73; Mostyn, Lord, 74; Norfolk, Duke, 77; Northwick, Lord, 72; Plunket, Lord, 78; Plymouth, Earl, 74; Ponsonby, Lord, 72; Portland, Duke, 74; Rolle, Lord, 86; Rossmore, Earl, 77; Saye and Sele, Lord, 73; Shaftesbury, Earl, 74; Sidmouth, Lord, 85; Sinclair, Lord, 74; Stamford, Earl, 77; Stanley, Lord, 76; St. Germain's, Earl, 75; Strathallan, Lord, 75; St. Vincent, Lord, 76; Teynham, Lord, 74; Wellesley, Marquis, 82; Wellington, Duke, 72; Western, Lord, 75; Westminster, Marquis, 75; Wynford, Lord, 75.—*Times.*

New Gold Coinage.—A fraudulent system has been carried on for some time, of defrauding the public by plugging the gold coin of the realm, which has been effected in the following manner:—From the rim towards the centre of a sovereign several holes are drilled with a very fine instrument, and the vacancies filled up with an inferior metal, so as to deceive the most experienced judges. By this process a sovereign is rendered, in many instances, not worth more than 17*s.*, and a half-sovereign not more than 8*s.* 6*d.* or 9*s.* Government, it is added, has been obliged, in order to put a stop to this fraud, to direct a new coinage to be issued. For the last fortnight, the Master of the Mint, Mr. Gladstone, and the assayer, have been engaged in witnessing many experiments, with a view to prevent the abstraction of the gold taking place without immediate detection. On Wednesday, the workmen commenced casting the new coinage, which will shortly be issued to the public; the expense will be very great, but Government, it is said, has been obliged to incur it, in consequence of the system above alluded to having much injured the credit and confidence in the value of our gold, not only at home, but on the Continent.

The Hunting Antelope of India.—Mr. Fane, in his "Five Years in India," states that the hunting-deer are very curious; and he does not remember to have seen them in any other part of India. A large male antelope is trained to walk quietly among a herd of wild ones, one of the males of which comes immediately out to fight. The tame one having ropes twisted in a particular manner among his horns, soon manages to entangle his antagonist; and the moment he finds he has done so, he throws himself on the ground and anchors the other until the people come up and secure him. The buck with which he saw it tried dashed immediately at his opponent; but the other perceiving that something was wrong about the tame one, started off as fast as his legs could carry him. The natives said this was rare, and that they generally managed to secure the wild one.

Travelling Camp in India.—Mr. Fane, in the same work, gives a sketch of a travelling camp in India; of which the following is an extract:—All the principal tents, that is, those of the Commander-in-chief, his personal and general staff, form a long street of about fifty feet wide, the General's always being in the centre; the great durbar, or dining-tents, on one side, and the sleeping-tents on the opposite. This street the Quarter-master-general takes care is always clear of trees, bushes, and other obstructions, and the holes filled up; and that sentries are posted to prevent the intrusion of the common people, and of wandering thieves. Behind the lines of great tents are the routys (a smaller kind of second tent for breakfast) and servants' tents; beyond which the saddle-horses and other cattle stand picqueted in long lines in the open air, in which way they do perfectly well in all weathers in this country. A few people think it better to have their horses under tents; but this is not by any means common. At some little distance in rear of the main camp is that of the bazar, separate entirely from the other, where all the rice and common articles of every description used by the servants are bought and sold, and of which a nèrric, or "price current," is daily given out by the commissary attached to head-quarters. Quite on the outskirts of all are the elephants and camels, standing enjoying themselves after a long morning's march—about four or five hundred of the first, and seventy or eighty of the last; and near them the long-drilled lines of picqueted dragoon-horses of the escort, with their masters' and officers' tents. The infantry are generally placed away from the cavalry, at the opposite side of the camp. The whole, what with escort and camp-followers of different descriptions, muster nearly 5,000 souls, and at times much more, as the camp occasionally varies a good deal in population.

Singular Wager.—About a century ago, Lord Orford made a large bet with another nobleman that a drove of geese would beat an equal number of turkeys in a race from Norwich to London. The event proved the justness of his Lordship's expectations, for the geese kept on the road with a steady pace, but the turkeys, as evening approached, flew to roost in the trees adjoining the road, from which the drivers found it difficult to dislodge them; in consequence of which the geese arrived at their destination two days before the turkeys.—*Morning Paper.*

Law.

COURT OF CHANCERY.—*In re Thorpe, a lunatic.*—A petition to confirm the Master's report, and had been argued at great length some time since. The Lord Chancellor said he had looked with attention into the accounts, and thought they disclosed circumstances which demanded further inquiry. The case was, indeed, so peculiar, that he hardly knew how to deal with it. It appeared that the estate produced an income of 8,000*l.* a year, and that although the lunatic had an allowance of no more than 1,000*l.*, yet there was a deficiency unprovided for. The lunatic was only tenant for life, and the committee entitled to the reversion; and although there must be covenants of repair in the tenant's leases, yet that 1,000*l.* were charged for repairs, which repairs were as much for the benefit of the committee as of the lunatic. There was also an item of account charged twice over, that must be inquired into. On the whole, his lordship thought that the next of kin must be called on to take a part in the proceedings in the Master's office, and the order must be to that effect.

Vice-Chancellor's Court.—*The Clarence Railway Company* v. *the Great North of England, Clarence, and Hartlepool Junction Railway Company.*—It appeared the Junction Railway Company proposed crossing the Sherbourne branch of the Clarence Railway in a manner to which the Clarence Company refused their assent. In consequence of the dispute which this occasioned this bill was filed, and an injunction was granted by his Honour during the last long vacation, restraining the Junction Railway Company from doing their intended acts, the Clarence Company being put under terms to bring an action forthwith, for the purpose of trying the question, which turned on the construction of the Acts of Parliament in a Court of Law; special liberty being given to either party, in the mean time, to apply to this Court. Under this permission, the Junction Company now applied to the Court, and represented that the Clarence Company had selected the Court of Queen's Bench for their action, the consequence of which was, that the action could not be tried sooner than Trinity Term next, at the very nearest. This delay, the Company alleged, would be very injurious to them, and therefore made the present application for liberty to go on with their works, and offered an undertaking to restore matters to their present position, and to make full compensation, should the judgment of the Court be finally against them. His Honour refused the motion.

Crawford v. *Scott.*—A motion was made in this case for an injunction to restrain defendants from proceeding with an action at law, on the ground that there were suits pending in equity which would better and more properly decide the question. His honour said he thought that there were some questions which might be better decided at law. The order that he would therefore make would be this:—An injunction to stay execution if the action brought should be in favour of the plaintiff, to bring the amount which should be recovered for debt and costs in the action into court within a week after final judgment, and in default, the information to fall without further notice. The money, if brought in, to be laid out, and directed to accumulate without prejudice. The costs to be reserved.

Stephenson v. *Everitt.*—This was a creditor's suit, the bill suggesting that the testator, by a will, had devised his estate in a particular manner. The personal representative, the heir-at law, and the widow were made defendants, the latter as a devisee. Upon evidence being gone into to prove the will, one witness stated that the attestation was not his handwriting, and denied that he had ever attested the will; the other witness admitted his writing, but stated that the will had not been executed in his presence; the third witness had died. The question having ultimately resolved itself into a question of costs, his Honour dismissed the bill as against the widow, without costs, and directed an amendment.

Rolls Court.—*Gardner* v. *M'Crutcheon and others.*—Lord Langdale gave judgment in this case, which related to some disputed property consisting of a cargo of wool; and said that the injunction against the defendant, John M'Crutcheon, must be granted, and the injunction against Messrs. Magniac, Smith, and Co., must be continued, preventing both parties from selling the goods, and a receiver must be appointed: and it would be better that some arrangement should be made to convert the property, and bring the money into court.

Court of Queen's Bench.—*Fountain* v. *Boodle and Wife.*—An action to recover damages for a libel, brought by plaintiff against the defendants. Plaintiff, it seems, had been a governess in the family of defendants, and, according to her statement, had been dismissed from her situation without any fault on her own part, or any cause assigned on that of the defendants. Having afterwards applied for a similar situation in another family, application had been made to defendants on the subject of her character and qualifications, the answer to which was such that the family in question refused to take plaintiff into their service, and this action was consequently brought to recover damages. For the defence it was urged that there was no proof of express malice on the part of defendants. The jury, however, returned a verdict for plaintiff, damages 60*l.*

The Queen v. *Nickels.*—A *scire facias* to repeal a patent obtained by defendant for a new and improved mode of manufacturing elastic and inelastic web. The objection was that the specification did not clearly set out the claim of the patentee, so that it was impossible on the face of that document to distinguish between those parts of the old mode which were still preserved, and those new means in respect of which the patentee claimed the character of an inventor. Lord Denman thought that the specification was defective in this respect. A bill of exceptions was tendered to his Lordship's direction, and subject to that the verdict was taken for the Crown.

Cooke v. *Pearse.*—An action for the infringement of a patent. The patent was taken out for improvements in the making of German blinds for carriages. Several objections were made to the specification: first, that it did not describe with sufficient accuracy the nature of the invention, for that the old and new parts were not properly distinguished from each other; and next, that in stating that the invention was applicable to carriages, the patentee claimed too much, for that it was not applicable to chariots and close carriages, and the patent having claimed more than could be supported, the patent became void on that account. There were several other objections, but most of them were given up; and it was finally admitted that plaintiff was entitled to a verdict on them, and the rest were merely of a technical nature. The Court having arranged the points admitted and disputed, a verdict was taken subject to future discussion in the Court above.

The Queen v. *Stowell.*—A prosecution against the defendant, well known as an informer, for having illegally attempted to induce a female named Esther Stanley to refrain from appearing as a witness in a prosecution instituted by her against a man named Wakeling, and another named Williams, whom she accused of having robbed her in an omnibus. The attempt of Stowell was ineffectual, and the persons in question were convicted. The prosecution was instituted by the Corporation of London. The defendant called witnesses for the purpose of proving an *alibi*; the defence, however, broke down, and the jury found a verdict of Guilty.

The Queen v. *Pearse.*—A prosecution against defendant, formerly a solicitor in great practice, and now a country gentleman and magistrate, residing in Cornwall, charging him with having committed perjury in the course of some proceeding in Chancery in which he had been engaged. The case was opened, and partly proceeded with; but Mr. Justice Wightman being clearly of opinion that the statements charged as untrue were wholly immaterial, stopped the case and directed an acquittal.

Stops v. *Pocock and another.*—An action against the defendants, who are coal-merchants, to recover compensation in damages for an injury alleged to have been occasioned to plaintiff by the negligence of defendants' servant, who in driving a waggon had knocked down a ladder on which plaintiff was standing, whereby he was severely injured and confined to his bed for some weeks. Verdict for plaintiff—damages 30*l.*

Birmingham, Bristol, and Thames Railway Company v. *Hall.*—An action for calls, and the question was, whether defendant had become a member of the Company or had ceased to be so, and was thus not liable to the action. There was a great struggle on the question whether the skin of parchment to which the signatures were attached was or was not attached to the deed under which the Company formed itself. If attached, then defendant's liability was contended to be established; if separated, then the verdict must be in his favour, as the legal proof, showing him to be a member of the Company, was not complete. The Jury having been a considerable time before they could all agree, ultimately returned a verdict for plaintiffs, finding that the deed and signatures were attached to each other.

Addy v. *Dillon and another.*—An action in which plaintiff sued *in formâ pauperis*, for damages for an assault alleged to have been committed to him by one of defendants. Plaintiff was toll-keeper of the turnpike in the Hampstead-road; and having seized the horses of defendant's carriage whilst driving along Mornington Crescent, and demanded the toll, was informed that there was none payable; and on refusing to let go the horses, was struck with a whip by defendant's coachman. The Court being of opinion that plaintiff must have a verdict, the Jury returned one accordingly, with 1*s.* damages.

Court of Common Pleas.—*Owen* v. *Maule.*—An action brought by the plaintiff, claiming to be heir to certain property which had fallen into the possession of the Crown, on a general failure of the heirs of the last possessor. The question involved was merely one of pedigree, and the details were therefore uninteresting. Verdict for defendant; thereby negativing the validity of plaintiff's claim.

Littler v. *Bowles.*—An action for assault and false imprisonment. Plaintiff was stated to be a gentleman, and defendant a meat salesman in Newgate-market. It appeared that plaintiff and defendant had made a wager, and defendant coming to demand the amount—the wager, as he alleged, having been lost by plaintiff—the latter objected to paying without proof that he had made the wager. Defendant produced a small memorandum book, in which he alleged the terms of the wager had been entered, and plaintiff retained the book, alleging that a figure had been altered with a view of deceiving him. Some altercation then ensued, and plaintiff having refused to return the book, defendant assaulted him and gave him in charge to a policeman for a felony. Plaintiff was taken to Giltspur-street compter on this charge, but liberated in about half an hour, defendant declining to follow up the accusation. It was contended on behalf of defendant, that although the facts did not furnish a legal justification, defendant was morally excused after the provocation he received. Verdict for plaintiff: damages 1*s.*

Evans v. *Milroy.*—An action brought by plaintiff to recover compensation in damages from defendant, for having given a false representation as to the circumstances of two persons of the name of Stuart, and another named Cock, by which he had been induced to give them credit for 10 chests of tea. Verdict for defendant.

Botibol v. *Wilson.*—An action of false imprisonment. It appeared that plaintiff occupied with his sisters, who carry on the business of dealers in feathers and artificial florists, the first floor of the house of defendant, situate in Old 'Change. Several disputes arose between the lodgers and their landlord, and ultimately the latter took away the key of their door. Plaintiff then removed the lock for the purpose of getting a new key made, whereupon defendant caused him to be apprehended on the charge of having feloniously stolen the lock. The case was afterwards heard at the Mansion House, where the Lord Mayor immediately dismissed the charge, expressing an opinion that no stigma attached to the character of the plaintiff. This action was subsequently instituted. Verdict for plaintiff: damages 40*s.*

Harris v. *Maclean and Larmuth.*—An action for false imprisonment. Defendants were policemen who had taken plaintiff into custody, and conveyed him to the station-house on the charge of being intoxicated. Witnesses were brought to prove that plaintiff was at the time sober, and the jury found a verdict for the plaintiff—damages 25*l.*

Court of Exchequer.—*Atkins* v. *Bessett.*—An action to recover the sum of 32*l.* 4*s.*, the amount of a balance alleged to be due to plaintiff on an account arising out of the sale of a quantity of champagne. It appeared that plaintiff had deposited the warrants for a quantity of champagne in the hands of defendant, as a collateral security for an advance made upon a bill of exchange for 53*l.* At the time the warrants were lodged with defendant, plaintiff said the wine might be sold at 28*s.* per dozen, but it turned out in course of time that he obtained 40*s.* per dozen for it, and that upon a settlement between the parties subsequently, defendant contended that, although he had sold it at 40*s.*, still he was liable only to plaintiff for the price which he himself had named as that at which the wine might be disposed of, namely, 28*s.* per dozen. Refusing to pay plaintiff the difference, he was compelled to bring his action for its recovery. The quantity sold was proved to be 57 dozen. Verdict for plaintiff: damages 32*l.* 4*s.*

Wilkinson v. *Gandell and another.*—An action of trover for a bill of exchange, drawn by plaintiff upon, and accepted by, one James Webber, for the sum of 170*l.*: to which defendants pleaded that they were not guilty; that the bill of exchange was not the property of plaintiff; and lastly, leave and license. The verdict passed for defendants on the first and second issues, and for plaintiff upon the third.

Lenormand v. *Spiller.*—An action brought by Madame Lenormand, a milliner of considerable reputation, residing in George-street, Hanover square, to recover from defendant, Major Spiller, the sum of 120*l.*, for articles of millinery supplied by his orders to his wife and daughter. It was admitted, however, by plaintiff that a sum of 100*l.* out of the 120*l.* was, by an agreement between them, to be taken out in millinery, in consideration of that sum being owing from plaintiff to defendant for the premium of the house in George-street, of which defendant was landlord: and defendant having paid 5*l.* into Court, the real contest between the parties was for the remaining 15*l.* For the defence it was urged, that the articles of dress sent in had been charged extravagantly high. Verdict for plaintiff, with 5*l.* damages.

Comley v. *Soar.*—An action by a cabinet-maker at Haggerstone to recover from defendant, who was described as holding the office of "master of the house" in the brewery of Trueman, Hanbury, and Co., the sum of 120*l.* for the board and lodging of defendant's son for five years. Lord Abinger directed the Jury to find for the defendant, as there was evidence of a written contract relating to the subject matter of the action, which had not been produced. Verdict for defendant accordingly.

Allen v. *Drew.*—An action by a builder, residing at Dalston, against a licensed victualler, to recover a balance alleged to be due for the building and repairing of the Crooked Billet, a public-house at Clapton. The defence was, that the whole sum to which plaintiff was entitled had been paid; and the jury ultimately returned a verdict for defendant.

Gye v. *Mitchell and another.*—An action by Mr. Gye, who was for many years one of the proprietors of Vauxhall Gardens, to recover from Messrs. Mitchell and Bunn a remuneration for his services as acting manager of the Gardens, during the season of 1841, when defendants, with Mr. Andrews, of Bond-street, since deceased, became lessees of Vauxhall for a limited period, under the assignees of Messrs. Gye and Hughes, the former proprietors. Lord Abinger left it to the Jury to say if, under all the circumstances, the Jury could imply any contract to compensate plaintiff for his services; and the Jury, after an hour's deliberation, returned a verdict for plaintiff: damages 100 guineas.

Evans and Co. v. *Nicholson.*—An action by Messrs. Evans and Foster, foreign merchants, to recover damages against Mr. Nicholson, a shipowner, for the loss sustained by the sale of goods at Calcutta, which were alleged to have been delivered to defendant to be conveyed to Canton in China. The plaintiffs claimed a sum beyond the invoice price, for the probable profit which they would have obtained if the goods had been conveyed directly to Canton, and by agreement this question was referred to a merchant, who should fix the amount to which plaintiffs were entitled. Subject to this arrangement, the jury returned a verdict for plaintiffs.

TATTERSALL'S, Thursday.—Several Derby horses were backed in the course of the afternoon, and at odds, except in one instance, agreeing rather closely with those last reported. The exception was Chatham, who was advanced to 11 to 1, taken, and had rather a formidable supporter in a party who has repeatedly invested "through evil and good report." Auckland, it will be seen, has fallen back, a movement that might have been expected from the feeling shown of late. Some outsiders were touched upon, but only one (William le Gros) backed to any amount. The Chester Cup betting was of some little importance, as showing an improvement in Vulcan and Alice Hawthorn, and the Oaks, as exhibiting a very different change in Lass of Louton, who is now at double the odds at which she was introduced. Closing averages:—

DERBY.

1000 to 30 agst	all the mares (taken)		50 to 1 agst	Meteor (taken)	
11	1	Chatham (taken)	50	1	Defier (taken)
30	1	Robert de Gorham (ta. and afterwards offd.)	50	1	Artful Dodger
			1000	20	Rover (taken)

13	1	Alice Hawthorn (tak.)	25	1	Rhodanthe

MARK LANE, Friday, Feb. 18.—There was no fresh supply of English Wheat at market this morning, and prices remain nominally the same as on Monday. Free Foreign and Bonded were not much inquired after, but the same rates are demanded. Barley and Peas are not altered in value; New Beans are lower, and Oats are a dull sale.—The demand for Clover seed is increased, but it is readily met by the sellers, without any advance being realised.

Kuper, Attache to her Majesty's Legation, of a son, who survived but a few hours—At Beaumaris, on the 9th inst., of a son, the lady of Capt. G. MacCall, of her Majesty's 20th Regiment of Foot—On the 11th inst., at Ramsgate, Mrs. A. Shelley, of a son—On the 12th inst., at Dublin, Mrs. William Brophy, of a daughter—On the 13th inst., of a son, Mrs. Forrest, 54, Strand—On Sunday, the 13th inst., in Gloucester-terrace, Regent's-park, the Hon. Lady Pearson, of a son.

MARRIED.—On the 10th inst., at St. Maurice's Church, York, J. F. Dawson, Esq., surgeon, of Tewkesbury, to Elizabeth, only daughter of the late Rev. J. Needham—On the 10th inst., at St. John's the Evangelist, R. W. Taynton, Esq., to Zoa, eldest daughter of J. Harrington, Esq., of North-street, Westminster—On the 12th inst., T. L. Walker, eldest son of G. Walker, Esq., of West-green, Tottenham, to Charlotte Elizabeth, daughter of A. King, Esq., of Queen-street, Cheapside—On the 14th inst., at St. Pancras Church, Vallis Bone, Esq., of Lincoln's Inn, barrister at-law, to Caroline Susanna, younger daughter of the late J. Henderson, Esq., of Charlotte-street, Fitzroy-square—On the 10th inst., at Prestbury Church, H. C. Mitford, Esq., of Truro, to Charlotte Grace, eldest daughter of T. P. Ashwin, Esq., late of Falmouth.

DIED.—On the 17th inst., at his house in Suffolk-street, Pall Mall East, D. E. Morris, Esq., proprietor of the Haymarket Theatre—On the 20th Oct. last, at Acoyapa, South America, G. Bell, Esq., of London—At Calcutta, on the 28th of November, of cholera, Capt. W. H. Armstrong, of her Majesty's 21st Fusiliers, son of J. Armstrong, Esq., of Bath—On the 11th inst., suddenly, Mr. J. Hastelaw, of Rutland-street, Hampstead-road, aged 59—At Exeter, on the 12th inst., Mr. R. Hollick, late of 131, Cheapside—On the 12th inst., aged 76, Barbara Lady Chambers, wife of Sir Samuel Chambers, of Bredgar-house, in the county of Kent. Her ladyship was the eldest daughter of the late Hon. Philip Roper, son of Henry, 10th Lord Teynham.

INDEX OF THE PRINCIPAL HORTICULTURAL SUBJECTS IN No. 7.

Amateur's Garden . . . 109 b
Anemone seed, treatment of . 113 b
Apples, dessert, a selection of . 113 a
Calceolarias, their treatment . 113 c
Carnation seed, treatment of . 113 b
Castor-oil plant, its culture . 108 a
Cauliflowers, kinds of . . 113 a
Celeriac, its treatment . . . 113 c
Chatsworth described . 107 c, 109 c
Dahlias, a selection of . . 113 b
— their treatment . . 113 a
Floriculture, state of in France 111 a
Florists' flowers, prizes for . 110 a
Forest-tree pruning . . . 110 b
Grapes, to colour . . . 113 a
Gunter, R., Esq., his garden noticed . . . . . 112 b
Hampton Court Forcing Gardens noticed . . . . . 112 b
Heat in May, instances of . . 112 a
Hollyhock, its treatment . . 113 b
Hyacinth, its management after flowering . . . . 107 a
Irises, their treatment . . . 113 c
Kale, Buda, to blanch . . 113 b
Lee's Nursery noticed . . 112 b
Niger, model farm at the . . 111 c
Nut Weevil described . . 108 b
Oaks, Fulham, mentioned . . 111 c
Pears, dessert, a selection of . 113 a
Pear, Knight's Monarch described 108 b
Plane-tree, its history . . 108 a
Plantations, thinning of . . 110 c
Planting, remarks on . . . 107 b
Potatoes, rot in . . . . 110 a
— to plant . . . 110 a
Timber, shrinkage of . . . 110 c
Walnuts, to raise . . . 113 c
Weevil, nut, described . . . 108 b
Whitethorn, its treatment . . 110 b

Printed by Messrs. Bradbury and Evans, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the Office, 3, Charles-street, Covent Garden, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, February 19, 1842.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.
THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

No. 9.—1842. SATURDAY, FEBRUARY 26. Price 6*d*.

SAMUEL GIRLING begs to inform his Friends and the Public that his General CATALOGUE of DAHLIAS, GERANIUMS, and PANSIES is now ready, and can be had on pre-paid application.—Danecroft Nursery, Stowmarket.

JAMES JONES, Florist, &c., Ackworth, near Pontefract, begs to inform his friends that he will let out his Seedling DAHLIA of 1840 (named Stanley), a fine rose blush, good form, constant and superior show Flower, four to five feet. The above is jointly in the possession of J. J., and Mr. Widnall. Plants sent out early in May, at 7*s*. 6*d*. each. Catalogues may be had on application.—Ackworth, Feb. 22.

ARAUCARIA IMBRICATA—Fine strong Plants one year from seed.—The most noble, hardy, and splendid ORNAMENTAL EVERGREEN TREES ever introduced into the British empire are now selling at Messrs. W. and F. YOUELL'S NURSERY, GREAT YARMOUTH, at 3*l*. 3*s*. per dozen, or 25*l*. per 100. Specimens may be seen, and orders taken at their Agents', Messrs. Flanagan and Co., No. 9, Mansion-house-street; and at Messrs. Gibbs and Co's., Seedsmen, Piccadilly, London.

CARNATIONS AND PICOTEES.

MESSRS. W. and F. YOUELL have a few pairs to spare of that most beautiful Rose Flake, Wilson's Harriet, which is considered by the first judges in the kingdom to be decidedly the most perfect flower of its class ever raised. Also that splendid Red Picotee, Anacreon. The above will be forwarded per post, free, to any part of the kingdom by inclosing a post-office order for 18s.—For their extensive Collection see Catalogue, which can be obtained by inclosing two post-stamps.
Great Yarmouth Nursery.

MYATT'S VICTORIA RHUBARB.

J. AND W. MYATT having a good Stock of Strong Roots raised by offsets from the original Seedling, can supply them at 10*l*. per hundred.—N. B. As various spurious sorts have been sold and are now selling under the name of "Myatt's Victoria," purchasers would do well to require them warranted.
—Manor Farm, Deptford, Oct. 23, 1841.

JAMES MAY begs to inform all growers of PANSIES, that his new Descriptive List of Pansies, with a List of FUCHSIAS, may be had on application as below; at the same time he begs to call particular attention to his genuine imported German STOCKS, ASTERS, and ZINNIAS, in great variety.

N.B.—A large collection of fine Show Pansies, including many of last year's new varieties. 30 fine strong Plants for 21*s*., package included; all parcels delivered free in London.
Pansy Nursery, Edmonton.

KENSINGTON NURSERY.

Under the Patronage of the Queen.

RICHARD FORREST and CO. beg respectfully to direct attention to their extensive Nursery stock in general, which never was finer than this year. The collection of Hardy Evergreens, and American Plants, Hybrid Azaleas and Rhododendrons, Pinus, &c., are extensive and select; and printed Catalogues may be had on application. Their Fruit-tree department, in particular, consists of everything worth cultivating, correct to name; and the trees of all ages were never so fine as they are this season. Their collection of Camellias, Rhododendrons, Arborea, Erica, Eastern Azaleas, and other interesting Greenhouse Plants, will well repay a timely inspection; and Catalogues of them also may be had on application.

R. F. and Co. beg also to state that they have still a quantity of remarkably fine Thorns, 2 years quartered out, strong and well-rooted. Packets of the choicest Flower-seeds, from 5s. upwards; and packets of the Bokhara or Giant Clover, from 1s. to 2s. 6d. each.

CHOICE FLOWER SEEDS.

LUCOMBE, PINCE, & CO., having an extensive and well-selected Stock of all the newest and choicest Flower Seeds, to the cultivation of which they have paid considerable attention, and the quality of which they can confidently recommend, beg leave to offer them for sale, delivered carriage free to any part of the Kingdom, on the following terms:—

25	packets of distinct-named sorts			21s.
50	do.	do.	do.	30s.
130	do.	do.	do.	42s.

Amongst them are—Asters, Brachycome iberidifolia, Clintonia pulchella, Erysimum Perowskianum, Godetia, Willdenowii and Schamanii, Lupinus Hartwegii, Martynia fragrans, Mesembryanthemum tricolor, Phlox Drummondii, Stocks, Zinnias, &c. &c. Catalogues of which may be had on application to them.
Exeter Nursery.

SCARLET PELARGONIUMS.

PHILIP CONWAY, Florist, Seedsman, &c., Old Brompton-road, near the West London Cemetery, has the honour of offering to the Nobility and Gentry the following variety of the above, viz.—Frost's Compactum, a very excellent variety, raised at Dropmore, distinct from every other, having a dense cluster of flowers of a globular form and a peculiarly pretty tint; good plants at 3*s*. 6*d*. King, a first-rate scarlet, fine large truss, and free bloomer, 2*s*. 6*d*. Shrubland, 2*s*. 6*d*. Towards Pre-Eminent, 2*s*. 6*d*. Scarlet Nosegay, very desirable sort for pots or beds, excellent habit, and very free bloomer, 2*s*. 6*d*. Frogmore, for bedding, (vide *Gardeners' Chronicle*, No. 39, p. 631), 18*s*. doz., or 2*s*. each. Ingram's New Dwarf, for bedding, a decided improvement on Frogmore, 30*s*. doz., or 3*s*. each. The dwarfishness and brilliancy of colour of the two last-named will ever insure them a place in the flower-garden.

The most approved varieties of Geraniums, Fuchsias, Verbenas, &c. &c., on very moderate terms.

NEW GARDEN SEEDS.

MESSRS. SUTTON and SON respectfully intimate to the Readers of "The Gardeners' Chronicle," that they devote a great portion of their Nursery-grounds to the growth of Garden-Seeds, including the best of the new kinds of Vegetable and Flower-Seeds as soon as introduced. The grounds being at considerable distances from each other, and of different soils, are very favourable for preserving Seeds true to their sorts. With these advantages, Messrs. Sutton supply all kinds of Garden-Seeds warranted New and True, catalogues of which are published annually. A complete collection of Kitchen-garden Seeds, including all the most esteemed kinds, 3*l*. 10*s*. A similar assortment in quantities suited for a smaller establishment, 2*l*. 2*s*.

An assortment of Hardy Flower-Seeds, 50 most showy sorts	£1	1	0
Ditto ditto 30 sorts	0	12	6
Ditto ditto (the best) 30 new sorts	0	15	0
A full collection of 150 sorts	3	3	0
Fifty choice Ranunculuses by name	0	15	0

For the accommodation of Customers residing in distant parts of England, goods are delivered Free of Expense to the Railway Stations and Packet Wharfs in London.

Messrs. Sutton having had much experience in packing Seeds for exportation, have confidence in soliciting orders for that purpose, for which 10 per cent. will be charged upon the above sums for packing.—Reading Nursery, Feb. 8.

NEW DAHLIA, "SATIRIST," MORTLOCK'S.

R. MORTLOCK begs respectfully to offer the above with confidence, as a real good variety; the colour is a lilac purple, fine-cup petals, of first-rate form, fine habits, and very free bloomer, large size, and constant. It obtained the second prize at the South Essex Show in September last; also the second prize at Hampstead, and was pronounced first-rate by Dr. Lindley. Height four feet. Plants in May 10*s*. 6*d*. each. Orders thankfully received by Messrs. Warner, 28, Cornhill; Smith and Co., Cambridge Heath, Hackney; Green, Warner-place, Hackney-road; and of the raiser, Luton-place, Hyde Vale, Greenwich.

NEW AND SUPERIOR SEEDLING DAHLIAS FOR 1842.

JAMES EDWARD, Florist, Layerthorpe, York, begs most respectfully to invite the attention of Cultivators of the Dahlia to the following Three Seedling Varieties (raised in 1840, and fully proved in 1841), which are quite distinct from any hitherto produced; of very superior habit, and constant in producing good Show Flowers throughout the season; in proof of which J. E. begs to state that he has shown above 200 blooms of the three, during the season, at various Exhibitions open to all England, and has had nine Seedling Prizes awarded for them, namely,—four 1st prizes, three second ditto, and two third ditto; they have also been shown in the following winning trays:—
In the 1st Tray of 24 at the Horticultural Society, York, Aug. 18,

2d	,,	24	,, ,, ,,
1st	,,	18	,, ,, ,,
2d	,,	36	at the Botanical Gardens, Hull, Sept. 2d;
2d	,,	12	,, ,, ,,
1st	,,	24	at the Horticul. Soc., Scarborough, Sept. 3d;
1st	,,	12	,, ,, ,,
1st	,,	6	,, ,, ,,
1st	,,	48	at the Yorkshire Philosophical Soc., Sep. 9th;
1st	,,	36	,, Botanical Gardens, Sheffield, Sept. 15th;
1st	,,	36	,, Horticultural Soc., Barnsley, Sept. 21st;
1st	,,	24	,, ,, ,,
1st	,,	48	,, Botanical Gardens, Leeds, Sept. 22d;
1st	,,	48	,, Horticultural Society, York, Sep. 24th;
2d	,,	24	,, ,, ,,

Besides having taken other Prizes in addition to the above.

Premier.—Fine bronze salmon, very superior form, of excellent habit, throwing its blooms well above the foliage, and always to be depended upon in producing good show flowers. This variety obtained the first prize, in its class, at the York Ancient Florists' Society, September 20th, and had also the premier prize awarded, as the best Dahlia of any colour.—Height 4 to 5 feet.—Plants 10*s*. 6*d*.

Mary Jane.—White ground, very deeply tipped and edged with purpled carmine—constant throughout the season, well up in the centre, of excellent habit, and never fails in producing good flowers. This variety obtained the first and second prize at Scarborough, as the best light-ground flower tipped or edged, and has justly been pronounced the most distinct and attractive Dahlia ever produced in its class.—Height 4 feet.—Plants 10*s*. 6*d*.

Duke of Richmond.—Fine light pink and yellow, colours beautifully blended together, with a light-yellow tip at the end of each petal, similar to the Duchess of Richmond, but quite distinct from that variety; very superior habit, always constant, and will prove a noble and excellent show flower.—Height 5 feet.—Plants 10*s*. 6*d*.

Good strong plants will be sent out the first week in May; and for the convenience of parties at a distance, orders will be received, and plants supplied, by Mr. George Charlwood, Seedsman, Covent Garden, London; and Messrs. Henderson, Nurserymen, Brechin, Scotland. No allowance to the trade unless 12 plants are ordered, and a remittance or respectable reference will be required from unknown correspondents. J. E. can also supply plants of all the best Dahlias in cultivation, of which a catalogue is annually printed, and can be had on application.

We the undersigned, members of the Committee of the York Horticultural Society, do attest the correctness of Mr. Edward's description of the above Dahlias; and we strongly recommend them as distinct varieties from any yet sent out, and well worth a place in the most limited collection.

Report of the York Amateur Florist Society, held on Monday, August 9th, 1841.—The Judges and Members of this Society consider it their duty to notice a seedling Dahlia of last year (sent for inspection) raised by Mr. Edward, Nurseryman, of this city. The colour is pure white, with a dark tip of purpled carmine; the form, depth of petal, and above all, good eye, require no consideration to pronounce it one of the best Dahlias yet seen of its class; and from the evident superiority of this distinct variety over such flowers as Glory of Plymouth, Beauty of the Plain, &c., there is no doubt but the year 1842 will cause these flowers to fall in the rear when brought into competition with the seedling exhibited this day, as it may safely be pronounced a gem of the first water, and will reflect the greatest credit on the fortunate raiser, for so long as Dahlias remain in cultivation this flower must form a prominent feature in a stand of six.—*York Courant.*

HUNDRED-FOLD POTATOES.—A New SEEDLING, selected for cultivation by the grower of 250 kinds from the Seed, as the most abundant and the best flavoured, is for SALE, in peck bags, at 5s. each, at Messrs. Flanagan & Co.'s, Mansion House-street; Mr. Gibbs's, 26, Down-street, Piccadilly; Messrs. Warner and Co.'s, 28, Cornhill; Mr. James Carter's, 238, Holborn; Messrs. Minier, Adams, and Co.'s, 63, Strand; Mr. F. Chatwin's, 6, Hungerford market; and at the "Gardeners' Gazette" Office, 320, Strand.

SPLENDID NEW POTATO—THE SWISS KIDNEY. This excellent Potato (the whole stock of which is in the hands of the advertiser) is now offered for sale. It produces an abundant crop, is of an excellent flavour, and has obtained several prizes at the Horticultural Shows as a superior vegetable. It may be obtained on application to Messrs. Beck, Henderson, Seedsmen, 67, Strand, London, in peck bags at 4s.; half-peck do., 2s. 6d.

JOHN HARRISON, Nursery Seedsman and Florist, Clifton, and No. 19, Parliament-street, York, begs to inform the Nobility, Gentry, and the Public generally, that he has entered on the above PREMISES, and trusts, from the long practice and experience he has had in the above line as Manager of the business of E. Hedley and Son, Rosehill Nursery, Yarm, for upwards of 20 years, and being well acquainted with all the leading houses in the trade, both British and Foreign, and the quick despatch of goods between Yarm and York by the Great North of England Railway, renders it in the power of J. H. to commence at once with an extensive Stock of every article in the Trade—Forest and Fruit Trees, Evergreens, Deciduous and Flowering Shrubs, Roses, Dahlias, Carnations, Geraniums, Pansies, and every other variety of Florists' Flowers, &c. &c. J. H. trusts, by strict attention, punctuality, and reasonable charges, to merit a share of public patronage and support, which it will ever be his study to deserve.

WANTED a SMALL COTTAGE, or HOUSE, near London, and, if possible, near the Garden of the Horticultural Society; must have Walled Garden to it.—Address, prepaid, "S.," Gardeners' Chronicle Office.

WANTED a Situation as GARDENER, by a Single Man, aged 30, who has a thorough knowledge of his profession, and can be well recommended by the gentleman he has just left. Address M.A.C., Mr. Conway's Nursery, Old Brompton-road.

WANTS a SITUATION as GARDENER, or Gardener and Bailiff, a Married Man, aged 30, who is competent in the different branches of his profession, viz., Early Forcing, New Ground Work, and the Management of Land and Cattle. Can have five years' recommendation from the family he has just left. No single-handed place will be accepted. Direct to A. R. Mr. Brown, Surveyor, Rickmansworth, Herts.

WANTS a Situation as GARDENER a Married Man, age 30. He has had much experience in all branches of Gardening, and culture of exotic Plants; his wife is accustomed to the Laundry, and the care of Poultry. Address, paid, J.A.D., Mr. Wood's Nursery, Brampton, Hunts.

WANTS a SITUATION as HEAD GARDENER in a Nobleman or Gentleman's family, a single man, aged 34, who has a thorough and practical knowledge of his business, and would not object to make himself useful to his employer, as he has been accustomed to the management of woods and plantations, and the general management of estates. Satisfactory references may be obtained from the nobleman he is just leaving. Address A. B., "Gardeners' Chronicle" Office.

TO NOBLEMEN AND GENTLEMEN.

WANTS a SITUATION, a Middle-aged Married Man, without family, who is well acquainted with the different Departments of Gardening, the Rearing of Timber, the Making and Management of Roads, and can undertake the superintendence of any improvements required. The most respectable references will be given.—Address "A. Z.," Gardeners' Chronicle Office.

WANTED by a Gentleman about 20 miles from London, a Man as GARDENER, and a Woman as COOK; the former to understand his business, and assist in looking after a chaise, cows, &c., and make himself otherwise useful: the latter to take charge of the house, poultry, and occasionally a small dairy and baking. Must be well recommended. Direct, with particulars, p.-p., to A. B., Post-office, Edenbridge, Kent.

WANTS a SITUATION as GARDENER, a Middle-aged Single Man, master of his business in all its branches, who can be well recommended from his late employer, with whom he has lived 13 years. No objection to take the management of a small farm, if required. Direct to R. K., at Mr. Payne's, near the Church, Hornsey, Middlesex.

W. P. AYRES, of the Place Gardens, Soham, Cambridgeshire, would be happy to recommend to any Gardener in want of a FOREMAN, an active, steady, intelligent YOUNG MAN, who has been living with him for several years past. He has had considerable practice in Forcing, and the propagation and culture of Plants according to the most modern and approved principles.—Letters addressed to Soham will be duly attended to.

EDMUND BUTCHER, late Gardener at Ealing Park, wishes to obtain a SITUATION, and begs respectfully to refer any Nobleman or Gentleman requiring the services of a GARDENER, to the various Exhibitions of Flowers, &c., at the Horticultural Society of London, where he has obtained many Prizes for Plants exhibited there during the last five years. For further particulars, please to address to the care of Messrs. J. A. Henderson & Co., Nurserymen, Pine-Apple-place, Edgware-road.

ONE HUNDRED AND FIFTY SHEPPARD'S "LAURA" PANSY, strong plant, price 5*s*.; Sheppard's "Princess" Pansy, 7*s*. 6*d*. Also, a fine large Scarlet Seedling Ribes—Sheppard's Ribes Grandiflora, price 3*s*. 6*d*. May be had immediately of James Sheppard, Nursery, Seedsman, and Florist, Winchester; or of Messrs. Warner and Co., 28, Cornhill, London.

PINE PLANTS.

W. DAVIS, Gardener, Green-street, Marlborough-road, Chelsea, has several hundred Fruiting and Succession Pine Plants to dispose of, principally Ripley Queens. Warranted perfectly clean and healthy.

CHARLES FARNES, 128, St. JOHN-STREET, LONDON, begs respectfully to call the attention of his Friends to the following select List of Annual Flower-seeds, &c. a general Catalogue of which may be had on application. Also his Catalogue of all the new sorts of Vegetable and Agricultural Seeds, &c.

UNION-ROAD NURSERIES, PLYMOUTH.

W. E. RENDLE begs to inform the Trade that he has a large Stock of FINE BEDDED LAUREL, from 9 inches to 2 feet high, at such prices as would be highly advantageous to the purchaser.

Fine Maiden Peaches and Nectarines, Seedling Larch, Scotch Spruce, Oaks, &c. at the lowest trade prices.—Feb. 16, 1842.

MARNOCK and MANBY beg to announce that their PASSIFLORA FRAGRANS will be ready to send out, in established plants, the first week in May, at 21*s*. each. This new and ornamental species is scarcely less remarkable for its beauty, than for its delightful and powerful fragrance; the latter of these qualities has scarcely been recognised in any of the previous species of Passion Flower, and it will therefore form a most desirable acquisition to climbing plants for conservatories and greenhouses. Also will be ready at the same time, plants of their new and splendid Annual, MARTYNIA FRAGRANS, at 21*s*. each (See figure and description in the "Botanical Register" for Jan. 1841, and in the "Floricultural Magazine" for Feb. 1842). The two following new and beautiful plants are now ready to send out:—HARDENBERGIA MACROPHYLLA, at 7*s*. 6*d*. each; this is a greenhouse climber of great beauty. (See figure and description in "Paxton's Magazine" of Botany for Jan. 1842). FUCHSIA GLABRA MULTIFLORA, 7*s*. 6*d*. Catalogues of their new and choice Flower Seeds may be had on application.

Wanted immediately a steady, active Man, who is experienced in budding, grafting, &c., and who can undertake the general management of out-door Nursery Stock.—Nursery, Hackney, Feb. 24, 1842.

SEEDLING DAHLIAS to be sent out in May next, by N. GAINES, FLORIST, SURRY-LANE, BATTERSEA.

Gaines' ORANGE PERFECTION; beautiful orange, at times shaded. This flower was sent for the opinion of the Horticultural and Floricultural Societies of London; at both places considered first rate. It is a fine grower, throwing its flowers well above its foliage. A good show flower. Awarded first Prize at Kingston, and 2nd Prize at Teddington. 4 ft. 10*s*. 6*d*.

Gaines' EMPEROR; beautiful rosy crimson, very superior petal, with great depth of flower, and well up in the centre. A constant good show flower. Awarded 2nd Prize at Kingston. 3 ft. 10*s*. 6*d*.

Gaines' COMPACTA; fine purple, very superior form, of excellent habit, throwing its blooms well above its foliage; its centre well up. A good show flower. Awarded 2nd Prize at Hammersmith. 5 ft. 10*s*. 6*d*.

N.B. The above were considered first-rate flowers by those that saw them growing. Plates of them will appear in "Wakeling's Amateur Guide," in April and May next.

N. Gaines' extensive List of first rate Dahlias, Geraniums, Pansies, Calceolarias, &c. may be obtained by post-paid application as above. His new Cineraria, Prince of Wales, will be ready for delivery 1st of March.

IMPORTANT to PLANTERS, AGRICULTURISTS, &c.—PURDIE and MERRILEES (Successors to Thomas Cleghorn and Co.), WHOLESALE NURSERYMEN, SEEDSMEN, and FLORISTS, STANWELL LODGE, BONNINGTON, LEITH, beg to inform the Public that they have on hand a large stock of fine two-years' transplanted LARCH, 1½ to 2 feet high, at unusually low prices, samples of which may be had on application. P. and M. also recommend their attention to their choice collection of HYBRID RHODODENDRONS, CAMELLIAS, HEATHS, &c., many of which are at present coming into bloom.

TURNIP SEEDS.—P. and M. have also on hand a fine stock of Skirving's and Laing's new Purple-top Swedish Turnip Seed, with all other approved varieties, of their own saving, warranted genuine; priced Catalogues of which may be had on application.

BENEVOLENT INSTITUTION for the RELIEF of AGED and INDIGENT GARDENERS and their WIDOWS. The Committee of this Institution hereby give notice that, in conformity with the resolution of the General Meeting of the Subscribers, which was holden at the Crown and Anchor Tavern, Strand, on the 13th of January last, and in consequence of the death of John Grier, that an election of THREE PENSIONERS will take place on Thursday, the 2d day of June next, at the Crown and Anchor Tavern, Strand, at one o'clock precisely.

Feb. 1st, 1842. J. J. BOWLER, Hon. Sec.

The testimonials of Candidates must be forwarded to the Secretary at the latest by Saturday, the 2d of April next. Copies of the Rules and Lists of Subscribers may be obtained of all the Members of the Committee; and of the Secretary, Albany-road, Kent-road.

*** Subscribers sending Post-office orders are respectfully requested to make them payable to the Secretary at the General Post-office, St. Martin's-le-Grand.

EDWARD BECK, MANUFACTURER IN SLATE, Isleworth, Middlesex, respecfully informs Horticulturists, that his IMPROVED SLATE TUBS for Orange Trees and Conservatory Plants, mounted upon rollers, Slate Cisterns, Shelves, and Edgings for garden paths may be seen in use at his house upon application to the gardener.

H. HAMMOND begs to return thanks to his numerous friends and the Public for their liberal orders for his new White Cape Broccoli, as advertised in the *Chronicle* of Oct. 16; and to inform those that are not supplied with that valuable article that he has a few packets left which can be had of Messrs. Flanagan, Seedsmen, Mansion-House Street, London, who know the stock.—Mundford Nursery, Feb. 10.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

TO BUILDERS and OTHERS.—The Royal Agricultural Society of England having decided to erect a Dining Pavilion, and to Enclose a space of Ground, and build Sheds thereon, for the exhibition of Cattle, Horses, Sheep, Pigs, Seeds, Roots, Vegetables, and Fruits, at the Meeting of the Society in the city of Bristol, in July next, all parties willing to Tender for the Building of the Pavilion, or for the Erection of the Fence and Sheds of the Exhibition Yard, or for both, may inspect the Plans, Sections, and Specifications, and receive further information at No. 5, Cavendish-square, London, or at the office of James Marmont, Esq., No. 15, Corn-street, Bristol.

Tenders must be delivered to the Secretary, in Cavendish-square, on or before the 28th day of March next.—The Society do not bind themselves to accept the lowest Tender.

By order of the Council, James Hudson,
London, Feb. 16th, 1842. Secretary.

STANDARD ROSES.—A Consignment of 1000 of the choicest varieties ever offered to public competition has been entrusted to Protheroe & Morris for SALE at the Auction-Mart, Thursday 10th March, and following day. This selection consists of Hybrids, Bourbons, Perpetuals, Tea-scented, Provence, and others, both Standards and Dwarfs, of varieties too numerous to mention, and of rare and diversified beauty. Catalogues can be obtained of the principal Nurserymen, at the place of Sale, and of the Auctioneers, Leytonstone.

IMPORTANT SALE.

SPLENDID COLLECTION OF STANDARD AND DWARF ROSES, new FUCHSIAS, an assortment of choice DAHLIAS in Roots, RANUNCULUSES, a superb collection of miscellaneous GREENHOUSE PLANTS, &c. Mr. T. Ansell, Jun. has received instructions to sell the above by Auction, at the Auction Mart, Bartholomew-lane, on Tuesday the 1st March, 1842, at 12 o'Clock. Among the Roses will be found Harrisonii (Yellow), Globe White, White Moss, &c. Fuchsia Monypenii, Magniflora, Splendens (of Humboldt), and other rare varieties. The Greenhouse Plants comprise a splendid collection of Azalea Indica, Woodsii, Macrantha, Coerulescens, Hibberth, Concolor, &c. Pimeleas, Brachysemas, Burtonia, New Correas, &c. &c. May be viewed the morning of Sale, and Catalogues had at the Auction Mart, and of the Auctioneer, Camden Nursery, Camden Town.

H. S. will feel thankful to be informed of contributions not published (if any), which shall then be acknowledged in a future Number.—*Isleworth, Feb. 24th*, 1842.

R. ORSON, FLORIST AND FLORISTS' AGENT, in returning his sincere thanks to the Gentlemen Amateurs, Florists, and others for the favours conferred upon him since his commencement, respectfully informs them that to the above business he has added that of AUCTIONEER, &c., and takes this opportunity of soliciting their kind support in that department, trusting by strict attention and punctuality to merit a share of the public patronage.

12, Hall-place, Kennington-lane.

HOT-WATER APPARATUS, upon the most improved and economical principles, for Horticultural and other Buildings.—STEPHENSON and CO., Agents for the Old Park Iron-works, and Manufacturers, 61, Gracechurch-street, London, annex the following list of prices of Hot-water Pipes of the best description, to assist persons desirous of adopting this mode of heating in their calculations of the probable expense, and respectfully solicit an opportunity of tendering their price for the completion of any work required. Socket-pipe for Hot Water, of two, three, and four inches diameter, at 2*s*. 3*d*., 3*s*. 3*d*., and 4*s*. 3*d*. per yard. Ditto, with Troughs for Orchidaceous-houses, three and four inches diameter, at 4*s*. 9*d*. and 6*s*. 9*d*. per yard.

The much-approved Conical Boilers made of strong plate-copper, and which require no furnace or setting in brickwork, from 5*l*. 5*s*. upwards. Also, every other description of Boilers of the most approved construction. Further particulars may be obtained at the Warehouses, Gracechurch-street, where also may be seen a variety of patterns of Iron and Strained-wire Fencing, Hurdles, Brass and Iron Bedsteads, &c. &c.

HEATING BY HOT WATER, WITH THE CIRCULATION OF ATMOSPHERIC AIR.

J. WEEKS & CO., Architects, &c., Gloucester-place, King's-road, Chelsea, Hothouse Builders, and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER; see the 3rd and 37th Numbers of the *Gardeners' Chronicle*.

References may be had, and their works seen, at Mr. Perry's Nursery, Banbury; Mr. Green's, Lower Cheam; Messrs. Henderson's, Pine-apple Nursery; Messrs. Rollisson's Nursery, Tooting; Mr. Knight's Exotic Nursery, Chelsea; Messrs. Low's, Clapton Nursery; Mr. Catleugh's Nursery, Chelsea; Mr. Gaines's Nursery, Battersea; Mr. Buck's, Portland Nursery; Mr. Young's, Milford Nursery; Mr. Smith's Nursery, Dalston; Mr. Woodroff's Nursery, Kensall Green; Mr. Hopgood's Nursery, Bayswater; Mr. Willmer's Nursery, Chelsea; and at most of the Nobility and Gentlemen's Seats in the country.

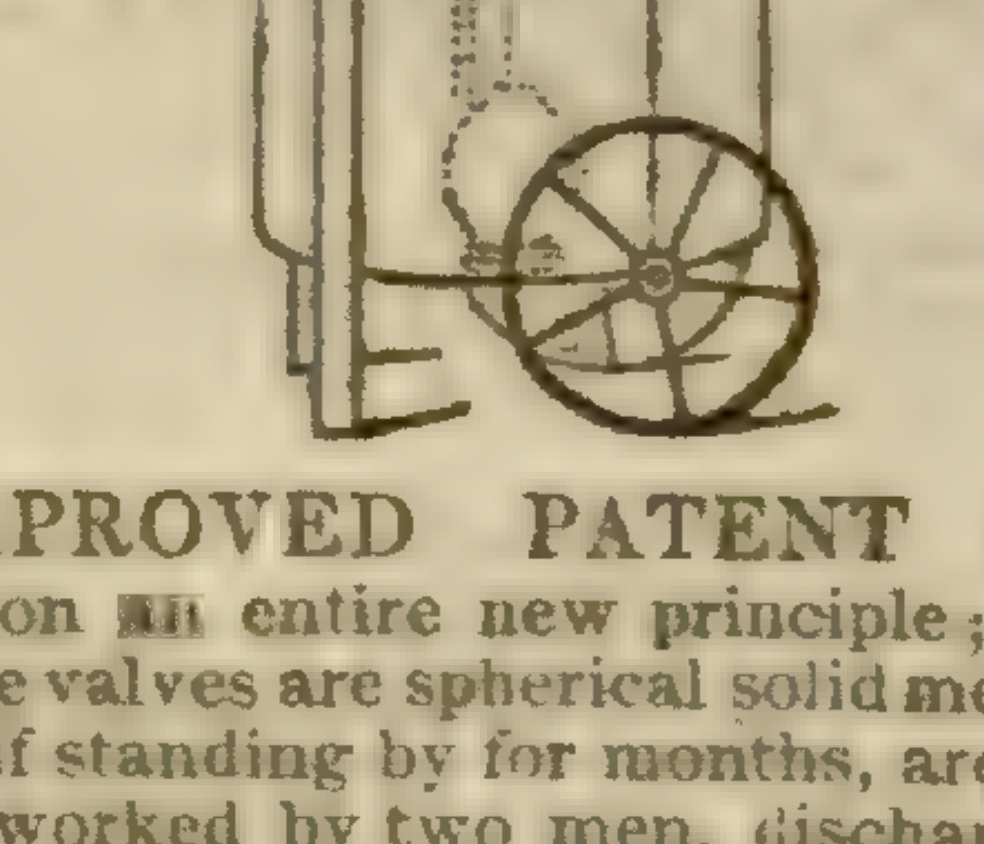
Every particular to be had at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

SLOUGH, BUCKS.

To the Nobility, Gentry, and Public in general.

IMPORTANT SALE OF PART OF THE SUPERIOR NURSERY STOCK of the highly-respectable Firm of Messrs. T. and E. Brown, dissolving Partnership.—To be Sold by Auction, by Mr. TEBBOTT, upon the premises, within five minutes' walk of the Great Western Station, on Tuesday, March 8th, 1842, and following days, each day at 12 o'clock, in Lots (without the least reservation) suitable to every description of purchasers, a part of the superior Nursery Stock growing on 14 acres of ground, called the "Hencroft Nursery," being part of the land belonging to Mr. E. Brown (who is retiring from the business), and which is required for other purposes, comprising very fine and valuable plants, in healthy condition, and will move well. The Ornamental Trees, varying from 6 to 10 feet, will consist of Laburnums, Elms in collection, Scarlet and Turkey Oaks, Poplars in collection, Ailanthus glandulosa, Liquid Amber, Deciduous Cypress, Scarlet Maple, Sumach, Catalpa syringifolia, Fern-leaved Limes, Pinus Cembra, Æsculus bicolor, rubra, and parviflora, Mountain Ash, Norway Maple, Planes, Spanish Chesnuts, Acacia, and Tulip Trees. The Ornamental Shrubs will include China Arbor Vitæ, large variegated Hollies, Green Hollies of sizes, Portugal Laurels, Common Laurels of sizes, from 1 to 4 feet, about 8000 Evergreen and Yellow-berried Privet, Syringas, Brooms, Dogwood, Judas Tree, variegated Box in quantity, Gum Cistus, Striped Elders, Irish Yew, Spireas of sorts, Euonymus, Gueldres Roses, Lilacs, Snowberries, Tartarian Honeysuckle, Ribes sanguinea, Calycanthus florida, Rose Acacia, Daphne, &c. &c. A few Standard Pears; 3000 Currants, of sorts; 500 Gooseberries, under names; Raspberries of sorts; Walnuts; Standard Quinces. The Forest Trees consist of about 2000 English Oaks, 4 feet; 1000 Beech, 2 to 3 feet; 2000 Hazel, 2 to 3 feet; Ash, 2 feet; 2000 Larch Fir, 3 feet; 15,000 Spruce Firs, 1 to 3 feet; 1000 Scotch Firs, 4 feet; 1500 Silver Firs, 1 foot; 2000 Berberries, 1 foot; 2000 Privet; 2000 Mountain Ash, 4 feet; 200 Sycamores, 4 feet; 1000 Laburnums, 4 to 6 feet; 500 Snowberries; 400 Poplars, 3 feet; 500 English Elms, 5, 6, and 7 feet; Horse Chesnuts, 4 feet. About 2000 Dwarf Roses, in fine collection, under names.

May be viewed three days prior to the sale, when Catalogues may be had on the premises; Hatchett's Hotel, Piccadilly; George, Hounslow: Chequers, Uxbridge; White Hart, Beaconsfield; Crown, Marlow; Bear, Reading; Rose, Wokingham; King's Head, Egham; Swan, Chertsey; White Hart, Maidenhead; Crown, Slough; and at the Auctioneer's Office, Windsor.



READ'S IMPROVED PATENT HYDRAULIC ENGINE, upon an entire new principle; the levers act by parallel motion, the valves are spherical solid metal, and can never get out of repair; if standing by for months, are ready to act in an instant. May be worked by two men, discharges 20 gallons of water per minute to a distance of 60 feet; and by four men may be continued for any length of time. It is so portable it will pass through a doorway, and may be kept in a hall or passage, and carried up or down stairs by two men. With a sufficient length of hose water may be conveyed to any part of a mansion, factory, or public building. This Engine, by shifting the fulcrum pin, is a most powerful GARDEN ENGINE, and may be worked by ONE man for all Horticultural purposes, which the Patentee from 31 years' practice in that science can safely warrant. Likewise Machines, Trucks, Pails, and Syringes, made of the best materials and workmanship, which may be seen and proved at 35, Regent Circus, Piccadilly.

Just published, in royal 4to, price 1*l*. 15*s*. bound,

RUSTIC ARCHITECTURE—Picturesque Decorations of Rural Buildings in the use of Rough Wood, Thatch, &c. Illustrated by Forty-two Drawings; consisting of Plans, Elevations, Sections, and Perspective Views; the Doors, Windows, Chimneys, Shafts, &c., drawn Geometrically to a large scale: with descriptions and estimated costs. By T. J. Ricauti, Architect.

"We have repeatedly and strongly recommended this elegant and useful work, and can safely say that we think no gentleman who purchases it will be disappointed."—*London's Gardener's Magazine.*

James Carpenter, Old Bond Street.

Publishing Monthly, with Four coloured Engravings,
Price 2*s*. 6*d*.

PAXTON'S MAGAZINE OF BOTANY. The Number for February contains beautifully-coloured figures of *Cattleya Aclandiæ*, *Brugmansia floribunda*, *Mahonia aquifolium*, and *Loasa Pentlandica*, with the history and directions for the culture of each: also comprehensive Papers on the science of Gardening, including the phenomena of impregnation and germination in the seed of plants; the Culture of Gesnera rupestris; on Arranging and Planting Specimens in Conservatories; the Propagation of Tropæolum tricolorum; Notices of Plants figured in the floral periodicals for December and January, and of those flowering in the suburban nurseries; with a copious Calendar of Operations for the month.

This work comprises, monthly, four admirably-coloured plates, and twenty-four pages of interesting and useful letter-press. The admirers of flowers are requested to observe—

1. That all the drawings are taken from nature, and are consequently made from plants which have flowered in Britain.
2. That, with few exceptions, they are all done by one artist, whose abilities are of the highest order, and who travels himself to the places where the plants are in flower.
3. That they are lithographed on zinc by the same individual, and, being coloured in a superior manner, have all the spirit and elegance, and much of the finish, of the original drawing.
4. That about one-half of the drawings are from plants which have never before been figured in this country, the rest representing the most popular novelties, as well as the more neglected, though sometimes far handsomer, old species; the majority being such as can be cultivated by every one possessing a flower-border and a greenhouse or frame.

It may, in conclusion, be safely asserted that, both for the beauty of its embellishments, and the utility of its contents, this work is well adapted to the wants of all who delight in gardening; and as the improved system of having the plates lithographed commences with this Number, and as it is intended that each volume shall now be perfect in itself, the present is a desirable opportunity for those who wish to become subscribers.

London: W. S. Orr and Co., Paternoster-row.

Uniform with the "Elements," price 3*s*. 6*d*.

Whittaker and Co., Ave-Maria-lane London.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. Bailey having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. Bailey also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. Bailey were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. Bailey have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their manufactory.

TO PARENTS and GUARDIANS.—A Lady, who intends remaining some months at BRIGHTON for the benefit of her children, would be happy to TAKE CHARGE OF A LITTLE GIRL OR BOY REQUIRING SEA AIR, and whose friends may not find it convenient to remain with them.

References can be given either in Brighton or London.

For further particulars, apply by letter (prepaid) to Y. Z., care of Mr. Gates, organ-builder, 19, Norfolk-square, Brighton.

PATENT ASPHALTE PROTECTING MATERIAL.—Extract from *Gardeners' Chronicle*, Dec. 25, 1841, p. 843.—"In the midst of frost it will not be unseasonable to warn all our Readers of the great importance of preventing their more tender Plants that may have been frozen from being thawed suddenly by the sun. All Gardeners know how often Peas frozen below a south wall are killed, and that if any contrivance to prevent their being suddenly thawed is made use of, they recover. What is true of Peas is, to a great extent, true of other things. A few weeks ago we had a severe frost, 16°; at that time young Araucarias exposed to the south died, while others within a few yards, but screened from the sun by stone, did not suffer at all. We may remark by the way that CROGGON'S ASPHALTE ROOFING forms a most excellent material for such screens." In page 5 of same Journal, Jan. 1, 1842, is fully described the purposes to which it is applied by the Royal Horticultural Society. Being a non-conductor it effectually protects from heat or cold.—Thomas John Croggon, 8, Ingram-court, Fenchurch-street, London.

Handsomely bound in cloth, with 93 Wood Engravings, price 6s. 6d.
ILLUSTRATIONS OF THE BIBLE, AND CONFIRMATIONS OF SACRED HISTORY, from the Monuments of Egypt. By W. C. TAYLOR, LL.D.
From the British Magazine.—"This is an elegant and well-executed little book, on a most interesting subject."

MEETINGS IN THE ENSUING WEEK.

Tuesday	Horticultural	3 P.M.
	Floricultural	7 P.M.
	Linnean	8 P.M.
Friday	Botanical	8 P.M.

WE are not surprised to find the statements made by Mr. Daniels of Twerton, near Bath, contradicted or doubted. It will be remembered that we, some time since, gave an account of them (p. 19), and that on a subsequent occasion (p. 67) we adverted to a confirmation of their accuracy which had been published by Mr. Webb Hall. The substance of Mr. Daniels' statements is this: land which would not yield more than four sacks of Barley an acre, or four bushels of Wheat, in the ordinary course of husbandry, has been made, by the application of a peculiar manure, to carry 5½, 6, and 7 sacks of Wheat an acre, *in successive years, without resting*, or the application of any farm-yard manure. Anonymous writers, who do not profess to know anything of the facts, are, we see, attempting to raise a disbelief of the statement; but as it is again confirmed, even so lately as last week, by Mr. Webb Hall, who is personally cognisant of the experiments, and as our private information from a known correspondent also corroborates the account, we must leave those who choose to doubt to the consequences of their distrust.

We can quite understand, however, why this incredulity is entertained; for we all know that in the eyes of too many agriculturists, that which has been is that which should have been. Men accustomed to waste all the most powerful portion of their farm-yard manure, to husband only that which is comparatively feeble in its action, and to estimate its value by its bulk, will naturally disbelieve the possibility of concentrating it, or of separating its constituent parts, or of forming it artificially. To these it is useless to say that ammonia, phosphoric acid, or alkaline and other substances hitherto heard of only in the laboratory of the chemist, are the most indispensable portions of manure, and that such ingredients will act as food for crops, whether formed by natural means in the stable and farm-yard, or compounded in the manufactory. If it were otherwise, they would see no cause for the doubts they entertain.

Perhaps a fact will convince where reasoning has no effect. It is not long since all the ammoniacal liquor formed in the process of generating the gas which lights our streets was poured into the Thames, polluting its waters, and killing its fish. At that time no one dreamed that a substance thus offensive in smell and destructive to animal life could be made to contribute most powerfully to the production of corn; and yet it is probably the most valuable of all the cheap agents we have as yet discovered, both to the gardener and farmer. On the 3d of December, 1840, a square rod of lawn in the Garden of the Horticultural Society was watered with this ammoniacal liquor, diluted in the proportion of 3 parts to 20 of water; in about 48 hours all the grass appeared scorched, and the moss and annuals among it were found to be killed; but in six weeks the grass recovered, and soon became conspicuous among the surrounding lawn for its deep rich green. On the 14th of April, 1841, this rod was mowed, and produced 64 lbs. of grass; in a fortnight more it was again cut, and yielded 17 lbs. At the same time another square rod, originally exactly the same, was mowed, and produced on the first occasion 13 lbs., and on the last 67 lbs. So that the land treated with ammoniacal liquor had formed more than 80 lbs. of grass while the other was forming less than 20 lbs. A similar space of ground had been dressed with nitrate of soda, but the additional quantity obtained in consequence was inconsiderable. Circumstances prevented the experiment being carried any further; but there could be no doubt that had the grass been allowed to stand for hay, the crop would have been enormous on the ammoniated ground.

Now let us ask why a similar effect should not be produced on Wheat, which, like the herbage of a lawn, is grass, and has the same constituent elements as hay. The farmer will say, perhaps, that to make Wheat rank is only to render it liable to mildew, and to be laid by rain and storms, which would be no advantage, but the reverse. Nothing can be more true, and therefore ammoniacal liquor is of itself an unsuitable manure for Wheat; but why not combine it with other agents—with alkalies to consolidate the straw, and render it stiff in proportion to its length, and with phosphoric acid for its grain? This certainly *may* be done, and probably *was* done by Mr. Daniels, whose straw was reported to *have been exceedingly heavy*, and who, we know, drills in rows 20 inches apart. In fact, some intelligence which has lately reached us leads us to believe that Mr. Daniels' manure consists of minute fragments of vegetable matter, such as stubble, sticks, weeds, and wood, mixed with nitrate of soda, lime, ammoniacal liquor, and gas tar. We have for some time been aware that the ammoniacal liquor, which is very caustic, speedily destroys the trimmings of shrubberies, grass-mowings, and similar garden refuse, that it also decomposes sawdust very rapidly, and that it thus forms a valuable manure; and we have little doubt, that as soon as it can be so combined with other substances as to form a dry dressing, not another gallon of it will be wasted.

"IF," says a correspondent, "you plant at all, remember this above every other thing, that whatever kinds of trees you plant, they cannot well be too thick, as in a short time they become shelter to one another, and materially assist one another for eight or ten years. I have invariably found the Oak thrive better *under* the Larch than under any other tree." It would be difficult to compress more bad advice into the same compass; and yet it is an advice often given, and as frequently taken, by those whose interest it is to know better.

If we ask why trees should be thus thickly planted, we are told of many reasons. One is, that they keep each other warm; another, that casualties are thus provided for; and another, that the trees draw each other up. Let us examine these reasons.

In a crowded plantation, the trees are said to keep each other warm; sometimes Scotch Firs are recommended for such purposes, and sometimes Larches. But how do they do this? Is the temperature raised in the winter? No evidence can show that, we suspect; and if it could be shown, what then? The hardy trees planted in our woods require no warmth in winter, and are the worse for it; for every garden apprentice knows, that to keep hardy plants warm in winter is to render them excessively susceptible of the influence of hard frost when it comes. Witness the destruction among trees in warm valleys in the severe winter of 1837-8, and their comparative escape on bleak hills. Perhaps it will be said that they keep off cold winds, acting as screens. We are far from undervaluing screens; which are useful in mitigating the caustic effects of sea-spray, and the withering influence of dry north-east winds; and belts to the windward of plantations are doubtless often valuable; but in no other sense can the word protection be admitted. On the contrary, we will engage that in every thickly-planted wood the trees on the outskirts are the best, and there the protection is the smallest. What injures trees is the very low temperature of our nights in the spring, when shoots are young and tender; but as such cold acts perpendicularly, not horizontally, the much-loved nurses which keep trees warm are of no avail. The truth is, that people fancy plantations are affected by cold in the same way as human beings, which is a great mistake.

As to providing against casualties by close planting, we would submit that much more efficient guards are a good well-kept fence, and active keepers to destroy hares and rabbits. In the absence of this sort of protection all the thick planting in the world will not ensure the success of a plantation, and with it close planting is superfluous.

That trees which are close planted draw each other up, we admit; but, for reasons given in previous articles, this, so far from being an advantage, is destructive of plantations, if profit to the planter or ornament to an estate are objects to be attained.

Having thus examined the reasons assigned by others in favour of planting thick, we will now give our own reasons for planting thin.

We object to it on the score of expense. An acre of land planted at two feet apart requires 10,890 trees; at six feet apart, 1210 are sufficient; on good land, the last number is ample. Now, suppose it were planted entirely with Oak 1½ to 2 feet high: an acre at two feet apart will cost 27*l.* 10*s.*; but at six feet it will only cost 3*l.* 0*s.* 6*d.* So that 24*l.* per acre would in that case be wasted; if Larch were taken, the difference would be as 13*l.* 15*s.* to 1*l.* 10*s.*, and with other trees in similar proportions. Planting thick is therefore an enormous unnecessary expense.

We object to it on the ground of its diminishing the rate of growth of the trees planted. An acre of ground contains only a certain amount of organisable matter, say 100 lbs. If 10,000 trees occupy it, there will be only 1 lb. of food for every 100 trees; but if only 1200 are growing on it, there will be more than an ounce and a half for each. It must be obvious that in the latter case the trees will grow much the fastest.

Now, let us suppose that trees planted at two feet apart are allowed to stand eight or ten years without thinning: can any one doubt that, if they grow at all, they must be by that time in the condition of fishing-rods? An Ash in fair land will grow two feet a-year; let the reader imagine an acre of Ash-trees, 20 feet high, at two feet apart! Not that such a thing could occur, because Nature would long before have righted herself, and the plantation would have disappeared, unless a few straggling trees should have remained to tell the tale of the folly of the planter.

"But," says our correspondent above quoted, "Oaks are found invariably to thrive better *under* the Larch than under any other tree." This may be; but who ever saw an Oak thrive at all under any tree whatever? or any one tree thrive under any other tree? Exposed to such circumstances, trees may live, but thriving is out of the question. A tree, to thrive, must have full access to light, and air, and wind; will it have such access under another tree? It must have a soil to grow in free from the roots of other trees; will this be the case where one tree grows on the roots of another? These questions demand no answer.

We admit that we have stated this case more strongly than our correspondent probably intended; but the reader can soften it down according to his own peculiar views; and when he has done so, he must still come to the conclusion that thick planting is one of the many mistakes which are daily committed in foresting; and that to leave a thickly-planted estate eight or ten years without thinning, under the notion that the trees will be keeping one another warm, and nursing each other, all that time, is a tenfold greater and more serious error.

ON FORCING THE CAMELLIA.

THE Camellia may be had in blossom nine months out of the year, though it is by no means so frequently or so successfully forced as it ought to be. Most families are in the country during the months of November, December, and January; and such being the case, means should be taken to have it in flower during that period; as it is, "full many a flower is born to blush unseen." I have a Camellia-house under my care, in which the plants have been in constant bloom since the first week in November, and they will continue so until the beginning of March. The house is only 24 feet long by 16 wide, and at the end of January I have counted not less than 400 blossoms expanded at once; and the amount of blooms from the 1st of November cannot have been less than 2,000; at least, reckoning those still unopened. The leaves are of a good dark colour, and the blossoms have opened freely, and are as large and as good in colour as those which bloom in April.

Soil.—The soil I use is, two parts rich loamy turf, rather tenacious; one do. decomposed turfy-heath soil; and to this I add a little sharp sand, and a little bone-manure. I am aware that some persons use leaf-mould and rotten dung; but as the texture of these is not of a permanent character, they are better left out, in my opinion, especially as liquid manure is used. The loam should be about six months old, and should be broken, and thoroughly blended with the other materials, but not sifted; and small lumps of the sod should be introduced occasionally while filling the pots with the compost, which will facilitate the escape of water.

Drainage and Potting.—In potting, I place three or four potsherds first, the one overlapping the other, to insure a certain and speedy passage for the water, in defiance of the earth-worm; then a sprinkling of pounded crocks, the size of horse-beans; and finally, another sprinkling finer still: on this I put a thin layer of sphagnum which has been dried but not decomposed. Many practitioners, and good ones too, recommend repotting just before the plants begin to grow. I am inclined to think this plan better adapted for nurserymen, and those whose only object is to make wood. The production of blossoms is another affair; and in the case of luxuriant plants, this can only be done by a temporary check of some kind, the best of which is, in my opinion, limiting the supply of water at the root, and not calling a new series of fibres into play until the blossom-buds are decidedly formed. I repot Camellias soon after they have made their young growth—as soon, in fact, as the young leaves are perfectly developed, and the end of the young wood at the point of junction with the wood of the former year begins to turn a little brown. In potting, the soil should be rather lumpy than otherwise, and tolerably dry, and should be put round the ball in regular layers, and dressed tolerably firm, but not hard, as the layers are thrown in—pressing every layer a little, so that no crevice be left. The ball of the plant should be rather moist at shifting; and when it is in a pot-bound state, it should be immersed in tepid water for an hour, about three days previous, allowing a day or two for the superfluous water to drain away before potting: I place the ball immediately on the sphagnum.

Period of Growth.—The thermometer should be kept from 60° to 65° by day, and 50° to 55° by night. The treatment should now be of a close and moist character, giving air in moderation and with caution every morning, from 8 o'clock until noon, and then, unless very hot weather, shutting close up. There should be a little fire-heat every morning, from 7 o'clock until 11, when it should be taken away until 4 o'clock, and then applied for the evening. The pipes, flues, and floors should be watered abundantly directly the air is taken away; then a good syringing at 3 o'clock, and the flues, &c. &c., wetted as before, between 5 o'clock and 6. Watering at the root must be carefully attended to when necessary, using weak liquid manure.

Period of Forming the Blossom-bud.—I shall suppose that the plants have been all repotted or examined. Shading will now be indispensable, the best material for which is coarse canvas. I kept my canvas on last summer, and my success was complete. I should, however, advise those who are not too busy, to remove it every afternoon at 4 o'clock, and replace it at 9 in the following morning. The temperature should range from 65° to 70° by day, and from 55° to 60° by night, and be accompanied with a free circulation of air, avoiding all cutting winds. The main business is the concentration of those principles which form the future blossom-bud, now in an incipient state; strong action of the root, with free watering, and an overmoist atmosphere, will readily convert the would-be blossom-bud into a second shoot. The plants must, therefore, be very sparingly watered; in fact, a good smart syringing every afternoon immediately the air is taken away, say 4 o'clock, will be nearly sufficient. A little fire should be made every afternoon, except on warm sunny days, about 3 o'clock; but it should be put entirely out about 5 o'clock, as it is only requisite to warm the pipes or flues sufficiently to produce a genial vapour for the night; and half an hour after the fire is pulled out, the whole of the flues, pipes, and floors should be saturated with water, to be evaporated by the next day's ventilation.

Period of Feeding the Bud.—The fires may now be dispensed with entirely, merely observing in the case of sunny afternoons to make free use of sun-heat, by shutting up the house early in the afternoon, say from 3 to 4 o'clock, according to the weather. Air should be given freely at all opportunities, and the plants should be syringed heavily at 7 o'clock in the morning, and again at 4 o'clock in the afternoon, saturating the floors and flues, or pipes, with water in the evening. The plants may be well watered at the root whenever they require it, using liquid manure from old dung, in the proportion of one part liquid manure to four of clean water. If it be used richer, alternate waterings of clean water will be necessary, or the soil will become choked, and its texture destroyed. The plants will now possess abundance of new fibres, and their powerful action, assisted by liquid manure occasionally, will produce both a plump bud and a dark leaf, and enable the plant to store up abundance of necessary food for the expanding blossoms.

Period of Blooming.—This is an important period. Three objects must be kept especially in view, viz.—the complete development of the blossom-bud; the retaining it on the plant as long as possible afterwards; and feeding the later blossom-buds. Free watering, and the use of liquid manure as before recommended, must be persisted in, avoiding however excess. The plants require to be kept decidedly moist at the root while in the flowering state, rather more so indeed than at any other period; and if the potting and soil be right, and the drainage complete, little harm will ensue from a liberal use of water; still any great extreme, either of drought or wet, will be fatal to the bud. Syringing must be entirely dispensed with, and in lieu thereof a deposit of dew should take place every afternoon at 3 or 4 o'clock. My Camellias have been thus treated all the past winter: and as it requires a little nicety to produce this fine dew without at the same time producing drip, I must state how I have managed it. My fires, which are smouldered up in the evening about 10 o'clock, burn but little all night, or at least as slow as possible; they are stirred up directly the fire-manager comes to work every morning, and burn as brisk as possible until 11 o'clock, when they are put entirely out until 4 o'clock in the afternoon. During the time the brisk fire is kept up, all the air possible is admitted consistent with the weather, so that all damp is carried away, and the leaf and blossom made perfectly dry for three hours. At 1 or 2 o'clock the pannels on the hot water pipes, which have become about the warmth of new milk, are filled full of water, and the floors are flooded as well. This produces a genial steam, which, instead of being forced immediately to the roof by a high temperature, to be condensed and become drip, floats over the plants, and is gradually condensed on the leaves and flowers, or remains suspended in the atmosphere. The pipes are watered again at 4 o'clock, and the plants being now covered with dew, I find it expedient to give a little back air at the ventilators, and this remains all night. By these means my Camellias have been covered every night through the past winter with a dew exactly similar to that in a fine night in May out-of-doors. If, however, the weather is so severe that I cannot give air at all, I instantly lower my fires, and the house is kept at 50° heat.

Rest Period.—The temperature at this period should be from 50° to 55° by day, and from 45° to 50° by night. This period is more artificial than any of the foregoing; but a little attention here will not be thrown away. By rest, I mean slow breaking of the wood-buds, as gardeners term it; the necessary consequence of which is, to cause a greater number of wood-buds to push than otherwise would. It will also tend to restore the exhaustion into which they have been thrown by blossoming, and render them more excitable when heat is applied. Nothing, however, is necessary in addition to a lower temperature, but syringing, steaming, and regular watering, with a moderate circulation of air.—*Robert Errington, Oulton Park.*

NOTES UPON SOME OF THE NEW PELARGONIUMS.

(Concluded from page 68.)

24.—Duchess of Kent has rose-coloured under petals, terminating in white and a fine dark spot in the upper petals.

25.—Cerito (Gaines). This is a fine free bloomer; the trusses, which are large, rise well above the foliage; the form of the flower is good, and the spot clearly defined, somewhat like the Sylph; the ground colour is a delicate pink in all the petals; the flower is large.

26.—Amurath possesses a singular combination of colour, the lower petals being lilac, the upper partaking of a crimson hue; this peculiarity is its principal attraction, the flower being deficient in form.

Several attractive varieties of Pelargoniums were exhibited by Mr. Pamplin during the past season; in describing these flowers it may be proper to remark that we have never seen plants of them in a growing state—our observations are consequently confined to the properties of the individual flowers. The general appearance of the plants and their manner of blooming we are unacquainted with; the following varieties are considered the best:—

27.—Enchantress is a large flower with a white ground; the dark mark in the upper petals nearly covers their entire surface, leaving but a narrow border approaching to white; it resembles the Queen of the Fairies, but the flowers are larger; the margin round the upper petals is not so broad, and it wants the purity and clearness of edge which is the distinctive mark of that beautiful variety.

28.—Camilla is a large and finely-formed flower of good substance; it has rich bright salmon-coloured under petals, with a fine spot in the upper part of the flower; the rich colour in the petals, combined with the size of the blooms, renders it an attractive variety.

29.—Alice Grey, and 30—Alice, are two flowers of good form and pleasing appearance; the former has clear rose-coloured under petals, with a white centre and a well-defined spot; in the latter the ground colour is a delicate pink, approximating to white; they are both desirable varieties.

31.—Lyne's Circassian. This very much resembles Climax, but is in every respect an improvement upon that favourite variety. The form of the flower is good; the bottom petals are bright pink, with a white centre, and an intensely dark spot in the top petals. It is a very free bloomer.

32.—Sirius is another flower of the same character.

33.—Grand Monarch (Kinghorne's). The lower petals are of a delicate pink; there is a large spot in the upper ones, which softens a little towards the edge. The flower is of a good substance, and finely formed: the lower petals are unusually broad, filling up the spaces between, and leaving but slight indentations in the general outline of the flower. This will prove an excellent variety for show.

34.—Proserpine. The lower petals are pink, and the spot in the upper ones is large and rich, leaving a slight margin of the ground colour.

35—Flash; and 36—Flamingo. These are two showy varieties: the trusses are large and numerous. Flash has the advantage in form; the under petals are rose; the spot in the upper petals is large and dark, leaving a crimson margin around the edge. Flamingo is a deeper and richer coloured flower, and rather coarse: the trusses are not sufficiently compact, from the footstalks of the flowers being too long.

37. Reward.—Mr. Russell has a seedling under this name, which appeared a promising flower. The colour is bright crimson, somewhat like Gaines's King; the flower is well formed, the petals even on the edge: the trusses are large, the foliage handsome, and the habit seemed free.

38. Rambler also promised well. It resembles Conservative in colour; it is a well-formed flower, and a good trusser.

39.—Princess Sophia Matilda (Basket's). This is a very singular flower. Those who are acquainted with Jehu or Forster's Beauty will at once recognise its colour. The blooms are superior in size to either of those varieties, and the trusses are fine and remarkably compact. The upper petals are very dark, being nearly covered by the spot, leaving a margin of rose; the lower ones are rose, with deeper rose-coloured spots. What constitutes the singularity of this variety is the appearance which the flowers present of being fringed, which arises from having a superabundance of material in the petals, and this causes a puckering at the edges. It is peculiar in appearance, and though not calculated for the purposes of exhibition, where floral properties are scrutinised, it will make a pleasing variety for a general collection.

THE AMATEUR'S GARDEN.—No. IX.

Many tender plants, such as Verbenas and Anagallises, which have been kept in pits all the winter, and which are intended for the beds of the flower-garden next summer, should now be gone over and top-dressed with fresh soil, or repotted where the roots are in bad condition. Auriculas should also have a top-dressing of rich soil well mixed with rotten cow-dung, removing at the same time all damping leaves, and admitting plenty of air in fine weather. If there are any hardy annuals in the beds or borders of the flower-garden which showed themselves in the autumn and have lived throughout the winter, thin them out, put a little fresh soil amongst them, and leave them to flower early. Sow a few favourite annuals in pots, such as Sweet Peas, Stocks, Nemophila insignis, &c. for planting out when the season is more advanced.

The weather is now favourable for going on with alterations and improvements. In No. 6, page 85, where some remarks were made upon laying out small gardens, the more common faults in style were pointed out in order that the amateur might guard against them. Where general effect is the object, nothing looks better than a fine grass lawn in the middle of the garden open to the house, and seen from the windows. If there are any flower-beds or clumps upon the lawn, they should be few and of considerable size, keeping them rather near the sides: their form must be regulated by surrounding objects. If the garden is a square or a parallelogram, and is bounded by straight walls or hedges, visible from the walks—which we will suppose are made down each side at a convenient distance from the boundary—then these walks must be made straight; but in many cases it is advisable to plant shrubberies round the borders to hide the straight lines, and then the walks may be formed in graceful curves. Too many turnings should be guarded against, as they never look well, particularly if there is no apparent reason for them. Much of the beauty is produced by a judicious selection and arrangement of trees and shrubs, planting those which have the most symmetry in their general outline nearest the dwelling-house. Every one must have admired the noble Cedar of Lebanon, with its wide-spreading branches, when planted in a situation of this kind. The Araucaria Dombeyi, which is now common, would form a fine object even in a small garden, for it grows slowly, and would be a long time before it got to an inconvenient size. A group of Yuccas in some corner near the house gives a kind of exotic character which is pleasing. At a little distance from the house, and on one side of the lawn, a plant or two of the Indian Cedar (Deodar), of which many thousands are now in the nurseries, would look well; then groups of the ornamental kinds of Hawthorn might come in: and if there is a pond or lake, some Birches, Weeping Willows, and trees having that character might be planted near it. The sides of the garden could be planted with the more common ornamental trees, evergreens, and flowering shrubs, and thus the eye would be gradually led from art and symmetry to the more natural appearances presented by wild scenery.

These are general principles which I think should be always kept in view where effect is studied; but the particular arrangement must be left entirely to the taste and objects of the proprietor, because his garden is for his own recreation and amusement, and therefore he should satisfy himself. If he lives in a retired spot, he may wish to have views of the surrounding country, and, by sunk fences and other arrangements, make his garden appear part of the fields and woods by which he is surrounded; or if near the noise and bustle of a town, seclusion and retirement may be his object, and he will therefore make his arrangements accordingly. A tree or shrub may look ill in a certain place to the eye of the garden artist, and yet the proprietor, for reasons of his own, may prefer that tree to all the others in his garden.—*R. F.*

ON THE MANAGEMENT OF CAPE HEATHS.

Many of your readers will doubtless remember how much Cape Heaths were admired and valued in the neighbourhood of London about twenty years ago. But at that time it was only the more skilful nurseryman or gardener who understood the art of keeping them alive, and as soon as they got into the hands of many private individuals, from some cause they became unhealthy and were soon lost. As this happened frequently, the opinion became general that they were most unmanageable plants, and people gradually gave up all hopes of succeeding with them. Several of the nurserymen, however, still kept up the collection, and in the mean time it was proved by the splendid specimens which were grown in some collections in Scotland, particularly at Edinburgh and Woodhall, that Heaths were as willing to submit to artificial treatment as other exotic plants, providing they were properly managed. Subsequently, this has also been proved by the very fine specimens which have been of late years brought to the exhibitions of the Horticultural Society of London, where they now form one of the principal objects of attraction. And when we consider that they are not like our favourite Pelargoniums and Calceolarias, which bloom only in perfection during the summer, when our gardens are gay with many other flowers, but that with a judicious selection we may have some of them in bloom at all seasons, and that their waxy forms "and flowers of all hues" are always pleasing to the eye, we cannot wonder that they are now likely to be greater favourites than ever they were before.

Having at page 699 (1841) given some directions for their propagation by seeds and cuttings, I will now describe their subsequent treatment. I ought, however, to have mentioned a quick mode of striking the free-growing kinds, which is practised by some of the nurserymen who grow them for the London market. A number of plants are put into a warm house and induced to send out a quantity of short young shoots, which are taken off as soon as they become a little firm at the base, prepared in the usual way, and plunged in a gentle bottom-heat. But I fear I am treading on dangerous ground here, and may as well inform your unknown correspondent who attacked my last paper, that Heaths are such perverse things, they will root by the thousand in this way notwithstanding all his knowledge, and therefore if I recommend bottom-heat this time he must blame them and not me. But if he had read the former paper with that care with which critics should always read, he would have seen nothing about bottom-heat, because it is only when the cuttings are taken off in a very young state and liable to damp that this is at all necessary. When the under part of the cutting is firm, a shaded frame in the spring or summer season is all that is required. As I have made the subject as plain as possible this time, I hope he will not endeavour to misunderstand me, but that he will try both methods, and I am quite certain he will report most favourably of each.

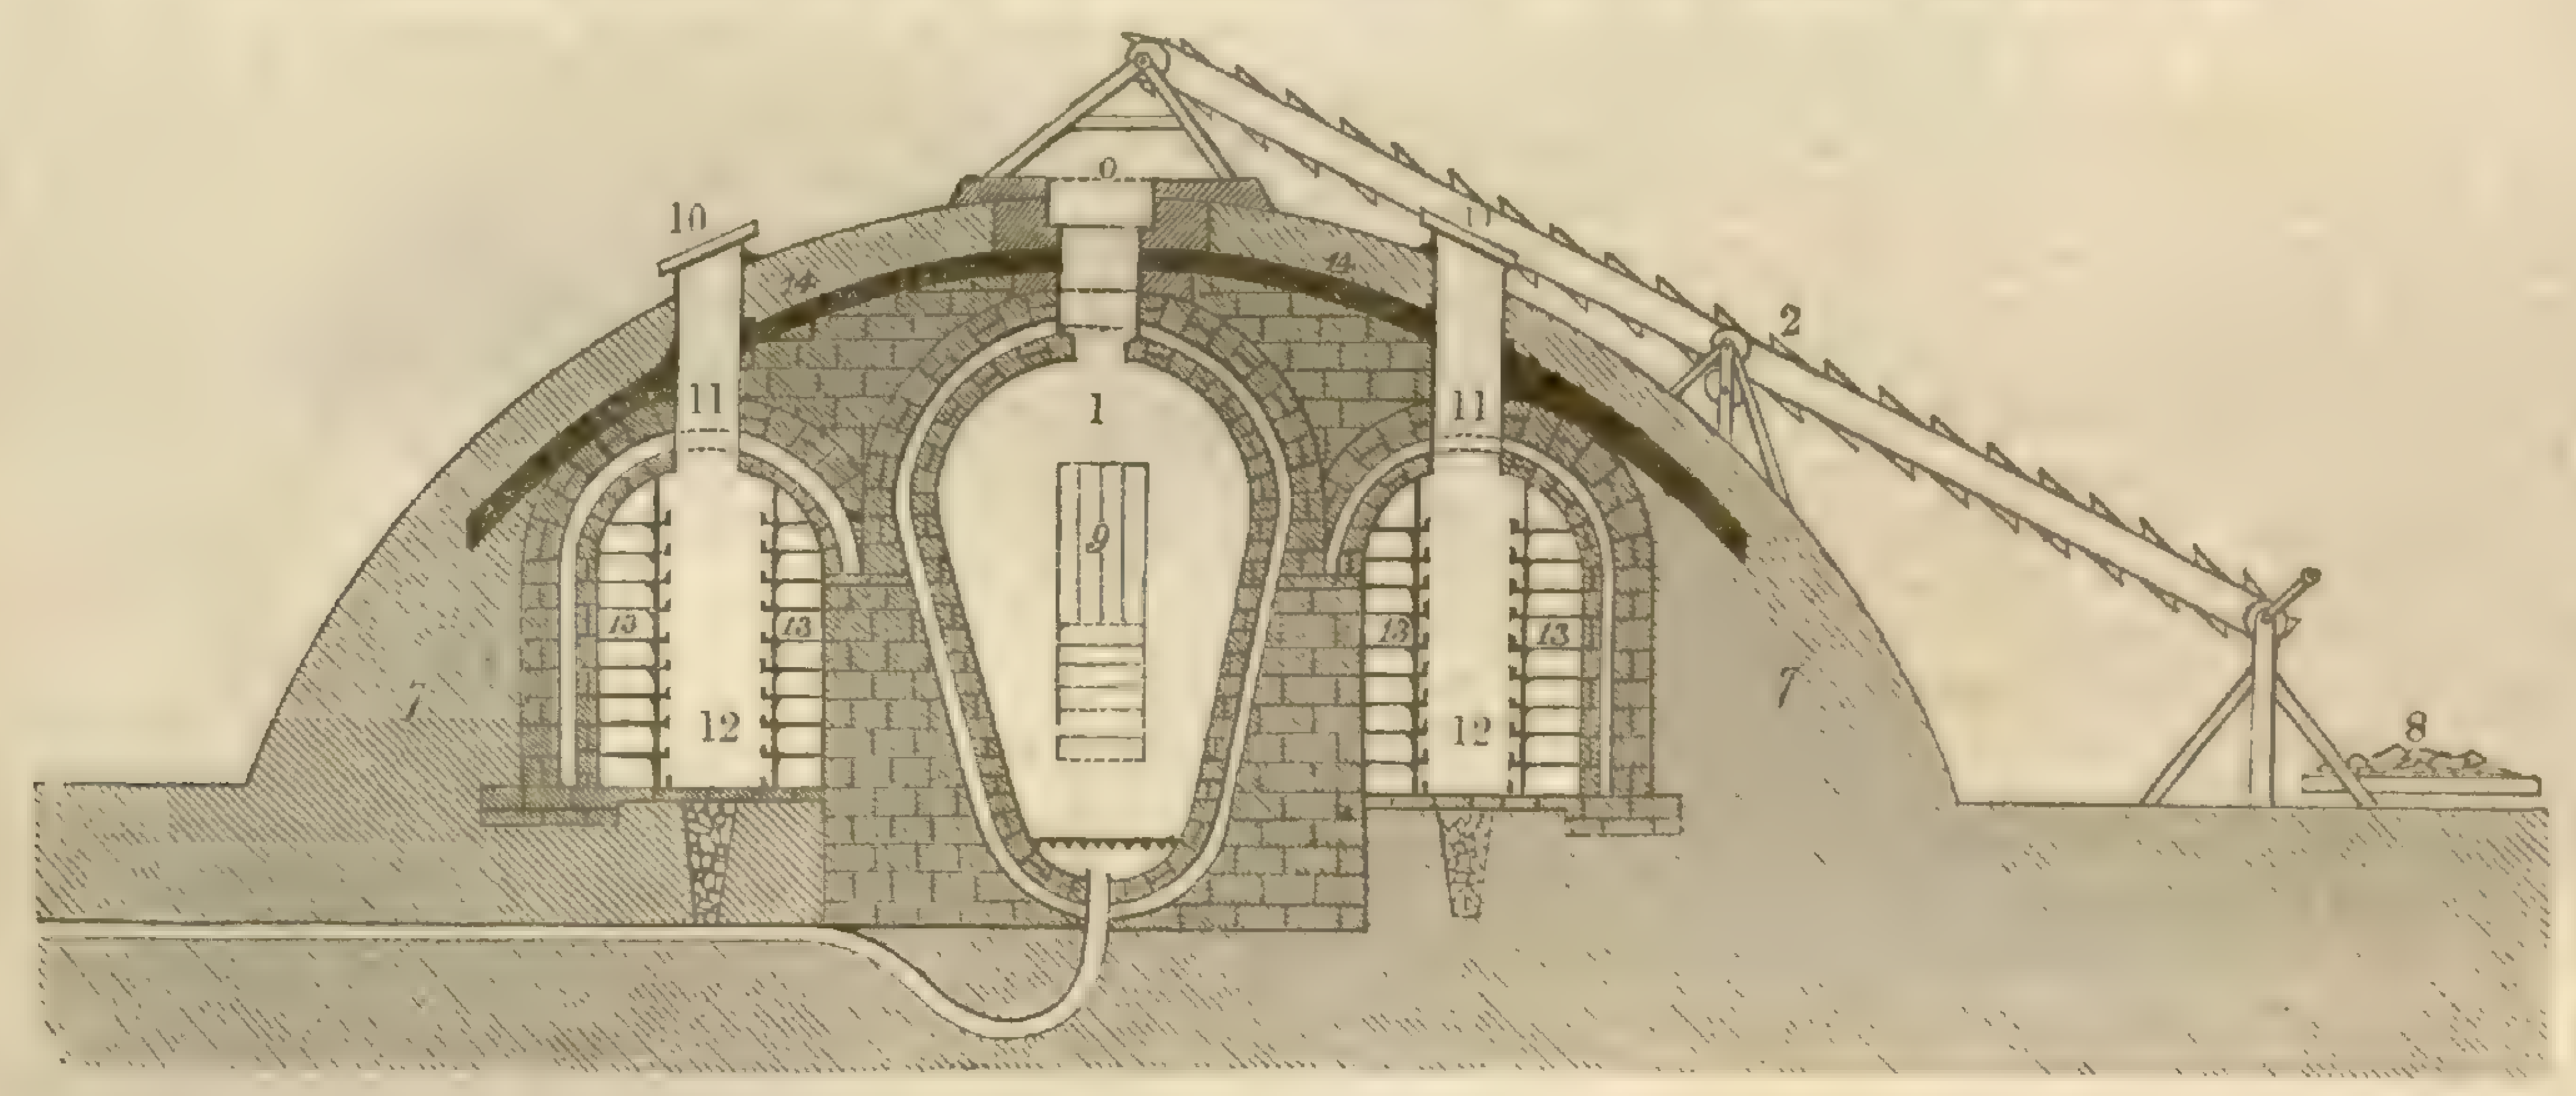
The best soil for the growth of Heaths is that rich brown turfy peat commonly found on the surface of land where the native Heather grows. Sometimes grass will be found growing very strong on this soil, as at Shirley Common; but wherever the land is barren it is an indication of poor soil, and should not be selected. It is always best to have it dug and brought home to the compost-yard at least a year before it is to be used. The fibrous matter will then have time to decay, and will make excellent manure for the roots of the plants. During the winter and spring it should be several times turned over, and by this means the whole will get well mixed and exposed to the influence of the frost. Peat-soil is generally found naturally well mixed with fine white sand; but where this is not the case, a small quantity should be added to the soil before it is used.

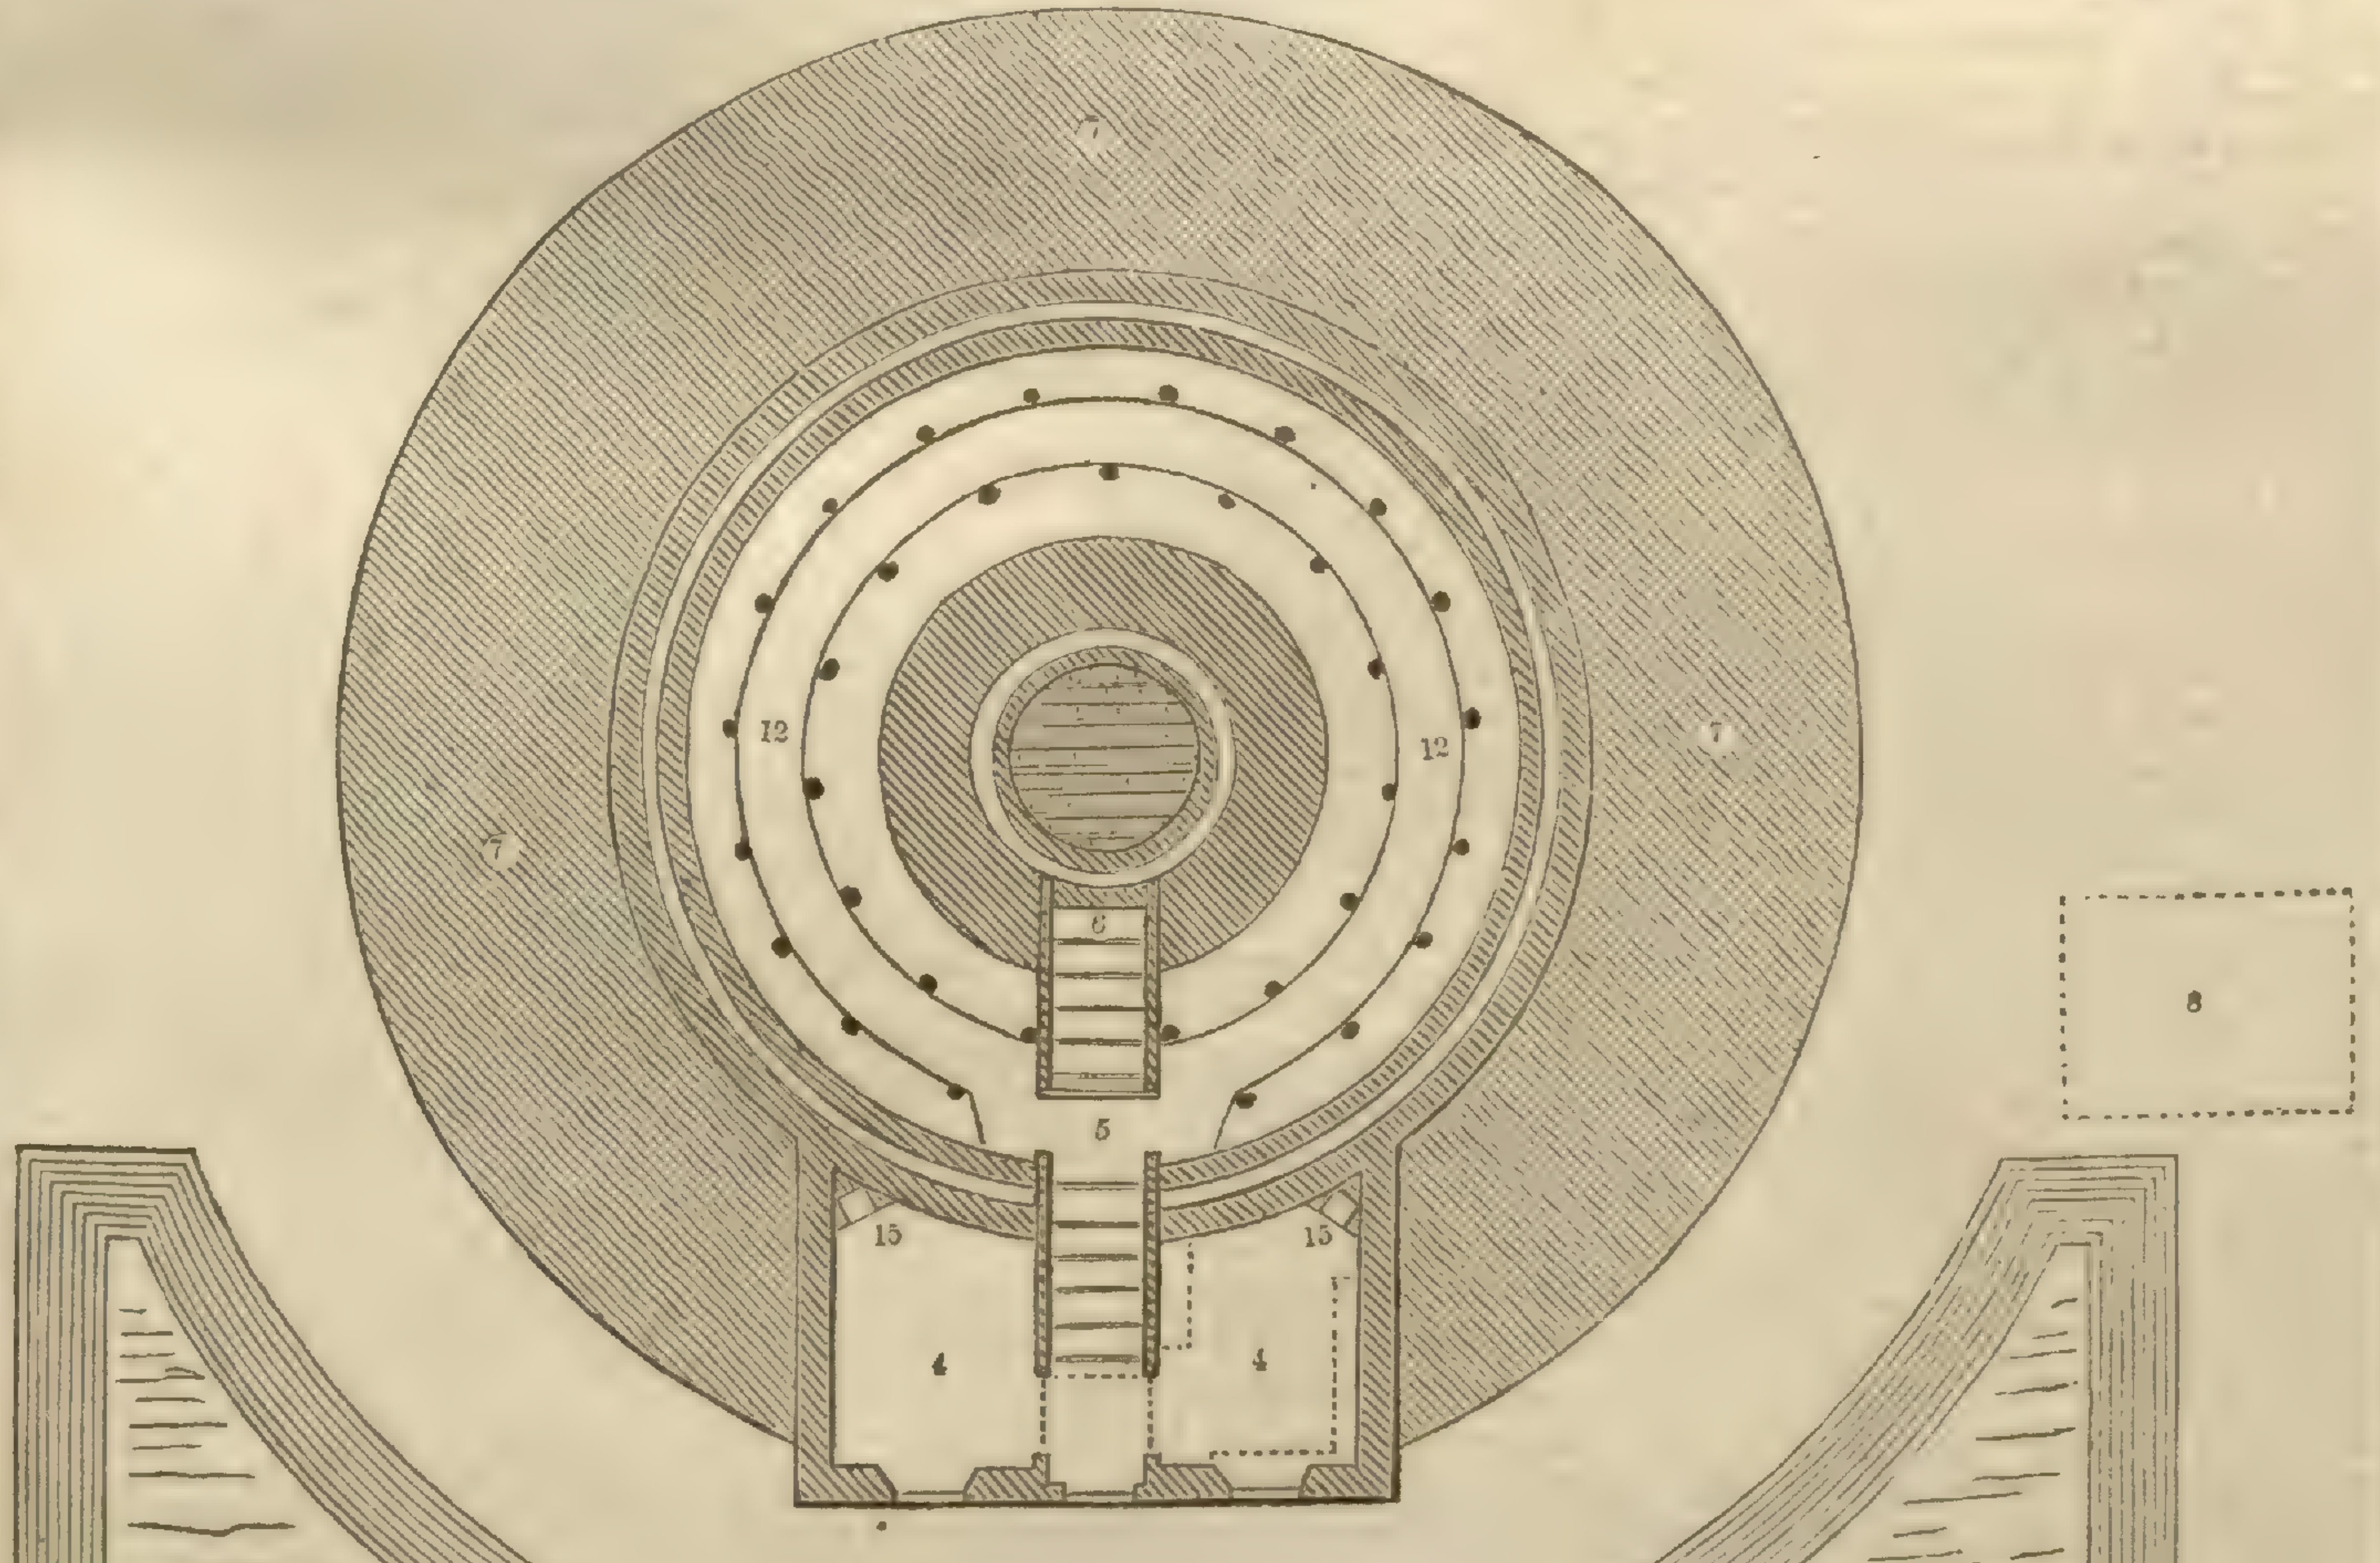
As the young plants grow and fill the pots with roots, they will require to be shifted into pots of a larger size. I do not know any better rule than to follow the different sizes of the pots commonly made in the potteries, from "thumbs" downwards to those of a larger size. Thus the young cuttings or seedlings are first potted in "thumbs," then in 60s, then 48s, and so on. At every shifting the neck of the plant ought to be kept a little higher than the soil, and when large pots or tubs are used, Mr. McNab's plan of mixing small pieces of freestone with the soil is a most excellent one; of course it is necessary for the health of the plants to have the pots properly drained, and the worms kept out of them. Heaths will not bear their roots being cut or destroyed, particularly after the plants attain a certain age. This is no doubt one of the reasons why so many of these plants die after being shifted by gardeners, who, not being aware of this, subject them to the same system of root-pruning as Acacias or Pelargoniums.

The shifting may be done at any season except winter; but this must be regulated in a great degree by the state of the plants, as they flower and grow at so many different times. Spring, however, is the time when the most of them ought to be shifted, and if they are placed out of doors during summer they will all require to be looked over again before they are brought into the house in autumn. The kind of water which is used for these plants is of the greatest consequence in keeping them in a high state of health. I know several kinds of spring-water which destroy Heaths in a very short time. Wherever such springs exist, rain or river water should always be used instead. When the pots are properly drained, there is not much danger to be apprehended from over-watering; but the plants are sure to suffer if the ball is allowed to get too dry, and hence the great use of small pieces of freestone recommended by Mr. McNab. In the winter season, when there is any danger from frost, Heaths and all other hardy greenhouse plants should always be watered in the early part of the day, as they are much more likely to be injured if watered in the afternoon. It is the best plan under these circumstances to keep them as dry as they will bear without injury, for wet soil freezes much sooner than dry. Frequent syringing is also of great use in fine weather; but this must never be done when the plants are likely to suffer from damp, or when the weather is cold and frosty. The principal art of making fine specimens of Heaths consists in dwarfing them, and forming them into round green bushes. This is done by pinching out the points of the shoots when the plants are young, and continuing the practice whenever the stems are inclined to grow long-jointed. It must, however, be done in a judicious manner; otherwise if done at the wrong season, the flowering will be spoiled. The proper time is after the flowering season is past, or when the plant is growing freely, and before it has begun to form its flower-buds.

As this paper is rather longer than I intended, I will reserve for another some remarks upon the construction and management of the Heathery.—*a, e, i.*

DESCRIPTION OF AN ICE-HOUSE AND FRUIT-ROOM COMBINED.





The annexed figure represents the ground-plan and section of an ice-house and fruit-room combined. 1 is the ice-house with a circular hole in the top for filling. 2, an endless canvas, revolved by means of rollers turned with a handle; this is for conveying the ice from the bottom of the bank to the hole in the top of the ice-house: the ice is prevented from falling back by means of laths of wood fixed across the canvas. 3 is one end of a bowling-green, surrounding the two rooms 4, 4, and entrance to the fruit-room 5, the ice-house 6, and part of the circular mound covering the whole, 7. The farther end of the bowling-green, should be convexly circular outward, and if practicable should have a jet-d'eau, or fountain, from the waste-pipe of which the water may be conveyed at pleasure into the bowling-green; and being by this means filled with water to the depth of 2 feet or so, in frosty weather a fine sheet of ice will be formed, and thus the bowling-green will serve for a bowling-green, curling-pond, ice-house-pond, and skating-pond. The method of filling the ice-house may be as follows:—an opening is made in the ice at the corner adjoining the stone flooring, 8, and increased in a diagonal line to the far corner on the opposite side, in which forms may be placed for the workmen to stand upon when breaking and spearing the ice along to the corner. Two men stand at the corner and drag the ice on the flooring; two others with mallets break the ice into small pieces, and two shovel it on the canvas; another one sprinkling it with salt*, while another turns round the canvas by means of the handle and rollers: by this the ice is conveyed to the top, and falls through the round hole in the centre of the house, from which there should be a bottomless sack of canvas suspended to prevent the ice from falling on the workmen below, who by means of wooden beaters should pound the ice as closely together as possible, frequently pouring hot water over it with the rose of a watering-pan. The door, 9, being shut, and a layer of reeds, wheat-straw, or laths, laid against it to prevent the ice from adhering to it, the house may be firmly filled to a little above the spring of the arched roof, when the packers may ascend through the hole in the top. The ice may then have an extra breaking, and the remaining part of the house be packed full. The hole should then be closed up with a circular board 9 inches or 1 foot in thickness; the space between this and the upper covering, which should be of stone, should be stuffed up with sphagnum, and the stone covered over with turf. It is not my design to explain the principle by which ice is kept in a congealed mass, as that has been already done in the first volume of the *Gardeners' Chronicle;* but I would state that I disapprove of having the ice insulated by means of straw. If it is necessary to have any material between the walls and the ice, strips of lath will be found the best. I would not even put straw between the two doors in the passage, but would, if space allowed, substitute a third door. The doors might be made nearly air-tight by having their edges covered with soft leather, or some such substance. There is a great waste of time in removing the straw to get at the ice, and consequently a great deal of air would be admitted into the interior of the house, which I believe is the cause of so much complaint about the speedy dissolution of ice. By means of the air-tight doors, the person sent for a supply of ice, after having opened the first door, may shut himself and pail in; the second door may then be opened, and should fold in the middle, so as to occupy little space in opening; the third door may open outwards, and to the reverse side of the second, and be shut on entering the house; by this means very little air will be admitted on entering, and far less on returning, and every sort of litter being done away with, there will be little danger of carbonic acid gas accumulating inside the house. In the above plan there may be a door at the foot of the stairs, and two others on entering, through the wall. The inner walls of both ice-house and fruit-room should be built with brick, and bound to the outer walls with long bricks or stones, reaching through the vacuity from the one wall to the other. The fruit-room is lighted from above with circular vents with glass tops, 10, and wooden shutters, 11, that may be opened and shut with cords and pulleys; five of these vents may be sufficient to light the passage, 12, of the fruit-room all round. The shelves, 13, should be supported on cast-iron pillars; they may be made of stone, slate, or zinc, either material in my opinion being preferable to wood, both for durability and for keeping the fruit cool and plump. The fruit-room is 12 feet high, 8 feet wide, and contains about 3540 square feet of shelfing. The passage between the shelves is 3 feet wide. The height of the ice-house is 20 feet from top to bottom, and 11 feet diameter at the spring of the arched roof. 14 is a layer of coal or gas tar, mixed up with sand to prevent the wet getting down to the building. The swan-necked pipe will exclude the air from below, as it will always stand full of water. The drain below the passage of the fruit-room will prevent an over-dampness in the flooring. Heated air might be conducted from the back of the fire-places, 15, into the vacuity in the fruit-room wall, and may be admitted into the interior of the room, by turning valves, in the inner wall. Cold air may have ingress by a pipe or pipes from outside the bank into the vacuity, and from thence through the valves into the interior, and the egress may be by the vents at top. However, I am of opinion, as far as my experience in keeping fruit goes, that little air, heat, or light is necessary; and that an atmosphere inclining to a damp state rather than dry is essential. The air-pipes of course will be useful in extraordinary cases. The room 4, on the left-hand side of the passage to the fruit-room and ice-house, is intended for the accommodation of bowlers; and, as a dessert and sitting rooms, should contain chairs, a table, and strong press of the bowls, curling-stones, &c. The room on the right hand is for preparing the dessert in, and for keeping and ripening some of the finer sorts of French and Flemish Pears, &c., and should be fitted up with shelves and drawers for seeds, &c.

Ice-houses are frequently built in a very obscure corner, and sunk in the side of a north sloping bank, under the shade of forest-trees, and often at a considerable distance from the house and garden, and when passed at any time present no peculiar attraction: whereas, if built on the plan here described, they may occupy a place at one side, or even in the middle of the flower-garden, and being of such magnitude, would contain ice and fruit for the constant supply of a large family. If the elevation of the rooms 4, 4, was built in the form of a Grecian temple, the bank of earth covering the ice-house and fruit-room planted with a selection of dwarf ornamental flowering shrubs, and partially shaded with trees on the south side, or studded over with rockwork planted with different species of Saxifrages, Sedums, Primulas, and Ericas; a scroll-shaped Aquarium encircled the far end of the bowling-green; and if it was situated near the gardener's house, the hot-houses, and fruit-garden, it would be an object not only of peculiar attraction and elegance, but would afford the means of recreation, and combine economy with utility. —*J. D. B. D.*

---

* This is wrong, and should not be done.

HOME CORRESPONDENCE.

Fences.—In the notices on planting and training quick hedges, your correspondents repeatedly direct the shoots to be cut back every year with a view to thickening the hedge. My experience has shown that such a practice will effectually mar the object that it is wished to advance. It is right to cut the Thorn within an inch of the root at planting, for the purpose of making it throw out a number of shoots at that point; and if the plant is pruned afterwards at two or three feet from the ground, the same result follows, *i. e.* a number of shoots spring from just below the cut. But these shoots soon steal the sap, and nothing but a bare stem will, in a few years, remain below that point: thus making the hedge hollow at the bottom. My rule is this, and experience has proved it to be a good one: never top a hedge till it has attained the required height; when it has been planted three years, the sides should be trimmed up with the shears or hook, to encourage the laterals to multiply shoots, taking care not to injure the leading shoots. This will make a single row of Thorns, originally planted at 4 in. apart, so thick, that a bird will not build in it. When the hedge has reached its full height, trim it level at the top, and keep the sides cut, so as to allow no part to overhang another. The practice of "laying" hedges, formerly so much in vogue, is now giving way to an improved plan, viz. after five or six years, cut out single plants at intervals where the bottom may be thinnest, at six, nine, or twelve inches from the ground. The hedge will thus be kept full at bottom; whereas, after 20 years, a "laid" hedge is good for little.—*P.*

Knight's Monarch Pear.—I am inclined, by the figure and description of the Monarch Pear given in p. 109, to ask if this is the variety distributed by the Society eight or ten years since. At that time I received grafts from which I propagated extensively; but I was much disappointed when the trees came into bearing to find the fruit a hard, worthless, green Pear—keeping well, it is true, even till May or June, but even then dry and valueless. The trees were remarkable for their thorny and robust habit. On inquiring of Mr. Thompson some two or three years since about it, he informed me that Mr. Knight had then found out the mistake, his gardener having taken grafts from the wrong tree to give to the Society, but that grafts of the true sort had since been received. Of this kind I had one small graft, and the plants I have propagated from it differ in habit from those before mentioned, not growing so luxuriantly. If the circumstance that I have stated occurred, I fear many of your readers will be deceived in thinking they have the Monarch Pear, which you describe so favourably, as many plants were propagated by different nurserymen, of that sort which was first distributed —*W. Rivers, Jun.*—[It is quite true that, in consequence of mistakes on the part of Mr. Knight's people, a wrong Pear was for a long time distributed by the Horticultural Society, and propagated by nurserymen, who cannot be blamed for having done so. The error could not be detected till the trees fruited.]

Cottagers—I cannot allow the subject of Cottage-gardens to close without suggesting the expediency of a few rabbits, as well as a pig, being kept; for the former are, under good management, very profitable stock, and their dung extremely valuable for many purposes in horticulture. The hutch may be made of an old tea-chest or box, and wherever placed, it should be well ventilated—cleanliness and fresh air being indispensable to the well-being of rabbits, and the principal points to be attended to. They may be fed upon Greens, Carrots, Lettuce, Lucerne, and baked Potatoes; and occasionally (always whilst being fattened) either Oats, Peas, Beans, Wheat, Pollard, and sometimes fresh Grains. A little Clover or meadow Hay will also be found beneficial. A good doe will produce from 20 to 25 young ones annually. This subject is, however, too lengthy to treat upon in all its bearings; and I merely throw out these hints for the consideration of the cottager.—*C. K.*

Guano Manure.—That the manures in present use, and the slovenly and expensive modes of applying them, are inefficient for the purposes required, no person, after reading the leading article in p. 19, can doubt; and I trust the time is not far distant when every agriculturist will coincide with the opinion there expressed. If individuals would but discard from their minds all prejudice, all dread of innovations being made on the old system, and discontinue those practices which they have hitherto adhered to merely because their forefathers did so, I feel confident one fair trial of guano, bone dust, nitrate of soda, and many other substances, would convince even the most sceptical that it is to their interest to continue the use of them, and that their lands never previously produced such heavy crops. Numerous experiments have been made on the guano, and the details given in various provincial papers by gentlemen who have no motive in misstating facts, and the result in every case appears to have been satisfactory. I can corroborate those statements in all essential particulars, and assert, that as a general fertiliser, and in the growth of Wheat, Barley, Oats, Hops, Turnips, Wurzel, and on grass lands, guano will be found one of the most valuable manures of modern introduction. Several of my acquaintance have tried it in the cultivation of Pines, Melons, Cucumbers, &c., and many florists' flowers, and all concur in giving it the highest character. The quantity used for the latter purposes was about a quarter of a pint of manure to one barrowful of common garden soil, but probably these proportions may be improved upon. From the experiments made, it would appear that two hundred weight of guano is sufficient for an acre of Wheat, Barley, or Oats. I am myself going to use guano in the cultivation of Dahlias, Carnations, Pinks, and Pansies, and shall forward the result in due season.—*C. K.*

The Treatment of the Mango.—When I first came to Walcot, the seat of the Earl of Powis, there was a fine stock of Mangoes, the largest plant that fruited annually being 15 feet high; and there were others which did not fruit so freely. In the spring of 1839 the large plant had eleven fine fruit, and there were also two fruit from a seedling raised from the large plant in 1832. The conservatory at Walcot was 400 feet long, from 30 to 40 wide, very lofty, and had no division in it, so that there was a great circulation of heated air. The temperature the Mango appeared to thrive best in was 60° Fahr., although it was often exposed to a much lower one, which did not affect the health of the plants. The conservatory was heated by steam in the following manner: the steam pipe passed through iron cisterns, and heated the water contained in them; and there were also brick cisterns, 2 feet wide, lined with cement to the depth of 3 feet, with a steam-pipe passing through water in them, which produced a pleasant vapour. These pipes were generally heated of an evening, after the hot days of summer, so that the conservatory was filled with vapour for hours together; and this, no doubt, contributed to the health of the tropical plants. The Mango does not require bottom heat; but the plants were here kept plunged in old tan to avoid any sudden changes of temperature or moisture to the roots, as they are soon injured, not being strong-rooting plants. The soil I used for them was well-rotted turf and leaf-mould in equal parts, with a little sand and rotten manure. The plants, when in a growing state, were watered with manure-water made from sheep-droppings. The spike of flower of the large Mango was 11 inches long, and the leaves were from 9 to 14 inches long; and the fruit would set very thick, but they always reduced gradually to two or three. I have seen 11 spikes of flowers on the large plant at the same time. Mangoes *will not bear pruning*, as they bleed after the operation. The fruiting plants were seedlings, as imported grafted Mangoes seldom produce any flowers, and are apt to fail. They wither in a day, without showing any previous signs of ill health, owing, I think, to a portion of the stock being in a decayed state where the scion was put, by which the circulation of the sap is obstructed. I believe the success with which the Mango was grown here may be attributed to the large conservatory, and the peculiar mode by which it was heated. The Mango was not the only tropical plant that fruited so well here, but many others did as well, among which were Coókia punctata, the Custard Apple, Guavas, Eugénia Jambos, and Granadilla.—*G. Bond.*

Root-pruning Vines.—As no one has complied with Mr. Duncan's request at p. 38 (1842), I beg to give you the result of my experience in root-pruning some old Vines that had been planted about forty years. As it was my intention to remove the whole of the old border, I had a trench, five feet deep and three feet wide, dug out at one end the entire length of the house; the mould was carefully thrown out with a fork, pegging the roots back as I proceeded, till I came to the front wall, which is two feet higher than the trench, which gives a good fall to the front drain. When the border was wholly removed, the roots of the Vines were tied together in old mats for two days, and kept constantly damp while the border was being filled up. When it was about half full, the roots were untied, and a few of the bottom ones were laid out and pruned; then a layer of mould about eight inches thick placed on them; then some more roots and mould, and so on, till the border was completed. The Vines partially lost their leaves, but produced a few lateral shoots afterwards. The operation was performed early in August, the Vines having been forced and the fruit all cut. A few small roots adhered to the foundation of the front wall of the house, which probably assisted them while making new ones. The house was kept close and damp for three weeks at least, and shaded in hot days. The Vines were pruned in the close-spurring method, and had not been cut down. The following year the Vines were not forced, and there was only a moderate crop; but some of the bunches were finer than I had ever seen them in the house before; and since that as fine crops have been produced as I could wish. Some of your readers will be alarmed at the depth of dry border; but after about eighteen inches of old bricks and a foot of faggots, there will be nothing to fear on a dry gravelly bottom; but I am rather in favour of moderately deep borders for early forcing, as the roots are not so likely to be affected by the alternations of the weather at an early season, when the solar heat has no power on them. I know places where as fine Grapes are grown as any in the country, where the borders are considerably deeper; but this depends on the situation.—*Vitis.*

Root-Pruning, and Fruit-Tree Borders.—The utility of root-pruning has been of late ably discussed in the *Chronicle*, and much light has been thrown on the subject; but no one with a knowledge of horticulture can think the plan new. I believe it to be at least a hundred years old. The late Mr. Beattie, gardener at Scone Palace, Perthshire, in 1811, cut the roots of Peach and Apricot trees, on a south wall, four hundred feet long, to within two and three feet of the stems; the result was satisfactory,—over-luxuriance was checked, and fruitfulness produced. Beattie acted on the principle of depriving the tree of the means of obtaining such a great quantity of sap, thereby preventing it from growing so freely, and of course inclining it to become fruitful. Nicol suggests the same expedient, in his "Forcing and Fruit Gardener," 4th edition, p. 240. So much for the originality of the system; that it is beneficial in many cases, no one will deny: I would suggest, in all cases practicable, the trees be lifted at the time the pruning of the root takes place; the operator will then see more clearly what he is doing. In large specimens, where this may be considered impracticable, cutting all round so many feet from the stem, and filling up with fresh soil, will check the vigour of the tree, and tend to the formation of fruit-buds. However plausible the doctrine, the system is founded on something radically wrong—namely, that of rich deep borders, and deep planting; instead of making borders from two to three feet deep, and that too with imperfect drainage, as is too generally done, let them be made one foot deep, on a bottom previously prepared, rendered solid by some combination of materials, it matters little of what, provided a hard bottom is obtained, with a fall of one inch in the foot from the wall to the walk, a drain to run parallel, at the extremity of the border, and, if the situation is wet, another about one foot from the wall, and cross ones at every fifteen or twenty feet. Instead of planting in the soil, spread the roots on the top of the border, and cover them from three to four inches; this will form a small mound round each tree: the roots will require protection from frost; some light litter is better for this than short dung, as the dung may tend to produce over-luxuriance, especially in young trees. If the trees are properly managed, I warrant little root-cutting will be required, and *rarely* will gum or canker make its appearance. A spade should not come within at least four feet of the stems; but break the surface of the soil, and this frequently, with a three-pronged fork: for the free admission of heat and air to the roots, this space of four feet should never have any dung, except as mulching, to protect from frost or drought. Supposing the generality of borders from ten to fourteen feet wide, this will leave from six to ten feet for cropping. But as the roots extend, care must be taken in digging not to injure them, as it invariably produces canker in the part cut, and also tends to the production of root-suckers. The surface cannot well be stirred too often, as pulverization is necessary for the improvement of all soils; in summer, by exposure of soil to the air, the particles are separated by the evaporation of the water in their interstices by heat; and by exposing a soil to the frosts of winter, the particles are separated, by the expansion of the water in the form of ice: adhesive soils are most improved by exposure to the atmosphere. A loose soil is also cooler in summer and warmer in winter than a solid surface, as the sun's rays act more powerfully on the hard surface; in loose soils the air is admitted among its particles, and confined there; and hence it becomes a non-conductor of heat, consequently warmer in winter and cooler in summer.—*J. Fish, Gardener to H. H. Oddie, Esq., Colney House, Barnet.*

Effects of Snow on Scotch Firs.—In p. 3 you have adverted to the importance of Arboriculture as a national source of wealth, and the correction of the improper practices that are still persisted in in the management of many of the plantations of this country. As you there invite your correspondents to assist you, I send you the following observations. One of the falls of snow which we had last month fell very gently upon the trees and shrubs in this part of the country, which gave them an unusual appearance; the Scotch firs in particular came in for a large share of it, and their strength was pretty well tried with the mantle in which they were enveloped. In a plantation about eight years old, where there is a considerable number of Scotch Firs, little or no damage was done; in another fifteen years old, a few Firs had their heads broken over, and some branches split off; in a third plantation, between thirty and forty years old, scores of Fir-trees were broken over, many of them half way down the stem; while the old solitary trees, about eighty and ninety years old, had scarcely any injury done them. There must be some reason why the old and the young trees remained unbroken, while those that may be considered in the prime of life suffered so much; perhaps the following explanation may account for it:—The plantation not being thinned in time, did not receive a sufficient share of solar influence to decompose the carbonic acid of vegetation, and of course had not sufficient carbon to strengthen the tissue of the timber. If this explanation be correct, we may learn that the quality of timber is much deteriorated when grown in a crowded state; for when a stress comes, it snaps asunder, while that which has had its full share of sunlight is enabled to resist a greater pressure.—*Peter Mackenzie, West Plean.*—[In addition to the cause assigned by our correspondent, we must assign the want of a sufficient quantity of earthy matter to solidify the wood, and the imperfect decomposition of water, the only source of hydrogen so necessary to resinous trees.]

Substitutes for Turf and Box Edgings.—"G. G." recommends bricks set on edge, and stone as edgings, for borders, and he also advises that they should be limewashed every season. One great advantage of such an edging, he says, is the few slugs it will harbour. [The objection to this mode of edging is its ugliness.]

Gardeners and Masters.—Among other grievances which gardeners are subject to, is their being prevented from exhibiting at Horticultural Shows. It often arises from the gentlemen thinking that the labour bestowed is wasted, and the time spent in attending the show lost, forgetting that these exhibitions have acted as stimulants in exciting gardeners to activity, as is shewn by the improvement that has taken place in garden produce. Important as this result is, another more gratifying still has been effected; it is an improvement in the moral habits of gardeners and cottagers. With this evidence, what reason can a gentleman advance for prohibiting his sober and industrious servant from attending and exhibiting at shows, and partly or entirely paying his expenses, receiving in return, as he does, the new information acquired by the gardener? The following will show the extent to which these prohibitions are sometimes carried: —I had an interview with a gentleman who discharged his last gardener at an hour's notice without a character, and he deserved such treatment, as the place bore evidence of is unworthiness. My character went through the severest test and proved satisfactory. In due time I asked permission to exhibit, and the reply was—"No, my last gardener behaved so badly that I cannot think of allowing such a thing—you may go to see the show on these conditions: That you must not exhibit anything, you must defray all your own expenses, and sacrifice as little of my time as possible." Now gardeners cannot afford to go 20 miles to see Horticultural Shows and to pay the entrance-money; but the latter would be required if he took a dish of fruit worthy of being placed on the table for competition; if successful, it would hardly cover his day's expenditure.—*D. P.* [No entrance-money is paid at the exhibitions of the Horticultural Society of London.]

On Ripening Potatoes.—I found my late Potatoes, such as Yorkshire Kidneys and Devonshire Reds, which generally come to table at this season, of very indifferent quality. With the greatest care they boiled to watery pulp, and were deficient in flavour; it occurred to me that this was owing to their not being ripened properly; I, therefore, had some taken from the Potato cellar, and placed in a warm kitchen near the fire; others in bags, near one of Arnott's stoves; in the course of a week their quality was entirely changed—they now boil well to their usual flowery consistence, and their flavour is quite equal to those of favourable seasons.—*R.*

Club in Broccoli.—I have attempted to cure the club in Broccoli with lime, but have not succeeded; but the following plan has anwered better. Previously to planting my Broccoli, I make with a dibber large holes, which I fill up with finely-chopped dung; and to compare the effect, I also had a row of limed holes. The plants in the former are less affected by club and much finer than those in the latter.—*W. Taylor, Gardener to J. Coster, Esq., Streatham.*

Gesnera elongata.—On reading some observations by "C. D." at p. 21 (1842), on Gesnera elongata, I was struck with its being a greenhouse plant, as I have frequently seen it fine in a stove; but as "C. D." keeps his greenhouse at from 50° to 55° in the autumn and winter months, I should like to know what plants he subjects to this temperature, and whether they are healthy. I find most greenhouse kinds, such as Pimeleas, Pultenæas, Ericas, Kennedyas, and even Pelargoniums, thrive well where the temperature is about 38°, and in autumn and winter in my greenhouse it never exceeds 44°. Last season I had three fine plants of Gesnera elongata in a vinery; at the end of August they were treated as greenhouse plants, and in September they began to flower, but not having a stove they remained in the greenhouse, and by the 1st of January they became unsightly; the flowers were pale and the leaves so spotted and rusty, that I found it necessary to cut them over and place them in the vinery; so that, as a greenhouse plant, except we are to understand that a greenhouse requires a temperature of 50° or 55°, the Gesnera elongata will be useless.—*T. W.*

Lost Cherry.—The Paramdam Cherry (not Baramdam) grows, or did grow twenty years ago, at Rauceby (on the Paramdam farm), a village about three miles from Sleaford, on the way to Grantham. It was highly esteemed. The general impression was that it would not succeed in any other place.—*O. W., Feb.* 8.

Sálvia patens.—Many papers have appeared in the *Gardeners' Chronicle* on the culture of Sálvia patens, but in none has the method been described which I practise yearly with success. In the autumn I dig up my roots with the Dahlias, and after drying them they are stored away in some dry and cool shed or cellar sufficiently warm to keep them from freezing; and they must be occasionally examined. About the middle of February (or earlier if required), I take a few roots to the Vinery, or some other house where a moderate temperature is maintained, and start them before potting, in the same way as is generally practised with Dahlias. In the course of a fortnight, the buds or crowns will be advanced from ½ to 1 inch in length. I then divide the roots into as many parts as there are young shoots, leaving one or more tubers to each. I pot them in moderately rich soil, and shift those to remain in pots as they require it, pinching the bloom from a portion of them as it appears, to insure a succession. I find this method to answer much better than striking cuttings, unless for a few late plants, it being certain of success; and good plants are made by the time cuttings would be fit to pot off.—*A Constant Reader.*

Gardeners' Advertisements.—Nothing can well be more injudicious than the manner in which some of the gardeners who advertise for situations draw up their account of themselves; and I think it would be a real benefit to the advertisers if you would give insertion to this letter. One man points out the place of his birth, as if that could have anything to do with his qualifications as a gardener; another refers you to the number of prizes he has taken in a given period at some exhibitions, omitting to say how much his prize-winning depended on the weight of his master's purse. It is well known that ever since horticultural exhibitions (I take them in general) have had existence, the prizes have seldom been awarded to merit, as far as plants are concerned; for everything new, and consequently high-priced, is sure to be favoured with the leading prizes (see note at end), so that the gardener who has been lucky enough to meet with a master of unlimited means and a lover of plants may walk over the course with little interruption. I was somewhat startled the other day at an advertisement of a Mr. Somebody who calls himself a first-rate gardener, and who is surely a conjuror in Grape-growing; for he says he "will undertake to get a crop of Grapes in 15 months from the time of planting young Vines." I would beg to ask this gardener, who says that he "can be highly recommended by the first horticulturists of the day," what quantity of Grapes he considers a crop for a single Vine, and what age his Vines are which he calls young. We all know that Grapes may be produced from Vines raised from single eyes in 15 months; but would any experienced gardener allow his permanent Vines to bear a crop of fruit in that short period after planting? Surely there are none of my acquaintance that would do so. Such advertisements as this are calculated to do mischief; they create discontent and disturb the good feeling which ought to exist between gentlemen and their gardeners, the more especially amongst those who are just commencing with young vineries, and who may not wish to spoil their Vines by letting them bear a crop of Grapes at 15 months.—*W. S.*—[We have nothing to do with the statements made by advertisers; and we agree with this writer, that those from gardeners are often injudiciously drawn up. All that a sensible gardener in want of a place has to do, is to name the wages he expects (which is never done, but which is essential if he hopes for an answer to his advertisements), to mention his age, whether or not he is married, the number of children in the latter case, and to describe the kind of places he has lived in and can take charge of. No doubt places are obtained by advertisements in which these points are not attended to; but gardeners may depend upon it, they would be far more successful if they would take our advice. There is every week a great many of the readers of such a Paper as this who want gardeners, and who would gladly communicate with advertisers, but who will not take the trouble of writing to persons who do not say whether they expect 15 or 50 shillings a week. With respect to what "W. S." says about prizes being given for rare plants without regard to good cultivation, we beg he will observe that this custom is in direct opposition to the practice of the Horticultural Society of London.]

PROCEEDINGS OF SOCIETIES.

AGRICULTURAL SOCIETY.

Feb. 16th.—The Duke of Richmond in the chair. Twenty-eight gentlemen were elected.—Mr. Pusey, M.P., gave notice that he should move, at the next monthly council, the adoption of certain regulations in reference to the particular conditions under which implements and machines should be exhibited at the meeting at Bristol, and be qualified to obtain any prizes which the judges might award to them on that occasion. Mr. Dean submitted to the council the various plans and specifications for the erection of the dining pavilion, and the enclosure of the show-yards for stock and implements, at Bristol, prepared, agreeably with the instructions of the general Bristol committee, for the inspection of builders and such other contractors as were disposed to tender for the works.—The council directed that the house committee, appointed to report on a suitable residence for the society, should hold its first meeting on Feb. 24.—Mr. Hobbs presented a copy of the rules and regulations of the East Essex Agricultural Society; Mr. C. Howard, a copy of the 4th Number of the Transactions of the Yorkshire Agricultural Society, and of the prize-sheet for the meeting of the Society at York, in August 1842; the Statistical Society, the last part of their Journal; Mr. C. Johnson, the 6th Part of the Farmer's Encyclopædia; and M. Jeppe, his printed Report on the exhibition of Wool at the Doberan meeting of German agriculturists last autumn.

BOTANICAL SOCIETY OF EDINBURGH.

This Society held its fourth monthly meeting for the season on Thursday last—Prof. Graham in the chair. Donations to the library were presented from Dr. Johnston, Berwick-on-Tweed, and the Leeds Philosophical Society; and parcels of plants were announced from the Marchioness Cornwallis, and nine other non-resident members. A letter was read from Sir J. Graham, communicating the presentation of the Society's address to the Queen on the occasion of the birth of the Prince of Wales, and stating that the same had been very graciously received by her Majesty. The following papers were read:—

1. Notices of several Vegetable Monstrosities, with specimens. Transmitted by Mr. H. C. Watson and others.—Some of these monstrosities were very interesting, particularly a Geránium (pusillum?) having the branches terminated by heads or umbels of flowers, through adhesions and excess of parts, the petals being mostly green or obsolete, and the stamens imperfect; Anthriscus sylvestris, with the umbels proliferous, which was gathered in the wet autumn of 1839; Linária repens, varieties growing together, and showing a gradual approach to L. vulgaris; Anemone nemorosa, having the pistils changed to leaves; and Gálium aparine, presenting a remarkable *lusus naturæ*, probably caused by insects, the quadrangular stem being twisted, so that the stellate leaves have become secund.

2. Mr. Goodsir described the Sarcínula ventriculi, a new vegetable infusorial, allied to the genus Gónium, which he had found existing in immense numbers in the fluid ejected for many weeks from the stomach of a patient labouring under a particular form of indigestion. This fluid was ejected in large quantities at a time, and had an appearance similar to that of liquor in a state of fermentation. The plant is microscopic, of a square form, and having the parts arranged in a beautifully symmetrical manner in the square. The number of cells of which the plant consists is 64. It propagates by the division of each of these 64 cells into four new ones, so as to consist of 256 cells—and simultaneously with this increase in the number of parts, divides spontaneously into four young plants. The author adverted to the extremely rapid increase of the plant by such a mode of propagation; and after some observations on the nature of the disease in which it occurred, and of which it probably constituted the cause, he concluded with remarks on the genera of plants and animals to which the new plant is allied.

3. On Prímula veris and allied species. By the Rev. J. E. Leefe.—Mr. Leefe, after remarking that P. inflata Lehm. approaches very near to P. veris, says, "In the woods at Audley End, Essex, I find a good deal of what is commonly known as P. elátior intermixed, but sparingly, with Primroses and Cowslips. It agrees with the character of P. elátior Jacq., as defined by Koch, but not with the figure in English Botany. The calyx teeth are more ovate at the base, and the leaves are those of a cowslip—indeed, the teeth are almost of precisely the same form as those of the P. inflata before alluded to. The limb of the corolla is, however, equal in breadth to more than half of the tube, and is flat, or nearly so."—Prof. Henslow writes on this subject:—"With respect to the three common Primulæ, I consider that no argument can be derived from their keeping distinct, in nature or under culture. It is purely a physiological question, whether all of them may not originate from the seeds of any one—a question which can only be decided by direct experiment. Let a Cowslip be highly manured, and its seeds sown in a shady, moist aspect, and I suspect the chances are in favour of some of them coming up as Primroses, or at least as Oxlips. I have had several independent testimonies to the fact of Cowslip roots changing to Primroses; and until proof, by direct experiment, contradict the experiments of Mr. Herbert and myself, I cannot help believing that the three species (as they are thought) and the Polyanthus, are merely races of one species."

4. On certain Fungi found near Audley End, Essex, &c. By the Rev. J. E. Leefe.

5. Notice of additions to the Flora of Aberdeen. By Mr. G. Dickie, Lecturer on Botany, King's College, Aberdeen.—These papers, though important to the society, do not present so much of interest for the general reader.

6. On the varieties of Dryas octopétala, by Mr. C. C. Babington, M.A., F.L.S., F.G.S., &c.—The characters distinguishing these are the proportional length and form of the sepals, the form of the base of the calyx, the form of the leaves, and the pubescence of the petioles. Two of these varieties are apparently confined to Ireland, where Mr. Mackay first noticed the differences existing among plants of this species; and the third is commonly found in Alpine situations in England, Scotland, and on the continent of Europe. The latter being the best known form, may be considered as the type of the species, and in it the sepals are acute, and three or four times as long as broad, the base of the calyx being hemispherical; in β the calyx is very nearly the same, being only less acute; but in γ the sepals are scarcely twice as long as broad, and very blunt, and the base of the calyx is truncated in a very remarkable manner.

MISCELLANEOUS.

Horticultural Society of Bath.—We learn from the *Bath Herald* that the two Bath Horticultural Societies have been united; the negotiations which have for some time been pending between the two committees having been brought to a close, and all sources of disagreement removed. In a few days the necessary preliminary arrangements will be completed, when the united committee will enter with vigour on the duties of their office. The horticultural shows of this city, although divided, would not suffer by comparison with those of other places; and now that the entire horticultural strength of the neighbourhood will be concentrated into one focus, we look forward to great results.

Wiers.—Mr. Brinsden, a civil engineer of Ballinasloe, has invented an ingenious contrivance for preventing the water of rivers, stopped by wiers, from overflowing and injuring the adjoining property. His remedy is a self-acting valve, with two arms of unequal length, which are alternately opened or closed, according to the quantity of water that impinges upon them.

Cardoons.—This excellent vegetable is well known in France, but hardly cultivated here. As nothing can be easier than its treatment in the garden, it is to be supposed that the cause of its neglect is the difficulty of managing it in the kitchen. When a Cardoon is to be cooked, its heart, and the solid, not piped, stalks of the leaves are to be cut into pieces, about six inches long, and boiled like any other vegetable in pure water, not salt and water, till they are tender. They are then to be carefully deprived of the slime and strings which will be found to cover them; and having thus been thoroughly cleaned, are to be plunged in cold water, where they must remain till they are wanted for the table; they are then taken out and heated with white sauce, marrow, or any other of the adjuncts recommended in cookery-books. The process just described is for the purpose of rendering them white, and depriving them of a bitterness which is peculiar to them; if neglected, the Cardoons will be black, not white, as well as disagreeable.

GARDEN MEMORANDA.

W. H. Story's, Esq., Heddon House, Isleworth.—There is here a most excellent frame for keeping Auriculas and other florists' flowers which are liable to suffer from damp in winter. It has hinged shutters along the front and back, which can be opened at pleasure. The ends below the level of the stage have also ventilators of the same description, so that a perfect circulation of air can be commanded at all times both among the plants and the pots. There is also a good contrivance to protect choice out-door flowers from slugs and snails, which consists in having a zinc gutter carried round the bed, and kept constantly full of water. They may get over a galvanic band, but this, one would think, they dare not cross. The most attractive part of this garden is two well-constructed span-roofed greenhouses filled with Heaths, Epacrises, and other hard-wooded plants. One of them contains several hundred seedling Heaths, all in the highest possible state of health, which when in flower will be extremely interesting. The other is filled with fine specimens of named Heaths, Epacrises, and many seedlings from Epacris grandiflora, and others of much interest. Several of the latter are in flower, and also a fine plant of Chorozema cordatum. There are two other houses, one of which is used for raising seedlings, striking cuttings, and other propagating purposes. Mr. Story knows the value of rain-water, and has excellent slate-tanks fixed below his stages to receive it from the roof. Slate is also used for various other purposes in his garden, one of which is to try what effects will be produced upon hard-wooded greenhouse plants, such as Heaths, by growing them in slate-pots.—*R. F., Feb.* 11.

Chatsworth.—In the Orchidaceous house numerous specimens are in fine flower, the most conspicuous being some splendid Dendróbiums—a plant of D. cærulescens having upwards of 460 expanded flowers, some single stems producing thirty blossoms; we never saw anything more beautiful. On a plant of Dendrobium nóbile growing in a 12-inch pot, there are 170 flowers open. D. Wallichiana is also in fine bloom; it resembling D. nóbile closely in the shape of its flower, but is much deeper coloured, approaching nearer to cærulescens in this respect. The largest plant of D. speciosum in the country is here, and is now flowering with six spikes, each measuring about 22 inches long. D. densiflorum has 14 spikes, each containing above 30 of rich orange yellow flowers, and is perfectly dazzling when looked at. A large plant of D. moniliforme is covered with beautiful delicate pink blossoms. Stanhópea Wárdii, suspended in a wire basket, has protruded through its bottom a spike of nine large flowers. The noble Angræcum ebúrneum has had a number of its ivory-looking flowers open for several weeks; but the most astonishing blossoms for duration are those of the lovely Phalænopsis amábilis, nine of which have been expanded since the middle of November, and are now very little faded; the flower-stem has since then elongated beyond the flowers, upon which new buds are formed to supply their place. Oncídium Cavendíshii is in fine flower; also several pretty Cœlógynes: barbata has six strong spikes; interrupta has pretty white blossoms delicately marked with yellow; Gardneriana, has pendulous flowers almost hiding the pot: Acanthophíppium striatum, has 14 flowers; Cymbídium Gibsónii is flowering most profusely; Rodriguézia crispa, although its pale green flowers are not very handsome, its powerful and delicious fragrance makes it deserving especial notice. The pretty Leptotes bícolor, Epidendrum Skinnerii, Oncídium pubes, Dendróbium Pierárdii in wreaths of flowers; Miltonia Russelliana, Zygopetalons, and some others, combine to make this house exceedingly interesting and gay. Several hybrid Rhododendrons are in flower, but all are eclipsed by a large plant of altáclerense, with 50 fine trusses of bloom. In the Orangery there are two large trees of White Camellia, with some hundreds of flowers. There are not many flowers in the great stove; but a peculiarly interesting object is a fine plant of *Poinséttia pulchérrima*, having large bunches of beautiful scarlet bracts upon 30 of its terminal points. *Abútilon striatum* has made growths the last season 13 feet long, and these have made side branches bearing a profusion of pretty, graceful flowers. A large tree of *Sparmánnia africana* is covered with bloom; and *Euphórbia fulgens*, which has grown very strong, has its last growths wreathed with scarlet flowers. That beautiful Palm, *Elate sylvestris*, is in flower, and several are making new tiers of leaves; and from the appearance of most things planted out, the next growing season may be expected to show the astonishing rapidity of growth which many tropical plants possess.—*X*.

Review.

Journal of the Royal Agricultural Society. Vol. II. Part III. Murray.

This Number contains eleven original articles, all well deserving an attentive perusal. Those on Drainage of Land, by Mr. Burke; on Guano, by Professor Johnston; on the Turnip Saw-Fly, by Mr. Curtis; and on the Improvement of Peat Soils, by Mr. Cuthbert Johnson, are of most general interest. There is also an essay on Cottage Gardening, by Mr. Jas. Main, containing some good general advice as to the management of Cottage Gardens.

The following extracts will interest our readers. In the paper on Draining, Mr. Burke names the following instances of improvement effected by that means:—

"One of these, lately published, contains the particulars of a purchase made by Mr. Denison, of Kilnwick Percy, of about 400 acres of rabbit-warren, of an apparently sterile sand, with a heavy ferruginous subsoil, the hills covered with heather, and the hollows a bed of marshy aquatic plants. The cultivation had been abandoned, as it was found, though pared and burnt, not to produce more than 3 quarters an acre of oats, and the land was let at 2*s*. 6*d*. the acre. Mr. Denison then subsoil-ploughed a portion of it, and tile-drained it with soles at every 12 yards apart, at the cost of 5*l*. 4*s*. 8*d*. the acre, exclusive of the carriage of the tiles from the manufactory. The land, being afterwards manured in the common way, has produced 10½ qrs. per acre of Tartarian Oats, which fetched 26*s*. per qr., and now bears Wheat and Oats on a property which was previously considered useless. In the same publication it is also stated, that some land belonging to the Rev. Mr. Croft, of Hutten Bushel, which was not thought worth 5*s*. an acre, is now let at a guinea; 'evidently from the effect of the drainage by the breaking up of the Moor-Pan.' Sir Jas. Graham likewise mentions his having recently let a farm at 20*s*. an acre, after its having been subsoil-ploughed and drained, which had been valued before the operation took place at 4*s*. 6*d*. per acre. The cost of this improvement was 6*l*. 18*s*. 4*d*. I have moreover the authority of the Marquis of Tweeddale for stating, that the increased product of his home farm, at Yester, in Scotland, has been nearly two-thirds on most of the crops, and in some cases much more, upon all the land which has been subsoil-ploughed and drained. One field, indeed, which his Lordship declares to have formerly carried only 17 bushels of Oats per acre, has given 67 bushels of Barley, after having been trench-ploughed and drained."

And in another case 467 acres belonging to Lord Hatherton, in Staffordshire, have been increased in annual value to the amount of 1013*l*. 2*s*. 4*d*., by skilful drainage. The particulars of several of these improvements are given.

Prof. Johnston recommends the following mixture as an equivalent for guano manure:—

"We have seen that this substance is a mixture of various chemical compounds. It is a natural mixture; but an artificial mixture may be made which shall more or less completely imitate it. What would such a mixture cost at the present price of the several ingredients of which it consists? The phosphate of lime it contains exists abundantly in bones: the ammonia may be applied either in the form of sulphate of ammonia or of sal ammoniac, both of which are low in price: the common salt and sulphate of soda can be obtained at little cost; and the urea, being so small in quantity, may be either neglected altogether, or may be replaced by a little dried urine or night-soil (Poitevin's manure). A mixture of this kind, equal in virtue to 4 cwt. of guano, would cost as follows:—

315 lbs. or 7 bushels of bone-dust, at 2*s*. 9d.	£0	19	3
100 lbs. of sulphate of ammonia, containing 34 lbs. of ammonia, ...	0	15	0
5 lbs. of pearlash, ...	0	0	10
100 lbs. of common salt, ...	0	2	0
10 lbs. of dry sulphate of soda, . . .	0	0	10
530 lbs., equal to 4 cwt. of guano,	£1	17	11

"To these it might be advisable to add 100 lbs. of chalk to aid in gradually converting the sulphate of ammonia into carbonate, in which state it may possibly be more immediately active upon the plant."

Mr. Curtis's paper on the Turnip Saw-fly is very interesting, and is illustrated by an excellent plate. The following is a summary of the remedies that have been employed for the destruction of its caterpillars:—

"Rooks and swallows are very serviceable in thinning their ranks, the former feeding on the caterpillars, the latter upon the saw-flies. The caterpillars seem to be nearly free from parasitic enemies. The strewing of quicklime, coal-ashes, and soot has been attended with various success, and generally with beneficial results. Repeated rolling has killed and checked the caterpillars; but its effects are partial. Hoeing an attacked crop is the most fatal experiment, until all the caterpillars have disappeared. Drawing a cart-rope over the turnips to shake off the caterpillars has proved more or less effective, most so when a brush made of elder-boughs has been fastened to it. An axletree with wheels, the former armed with green furze, drawn along the rows, wounds and destroys the larvæ, as will also a bushed hurdle. Brushing the larvæ off with live twigs and stamping upon them, a man following with a scuffler, has cleared a field of the larvæ. A trench judiciously cut will often preserve a portion of a field, or an adjoining one. Hand-picking, when the larvæ are not excessively abundant, may be depended upon as a certain remedy; and when in great numbers, they may be brushed into sieves. Pigs will destroy the black caterpillars. Ducks and poultry will devour them with avidity; and this seems to be the most easy and effectual method of extirpating the black caterpillars: the birds may either be carried or driven into the field, according to the distance. Sheep driven over fields infested with the caterpillar have done essential service."

Mr. Cuthbert Johnson's prize essay on the improvement of Peat-soils is full of excellent practical advice. How just are the following remarks!—

"The most common delusion in which the possessors of peat-soils are apt to indulge is the belief in the possibility of rendering them permanently productive without either previous drainage or the application of earth. The melancholy attempts of this kind which I have witnessed on the peat-land of various parts of England, especially in timber-planting, can only excite the pity of those who witness the effects of such misspent time and money. The young trees too, which are most commonly employed in these ill-judged attempts, are usually of the Fir tribe, precisely the kind the least adapted to prosper in a bog of water and peat. Common reflection would suggest that if any kind of trees could be expected to vegetate with even moderate vigour in soils such as these, composed as they are often of merely a mass of hard, inert vegetable matters, saturated with a weak solution of green vitriol—if any kind of plantations would progress, it would be the Alder, the Willow tribe, or the Hardy Birch-trees, tenacious of life, which can endure more moisture and subsist on poorer soils than most other plants. After the slightest consideration, we should hardly decide upon placing on such swamps trees which delight in dry upland slopes, as the Scotch Fir and the Larch; yet we can hardly traverse a single line of railway, driven as their constructors have too often been to take for their line of country the most trembling, dangerous bogs, the most worthless heaths, without being struck with the ludicrous appearances of bright yellow-topped larches and ragged sickly-looking Scotch Firs, soaking in bog-water—and that too not in mere patches, but over hundreds of acres. I do not confine these observations to the north of England—to Lancashire and Yorkshire—but the remark 'applies to many of the southern counties: for instance, by the road-side between Wareham and Poole, in Dorsetshire, may be seen similar wet peaty heath plantations of Scotch Firs."

Drainage and the application of well-burnt lime are what Mr. Johnson more especially recommends; not, however, slight surface-draining, which does little good, but deep efficient channels which completely clear of water the land where the roots of plants are found.

"For it is not, let me again remind the farmer, the mere presence of too much water which renders the peat-moss sterile, but the noxious, astringent, irony quality of that water. Some of the richest water-meadows of the valleys of the Kennett and the Itchen, in Berkshire and Hampshire, are formed on a deep stratum of peat, merely covered with a shallow dressing of chalk mixed with bog-earth; and these are periodically flooded and kept for many days soaking in the bright rapid waters of the Kennett and the Itchen: but then the excellent managers of those prolific meadows take especial care that no stagnant mineral waters shall be allowed to corrode the extreme roots of their grasses; deep drains and lands laid in elevated ridges carry off all these, and keep the surface-soil clear of the red oxide of iron and green vitriol, which are sure to accumulate in situations where chalk mixed with iron pyrites exists in the immediate neighbourhood. It is only necessary to observe the bright, irony, rusty incrustations of the deepest drains of many of these celebrated meads to be convinced of the nature of the mineral substance against which their skilful owners are so sedulously and successfully guarding.

"The first operation after the water has been drained off is to break up as deeply as possible, by the common and the subsoil ploughs, the surface of the peat; and then, if good well-burnt lime can be procured, there is no earthy addition so rapid and so powerful in dissolving and rendering pliable the peat as this. A few ploughings, assisting the combined operations of the atmosphere and the lime, will in a few weeks bring the soil into such a state as to enable it to bear a first crop. The quantity of lime should be about 250 or 300 bushels per acre; but the quantity of necessity must vary with the readiness with which the lime is procurable: where it is very expensive, the cultivator is obliged either to reduce the quantity or mix it thoroughly with a proportion of clay or marl before he spreads it over the surface of the peat. Where limestone is to be obtained in the immediate neighbourhood, and other fuel is not to be readily procured, peat may be employed in many cases in the process of lime-burning without much difficulty, it chiefly requiring that the peat should be thoroughly dried previous to its being used. For a first crop on the thus so far reclaimed peat-soils I have found no other crop equal to Potatoes. These are best planted in ridges: the horse hoe-plough can then be easily kept at work, which not only considerably promotes the decomposition of the peat, by facilitating the introduction of the moisture and gases of the atmosphere, but this very operation adds very materially to the vigour and produce of this valuable root, than which no other plant more delights in fresh soils, such as that produced by well-drained fresh earth-dressed peaty lands."

Mr. Cuthbert Johnson's paper is followed by another excellent communication on the same subject, by Mr. Pusey; but our limits forbid our doing more than recommending it to the attentive study of all practical men.

CALENDAR OF OPERATIONS *for the ensuing Week.*

The time for a general repotting of stove and other permanent pot-plants being now at hand, it may be useful to draw attention to some points connected with that operation, upon which the well-doing of the plants is in a considerable degree dependent, but which in the hurry of business are liable to be overlooked. 1st: The pots to be used ought to be made quite clean. 2d: Effectual means must be provided, by efficient drainage, for the ready escape of superfluous water; this is of great importance. 3d: The compost must on no account be wet when used. If so clammy that its particles adhere closely together upon moderate pressure in the hand, it is not in a fit state for plants to grow in. 4th: Whenever practicable, let the compost be rough and lumpy. 5th: Give water to the plants the day previously to potting, and not immediately afterwards, unless they have a large surface of foliage, or the roots have been much reduced. 6th: If possible, pot growing plants in dull weather, or keep them in the shade for a few days afterwards.

KITCHEN-GARDEN AND ORCHARD.

In door Department.

Pinery.—Do not much exceed a night temperature of 60° for fruiting plants that are not wanted to show sooner than April or May. Fruit in all stages may be kept at 70° by fire, and 15° or 20° higher by sun heat, with a humid atmosphere. These should have a steady bottom-heat of 90° or 95°. If higher, draw the bark away from the pots.

Vinery.—If the roots of the vines that have set their fruit are inside the house, they will require occasional supplies of water, especially near the heating apparatus. Rain-water collected into a tank in the house should be used for this purpose; on no account give cold hard water. When the long-rod system of training is adopted, the shoots intended for next year's bearing-wood must be allowed to extend themselves, only stopping all laterals and cutting off the tendrils as soon as they appear.

Peach-house.—Where many more fruit are set and swelling than will be wanted for a crop, a portion of the superabundance should be destroyed at once, and not suffered to exhaust the tree by living upon it till after they are stoned, then to be pulled off; it is better, however, to leave a few extra as a provision against contingencies. Give air early on fine days, but always close soon in the afternoon.

Cherry-house.—Follow the directions given last week.

Fig-house.—Gradually increase the temperature from 55° to 60°, with a liberal supply of air in fine weather, and do not neglect syringing.

Cucumbers and Melons.—Keep the plants stopped till they throw out four strong shoots, one of which is to be trained towards each corner of the light they are under. Continue adding proper soil to the hills, a little at a time, as the roots make their appearance on the outside. Pot off young plants before they become weak and spindly, and keep them near the glass. The Masulipatam Melon, although very good for an early crop, is not a showy fruit; therefore some larger variety, such as the Beechwood, should now be sown.

Mushrooms.—Where horse-drippings are scarce, the half-spent material of an old Asparagus bed may be used as a substitute, if some well-prepared doppings can be procured for a surface layer. Turfy loam chopped up and mixed with the droppings is said to induce the spawn to run more freely. Frequently steam the house, which will in a great degree supersede the watering of the beds.

Potatoes that are planted out will be strengthened by exposure to light and air at all suitable times.

Cauliflowers, Radishes, and Carrots, growing under glass, should also be freely exposed, and not suffered to crowd each other.

Succory.—House another crop in some dark place. This is an exceedingly useful substitute for blanched Endive and Lettuce in salads.

Out-door Department.

Peas.—Should the weather be tolerably fine, and the ground not too wet, those first sown in boxes or pots may be planted out across a south border. Branches of green Fir used in the way of sticks will be a great protection to them afterwards. Likewise transplant forwarded Beans.

Lettuce.—The autumn-sown plants, whether in frames or the open ground, may now be transplanted, leaving every alternate one to come in for early use. Plant a few at the foot of a south wall.

Welsh Onions should be sown, to be drawn for salading. Also plant Potatoe-Onions, if such are used.

Horse-Radish.—Make a new plantation in trenched ground. The top part of the root, divested of the crown, makes the best sets, which should be planted deeply and covered with light soil.

Asparagus.—If not done in winter, the ground must immediately be prepared upon which it is purposed to make a new plantation. Trench three feet deep at least, and mix a large quantity of good dung with every digging. Bones, and other nutritive substances which decay slowly, will be very beneficial; and if the ground is heavy, a good portion of sand ought to be added. Asparagus being a durable plant, and not a mere summer crop, a little extra expense in the preparation of the ground will be amply repaid by its future productiveness; for its quality, from "sprue" up to "Grayson's giant," essentially depends upon the soil it grows in.

Orchard.—Pruning of every kind ought now to be finished. Dig between the rows of Strawberries, and top-dress with rotten manure if they appear to be wearing out: this, however, is an unprofitable system, and might be prevented by making a plantation every year, and destroying a portion of the old beds. After gathering the forced fruit, the plants should be put out in rows, and they will bear abundantly the following year.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

Stove.—Seeds imported during the winter, or saved from the plants last year, must now be sown; do not give them very much water at first, particularly the imported kinds which are not in good order. Continue the propagation by cuttings, as also the potting and dressing recommended last week. Use means to eradicate insects, particularly the red-spider.

Greenhouse and Conservatory.—Pelargoniums should be gently syringed now and then on fine days; and those which have some time since received their final shift may have manure-water once a week. Forced Camellias that have begun to make wood ought not to be checked, but encouraged to complete their growth, for which purpose a Vinery in action is well suited. The present is a good time for propagating the best varieties by inarching or grafting.

Pits and Frames.—Be careful to keep forced flowers clear of aphides, for which purpose it will be advisable to fumigate the forcing-house moderately once a week or ten days. In introducing plants for a succession, bear in mind that they will now come into bloom in considerably less time than those of the same kinds which were forced in January. Deutzia scabra forces well, and is highly ornamental. The Persian Cyclamen, also, is one of the prettiest plants in cultivation, and a little extra heat will cause it to blossom early. Divide and pot Lobelias. If intended to make large plants, put one sucker only into a small pot, and place them in heat. Take off and pot Dahlia cuttings before they grow too long. Sweet Peas, Convolvulus major, and Tropæolum aduncum may be sown in pots and forwarded a little before they are planted out. Do not suffer water to stand in the hearts of the best Auriculas.

Out-door Department.

If Gladiolus roots have been kept out of the ground, they had better now be planted; but the best mode of treatment is to let them remain in the beds all winter if the soil is not wet, protecting them from frost by a covering of rotten leaves. Ranunculuses to flower late should now be planted. The planting and pruning of shrubs had better be completed as soon as possible; also the laying of turf. Protected shrubs may now be partially uncovered.

NURSERY AND FOREST DEPARTMENT.

NURSERY.—As a week sooner or later is not of great consequence in the sowing of seeds of arborescent plants, it will be advisable first to get the principal part of the transplanting over, for the reason given last week. Make a bed of peat-earth, or where that is not accessible, of sandy-loam and leaf-mould, for seedling Rhododendrons and Azaleas. These, with the Holly-leaved Berberry, ought to be largely propagated.

FOREST AND COPPICE WOODS.—Persevere in planting, but only on heavy land. Old hedges may be plashed, and new ones planted. Finish the cutting of coppice-wood as speedily as possible.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending Feb. 24, 1842, as observed at the Horticultural Garden, Chiswick.

Feb.		Barometer.		Thermometer.			Wind.	Rain.
		Max.	Min.	Max.	Min.	Mean.		
Friday	18	30.367	30.316	47	24	35.5	N.W.

The highest temperature during the above period occurred on the 27th Feb., in 1828—thermometer 60°; and the lowest on the 5th March, 1840—thermometer 19°.

REPORT ON COVENT GARDEN MARKET,

For the Week ending February 25, 1842.

LITTLE difference has occurred since our last Report; the supplies of most articles have been well kept up, and many of the samples have improved. Trade has been rather dull.—*Fruit*. Pines are not very plentiful, and the prices have somewhat advanced. Apples have not changed since the last Report. Good samples of Easter Beurré and Beurré Rance Pears are tolerably abundant. Pummeloes and Shaddocks are plentiful, and remain at the prices quoted in our last.—*Vegetables.* Cabbages and Savoys are plentiful and pretty good. The supply of Broccoli has increased, and the quality has improved. Kidney Beans still continue scarce. Asparagus and Seakale have become more abundant, and the quality is generally good. Excellent Rhubarb abounds; Myatt's Victoria commands rather a higher price than the common. Mushrooms are not very plentiful.—*Flowers.* Among the cut flowers this week we noticed beautiful specimens of Amaryllis psittacina, and reticulata, and many forced Roses and Pelargoniums.

PRICES, SATURDAY, FEB. 26, 1842.—FRUITS:—

Apples, Kitchen, per bushel, 3*s* to 7*s*
— Dessert, per bushel, 5*s* to 14*s*
Pears, dessert, per half-sieve, 3*s* to 16*s*
Pine Apple, per lb. 8*s* to 12*s*
Cucumbers, per brace, 6*s* to 12*s*
Grapes, Spanish, per lb., 1*s* to 2*s*
— Portugal, per lb., 1*s* to 5*s*
Oranges, per doz., 9*d* to 2*s*
— per 100, 3*s* to 14*s*
— Bitter, per 100, 7*s* to 16*s*
Lemons, per doz. 1*s* to 2*s*
— per 100, 5*s* to 14*s*

Almonds, per peck, 7*s*
Sweet Almonds, per pound, 2*s* 6*d* to 3*s*
Chesnuts, per peck, 5*s* to 8*s*
Walnuts, per bushel, 16*s* to 24*s*
Filberts, English, per 100 lbs. 120*s* to 140*s*
Cobb Nuts, 140*s* to 160*s*
Nuts, per bushel—
— Messina Cobbs, 14*s* to 16*s*
— Brazil, 20*s*
— Spanish, 16*s*
— Barcelona, 20*s* to 24*s*
— Turkey, 16*s*

VEGETABLES.

Savoys, per dozen, 6*d* to 1*s*
Cabbage, White, per dozen, 1*s* to 1*s* 3*d*
— Red, for pickling, 2*s* to 6*s*
Cabbage Plants, per doz., 3*s*, to 4*s* 6*d*
Brussels Sprouts, per half sieve, 1*s* to 2*s*
Broccoli, White, p. bunch, 1*s* to 3*s* 6*d*
— Cape, 1*s* to 2*s*
— Brown, 8*d* to 1*s*
Turnip Tops, per bushel, 1*s* 3*d* to 1*s* 9*d*
Kidney Beans, forced, per 100, 3*s* to 4*s*
Potatoes, per ton, 50*s* to 75*s*
— per cwt. 2*s* 6*d* to 4*s*
— per bushel, 1*s* 6*d* to 2*s* 6*d*
— Kidney, per bush. 2*s* to 2*s* 6*d*
Artichokes, Jerusalem, pr half sieve, 1*s* to 1*s* 3*d*
Turnips, pr. doz. bunches, 2*s* to 3*s* 6*d*
Carrots, per doz. bunches, 4*s* to 5*s*
Parsneps, per dozen, 6*d* to 1*s*
Red Beet, per dozen, 6*d* to 1*s* 6*d*
Scorzonera, per bundle, 1*s* to 1*s* 3*d*
Salsafy, per bundle, 1*s* to 1*s* 3*d*
Horse Radish, per bundle, 1*s* to 5*s*
Radish, per doz. hands (24 to 30 each) 3*s* to 4*s*
Spinach, per sieve, 3*s* to 3*s* 6*d*
Leeks, per dozen bunches, 9*d* to 1*s*

Garlic, per lb., 8*d*
Shallots, per lb., 1*s*
Onions, per bushel, 2*s* to 3*s* 6*d*
— for pick., per hf.-sieve, 3*s* to 4*s*
— Green, per doz. bunches, 3*s* to 4*s*
— Spanish, per dozen, 1*s* 6*d* to 6*s*
Asparagus, per 100, large, 8*s* to 11*s*
— Second or Middling, 4*s*
— Sprue, or Small, 3*s*
Sea-kale, per punnet, 1*s* to 2*s* 6*d*
Lettuce, Cabbage, p. hf. sve., 1*s* 6*d* to 2*s*
Endive, per score, 2*s* to 4*s*
Celery, Red, p. bdle (12 to 15) 6*d* to 2*s*
— White, per bundle, 6*d* to 1*s* 3*d*
Small Salads, per punnet, 3*d*
Corn Salad, per half sieve, 9*d*
Watercress, p. dz. small bunch., 7*d* to 9*d*
Parsley, per half sieve, 3*s* to 4*s*
Tarragon, per dozen bunches, 4*s*
Fennel, per dozen bunches, 3*s* to 6*s*
Thyme, per doz. bunches, 2*s*
Sage, per doz. bunches, 3*s*
Mint, per doz. bunches, 4*s* to 6*s*
Savory, per dozen bunches, 3*s*
Rhubarb Stalks, per bundle, 6*d* to 1*s* 6*d*
Mushrooms, per pottle, 1*s* to 1*s* 3*d*
Truffles, per pound, 2*s* to 3*s*

Notices to Correspondents.

THE publisher is still willing to give 1*s*. each for Numbers 9, 10, and 38.

We are much obliged to *Nemo*, but have calculated, and find the cost for reprinting as he suggests would amount to 800*l*., which is more than could ever be hoped to be realised.

R. Hingston.—No. 1 is Helichrysum proliferum; 3 is not in flower; 2 is Hákea ruscifólia. The Heaths we have not time to determine.

H. O. C.—We are unacquainted with any mule between an annual and perennial; that between Papaver orientale and somniferum must be curious.

Cryptogamia.—We cannot undertake to name Cryptogamous plants. They are not objects of cultivation.

A Constant Reader shall be answered in a leading article on the Potato next week.

D. F. G.—An extract in our paper of to-day, under the head of "Reviews," will direct you to an excellent account of the manner of managing peat-land, in the last number of the Proceedings of the Agricultural Society. Drain first, then lime and clay, and then plant. This cannot be inverted.

Beppo.—Barker's forcing Melon had very little flavour when exhibited to the Horticultural Society on the 18th January. Its merit appears to have been its productiveness during all the summer.

A Subscriber has asked us as many questions as would fill a volume with their answers, even if they could be given, which, in the present state of our knowledge of artificial manures, would be impossible. He had better consult "Johnson on Fertilizers," and our columns from time to time, in which the subject is never lost sight of.

S. N. V.—Your letter contains many different subjects, which, with your permission, we will use singly, as opportunities arise. See our leading article of to-day.

T. C.—Many thanks. The subject of ice is no longer interesting, because the season for collecting it is past. We shall be very glad to print the paper next year. A communication in our columns of to-day is the last that can be inserted during the present season.

A Solicitor.—Have we not kept our promise? Surely we have. What is the Amateur's Garden? and what the papers on cultivation every week since Christmas? Perhaps we do not clearly understand your objects.

Amicus.—Sow for your lawn, Crested Dog's-tail Grass, Meadow Poa, Fertile Poa, Meadow Foxtail, and White Clover, at the rate of 40*s*. worth per acre. The seedsmen will send them in proper proportions. If you double the quantity, the Grass will be the closer.

Πρωτόπειρος.—In the autumn when the Portugal Laurel-berries are ripe, collect a quantity, bruise and mix them with a portion of dry sand sufficient to keep them from sticking together; prepare a piece of ground, loamy, but not stiff, in rather a dry situation, and level the surface, and draw some drills about 1 in. deep. The berries must be sown rather thin, and they will come up the following season, and require no more trouble beyond keeping free from weeds. The seeds of the A'rbutus should be treated in the same way, but they must be sown in pans filled with light sandy loam, and protected during winter from the wet.

Pone.—About the beginning of March sow German Stock seeds thinly in pots filled with good rich soil, and place them either in a cold pit or frame, which must be kept close. Water should be sparingly given, as the plants are subject to damp off; when they have two rough leaves, pot them off into small pots (60's) filled with rich soil, putting three or four plants round the sides of each pot. About the beginning of May turn the plants out into the borders or beds, and when planting put a portion of rotten dung into each hole. German Stocks may be sown broadcast, on a moderate hotbed, if the quantity required is large; but if the collection is numerous, and a little more trouble no object, sowing in pots is the best and surest way. It should be observed that the weakest plants are the most likely to be the double ones, and should be preferred when potting.

Clericus, F. H. S.—We fear you would not be able to succeed with Orchidaceous plants in a greenhouse, even with a temperature of 50 deg. Those kinds imported from the high lands of Mexico and Guatemala require a temperature of at least 55 deg. in winter; and the atmosphere of the house must be kept more moist than a greenhouse. We will comply with your wishes, and give some practical directions for their management in "The Amateur's Garden" by and by.

A Wellwisher.—Give your Brunsvigia gradually as much heat and light as you can command, watering it in proportion to the temperature it is kept in. It is very thirsty. On no account let the *ends* of the leaves be injured. For your apprentice-gardener who intends to spend 8*l*. on books now, and 1*s*. weekly afterwards, we recommend the following in addition to those he now possesses: Murray's Geography; Sweet's Hothouse and Greenhouse Cultivator, last edition; Lindley's Elements of Botany, and Theory of Horticulture; Loudon's Suburban Gardener; Paxton's Botanical Dictionary; Lindley's Guide to the Orchard, &c.; Alison on Taste. If he has any money to spare, he may add Dr. Reid's Chemistry, which he will find a very useful book. With his 1s. weekly he can get the *Gardener's Chronicle*, price 6*d*., and save the other 6*d*. to be spent on books which he may want afterwards.

H. G. B.—On your Peach-tree which covers 100 square feet, you may leave 10 dozens of fruit.

Clericus.—You may remove the Comte de Lamy and the Seckle Pears from your walls, and place them among your standards; and entirely expel from your collection the Bon Chrétiens, both Winter and Summer, Buchanan's Spring Beurré (for it is not a Beurré), Green Yair, and Grey Achan. The Jargonelle and Poire d'Auch require a wall. The Pear you have under the name of "Bondeminensis" may probably be referred to Bonne de Malines, which is the same as Nelis d'Hiver. By "Monsieur la Cuse" has doubtless been intended Monsieur le Curé. In the "Fonella" you will probably recognise, by its speckled appearance, the Forelle, or Trout Pear. Your new wall may be filled with Hacon's Incomparable, Glout Morceau, Jean de Witte, Nelis d'Hiver, Knight's Winter Crassane, Ne plus Meuris, Easter Beurré, and Beurré Rance. Good turfy loam, with a moderate quantity of cow-dung, which ought to be well mixed, will form a proper composition for your Pear-border.

An Inquirer.—The general form of a tree trained 'en quenouille' is that of a cone. In order to produce this form, it is best to commence with a young tree having one vigorous upright shoot. This shoot should be cut back to within 15 inches of the ground, so as to cause it to push forth lateral branches. In summer these laterals are trained horizontally, whilst only one central shoot is allowed to grow upright, for the purpose of being cut back in autumn to within 15 inches of its base, and thus furnish another tier of lateral branches. In a similar manner successive stages are annually produced, till the desired height, generally eight feet, is attained. Four branches in each stage are a sufficient number; and, as will be inferred from the general form, the branches composing each stage must be prevented from extending so far as those of the stage next below them. The mode is rarely applied to any fruit-tree except the Pear; and this cannot be brought into a bearing state when the system is strictly followed, unless recourse is had to removal or root-pruning. The Auvergne Pea is advertised by Charles Farnes, Seedsman, No. 128, St. John-street, London. The Dunmore Pear succeeds so well as a standard, or rather dwarf, in the open ground, that it is not considered necessary to plant it against a wall.

J. T. Astle.—If you can place your Cactus speciosíssimus in a window with a south aspect, it will be more likely to flower. For its general management we refer you to page 35. You should, if possible, propagate your Verbenas from cuttings as soon as possible; repot the old plants now, and in May, after the frosts are over, plant the whole out in the open garden. Do not cut down Fuchsias until they begin to bud out, unless the stems are quite dead. They grow well in equal parts of loam, peat, leaf-mould, or rotten dung; but they will succeed in almost any free soil. Examine the roots of your Hydrangeas; repot them if they require it, and try again—they generally flower freely enough.

Henrietta is answered to-day in another part of our paper.

Ροδον.—Such of your New Holland seeds as we can make out are all of hardy greenhouse plants, and may be raised in a little heat as soon as you please. As to those marked Heptandria, &c., such words convey no information of any use, and we can say nothing about them.

A Doubtful Bird shall have some information about Cucumber-beds next week.

Forester, Ringwood.—Would you have the kindness to send your address to C. Castleman, Esq., Wimborne, Dorset, who is desirous of consulting you about his ice-house?

W. D.'s letter is sent to Mr. Green.

An Amateur must give us his name and address with the communication he proposes to send. The mode of drawing up some papers will be seen by examining similar articles already published.

J. C.—Myosotis arvensis is certainly an annual. If you have a White Myosotis which is perennial, it is misnamed arvensis.

Clareinch.—A correspondent inquires, "if there are no exceptions to the rule you have laid down for planting Evergreens in England, namely, in April; or whether it is a principle generally applicable to all soils and situations?"

J. D. A.—Your plant is Briza máxima.

A. L. M. is answered in the leader of to-day.

G. R. has sent Phýlica plumosa.

J. C. L.—Your Catasetum is a variety of tridentatum, of which there are many in the gardens.

D. C. L.—The soil in which Lime-trees grow to the largest size is a moist sandy loam.

Messrs. Chapman.—We have several letters on the subject of your Potato, which we shall notice next week. Your own is too long for insertion literally; but we shall give the substance of it.

W. and F. Y.—We see no particular merit in your Correa, which was very badly packed.

A Subscriber.—We do not know whether the Dahlia you refer to will come out this year.

Ryall Hill.—Full directions for the management of the seeds of Coniferous plants are given in a paper in p. 83 of the present volume.

S. J., Muswell Hill.—Your seedling Epacrises are very pretty, especially the one like impressa in habit.

E.—Seeds of Brachycome and Rhodanthe should be sown in pots of light rich earth, and plunged in a gentle hotbed. In order to obtain blooming plants early, the seeds may be sown now; but if that is not an object, a fortnight or three weeks hence will be better. As soon as the young plants are up, they should be put into small pots, and shifted into larger ones as they require it.

H. P.—Nitrate of soda can be obtained at the drysalters'. We never recommend any one.

A Constant Reader.—From the state in which your Cucumber-leaf arrived, we could not determine the insect infesting it; there appears to be two or three kinds feeding on the under side. We recommend you frequently to water the under side of the leaves with strong tobacco water, and after several applications the insects will, no doubt, disappear.

K.—It is the best way to start Dahlias in heat, and afterwards to plant them out; it is not necessary to divide the roots if you are careful only to let one stem produce flowers; all the others should be cut away as they appear.

Potentilla.—Any respectable nurseryman will supply the Auriculas; we cannot recommend one. If your Cape bulbs are beginning to grow, you may pot them now; after potting they should be plunged in a gentle hotbed. Root-prune your Banksian Rose, and then it will, no doubt, flower. If Trevirana coccínea is beginning to grow, it may be repotted now in equal parts of loam and peat, with a little sand and well-rotted manure or vegetable mould. It must be watered tolerably freely, and shifted into larger pots as often as it requires. Your question respecting Prímula sinensis is answered in p. 120.

G. G.—Pinus halepénsis and Pinaster, the Ontario Poplar, the Sycamore, and perhaps the Evergreen Oak, will succeed near the sea. While the plants are young, we should recommend you to have a border of Tamarisk set round them as a protection.

T. H.—Directions for destroying the scale were given at pp. 72, 105, 131, 165, 169, and 229 (1841). We believe the best method is to wash the infested plants with gum or size, which will effectually destroy the insects; and when it cracks off, they will adhere to it, and thus the plants will be cleansed without trouble.

Inquisitive. — Strawberries in beds should not be allowed to run together, but have their runners removed. You will find upon referring to the article "Fruit" in the Cottage Calendar for Feb., that I have recommended beds.—Onions sown in 8in. drills may be left from 4 to 6in. apart, according to the nature of their growth; if the ground will produce large Onions, 6in. is not too wide. There can be no objection to the growing of Shallots in a cottage garden; but I have met with none who will substitute them for Onions. I am not prepared to say whether they will keep two years, but should recommend a supply to be grown every year. October is the best month for planting them in dry situations; in wet ones it is safer to defer it till February; when planted in autumn they are earlier and usually finer. They should be planted in drills the depth of the bulb, and surrounded with sand.—Potato-Onions should be planted their own depth, as Shallots. The reason I prefer December-planting is that I have found the roots much weakened by growing; when deferred late in the spring, I have seldom been able to preserve them out of the ground after February. An exceeding good plan is to half cover them only in the soil, earthing them up afterwards with decayed leaves, especially if the ground be at all stiff. — I do not grow Groom's Dwarf Pea; but as it is a branching kind, I should consider single rows preferable. I do not recommend sowing Peas, even of dwarf sorts, in a plot; but if they are grown so, I should say their own height apart would be sufficient.—*J. Paxton.*

L. Z. will find excellent directions for growing Ferns, and for the formation of a Fernery, in the review of Newman's book on Ferns, in p. 159 (1841). Tulip-seed should be sown in the autumn in sandy loam; the young plants should not be removed till the second year.

A Subscriber.—Price on the Picturesque is, we believe, out of print, but it may be obtained at the old book shops.

C. W. F.—We are not aware of the cause of the excrescences growing on your Pelargoniums; they should be cut off when they appear, as the stems of the plants are apt to become cankered, and break off at the point where the excrescences grow.

A Barrister.—Oiled cotton is prepared as follows:—Mix a small quantity of bees'-wax with some linseed oil and boil them together; then steep the cotton in the mixture, and hang it up to dry.

A Novice.—Soap-lees are a useful manure, but they will not lighten the land. We do not know their effect on fruit-trees and Strawberries. Fuchsia fulgens should be cut down close to the ground.

As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

THE motion of Mr. Villiers for the abolition of the duty on foreign corn was negatived on Thursday by a majority of 303, after a debate of five nights. Mr. Christopher last night brought forward a motion for a higher scale of duties than that proposed by Ministers; after a long discussion, the House divided on the Ministerial measure, which, as a point of form, it was necessary to put before Mr. Christopher's amendment could be proposed; when there appeared a majority of 202 for the resolutions of Sir Robert Peel. On Monday Ministers presented to both Houses of Parliament the treaty for the more effectual suppression of the Slave Trade, which had been ratified by the Plenipotentiaries of Austria, Russia, and Prussia; and announced that the French Government had officially communicated their inability to ratify it under existing circumstances. The ratifications, however, had been exchanged in the presence of the French Ambassador, at whose request the treaty had been left open, in order to give France an opportunity of ratifying it at a future time. Lord Aberdeen explained, in reference to the operations of this treaty, that although France had an unexpected difficulty in acceding to it, it was originally proposed by her in concert with Great Britain to the other powers, and that France is bound to every principle it involves by previous treaties with this country which still remain in full force.

We learn from France that the decision of the Ministry in withholding the ratification of the treaty is not altogether the result of the late discussion in the Chambers, but is in a great measure attributable to a formal protest made against it by Gen. Cass, the American minister in Paris, and fully noticed under our Foreign News. Considerable excitement prevails in the political coteries of Paris, in consequence of the conspiracy in that capital for renewing civil war in Spain; the existence of this conspiracy is no longer doubtful, and the main impediment which appears to have arisen to the open execution of the scheme, is the difficulty of reconciling the partisans of Don Carlos to any union with Queen Christina.—Our advices from Spain are of a very serious character, and materially confirm the reported intrigues of the Paris conspiracy. The Junta of Vigilance has been re-established at Barcelona with the sanction of the Municipality, almost at the very moment when the Chamber of Deputies at Madrid was endeavouring to pass a vote of censure on the Government for their vigorous measures against the same Republicans in the insurrection of October. The re-establishment of this Junta is regarded as the first act of the conspirators, and as being designed to bring the Republicans into immediate collision with the Regent. The difficulties of the Government are considerably increased by this occurrence; and the present aspect of affairs is considered so grave and alarming, that the moderate members of the Opposition have offered their support to Ministers during the impending crisis. The outbreak of the conspiracy is evidently regarded as not far distant, since the Regent has lost no time in calling out 50,000 national guards, and in taking other measures of precaution. These important events have again been the subject of a conversation in the House of Commons, during which Sir R. Peel renewed his expression of sympathy with the Spanish Government; he declared his belief, not only that it has given repeated indications of advancement, but that it is conducive to the civilisation and prosperity of the country; and he concluded by assuring the House that no exertion shall be wanting on the part of England to restore Spain to the station she used to fill as one of the Powers of Europe.—An express reached town on Saturday from Lisbon, announcing the complete success of the Chartist movement in that capital. This event was not accomplished without a revolution—the ninth which Portugal has seen since 1820; but although the public arsenals were thrown open, and the City was exposed during three days to the dangerous excitement of a sudden political convulsion, the affair happily passed off without bloodshed. The Queen, finding it useless to offer further opposition, formally subscribed the Charter on the 9th; a new Ministry was immediately formed under the Duke of Terceira and other well known partisans of Don Pedro, and the Cortes were summoned under the Charter for the 10th of June.—Advices from Germany announce the arrival of the King of Prussia at Berlin on the 16th, on his return from England; they also state that the Prussian clergy have expressed much dissatisfaction at the rumour of a projected union between the Church of Germany and that of England; and they intend, it is stated, to protest against the circular of the Archbishop of Canterbury, in which their conversion is said to be mentioned as a probable result of the establishment of the Protestant bishopric of Jerusalem.

Home News.

COURT.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal remain at Brighton and continue in excellent health. Her Majesty and the Prince have taken their usual airings on the Cliff during the week. On Wednesday, Prince Albert, the Princes of Saxe Coburg, and their suite honoured the Earl of Liverpool with a visit at Buxted Park, and returned to the Palace on the same evening: it was expected that her Majesty would have accompanied the Prince, and great preparations were accordingly made at Lewes to do honour to her visit; but circumstances occurred to lead to its postponement. According to present arrangements, the Queen, Prince Albert, and the Court will visit Portsmouth next Monday, where the house of Sir Edward Codrington has been fitted up for her Majesty's reception. The Court will return to Brighton on Tuesday; and it is believed that her Majesty will take her departure for Buckingham Palace on Thursday next. Thursday, the 24th, being the birthday of H.R.H. the Duke of Cambridge, the members of the royal family in town, the foreign ambassadors, and a great number of the nobility called at Cambridge House and left their congratulations for his Royal Highness; and in the evening the tradesmen of His Royal Highness illuminated their houses.

Parliamentary Movements.—The *Gazette* announces the return of Maj.-Gen. W. Morison, C.B. for the Counties of Clackmannan and Kinross, in the room of the Hon. G. R. Abercromby, who has accepted the Chiltern Hundreds.

Official Appointments.—The Marquis of Londonderry has accepted the appointment of Lord-Lieutenant and Custos Rotulorum of the county of Durham, vacant by the death of the late Duke of Cleveland. Major-Gen. the Earl of Munster is to have the command of the western district of England, in succession to Lieut.-Gen. Ellice; and Major-Gen. W. F. Napier replaces Lieut.-Gen. Sir James Douglas as Lieut.-Governor and Colonel on the Staff at Guernsey. Both these appointments are to take effect from the 1st of April next.

Foreign.

FRANCE.—*The Slave-trade Treaty.*—The only matter of interest or importance in the Paris papers is the convention of the five Powers for the suppression of the slave-trade. The "Journal des Débats" confirms a report current for some days past in the French capital, that the Government of the United States had declared that it would not submit to the consequences of the right of search, neither from England nor from France, nor, in fact, from any other of the contracting parties. The "Patrie" is more explicit as to this note, and states, "that General Cass, Ambassador from the United States, has placed in the hands of the Minister for Foreign Affairs an official note, in which he energetically protests against the treaty. One of the documents in support of this note gives an exact account of the habitual commerce carried on by the United States on the seas now divided by the zones. It results from these returns that the tonnage forced to traverse them within the limits fixed by the treaty amounts to 828,583, which will give, for out and home, a movement of 1,657,166 tonnage. In this account the vessels of New Orleans and the ports of the Gulf of Mexico trading with the north of Europe are not comprised, and which may be estimated at 500,000 tons, the total making 2,157,166. The note adds that, rather than to abandon its commerce, war would be a thousand times preferable, and that the American Government had made up its mind on this subject, and could not for a moment hesitate. Finally, it makes the observation, that in case of rupture France would be, by obligation, a belligerent, and be forced to exercise the right of search; and can France decide to assist in the destruction of the only naval power which could offer France support in the event of a conflict with England?" The "Constitutionnel" notices a rumour relative to the treaty, which states that M. Guizot, immediately after the discussion in the Chamber of Deputies, applied to Lord Aberdeen for a prolongation of the period of delay granted for the exchange of ratifications of the treaty, and for the opening of new negotiations, having for their principal objects the modifications of the zones, and the limitation of the number of warrants to be granted to cruisers. Lord Aberdeen is reported to have replied, that the British Government was ready to grant to France all the delay that the recent discussion in the Chamber of Deputies rendered necessary, but that it could not consent to the slightest modification of the treaty.

The Chambers.—The Chamber of Deputies assembled in the standing committees on Saturday to appoint the commission on M. Galbery's proposition concerning the publication of an official report of the legislative proceedings. It seemed to be the general opinion that the scheme is impracticable, and that it would entail a useless expense of 12 millions of francs per annum, without any corresponding advantage. It is said that five members of the committee are disposed to do something, but four are opposed to the project, and it was expected it would fall to the ground. In one of the discussions on the subject one gentleman proposed to turn the reporters out altogether. After a variety of suggestions of a similar kind, M. Barrot got up and moved gravely—that the liberty of the press, the liberty of speaking in the Chamber, and the revolution of July itself be declared null and void. Some of those present are said to have mistaken M. Barrot's gravity for seriousness, and were about to second the motion. In regard to the recent prosecutions of the press, eight out of the nine committees into which the Chamber of Deputies is divided have refused leave that M. Montlavelle propose to introduce a measure for relieving printers from the responsibility in printing matter declared to be libellous or seditious.

Criminal Law.—The Minister of Justice has presented a law modifying some parts of the criminal code. One is to remedy the defect which prevents French courts from taking cognisance of a crime committed by a Frenchman in a foreign territory. Another part of the project modifies the law of arrest. In many cases it was not in the power of a judge to set a prisoner at liberty, even though he found nothing against him: the judge is now to have discretionary power both for bail and liberation. Another of the objects contemplated by this bill appears to be to secure the more expeditious administration of justice, and, above all, to shorten the period of what is called preventive imprisonment—viz., imprisonment before trial, which in France is sometimes of four, five, six, and even eight months' duration; during which time a man who may be innocent of the crime laid to his charge is exposed to contact with thieves and assassins, whilst his interests in society, whatever they are, may be ruined.

The Capital.—Considerable excitement prevails in Paris, in consequence of the known existence of a conspiracy in that capital for the purpose of renewing civil war in Spain. Most of the journals are silent on the subject, but private letters contain numerous circumstantial details, which would seem to prove that the attempt to revolutionise Spain from the French frontier may be almost daily anticipated. They dwell on the continued confidential intercourse of Queen Christina, the head of the conspiracy, and the King of the French. They allege that, although carried on more secretly than hitherto, the intercourse of the conspirators with the French Government was constant and unremitting, and that nothing appeared likely to prevent a general united effort of the partisans of Queen Christina and the Carlists, but the repugnance of Don Carlos and the elevated personages in his interests to any connexion with the ex-Queen Christina and her party. The latter are said to have proposed a marriage between Queen Isabella and the son of Don Carlos; which is opposed by the Carlists, on the ground that if the Queen dies without issue, the plan will have turned out exclusively to the advantage of the Orleans dynasty, as it is part of the scheme to marry the sister of the Queen to the Duc d'Aumale.—The funeral of Count Pozzo di Borgo took place on Friday at St. Thomas d'Aquin. His funeral was attended by the Russian Chargé d'Affaires, the whole of the officers of that embassy, and a great number of the diplomatic corps, many members of both Chambers, and other personages of distinction. The King and Royal Princes were represented by two orderly officers. Colonel Pozzo di Borgo, the late Count's nephew, appeared as chief mourner. This eminent diplomatist is said to have left a fortune of five millions of francs.—In consequence of some legal question which had arisen respecting the manuscripts and copyright of the works of M. de Chateaubriand, they were sold by auction on Friday, and purchased by M. Delandine de Saint Esprit for 153,000f.—Letters have reached Paris from Montpellier, dated the 14th inst., which state that the convict Marie Capelle (Madame Laffarge) is dangerously ill, and that her physicians have given her over. In fact, she has already received the last sacraments of the church.

Algeria.—The *Moniteur* of Tuesday represents the arms of the French as likely to achieve a solid triumph over the Arab Emir, who had lost 14 pieces of cannon in the recent expedition. Fifteen hostile tribes had made their submission to France. It is said that the fort of Lebdon, the last fortress of the Emir's second line of defence, has been taken and destroyed, and that Abd-el-Kader himself has withdrawn within the territories of Morocco. The despatch conveying this news was dated Telemsen, the 11th inst.

SPAIN.—Advices of a very serious and important character have been received from Barcelona, dated the 15th inst., announcing that the Junta of Vigilance has been again re-established, with the assent of the Provincial Deputation and of the Municipality. It is composed of the same members as those of last year; it holds secret sittings, but is not yet officially installed. On the evening of the 14th, in a sitting which was prolonged till late at night, it was decided that the Moderados (Christinos), as well as the French, who reside at Barcelona, should be assassinated at the first signal. Several Carlist guerillas have appeared in the environs of Berga, and it is affirmed that one band consists of 700 well-armed men. This Junta is the same which set at defiance the Madrid Government, and was dissolved by a decree of the Regent, who, in addition, declared Barcelona in a state of siege; a decisive course of action which led to the opposition in the Deputies against the present Gonzales Cabinet, which only escaped a vote of censure on the 10th by a feeble majority of 10. A Ministerial paper states that the Madrid Government will be placed in a situation of extreme difficulty by the acts of this Republican Junta, and that it will have to overcome great embarrassments produced by its refractory allies and supporters, and its open opponents the combined Carlists and Christinos. This re-establishment of the Barcelona Junta of Vigilance may be regarded as the first act of conspiracy, namely, the pushing of the Republicans in Spain to a demonstration against Espartero. It appears indeed to be generally believed that if the Regent cannot resist them, he must either throw himself into their party, or fall beneath their coalition with the other factions. The Spanish Government is said to have called out 50,000 National Guards.—Subsequent advices have brought intelligence from Madrid to the 16th inst. They give the details of the calling the National Guards into actual service, if occasion require. The Minister of the Interior, in presenting the project of law, stated to the Chamber of Deputies, in the name of the Regent and Council of Ministers, that Spain might be in danger very shortly, as the consequences of the conspiracy preparing both in and out of Spain against all liberal institutions. The bill was referred with urgency to the Committee, which will report thereon, and no doubt was entertained that it would be favourable to the measure. A report was in circulation on the night of the 16th, that the opposition Deputies would give a vote of support to the Ministry in the impending crisis.

PORTUGAL.—An express reached town on Saturday from Falmouth, announcing the arrival of the Lisbon steamer, with intelligence of the complete success of the Chartist movement in that capital. The revolution by which this was effected was happily unattended with bloodshed. The particulars of the event present a series of extraordinary incidents, which are without a parallel even in the history of the eight previous revolutions which Portugal has witnessed since 1820. The details are rather those of a melo-dramatic representation than the sober occurrences of political history. Three distinct ministries have existed in Lisbon within a week; the National Guard has been called out, the populace has been armed, and barricades have been erected in the streets to resist the introduction of that charter which has now been subscribed by the Queen, and proclaimed as the law of the land. These occurrences have been crowded into a space of little more than three days; and from the multifarious details which have reached us, the following abstract gives all the leading facts:—It appears that on the failure of the first attempt to form a Ministry, of which we were informed by the last mail, the Queen acceded to the terms proposed by Viscount Sa de Bandeira, who was appointed Minister of War under the Presidency of the Duke of

Palmella. The first act of the new Ministry was to displace the Duke of Terceira, whose attachment to the charter was well known, from the command of the troops, and to appoint Count Bomfim, an adherent of the constitution, in his place. Measures were organised for the purpose of suppressing the Chartist movement wherever it had appeared, and Count Das Antas was appointed to command the force about to proceed against the Chartists of Oporto. A proclamation was also issued, calling on the friends of the constitution to take up arms to support it, and orders were issued to give out arms from the arsenal to all the Constitutionalists who might apply for them. These proceedings took place upon the 7th inst. On the following day, while the drums were beating to summon the old National Guards to arms in defence of the constitution, a salute from the castle of St. George announced that the garrison of that fortress had declared for the charter. Notwithstanding this indication that the troops could not be relied upon to fight against the charter, the Ministry determined on attacking the castle. On the Queen's humane refusal, however, to sanction any proceedings that might lead to bloodshed, it was determined, by cutting off their supplies, to starve out the garrison. It was found, however, that the pickets stationed in the avenues leading to the castle were deserting so rapidly that in the course of the day they were all called off, and the friends of the charter sent in abundant supplies of provisions and wine to the garrison of the castle. Meantime the friends of the constitution, or the Septembristas, as they are termed in the political circles of Lisbon, had assembled a large force, and appointed a committee to direct the measures to be taken for the reduction of the castle. The National Guards were out, the arsenal was thrown open, and the workmen and populace indiscriminately allowed to arm themselves. The streets were cut up, trenches dug, and barricades of carts and other vehicles formed so as to impede any attack that might be made on them from the Chartist troops at the palace. Great anxiety prevailed throughout the city, and the regular troops manifested much dissatisfaction at the proceeding. The arming of the arsenal workmen and populace contributed to increase this feeling, and alarmed the citizens generally, very few of whom presented themselves. An outbreak and a collision between the people and soldiery appeared to be inevitable. On the 9th the alarm was increasing when it became generally known amongst the better informed classes, that Viscount Sa and his colleagues had resigned in despair of suppressing the revolt, and that a new Ministry was formed, with the Duke da Terceira at its head. Nothing was said at this moment about the charter being proclaimed, as it was considered politic not to make the fact public until the populace had been disarmed. An order was issued to withdraw the Arsenal workmen and the rest of the armed people, in small bodies, and get them to surrender their arms. The Count das Antas at this critical moment addressed the people briefly, but effectively, not giving them the slightest intimation that the Queen had declared for the charter, but intimating that they must deliver up their arms, their services not being further required at this period, and that each should retire quietly and obediently to his own dwelling, where, if his services were again required, he should be called on. This was successful. No less popular or less distinguished man than the Count could probably have succeeded in effecting so important an object. In truth, the people little suspected the real issue, and the general impression was, that the soldiery in the castle had capitulated. The Duke of Terceira lost no time in forming a Chartist Ministry, including Mousinho d'Albuquerque, the late governor of Madeira, and Colonel Loureiro; and on the 10th, the charter was formally proclaimed, the Cortes being summoned under it for the 10th of June. Thus has passed over one of those periodical convulsions that have become so frequent in the Peninsula as to have lost even the character of novelty. Men of all parties unite in congratulations that the city was spared the possible excesses of an armed mob; and the unlimited calling out so large a body of the worst classes in the capital is openly denounced as the great blot on the brief administration of the Duke of Palmella, and as a course which no motives of expediency could justify.

Holland.—Letters from the Hague state that the report that M. Laurent is appointed apostolical Vicar for Luxembourg seems to be confirmed. "Rome," they add, "could not have chosen a more proper person for this post; for the zeal of M. Laurent in the cause of his church has obtained for him the title of "the fiery sword of the Pope." The Journal of the Grand Duchy of Luxembourg publishes a resolution of his Majesty the Grand Duke, of the 6th inst., revoking the tariff which was introon the 12th Nov., and retaining that of the 24th July, 1840, as preparatory to the admission of the Grand Duchy to the German Customs Union.

Belgium.—The debate in the Chamber on the Ministerial demand for certain sums to enable the Government to run the British Queen steamer between Antwerp and New York, has terminated with a majority of 71 to 16 in favour of Ministers. The Brussels Papers state that the discussion was an amusing scene of recriminations and surmises as to the object of the English company in selling her. Some contended that she must be good for nothing, or a people like the English would not have parted with such a vessel; others said that she was too long; a third party insisted that she was too broad; a fourth insisted that she was not seaworthy, and that it would be reckless to allow poor emigrants from Germany to sail in her, as she was sure to be lost, like the President. The opinions of the engineers of the British Admiralty and of an eminent American engineer were brought forward in reply to their speculations; the latter said that he knew the British Queen well, having seen her many times in America, and since in dock at Antwerp, and did not hesitate to declare that she is a vessel of perfect construction, as good as new, and possessing none of the defects for which she is denounced to the public.

Germany.—The King of Prussia reached his capital, on his return, on the afternoon of the 16th. It is rumoured that his Majesty has obtained from the King of Holland the promise that no obstacles shall be henceforth offered to the free navigation of the Rhine. "The King," says the 'Presse,' "during his stay in London, was urgently pressed by the English clergy to consent to the establishment of an English Bishop at Cologne. It was proposed to his Majesty that the occupant of this see should have jurisdiction not only over the English resident at Cologne, but also over those who live in the south of Germany, Wurtemburg, the Grand Duchy of Baden, and other counties. The King is said to have received this proposal with favour, and it is likely to be realised upon the bases of the negotiation for the establishment of the Protestant Bishop of Jerusalem.—The "Frankfort Post Gazette" of the 19th inst. states, under date Berlin 13th, that the Prussian clergy were much displeased with the circular of the Archbishop of Canterbury respecting the new Bishop of Jerusalem, and in which it is said that the establishment of that episcopal see would greatly tend to unite the Church of Germany with that of England, and induce the former to convert itself. "Our clergy," observes that journal, "is opposed to such a conversion, and intends, consequently, to address to the King a protest against that circular.—A letter from Heidelberg of the 9th Feb. says that a prohibition of duelling addressed to the students has produced a great sensation there. The students are forbidden to fight a duel on pain of expulsion; and those are threatened with the same punishment who shall frequent a tavern near the town, on the right bank of the Neckar, notorious for being the usual scene of these single combats.—The Princess of Prussia has presented to the celebrated pianist Liszt, who is at present in Berlin, a manuscript musical composition of Frederick the Great, the manuscript being written by the King himself, together with all the musical works of Prince Louis Ferdinand of Prussia. The concert given by Liszt, at Berlin, in aid of the funds required for the completion of the cathedral of Cologne, is said to have produced 1,500 thalers.—The Frankfort Papers of the 13th inst. announce that Prince Esterhazy had taken his departure from Ratisbon to resume his duties as ambassador at this Court, but having experienced a disposition to a relapse of his previous malady on arriving at Nuremberg, his Highness determined to return to Vienna, where he will remain until his health be completely restored.—Letters from Munich announce that the marriage of the Hereditary Prince of Modena with the Princess Aldegonda of Bavaria is to be celebrated in that capital on Easter Monday. Immediately afterwards, the King of Bavaria will accompany the Prince and Princess into Italy.

Italy.—Letters from Rome inform us that the Pope has perfectly recovered from his late illness, and assisted at the ceremonies of the church on the 2d Feb., when he answered the allocution of the deacon of the holy college with a firm and vigorous voice. These letters also announce that by a recent decree the French "Journal des Débats" and the "Commerce" are not suffered to enter the Papal States.—Advices from Turin state, that great preparations are making in that capital for the marriage of the Duke of Savoy with the Archduchess Adelaide of Austria. After passing three days at the Chateau of Stupinitz, the bride and bridegroom are to make their solemn entry into the capital, when a series of fêtes will ensue. The Municipality of Turin has voted 1,000,000 francs for the expenses of the occasion, of which 200,000 are for wedding presents to the young Princess. It is said that the King will grant a political amnesty in commemoration of the event, and will also concede a diminution of duty on salt, for the benefit of agriculturists. A grand tournament on the Piazza of San Carlo is talked of.—The same advices state that negotiations have been opened by the court of Brazil for the marriage of the two young Princesses, sisters of the Emperor, with two Princes of the house of Savoy.—We learn from Naples that the Cross of Commander of the Legion of Honour has been conferred on the King of Naples by the King of the French. The "Giornale delle Due Sicilie" of the 5th and 6th inst. promulgates Royal decrees for the final abolition of feudal rights, and the suppression of the Promiscuita, or inter-communal rights, in domanial lands, between the communes or ex-baronies, or churches. Private letters state that the Castellamare railroad would certainly have been finished for the spring, as intended, but that a large and previously unknown lava current, of unusual width and depth, and 1500ft. long, having been found running across the line, the operation of blasting and cutting through it will delay the completion of the line till autumn.—Some interesting details, relative to the excavations going on in different parts of the kingdom, with a view to the discovery of antiquities, have just been published. The year 1841 has been remarkable for the discovery, in various parts of the kingdom, of numerous Greek coins. Among them is an entire collection of gold coins of Locri, the celebrated republic of Magna Græcia; they are of a small form, and hitherto only a single example of this kind had been found. The excavations at Pompeii have not been productive of interesting results for the last two years, probably because the locality is unfavourable; but important discoveries are expected from the clearing of the ruins of the Amphitheatre of Pozzuoli, which has been ordered by the King. The work on this point is going on with great activity, under the orders of the minister St. Angelo. From the portion of the ruins already cleared, it is to be presumed that the remains of one of the most important monuments of architecture in Italy will come to light, and that the Royal Museum of Naples will be enriched by some fine fragments of antiquity.—Letters from Genoa state that Signor Isnardi, of that city, has brought forward additional proofs that Columbus was born in the commune of Cogoleto, and not in Genoa. In addition to other facts in support of his assertion, S. Isnardi has published four authentic documents, consisting of instructions from the Doge, Governors, and Procurators of the Republic of Genoa, issued in 1586, 1590, 1595, and 1602, in which this great man is styled "Columbus, of Cogoleto, so celebrated in Spain."

Russia.—A report is current that a marriage is likely to take place between the Duc de Bordeaux and the Grand Duchess Olga. It is stated in the French papers that "proposals to the above effect have been made by a lady nearly related to Prince Talleyrand, and who was for some years a devoted partisan of the Orleans dynasty. This lady, who now resides at Berlin, is said to have suggested the scheme through the instrumentality of the Queen of Prussia, sister of the Emperor, and they had insured the support of the Empress of Austria. The Czar, it is stated, did not oppose the projected alliance, but said he was desirous that his daughter should be at liberty to make her own choice, and that he agreed to the Duc de Bordeaux's coming to St. Petersburgh, in order, if possible, to gain the affections of the young Princess. According to the report, it was objected that if this plan were adopted, the Duc de Bordeaux would be exposed to the risk of rejection, and a middle course was suggested, viz.—that the Empress should pay a visit in the spring to the waters of Ems, whither the young scion of the exiled house of Bourbon is also to proceed, in order that the interview may take place upon a neutral territory."—Letters from St. Petersburgh state that Goethe's complete works are to be published in a Russian translation; the 1st part to appear shortly, at the small price of 75 silver kopeks.

Turkey.—Recent letters from Constantinople inform us that M. de Bourqueney, the French Envoy, had received a second note from the Porte, demanding that the French squadron before Smyrna should receive orders to retire, and declaring at the same time that no expedition against the Pachalic of Tunis was contemplated. The Beiram was at an end, and the greatest activity prevailed in the supreme council, whose principal attention was directed to the abolition of useless employments and retrenchment of overpaid salaries. The same letters affirm that Sir Stratford Canning was charged to offer to the Porte, on the part of the Greek Government, an indemnity of a million of drachms, which had produced some sensation in the Turkish councils, on account of the financial state of the Ottoman Government. In regard to the affairs of Syria, it is asserted that the Porte intended to put a stop to the quarrels in the mountains by adopting a system of administration based on the municipal organisation of the Druses and Maronites. A letter in the "Augsburgh Gazette" affirms that the Porte would not yield to the demand made on the 26th ult. to the Reis Effendi, for a firman for the official recognition of the English Bishop of Jerusalem. Sir Stratford Canning landed on the 24th, and was to present his credentials to the Sultan on the 27th.

West Indies.—The Alert packet, with the West India mail, brings advices from Jamaica to the 19th ult., Demerara to the 9th, Trinidad to the 8th, Barbadoes to the 9th, and Antigua to the 18th. The Jamaica papers confirm a rumour which had previously reached us through the United States, that a sanguinary collision had taken place on Christmas day between the European inhabitants of Jamaica and the negroes. It appears that the origin of this occurrence was a desire on the part of the whites to suppress the customs of the black population during the Christmas holidays. These papers also confirm the capture and destruction of the fleet of Carmona, the rebel chief who had set up his forces against Carthagena. The gallant conduct of Lieutenant de Courcy, of H.M.S. Charybdis, who, in repulsing an assault upon an English merchant vessel, rendered valuable assistance to the Carthagena cause, is alluded to in gratifying terms, while, as a reward for his courage, the Governor had ceded, as his prize, the enemy's brig Marcellino. Carmona was so incensed at the destruction of his fleet, mainly brought about by the tact of Lieutenant de Courcy, that he had declared war against England. The Trinidad agricultural report for Dec. states that the month had proved unusually dry, so that, in many places, there was great danger of the plants failing. The canes for the ensuing crop looked well; they had the appearance of being very ripe, and it was expected that they would make superior sugar. The labouring population was in every way improving, its advancement being especially observable since the abolition of the allowance system, and the adoption of moderate wages. At Barbadoes and at Antigua a want of rain had also been experienced, but on the whole the prospects of the crops were promising. Demerara at the latest date was in an unsettled state, owing to the endeavour of the planters to force the labourers into submission as regards certain rules and regulations for the better working of the estates, and which would tend to reduce the price of labour in proportion to the market price of produce, but without the ordinary course of having first consulted the labourers, or their "headsmen." We also learn by this arrival that Mr. George Bell, who acquired considerable celebrity by his connexion with the *Vixen* case, and his spirited enterprise in aiding the Circassians, died on the 28th Oct., at Acoyapa, a small town in Central America, whither he had been carried as a captive by the natives of a neighbouring state, in revenge for the aggressive acts of the British.

Parliament.

HOUSE OF LORDS.

Monday.—The Earl of Aberdeen laid upon the table a copy of the treaty agreed to by the representatives of the five great Powers for the more effectual abolition of the slave-trade. He regretted that he was under the necessity of informing their Lordships that the ratification of his Majesty the King of the French had not been exchanged with those of the other Powers; neither was he able to inform the House of the precise time when that ratification might be expected. Their Lordships, probably, were aware of the causes which had produced this decision on the part of the French Government, and which his Majesty the King of the French had thought reason sufficient to suspend his ratification. Their Lordships might be aware of the nature of these reasons, and he felt that it was his first duty to say nothing more, and to do nothing which could by any possibility increase the difficulties which existed, or throw any efficient obstacle in the way of their removal. The protocol, at the desire of the French Plenipotentiary, had been left open for the accession of his Government. The noble Earl then proceeded to explain that the two treaties which had been concluded between this country and France in 1831 and 1833 were almost as extensive in their operation as that which the French Government now declined to ratify.

Lord Brougham expressed his deep regret that the ratification of this most important treaty should have been even temporarily postponed, and vindicated the Government, as well as the people generally, from the imputation of any sinister motive in the effort they were now making to abolish for ever the African slave-trade.

The treaties were then laid on the table, and their Lordships shortly afterwards adjourned.

Thursday.—After the presentation of petitions for a repeal of the Corn-laws, and respecting Presbyterian marriages, on both of which subjects conversations arose,

The Bishop of Exeter called the attention of the House to a petition containing serious allegations against the poor-law commissioners, and the administration of the law in the Crediton union. Two paupers had died in the workhouse, under circumstances which called for inquiry. It was alleged that the inquiry had not been fairly conducted, and that the poor-law commissioners had suppressed the evidence. Lord Wharncliffe stated the facts of the case at great length, which he considered had been got up by the petitioner for some reason which he was not called upon to particularise. After a reply from the Bishop of Exeter, in which he stated that he did not consider any real answer had been given to the charges made against the commissioners in the petition, the House adjourned.

HOUSE OF COMMONS.

Monday.—Capt. Berkeley asked if the release of Mr. Elton, late midshipman on board one of her Majesty's ships, who had been dismissed the service and imprisoned, for writing a disrespectful letter to a superior officer, had arisen from dissatisfaction with the proceedings of the court-martial, or as an act of clemency on the part of the Crown?—Sir G. Cockburn vindicated the court-martial and Captain Williams, and said that the release of Mr. Elton was an act of clemency, arising from the feeling that the discipline of the service had been sufficiently vindicated by the confinement he had already suffered.

Sir James Graham stated, in answer to some questions from Mr. Duncombe, that although the several important questions already before the House, together with the financial measures, which would as soon as possible be brought forward, would compel the Government to postpone any measure on the subject of the Poor-laws until after Easter, it was not then their intention to blink the question, but to introduce a measure which should not only continue the Poor-law Commission for a considerably longer period than one year, but incorporate such modifications of the existing measure as might be deemed expedient. He declined to enter into explanations upon matters of detail, but would be prepared to lay his bill before the House immediately after the Easter recess.

Mr. Cobden asked Sir Robert Peel if the Government were prepared to lay on the table of the House a particular specification of the peculiar burdens of taxation borne by the landed interest?—Sir R. Peel was not prepared to do so. It was matter of controversy as to what constituted a peculiar burden.

The adjourned debate on the Corn-laws was begun by Mr. Hardy, who vindicated a sliding scale, as opposed to a fixed duty, and contended that the protection given to agriculture was for the benefit of the whole community. As a manufacturer himself, and on behalf of many other manufacturers, he disclaimed all participation in or sympathy with what he considered the improper system of agitation adopted by the opponents of the Corn-laws.—Col. Fox said he would have supported a gradual repeal of the duty; but not being prepared to concur in an immediate abrogation of the whole impost, he should abstain from voting at all.—Mr. Lindsay defended the landlords from the charge of oppression. He would never act from party motives upon a subject so important as commerce; but he thought the interests of agriculture a still higher consideration.—Captain Layard could not support Mr. Villiers's resolution, but was desirous of a fixed duty. The land in this country paid a less proportion of the public burdens than in several of the Continental states.—Mr. Smythe had no doubt that if the Anti-Corn-law principles were pushed to the extreme, and corn put on the footing of tobacco, the revenue would be much increased; but was that a principle, he asked, for a minister to act upon against such a body as the agricultural interest?—Mr. Macaulay controverted the opinion expressed by Sir R. Peel, that cheapness of food was not always a blessing to the people. It was always a blessing to them, though not of itself alone sufficient to their happiness. To show that in a country like Prussia, which, within living memory, had been so often and so widely the seat of war, the people were in a state of less comfort than in this secure land, was not a proof that Prussia had no advantage in the cheapness of her food. He himself might just as well take the opposite extreme by instancing Ohio, where cheap corn and high wages were co-existent. As to independence of foreign supply, that was impossible in any country where, as in England, corn is dearer than in the neighbouring states. Sir R. Peel had declared his preference of a casual over a constant dependence, but he himself preferred a constant dependence to a casual one, for a constant dependence would be mutual. Sir R. Peel's plan allowed us access, in the years of dependence, only to those places where it was confessed that the harvests were likely to fail simultaneously with our own, and excluded us from commerce with America, where the seasons were not thus coincident. Yet even when the Continental system of Bonaparte was at its height, we had imported into England, from the very territories under his control, a greater quantity of corn than in any previous or succeeding period. He enlarged on the impolicy of forcing the foreign growers of corn to exchange their own ploughs for our looms, and warned the Conservatives against the suspicious co-operation of the Chartists, who, he was persuaded, sought to keep up the price of food, in the hope of ultimately driving the people into the only rebellion really formidable—a rebellion of the belly. He denied that there was anything of principle in the Government measure; but he was not disposed now to take away, according to the tenour of Mr. Villiers's resolution, all protection from agriculture, and should therefore abstain from voting.

Mr. S. Wortley combated the opinion that the labourers would be materially benefited by the cheapening of corn. He quoted Adam Smith and Ricardo to show that wages are regulated not solely by the proportion between the supply of labour and the demand for it, but also by the price of the labourer's food. If thus the reduction of the price of corn should occasion a proportionate reduction in the wages of labour, the labourer would be left on the whole with no greater command than before over the enjoyments of life.

After some observations by Mr. Mitchell in favour of the Ministerial measure, Mr. C. Buller said the great objection to the present Corn-law was its manifest injustice. The landowners disclaimed all selfish motives in maintaining this law; but at least the fact was, that the law had the effect of raising their rents, and so of throwing suspicion upon their characters. He did not know what was meant by overproduction; nothing had been produced but by capital and labour, which were waiting for that employment. Since 1821 there had been an increase of more than 4,000,000 in the population, and for no part of that increase had our own agriculture furnished any provision; their whole maintenance had been provided by our manufactures. Surely you ought not to prevent these increasing multitudes from resorting to the agriculture of foreign countries. He could not, however, vote with Mr. Villiers for the total and immediate repeal of the duty. He thought the agricultural interests did bear exclusively some burdens, for which, being peculiar to themselves, they ought to be compensated. But a still stronger argument against a total and immediate repeal would be found in the vested interests which such a repeal would instantaneously destroy—interests not of landlords only, but of farmers and of labourers. The mischief itself would be most injurious; the alarm consequent upon it still more so. But these were not reasons for a sliding scale, for they were not circumstances of a fluctuating character.

Mr. Hope defended the agriculturists; and Mr. Rice wished that the fixed duty of the late Government had been accepted; he thought Mr. Villiers's plan dangerous, and would therefore vote against it.—Mr. Milnes remarked upon the inconsistency of Mr. C. Buller, in declaring the principle of the Corn-law to be unjust, and yet proposing to postpone its abrogation. For his own part, he was convinced that no necessity now existed for the proposed repeal; and if such a necessity should at some future time be brought on, he was by no means satisfied that the country would gain by the change. The landholder might possibly be unable to stand, but if he fell he would bring down the fundholder with him.

Mr. Wakley said it was only in the House of Commons that this subject was treated as difficult to be understood; the people out-of-doors understood it perfectly. Your protection was only to the landlords; the labourers had none; they were left in a state of deplorable destitution. Protection had been taken from manufactures; you should have begun with food. The country was now in actual insecurity, so feverish was the public mind on this subject. He agreed with those who thought the true remedy was to remodel the House of Commons.—Mr. Muntz doubted whether Sir R. Peel was justified in taking the Government if he had nothing better than this to produce; but he was so fettered that he could not do the good he desired. The land was certainly entitled to protection, but not in this shape. Two-thirds of the labourers of this country were well paid; but the remaining third, who were employed in the manufacture of articles for export, were in a state of woful destitution. He then read some extracts from a pamphlet against the Corn-laws, published some years ago, and attributed to Sir J. Graham; after which he entered into some considerations upon the connexion of the Corn question with the question of currency. The laws on currency and on corn were both of them the work of the right hon. Bart., whom he apostrophised in a passage from Gray's "Bard."

On the motion of Mr. S. Crawford, the debate was then adjourned.

Tuesday.—Sir R. Peel, in reply to a question from Mr. Hindley, repeated, on the part of the Government, an expression of strong sympathy with the present Government of Spain; and his conviction that, on the whole, it was conducive to the civilisation and prosperity of the country. "Our anxious wish," he said, "is to see Spain a prosperous and perfectly independent nation—independent of all foreign interference. No power which she can possess for her own just defence can, in the slightest degree, be the object of our jealousy. It is our desire certainly to give strength and stability, by our counsel and influence, to the present Government of Spain, because we see under that Government repeated indications of an advance towards civilisation and prosperity, and we certainly have exercised such influence as we could command for the purpose of inducing the Governments of Continental Europe to recognise it. My own opinion is, that it will be a great security for the tranquillity of Europe, when we see Spain restored to prosperity, and filling the station which she used to fill as one of the Powers of Europe, and no exertion shall be wanting on the part of England for the attainment of that object."

The Chancellor of the Exchequer stated that the Government intended to take measures to remedy the deficiency in the gold coinage.

The House went into committee on the Corn-laws; and Mr. Sharman Crawford resumed the adjourned debate, expressing himself strongly in favour of a repeal of protective duties.—Mr. Martin entered into some statements involving calculations, showing that the landed interest bore a larger share of the public burdens than other classes of the community, such as the manufacturing.—Mr. F. Villiers explained, that Mr. Villiers's motion, though, from the introduction of the word "now," it demanded the immediate repeal of protective duties, yet, nevertheless, there was no wish on the part of either the mover or its supporters to injure the landed interest, by refusing proper time for the change.

A long discussion now ensued, in which several members stated their opinions on the subject of the motion, but no facts were brought forward which have not already been noticed in previous discussions. Sir C. Burrell declared that the landlords' case had never been answered; Mr. Powell said that the landowners must be prepared to enter into competition with the foreign producer at no distant time. Mr. Granby thought that a repeal of the Corn-laws would increase distress in the manufacturing districts. Mr. M. O'Connell said he should vote for the total repeal. Sir F. Burdett vindicated the landed proprietors, and contended that Sir R. Peel's measure had given great satisfaction to agriculturists. Lord Duncan affirmed that the difficulties of our circumstances were caused by the system of protection, and reminded the House that unjust taxation lost us America. After some observations in favour of the working classes from Mr. Stanton, Mr. P. M. Stewart enlarged upon the existing distress; and said that the history of all the successive Corn-laws had proved that the principle of them was a fraud on the landed interests, and an injury to the commercial ones; and he would support it no longer in any shape.—Mr. Wodehouse contended that the landlords bore more than their proportion of the public burdens.—Dr. Bowring enlarged on the present distress, specifying several employments in which wages are miserably low. This distress was leading to a demand for great political changes. The feeling was, that in the House of Commons there were too many who represented the few, and too few who represented the many.—Mr. Gibson rejoiced in the admission now made on all sides, that no legislation can be justified for the sake of a particular class: yet it was for the sake of a particular class that these laws were maintained; though that class were remarkably sensitive in denying it. They talked about independence of foreign supplies; but he had heard of no country in any age which failed to get supplies of food when it had the means of purchasing them. As to the Corn-laws, the farmers had no interest in them: they were imposed only for the maintenance of rents.—Mr. Escott protested against the mad disturbance of a system under which so much property had been invested, and in which so many interests were involved. Was the House prepared, before the ink of the last agreement for tithe commutation was dry, to rescind the very ground of the contract? The manufacturers owed to the agriculturists what the agriculturists could never owe to the manufacturers—existence itself. He illustrated from Roman history the danger of relying on foreign supply. For his own part, he would stand by the landed, which he considered to be the English, interest.—Mr. Ewart then moved an adjournment of the debate.

Wednesday.—In reply to a question from Mr. Fox Maule on the subject of turnpike trusts, Sir James Graham said that it was the intention of his hon. friend the Member for Cambridge to introduce a General Turnpike Bill.

Mr. R. Wason moved that Sir Thomas Cochrane be called to the bar of the House to answer certain allegations in a petition from W. H. Ashurst, to the effect, that the gallant admiral was about to leave the country, although he had been served with the Speaker's warrant to attend the committee on the Ipswich election, and produce certain important correspondence in his possession.—The motion was opposed by the Attorney-General, the Solicitor-General, and Sir R. Peel, and supported by Mr. O'Connell and Mr. Aglionby, after which it was withdrawn.

Some conversation then took place as to the intended course of public business in the House, in consequence of a question from Mr. Hawes.—Sir R. Peel declared his determination that no other business should be introduced on the part of Government, until the resolutions of the committee upon the Corn-law had been disposed of.

On the motion of Mr. F. Maule, the Buildings Regulation Bill and Borough Improvement Bill were ordered to be read a second time that day six months, on the ground that as they had been passed by the Lords, they involved a violation of the privileges of that House. The hon. member gave notice of his intention to move for leave to bring in two similar bills.

The House then resolved itself into committee upon the resolutions of the Government relating to the importation of corn.—Mr. Ewart resumed the debate, and spoke at considerable length in support of the resolution of Mr. Villiers. He gathered from the language of ministers that they did not contemplate the permanence of their measure; there was not only a sliding scale, but a sliding cabinet. He attributed the existing distress to none of the causes assigned for it by Sir R. Peel, but to a cause hitherto existing alike in all times, whether of prosperity or of adversity—the present Corn-law.—Mr. F. Berkeley, Mr. Thornely, Mr. Hastie, and Mr. O'Connell addressed the House to the same effect.—Col. Conolly supported the measure of Government, and Mr. Hawes and Mr. M. Phillips advocated a total repeal.

Sir R. Peel took a comprehensive view of the recent history of British commerce with various countries, in order to show that the present depression of the manufacturing interest has not arisen from the operation of the Corn-law. The right. hon. Baronet appealed to the good sense of the House in deprecation of any unnecessary prolongation of the discussion.

Lord John Russell argued against such precipitation as would deprive any member of that House of the opportunity of being heard upon the question. The question was one for Parliament to deliberate upon; they, and not the Ministers, were to decide it. Was the House to pass in a hurry a measure which Ministers had taken so many months to consider? The manufacturers were bound to ponder it well; and the agriculturists, who had given way, would expect that it should be so well digested as to be permanent when once passed.

After a few words from Sir R. Peel, Mr. Johnstone moved the adjournment of the debate. The gallery was cleared for a division, but none took place, and the debate was therefore adjourned.

Thursday.—Mr. O'Connell renewed his question respecting the outrages in Jamaica. Lord Stanley entered into some details respecting the history of the case, and stated that the matter was still under investigation. The conduct of the Mayor of Kingston had been disapproved of by the Governor of Jamaica.

Lord Eliot obtained leave to introduce a bill for the purpose of legalising marriages in Ireland between Presbyterians and Episcopalians, when solemnised by a Presbyterian clergyman.

Mr. Muntz brought forward his motion, that strangers in the gallery should not be required to withdraw during a division, unless on special motion. It was resisted by Sir Robert Peel, and lost by 187 to 51.

Colonel Sibthorp addressed the House at some length, in moving for returns connected with the management of the Comptrollership of the Exchequer.—The Chancellor of the Exchequer had consulted Lord Monteagle on the subject of the returns, and that noble Lord had expressed his anxiety that the motion should be acceded to. Though, therefore, it was contrary to his own sense of right and propriety, he (the Chancellor of the Exchequer) consented, lest it should be thought that there was a wish to conceal anything. The House then went into committee on the Corn-laws at ¼ to 7, and the adjourned debate was resumed by

Mr. Johnstone, who expressed his regret that the Government should have brought forward a measure to perpetuate class legislation.—Mr. V. Stuart had attentively considered the subject, and had come to a dispassionate conclusion, that agriculture could not be injured by a repeal of the Corn-laws, while the condition of the country imperatively called for a great change in our policy.—Mr. Aglionby said the extreme distress of the country called for alleviation, while there was nothing in the measure of her Majesty's Government which held out a prospect of relief. A sliding scale was pernicious to the farmers and fatal to the manufacturers. A moderate fixed duty, had it been adopted, might have been beneficial.—Mr. Heneage said that the fundholder had, at former periods, been as much an object of invective as was now the landowner; then the remedy for distress was the sponge, now it was a repeal of the Corn-laws. He had voted against a fixed duty, and would now certainly vote against this ruinous motion.—Mr. Horsman affirmed that the whole of the existing laws were based on the false principle of protection, which had been abandoned by Sir Robert Peel: while the new measure of Government unsettled everything, and settled nothing.—Sir R. Bateson would support Sir R. Peel's measure, though he feared, so far as Ireland was concerned, that the protection to home-grown oats was rated too low.—Mr. Protheroe, as the representative of a manufacturing constituency somewhat peculiarly situated with respect to impartial judgment, gave their opinion and his own, that the Corn-laws were the cause of the existing distress. He should, therefore, vote for their repeal, as the only means of giving relief to our people by extending trade and commerce.—Sir Howard Douglas spoke at some length against the doctrines of free trade, and declared that all the Presidents of the United States, from Washington downwards, more or less repudiated them in their annual messages.—Mr. Cobden had sat for seven nights listening to debates on Corn-laws, but had not heard above two hours devoted to the bread-tax. As to the influence of the price of food on wages, where else was labour cheaper than in this country, when quantity was compared with quality? The men of England were treated by the landed interest worse than their dogs and horses, which were fed in proportion to their toil.—Mr. Ferrand asserted that it was not the Corn-laws, but the master-manufacturers, who taxed the food and clothing of the workpeople by unjust exactions. It was not, perhaps, known that they consumed 100,000 quarters of wheat annually in defrauding the public by bedaubing their calicoes with flour-paste. By this means they gave a false appearance to their calicoes, and made that which was really bad appear both beautiful and good; but on washing, the confiding purchaser became fully sensible of his loss.

Mr. Ferrand's speech called up Mr. Brotherton and Mr. Cobden, in order to explain; and Mr. Hindley censured the spirit and temper evinced by the Member for Knaresborough. Mr. Hindley also went into the general subject of the Corn-laws, but was greatly interrupted in the course of his speech by calls for a division.—Mr. Gill (Plymouth), Mr. Fielden, and General Johnson followed, but they were heard with great impatience.—Mr. Villiers then rose to reply; he censured Mr. Ferrand for the unseemly speech which he had made, and the Government side of the House for the way in which it had been received. He challenged that gentleman to bring his reckless assertions to the proof, and vindicate at once his own veracity and the dignity of the House. As to the general argument on the Corn-laws, nothing like a reply had been attempted; the Government measure itself was a concession to agitation, and an acknowledgment in part of the justice of the repeal of the Corn-laws.

The House divided, when there appeared—For Mr. Villiers's motion, 90; Against it, 393; Majority, 303.

Friday.—Mr. CHRISTOPHER brought forward a motion for a higher scale of duties. He proposed that the maximum duty should be 5*s.* higher than the maximum duty proposed by the Government—namely, that at 50*s.*, and under 51*s.*, the duty should be 25*s.*, gradually decreasing until at 73*s.* the duty should be 1*s.* His object was to show, that while considering the proposed scale of the Government a decided improvement on the present system, and however desirous he might be not to be found opposing the administration, he thought that a higher maximum duty and graduated scale were required for the protection of agriculture. After a long debate, the House affirmed the resolutions of Sir R. Peel by a majority of 306 to 104.

CITY.

Money Market, Friday.—Consols have advanced to $89\frac{1}{4}$ to $\frac{3}{8}$ money, and $89\frac{5}{8}$ to $\frac{1}{2}$ for the new account (April 14th.) Three per Cents. Reduced, $89\frac{3}{4}$; Three-and-a-Half per Cents., $99\frac{7}{8}$ to 100; New Three-and-a-Half per Cents., $98\frac{7}{8}$, to 9; Bank Stock, $169\frac{1}{2}$ to $70\frac{1}{2}$; India Stock, 245 to 6; Exchequer-bills, 22s. to 24s. premium.

Metropolis and its Vicinity.

The Weather.—On Saturday morning until twelve o'clock, the whole of London was enveloped in a dense fog, of so thick a description that it was almost impossible to see from one side of the street to the other. The gas was lighted in many of the streets and shops, and candles were used in almost all the houses. It was so thick about London-bridge that many of the steamers did not venture to start until several hours after their appointed time. A Margate boat was the first to make the attempt, but was obliged to drop her anchor opposite the Custom-house; she was speedily followed by one or two Gravesend boats, but they were obliged to drop their anchors, and could not proceed before the afternoon. Several accidents occurred in different parts of the River.

Metropolitan Improvements.—In the House of Commons, on Thursday, the Sheriffs of London presented a petition at the bar of the house from the lord mayor, aldermen, and common council, praying that some means might be adopted to diminish the nuisance arising from the smoke of steam-boats on the river, and also of the manufactories in various parts of the metropolis.—Sir M. Wood also moved for the appointment of a select committee, to take into consideration any plans for the improvement of the metropolis which they may deem worthy of consideration; and also, the petitions presented to this house in the last parliament, for the purchase of the interests of the proprietors of Waterloo, Southwark, and Vauxhall Bridges, in order to their being immediately opened to the use of the public free from toll; and to report their opinion as to the expediency of adopting any of the said improvements, and also as to the best means of carrying the same into effect.

The Metropolis Roads.—In the debate in the House of Commons on Friday, a conversation of some interest to persons residing in the suburbs took place between Mr. Borthwick and Sir James Graham. Mr. Borthwick asked of the right hon. baronet the Secretary for the Home Department, what steps were likely to be taken in regard to the lighting of the approaches to London. Up to a very recent period these approaches had been lighted by means of money collected as tolls. But during the present winter, in consequence of the increase of communication by railway, the tolls had so much decreased, that the trustees of the roads could no longer light those roads, and had, in fact, refused to light them. The parishes, also, had declined to light the roads. The consequence was, that persons passing to and from the Metropolis by night were exposed to much danger. He wished then to ask the right honourable gentleman, whether he had any measure in contemplation for the purpose of securing the safety of persons travelling by these roads, by compelling the parishes, or some other authorities, to light them? Sir James Graham said that the various parishes had power by law to make rates for the lighting of the roads, if they should think fit to do so, but the executive had no power to compel them to do so. He had been applied to by some of the inhabitants of the parish of Kensington on the subject, and he had recommended that a vestry-meeting of the rate-payers should be called, and that the propriety of levying a rate for the purpose of lighting the roads should be submitted to them. The vestry meeting was called, and he regretted to say that a large majority decided against levying any rate for that purpose. It was a question entirely for the decision of the rate-payers of the different parishes, and the executive had no power whatever to interfere in a matter of local taxation for such a purpose.

Metropolitan Prisons.—After the adjourned debate on the Corn-laws on Monday, Sir J. Graham obtained leave to bring in a bill for consolidating the Queen's Bench, Fleet, and Marshalsea prisons, and for regulating the Queen's Bench prison. The right hon. baronet stated that the Bill would have the effect of bringing all the prisoners in these prisons within the walls of the Queen's Bench, by which a considerable saving would be effected to the country, while a better discipline would be established among them; the size of the Queen's Bench prison was ample for the purpose in view; and it was proposed to include certain regulations for its better government in the Bill.

Public Meetings—A meeting of the friends of the late Mr. Sydney Taylor was held on Saturday in Exeter Hall, for the purpose of raising a subscription for paying some tribute of respect to his memory. Sir John Chetwode, Bart., M.P., presided. A letter, highly complimentary to the memory of the deceased, was read from the Duke of Buckingham, and Mr. Thomas Clarkson also bore tribute to his zeal in the cause of philanthropy. It was ultimately determined that the funds raised should be appropriated to the erection of a monument to his memory, and to the dissemination of his works. A committee was appointed to carry out the objects of the meeting.—Several meetings have recently been held for the purpose of establishing an asylum for the destitute French in the Metropolis, at the expense of their more opulent countrymen. The institution is now definitively established, and a committee of the oldest French inhabitants of London has been formed to manage the charity. Count D'Orsay, to whom the credit of this philanthropic establishment is due, observed at the first meeting that it was essential to limit the nature of the relief, so as not to offer a premium to indolence or vice, and to avoid holding out any temptation to the poor on the Continent to resort to London for the purpose of availing themselves of its resources. He also thought that no appeal for pecuniary assistance ought to be made to the English; that England had her own poor to take care of, and that at the present moment of distress it was more becoming to refrain from soliciting that charity for foreigners which, if solicited, would not be withheld. The meeting afterwards adopted the proposed regulations of the society. An asylum will be forthwith opened in London for the reception of indigent French, and for the supply of articles of primary necessity. No money relief will be given to the objects of the charity. The management of the asylum will be confided to a resident director, under the inspection of a committee of subscribers. If the funds raised should admit of it, it is proposed to annex to the establishment a gratuitous school for the children of indigent French in London. Count D'Orsay has been elected president of the society, and Count St. Aulaire, the French Ambassador, has promised it his support and patronage.—The Annual General Meeting of the proprietors of University College took place on Wednesday, Mr. Warburton in the chair. The only novelty in the proceedings was the motion of Col. Leicester Stanhope for introducing religious instruction; the following were the terms of this motion: "That this meeting recommend to the council the establishment of a Professorship of Christian Divinity in the London University; that prayers and the scriptures be read, and at which the students be invited, not compelled, to attend; but those who from conscientious motives object to this course of prayer, are solicited to study according to the principles of their respective pastors." The resolution having been seconded by Mr. Pitt, and warmly discussed, was put to the vote, when there appeared for it six, against it forty.

Royal Society.—At the last meeting, Sir John Lubbock, vice-president of the Royal Society, at the request of the council drew attention to the existence of a fund, called the "Donation Fund," which was very little known, and the dividends of which are to be applied to promote experimental research, or rewarding those by whom such researches are made; the same to be extended to individuals of every country. This fund was instituted by the late Dr. Wollaston, F.R.S., who contributed to it 2,000*l.* in the three per cent. consols; and it has since then received contributions of 1,000*l.* from the late Mr. Davies Gilbert; 105*l.* from Mr. Warburton; 105*l.* from Mr. Hatchett; 105*l.* from Mr. Guillemard; and a similar sum from the late Sir Francis Chantrey. The dividends for the present year thus available to scientific purposes amount to 140*l.* 16*s.* 6*d.*

Metropolitan Post.—The following is the weekly statement of the letters which have passed through the London office:—

THROUGH THE GENERAL POST.	
Four weeks ending Feb. 19, 1842 . .	5,459,385
Corresponding period of 1841 . .	4,955,579

Accident.—A serious accident occurred at the foundry of Sir John Rennie on Saturday. It appears that several men were employed in holding the rim of a pot, or ladle, containing about six tons of melted mettle, which was carried by a crane from the furnace to a mould prepared for a diving-bell, when, owing to the ignorance of some of the men, the ladle became top-heavy, and the whole of the metal was capsized, and ran amongst the workmen, six of whom were so severely burned that it was necessary to carry them immediately to Guy's Hospital. A part of the wood-work about the premises was fired by the melted metal, but was soon extinguished. One of the workmen died in the hospital on the following day. At the inquest held to inquire into the circumstances, it was proved that the accident was caused by the fright of one of the workmen, who ran away from the ladle, and thus caused it to upset. The jury returned a verdict of "Accidental death."

Robberies.—On Saturday, the magistrates of the Thames-street Police-office was engaged for some hours in the final examination of six persons, charged with being concerned in no less than fifteen burglaries in Mile End, the Commercial-road, Bedford-square, and other places at the eastern part of the Metropolis. The prisoners were George Fernley, a fellowship porter, his two sons and sister, a young man named Bennett, and Aby de Soiza, a Jewess. The two principals in these robberies appear to have been Elizabeth Fernley and Bennett, who is well known to the police as having been a thief from infancy. The houses of the persons robbed were broken into during the last four months, and wearing apparel, linen, plate, money, and other valuables stolen to the amount of 700*l.* About three weeks since, the police received information that Elizabeth Fernley was in the habit of pawning stolen property, and communicated with the pawnbrokers. On searching her dwelling in Bethnal-green, they found the elder Fernley, his two sons, and the Jewess. The officers discovered a complete set of housebreaking implements in the house, together with about 80 china vases and other chimney ornaments, a tortoiseshell box, a trinket box, and several table-cloths, and other articles. On searching the lodgings of the elder prisoner, in Whitechapel, a great-coat and other stolen articles were found, many of which were identified by some of the numerous householders who thronged the office in support of the indictment. Mr. Ballantine summed up the voluminous evidence he had heard, and said all the family of the Fernleys appeared to be connected with the robberies. They were all taken out of the same house, three of them were in possession of stolen property, and the fourth was found loitering about the houses which had been burglariously entered. The Jewess had also been disposing of stolen property, and was found in the same house. As to Bennett, he was, no doubt, the principal in the numerous burglaries committed, and had been engaged in a long career of crime. He should now fully commit all the prisoners for trial. They were then formally committed on nine different charges of burglary. There were ten or twelve other cases of burglary ready to be preferred, but it was considered unnecessary to accumulate more evidence.—On Tuesday, a Russian, named Bowniski, was brought up before the magistrates at Clerkenwell, charged with stealing a gold watch chain and seals, valued at 50 guineas, from the office of Mr. Tooke, solicitor, Bedford-row. On being apprehended, the prisoner attempted to murder the policeman, and had nearly succeeded in committing suicide. The case was fully proved, and the prisoner was committed for trial. It was said that he has been a writer of begging-letters, representing himself to be a Pole.—Another occurrence of a somewhat similar character took place on Wednesday. A young man, named Rowen, under-warehouseman at the printing-office of Messrs. Bradbury and Evans, Whitefriars, who had been apprehended on a charge of robbery and conveyed to Bow-street, cut his throat with a razor while the officer was leading him through the passage of the police-court. He was at once conveyed to Charing-cross Hospital, with little hope of his recovery.

Mortality of the Metropolis.—The following is the number of deaths, from all causes, registered during the week ending Feb. 12th:—total number 1,042—weekly average of 1841, 912.

Camberwell.—It is said that the committee for opposing the proceedings of the vicar, churchwardens, and church-building committee of St. Giles's, Camberwell, have succeeded in putting a stop for the present to the plans intended to be carried out. It is understood that the Exchequer-bill loan commissioners, having taken the opinion of the law-officers of the Crown, have refused to grant a loan of 20,000*l.* of Exchequer-bills, on the ground that the proceedings have not been in accordance with law.

Brentford.—On Saturday afternoon considerable excitement was occasioned in the Metropolis by the circulation of a report that one of the powder-mills on Hounslow-heath had blown up in the course of the forenoon, by which several lives had been lost and persons wounded. The following are the particulars of the occurrence: The works at which the explosion occurred, are those belonging to Messrs. Curtis and Harvey. About seven A.M., two men, named Finch and Woolman, commenced their duties as usual in a corning-mill, at which time there were thirteen or fourteen barrels of dry powder, each containing 100lbs. weight, in the mill. From the time of their entering the mill they were not seen by any of the other workmen, so that no clue can be obtained as to the cause of the explosion, which occurred about ten o'clock. The report occasioned by the explosion of so large a quantity of powder was tremendous, and shook the houses, for miles round, to their very foundations, to the great alarm of the inhabitants, numbers of whom rushed out of their dwellings, believing that it was an earthquake. The mill was blown to pieces, and the remains were scattered to a considerable distance. Mr. Harvey, one of the firm, was speedily on the spot, and by his directions the other workmen began searching for the unfortunate sufferers, when it was found that, in addition to the two men, who were ultimately discovered to have been blown across the stream, where they were picked up quite dead, three other men, who were accidentally passing the mill at the moment, had received serious injuries, from which one of them shortly after died. At the inquest held on the bodies of the three men, the coroner said it was unfortunate that, at every inquiry into accidents of that nature, they got no nearer the truth as to the cause, and he felt if the mills were his he would never rest until he had found it out. With the evidence before them, they could come to no other conclusion than that the deaths of the unfortunate deceased had been caused by accident, for there did not appear to be the slightest blame attachable to any one. The jury expressed their concurrence in the opinion of the coroner, and returned a verdict that the deceased died from injuries caused by the accidental explosion of gunpowder. It is said that the other two injured men are likely to recover.

Provincial News.

Brighton.—In consequence of the inconvenience to which her Majesty was subjected on her arrival here by the crowd pressing around her when she made her appearance in the streets, the commissioners of the town have issued a handbill, requesting the inhabitants to refrain from congregating about her Majesty. The notice had the desired effect, and the Queen now walks out without being subject to molestation such as was at first offered, even by respectable females.—Archdeacon Wilberforce attended a meeting at the Town Hall on Monday, in behalf of the Society for the Conversion of the Jews, and in the course of his address announced that Prince Albert had given 100*l.* as a donation to the society.

Bristol.—Advices have been received from the African coast, announcing the loss of the schooner Pitt, of this port. It appears that on the 7th Oct. the vessel got ashore upon Cape Lopez, in beating down the coast, from Gaboon to Angola, the wind being very light and the current strong. The crew not being able to succeed in getting her off, sent the krowmen ashore to the King of Cape Lopez for assistance, but he refused, and stopped the men. Two days afterwards they observed the natives alongshore in their canoes, in great numbers, preparing to come off and take possession. The captain and crew fearing that they should be murdered, resolved to abandon her, and embarked in the long-boat, taking only part of their clothes with them. Before leaving the vessel, the captain set fire to her, in order that the natives should reap no benefit by the loss. In about an hour she blew up, and shortly afterwards a sea struck the long-boat and swamped her. Capt. Antrobus, the mate, and two of the crew, were immediately drowned. The second mate and four of the crew were saved, after being in the water twenty-four hours; but only three have survived to reach England, viz. Mr. Knight, second mate, and two seamen.

Cambridge.—The fine breezes and drying weather for the last few days have proved beneficial to the fens. The lands which had previously been very wet or under water are quickly getting dry, and in working order for the operations of spring. The wheat, where kept dry, is looking healthy, and where wet or overflowed has sustained little if any injury. Numerous flocks of sea-birds have lately visited the Meres, from which circumstance it is inferred that the severe weather is not yet over.

Chatham.—One day last week an artilleryman belonging to the East India Company met a countryman driving a team of horses near the Star, on Chatham-hill. They entered into conversation, and the soldier persuaded his companion to have something to drink. After drinking some time, the soldier induced the countryman to exchange clothes, and see how he would look in regimentals. The soldier put on the countryman's clothes, and contrived to slip out of the room, but forgot to return, taking with him a watch and 7s. It was some time before the countryman found that his comrade had disappeared, and he was at length obliged to drive his team in full regimentals. As he passed through Chatham, he was taken up as a deserter and conveyed to the barracks, when the cause of his military appearance became known. The deserter has not been heard of since.

Falmouth.—On Thursday morning, the 17th, a vibration of the earth, accompanied by a rumbling noise, supposed to be the effects of an earthquake, was felt in this town, Penryn, Helston, Constantine, St. Mawes, in the parish of St. Just, and in some other places. So great was the motion, that doors in the houses are said to have been thrown open. Great alarm was excited; but no serious injury appears to have been sustained.

Leeds.—The local papers state that on Wednesday, the 9th inst., some evil-disposed persons entered the Free Grammar School at Batley, and wilfully set fire to a large quantity of school-books and other property, to the imminent peril of the premises. Not satisfied with this, they proceeded to the vicarage and parish church, where they left ample proof of their love of mischief. A reward has been offered for the discovery of the parties, but no trace of them has yet been found.

Liverpool.—The steam-ship Acadia left this port on Saturday on her outward passage for Canada and the United States. She took the mails from the Caledonia, the largest ever despatched from this port, and an additional heavy one made up since the return of that vessel. The Acadia, although not intended to go to sea for some weeks, was, in the course of Friday, got out of dock into the river, provisioned and equipped for sea in the most efficient manner. All the passengers from the returned steamer embarked on board the Acadia, with some others, and she steamed down the Mersey, a little past two o'clock, firing her guns, in sight of thousands who had assembled to witness her departure. During the severe storm which disabled the Caledonia, her engines never failed her, and an examination of them since her return has shown that they sustained no injury whatever.—A letter has been received from the Cape of Good Hope, dated December 17, 1841, containing the following passage: "The emigrant ship Lloyd's, bound from London for New Zealand, has arrived at Table Bay. During the passage from England no fewer than 57 infants and children, all under six years of age, died from diarrhœa."—An account has appeared of the interview between the deputation from the American chamber of commerce of this port and Sir Robert Peel on the subject of the Corn Laws as they affect the trade between Great Britain and the United States. The deputation, it is said, stated, among other reasons, that the southern states were anxious for an extension of the intercourse with Great Britain, and the eastern states, the seat of manufactures, were desirous that it should be limited; the middle states were wavering on the subject, but ready to throw their weight on the side from which they might hope to derive the greatest advantage; that the settlement of the corn-law question in this country would have a material influence on the condition of things in the United States; if that settlement should lead to the regular import of corn from abroad, and on terms on which the American grower could compete with the Continental grower, then the middle states would in all probability side with the southern, and thus greatly extend the market for British manufactures, which was limited at present by the state of the law, which practically prohibited the exportation of "bread stuffs" in return for our manufactures; that the system of taking the averages operated disadvantageously for the United States, and that a longer period than six weeks, perhaps eight or ten, would be requisite to put the American merchant on an equal footing with the Continental merchant in the supply of the British market.—The local papers state that the shipowners of Bristol, like those of London, have been compelled to admit that Liverpool is the port of transit for passengers as well as goods to the United States; the proprietors of the Great Western, after running their splendid steam-ship for several seasons to and from New York, having resolved to run her alternately from Bristol and Liverpool to New York, and thence alternately to Liverpool and Bristol. By the new arrangement, the Great Western will, during the season, sail twice from and thrice to this port; thus competing directly with the British and North American royal mail steamers.

Manchester.—A special meeting of the Chamber of Commerce has been held to consider the ministerial proposition for the modification of the Corn Laws. The following resolutions were submitted by the directors, and unanimously adopted:—That, in the opinion of this meeting, the propositions for modifying the Corn Law which have just been submitted to the House of Commons by her Majesty's ministers are totally inadequate for every beneficial purpose; that they are based upon unjust principles, and have been framed for the exclusive advantage of a particular class, without reference to the wants and interests of the great body of the people, and ostentatiously regardless of present distress, and of the ruin which impends over the manufacturing and commercial community. 2. That in expressing their opinions, this meeting reiterates the declaration the chamber has frequently put forth, namely, that it denounces partial or class legislation of every kind, and repudiating all protection whether of manufactures or agriculture, claims, as an indefeasible right, the power of freely exchanging the products of our industry for the food of other countries. 3. That these resolutions be set forth in a petition to the House of Commons, and be forwarded this day for presentation, with a prayer that the measures proposed by her Majesty's ministers may be rejected by the house, and that no proposition may be entertained which has not for its basis an entire repeal of all duties on the importation of food."

Merthyr.—The "Carmarthen Journal" notices a prevalent report that the Chartists are again on the move, and states that meetings are held every night, and that a club is also in existence, where each member pays a certain sum monthly, for buying muskets and ammunition. No less than six hundred muskets, it says, arrived at Merthyr last week, which were sold to the members of the club at 13s. each. The same journal expresses apprehensions that were a rise to take place, numbers would join the infatuated people, as many are in actual want of food, and the distress and poverty existing in the neighbourhood is extreme.

Oakhampton.—An inquiry has been instituted into the cause of the recent destruction of the parish church of this town by fire. From a statement of the vicar, it appears that the fire originated wholly from accident, and not by incendiaries, as has been circulated. He says that a short time since a stove on Dr. Arnott's principle was erected in the organ-loft to keep the organ dry, and the flue was carried through the ceiling, and out of the western wall above the belfry in the tower. During the morning, the wind, which blew a gale from the westward, caused an unusually great change in the stove, and the heat in the organ being considerable, there is no doubt that the iron plate placed between the stove and the frame of the organ became red-hot, and set fire to the woodwork. On the discovery having taken place, an attempt was made to arrest the fire, the organ being the only part in flames; but the smoke was so dense that it was impossible to remain inside, and in less than an hour the roof had fallen in. The fire continued during the whole afternoon, and was not entirely extinguished till midnight. All that remains of the ancient fabric is the tower, which has escaped with slight injury. The loss is estimated to be at least 5,000*l.*

Oxford.—The Rev. Mr. Garbett, the new professor of poetry, delivered the first Bampton lecture for the present year, at St. Mary's Church, on Sunday. The church was crowded in every part. Mr. Grant, commoner of St. John's college, has announced his secession from the establishment, and has followed the example of Mr. Sibthorp, who was ordained a priest of the Romish Church at Oscott a few days since. It is rumoured that several junior members of the university intend to join the Roman Catholic communion shortly.

Portsmouth.—The court-martial held by order of the Lords of the Admiralty on Capt. Toup Nicholas and the officers of H. M. S. Vindictive, for their conduct on the occasion of that ship running aground near the Nab light, has at length been brought to a close. The particulars of the accident were given by us at the time: it is therefore only necessary to state that it was proved by witnesses on the part of Capt. Nicholas that the ship was at anchor off the Nab on the 26th ult., and that stormy weather coming on, Capt. Nicholas got her under weigh for the purpose of proceeding to a better anchorage; but by some accident, not explained, the ship did not take the course intended, and struck on the Dean shoal. The evidence further proved that Capt. Nicholas personally superintended the working of the ship, and that his proceedings, both before and after she struck, were considered to be judicious and proper. Numerous technical details were adduced and witnesses were examined at great length on various points of seamanship arising out of the peculiar circumstances of the case. The trial, after lasting several days, terminated on Saturday, when the court acquitted Capt. Nicholas, together with his officers and crew, declaring that they could not decide with precision on the causes which led to the disaster; that the conduct of Capt. Nicholas was marked by propriety and energy, and was such as to inspire confidence in those around him; and that every possible exertion was made to save the ship, and to prevent worse consequences than did occur. At the conclusion of the sentence there was some indication of applause.—Much satisfaction has been caused in the naval circles of this port by the intelligence that Mr. Edmund Elton, late midshipman of the Cambridge, whose case has excited a good deal of attention, in consequence of his having been dismissed the service, and sentenced to imprisonment for writing a disrespectful letter to a senior officer, was released last week from the Marshalsea by order of the Lords of the Admiralty.

Sidmouth.—On Saturday night an enormous portion of the Chit-rock cliff, at the western end of this town, fell with such violence as to cause great consternation to the inhabitants in the vicinity, to whom it appeared as the shock of an earthquake. A person in an adjacent cottage asserts that he was thrown out of bed by the violence of the concussion. It is described by the "Western Times" as being not what may be termed a landslip from an inclined plane, but a vast section fallen from its perpendicular, preserving a well-defined outline of its various stratifications, affording an ample field of research to geologists. There are also detached masses in all shapes and positions, many of them resembling gigantic slabs of hewn marble, so even are their surfaces. Numerous persons have been to visit the place, many of them searching for fossils, and other geological remains.

Southampton.—The local papers state that some excitement has been caused by the practice of the Judges in Guernsey and Jersey to transport the convicted criminals to this town. A highway robber recently convicted of four distinct felonies in the former island is ordered to be shipped for this port, where he will be let loose upon the public. In the Jersey court, about a fortnight ago, another offender was sentenced to be transported to England, on the recommendation of the Attorney-General. Judge Winter Nicolle is said to have protested against the system, and maintained that criminals ought to be punished in the island. Judge Perrott, however, thought differently; and as the bench was divided, the Chief Justice, Sir John de Veulle, by his casting vote, sentenced him to be transported to England, with his wife and family, who had not participated in his crime.—Intelligence has been received of the wreck of the Commercial Company's steamer Kent, between Hurst Castle and Christchurch Point, on her voyage from Torquay to this town. It appears that she left Torquay on Friday evening with about 50 passengers, and proceeded favourably until the following morning, when a heavy fog came on, during which she ran on shore. The shock is said to have been so great that all those on deck were knocked down, and two of the seamen thrown overboard; but they fortunately regained the deck. The greatest alarm prevailed among the passengers, several of whom were females, and it was fully anticipated that the vessel would go to pieces. Capt. Lakeman lowered his boats, and in the course of an hour all the passengers were safely placed on shore. In the mean time assistance arrived from the Coast Guard Service, when every exertion was made to get the vessel off, but it was found impracticable: these attempts have since been renewed, but without success, and the vessel has become a total wreck. She is not insured.

Railways.—The traffic of the principal railway companies for last week is stated to be as follows: Blackwall 538*l.*, Manchester and Birmingham 322*l.*, Eastern Counties 656*l.*, Birmingham 13,409*l.*, Croydon 275*l.*, Greenwich 697*l.*, Great Western 9,541*l.*, Southampton 3,793*l.*, North Midland 3,698*l.*, Great North of England 1,341*l.*, Midland Counties 2,503*l.*, York and North Midland 1,468*l.*, Birmingham and Gloucester 1,303*l.* — In the House of Commons on Monday a conversation took place in regard to accidents on railways. Mr. Ewart wished to know whether it was the intention of her Majesty's Ministers to alter that anomaly in the law which gave compensation to individuals who happened to be injured on railways, but refused it to the relations of persons killed on railways? whether, in fact, it was intended to introduce a reform with respect to the law of deodand? The Attorney-General said that at present he was not aware of any such intention.—A special general meeting of the shareholders of the Eastern Counties Railway Company has been held at the station in Shoreditch, for the purpose of raising a further sum of money by the issue of new shares, and for declaring the forfeiture of certain shares on which the calls were unpaid. The chair was taken by Mr. Bosanquet, who submitted to the meeting the plan of the directors, which was embodied in a string of resolutions, and suggested the creation of 36,000 new shares of 25*l.* each, upon which the sum of 8*l.* 6*s.* 8*d.* only was to be payable in the following manner: 2*l.* 6*s* 8*d.* on the 5th April, 2*l.* on the 4th June, 2*l.* on the 5th August, and 2*l.* on the 5th Oct. next; one of such new shares (as nearly as practicable) to be given for every three of the original shares, and for every three of the convertible debentures, or as the case may be, for every three of such shares and debentures jointly, the new shares to be entitled on the 4th of next Jan. to rank with the now existing shares in respect to the traffic of the previous half-year, and from and after that date, in regard to dividends and all other purposes, to be considered as if 25*l.* had been paid thereon. The adoption was carried unanimously. Mr. Hamilton thought the debenture and the shareholder should be put on an equality; the former had paid his 8*l.* 6*s.* 8*d.*, but the latter only 6*l.* 6*s.* 8*d.* The Chairman said the Birmingham did not demand their last call, and the Great Western only

65*l.* out of the first hundred, and still they went on creating new stock. The Directors had only taken care of the old shareholders, and had endeavoured to keep faith with the debenture-holder. A proprietor wished to know whether the Directors meant to call for the 2*l.* instalment during the time the new shares were being paid up. The Chairman hoped that would be left to the discretion of the Directors; and, in reply to a proprietor, said that the question of a reduction of their fourpence toll to twopence-half-penny on the passengers of the Northern and Eastern Railway was at present broken off through that Company not agreeing to their conditions. Two hundred and fifty-seven shares were then declared to be forfeited.—The half-yearly meeting of the Gloucester and Birmingham Railway Company has recently been held at the former city. There was an unusually large attendance of the proprietors. From the report it appeared that the total receipts of the company, for the half-year ending Dec. 31, were 50,114*l.* 5s. 10d., and the expenses, including interest, 39,381*l.* 0s. 8d., leaving a balance upon the half-year of 10,733*l.* 5s. 2d., which, added to the balance declared on the 30th June of 11,170*l.* 6s. 3d., made a total of 21,903*l.* 11s. 5d., from which, however, there were to be deducted for wear and tear, depreciation of the carriage, stock, &c., 5,120*l.*, leaving a clear net profit of 16,783*l.* 11s. 5d. With this the directors were enabled to declare a dividend of 1*l.* 10s. per share, which is the first that has been declared. The total amount of passengers that have travelled upon the line during the six months ending Dec. 31, was 193,276, of which number 50,294 were first-class, and 117,666 second-class passengers.—Mr. Broome, book-keeper at the Manchester and Leeds railway station, Oldham-road, was run over by an engine and tender on the night of the 17th inst., as he was proceeding along the viaduct to his residence in Cropper-street. His left arm was completely severed from his body, and one of his legs was broken, and he died on the following morning.—The half-yearly general meeting of the proprietors of the Great Western Railway took place on Thursday. The report expressed the pleasure of the directors in laying before the proprietors the result of the first six months' business on the entire line of the Great Western, together with that on portions of the Bristol and Exeter, and of the Cheltenham Railway between Swindon and Cirencester. The gross receipts for six months, up to the 31st December, 1841, were 337,352*l.* 4s. 2d., of which sum 295,010*l.* 18s. was earned exclusively on the Great Western. The number of passengers conveyed on the line between the 1st July and the 31st Dec., 1841, was 882,119. The expenses on the traffic amounted to 125,910*l.* 6s., being in the ratio of 37,323 per cent. on the receipts. The locomotive expenditure was 40,110*l.* 19s., of which 22,144*l.* 3s. was paid for coke, but which would become much reduced, arrangements having been made for procuring it at Bristol. The number of miles run by the engines during the half-year was 673,398, of which 613,616 miles were travelled by regular engines with trains of passengers and goods, and 20,654 miles by the assistant engine upon the box incline, and the sum of 15,940*l.* 14s. 11d. had been paid for Government duty. The first charge upon the profit of the half-year was the interest on the Company's debt, and the rents payable under lease to the Bristol and Exeter Railway, and to the Cheltenham and Great Western Union Railway, to the amount of 93,259*l.* 10s. 11d., which, deducted from 212,446*l.* 16s., would leave a balance available to the company of 119,187*l.* 5s. 1d. The report, after recommending that the sum of 20,000*l.* per annum should be appropriated for ten years to meet the first cost, and probable depreciation of stock, concluded by recommending that a dividend of 6*l.* per cent. on the amount called up should be declared for the last half-year.

IRELAND.

Dublin.—The hitherto neglected streets and squares of the city are completely occupied by numerous wealthy families from the most distant parts of the kingdom, attracted by the unusual brilliancy of the Irish Court since the arrival of Earl and Countess de Grey. The local papers repeat their statement, that the trade of Dublin, so far as it is susceptible of being benefited by the stimulus of Viceregal expenditure, has not been in so a healthy a state for the last 20 years. It is said to be the intention of the Lord Lieutenant to take a marine villa for the summer season at Kingstown, for the benefit of sea-bathing and sea-air. This will infuse fresh life into that delightful place, which may now be called a suburb of Dublin, in consequence of the quarter-hour facilities of access by means of the Dublin and Kingstown railway. It is expected that a great source of employment for the poor in that neighbourhood will be created by the extension of the railway to Dalkey, on the principle of Clegg and Samuda's atmospheric plan, which will, it is thought, be commenced in a few months from this time.—At the weekly meeting of the Repeal Association, the proceedings were opened by the announcement of additional donations from the sympathisers of New York. The Lord Mayor then addressed the meeting on the usual topics. He denounced the Poor-law, and hoped there would be a rally against it. In 1830 he prophesied that, if the Union were not repealed in ten years, we would have a Poor-law. He was laughed at; the country gentlemen refused to join him. His words came out true, and he was thoroughly convinced now, that a sanguinary insurrection would take place in Ireland before 1850, if that law were not repealed. He threw that remark out, not in order to the prophecy being fulfilled, but in the hope that it might be prevented. Let American sympathy, he said, proceed; let Irish enthusiasm glow into its proper warmth, and the cry for "Repeal" resound throughout the country. His monument would then be in College Green, and Ireland would be a nation. He described the present Parliament as sustained by the selfishness of the landlord class, and by pecuniary bribery. Never was there, he said, so corrupt a Parliament as the present, or a Parliament brought together by such extensive corruption. It was a Legislature of the selfish interest adverse to Ireland, and founded upon pecuniary corruption. After expressing his hope that the Chartists and Corn-law Repealers would form one body, he proceeded to the subject of Repeal. No nation of nine millions, he said, were ever yet slaves, except by their own fault. If he had a roll on the table signed by five millions of repealers, he would give them repeal. If he had the subscriptions of five millions of repealers, they should have repeal. If five millions of repealers would subscribe one farthing per week, they should have repeal. Where was the man who, when he (the Lord Mayor) should have five millions of repealers, would tell him it would be impossible to get it? He then moved that a committee prepare forthwith a petition to Parliament for the furtherance of reform, to embrace the following subjects: Manhood Suffrage, Vote by Ballot, Short Parliaments, No Property Qualification, and the Equalisation of Voting Districts. His Lordship announced the week's rent to be 243*l.* 13*s.* 9*d.*—At one of the late sessions in this country, a man was sentenced to death for stealing a goat. On Friday, previous to the debate on the Corn-law in the House of Commons, Mr. C. Buller asked Lord Eliot whether in Ireland such a penalty existed for such an offence? He did not suppose for a moment that the Government would inflict such a punishment in such a case; but he wished to know what course would be taken, and what punishment this unhappy man would suffer? Lord Eliot in reply expressed his belief that the main fact was correct, as stated by his honourable and learned friend; but the man was tried, not at the assizes, but at the sessions before an assistant barrister. On the case being proceeded with, it appeared that an ancient statute, which had not been repealed, inflicted the punishment of death in such case; there was, therefore, no remedy to the assistant-barrister but to pass the sentence. On the case being communicated to the Government, they ordered the instant release of the man, as he had undergone several weeks' imprisonment. He (Lord Eliot) regretted that such an Act continued to disgrace the statute-book, and he might add that it was the intention of his learned friend the Solicitor-General for Ireland to bring in a bill to assimilate the criminal law of Ireland with that of this country.

SCOTLAND.

Edinburgh.—A meeting of the General Assembly has been summoned by the Moderator for the 9th of March next, to take steps in the momentous questions of Presbyterian marriages and the present critical position of the Church of Scotland. The latest interesting case which has been before the Court of Session at Edinburgh, is that of the Marquis of Huntley's Aboyne Entail, in which the printed opinions of the consulted judges were given in a few days ago. Lord Moncrieff prepared his opinion at great length, considering upon the whole the entail to be good and sufficient, except as to that part of the estate called Drumniochy, in Birse parish, which he did not think was effectually entailed. The other judges, viz. Lords Meadowbank, Medwyn, Murray, Cockburn, Cunningham, and Ivory, have added a concurrence in opinion with Lord Moncrieff. Lord Jeffrey adheres to his original opinion, as Lord Ordinary, in favour of the sufficiency of the whole entail.

Glasgow.—The magnificent line of railway between this city and Edinburgh was opened on Friday last. In the afternoon a banquet took place in the passengers' shed at the Glasgow terminus, which formed a hall 230 feet in length, and upwards of 80 feet in width. It was calculated to hold 1,200 persons, and the effect is described as very striking. No accident occurred on any part of the line, although large numbers had assembled from various parts to witness the ceremony. The proceedings altogether formed an auspicious commencement to this great national work. The distance, 46 miles, will be performed with ease in about two hours.

Perth.—The salmon fishery has already made a satisfactory beginning. For the last fortnight the take, though not equal to the first few days, has upon the whole been favourable, and far superior to what it has been at the commencement of the season for some years past. Not only in the Tay is the promise good; almost every river in Scotland is doing comparatively well, so much so, that the supply already in the London market has produced a fall in price, and the fishermen in the North are anticipating a prosperous season.

Dalkeith.—The "Caledonian Mercury" states that about a fortnight since, Mr. Williamson, the huntsman to the Duke of Buccleuch, had very nearly met the fate of Actæon, in the kennel near Dalkeith Palace. He had gone into the kennel with a whip in his hand, but without the red coat, when a dog which had been recently added to the pack approached him with a threatening growl, upon which Williamson gave the animal a smart rap over the nose with his whip. The dog instantly fastened on his arm, and directly the whole kennel flew at their master. Fortunately two of the keepers, who were at hand, came to the rescue, and whipped off the dogs. Williamson was considerably lacerated, but is in no danger, as his wounds are rapidly healing.

THEATRICALS.

Drury Lane.—A new play, in five acts, entitled *Gisippus*, was performed for the first time on Wednesday night, with decided success. It is from the pen of the late Mr. Gerald Griffin, author of "The Collegians," and other compositions. The plot is taken from Boccaccio's story of Tito and Gisippo, and the scene lies at Athens through the first three acts, and is transferred to Rome during the fourth and fifth, the period being in the reign of Augustus Cæsar. Our space will not allow us to give the details of the plot this week; but we may state that it is said to have been written when the author was only 20 years of age; and that after being neglected and rejected by previous managers, it has at length been rescued by the appreciation of Mr. Macready, who has brought it forward with all the appliances of scenic art and admirable acting. The success of the play was so great that it was announced for repetition three times a week.

Adelphi.—A drama in two acts, adapted from Scribe's "La Chaine," was produced on Monday, under the name of *The Breach of Promise of Marriage.* The plot is simple, but is complicated by the incidents, and the continual yet humorous *contretemps* of one of the agents. The piece was well acted, and was received with applause by a crowded house.

Haymarket.—A little piece has been brought out here by Mr. Bernard, entitled *The Woman Hater*, and with some pretension designated in the bills a petite comedy. The character which it introduces is not a new one; nor has the author's treatment of it added much to its usual stage characteristics. The whole interest of the plot consists in the successful endeavours of a nephew to overcome the theories of a German Baron, who is represented as the woman-hater. The piece was well received, although it developes the plot too soon, and is devoid of that variety of incident which marks the previous works of this author.

Miscellaneous.

The Duke of Wellington and Napoleon.—It is a singular fact as illustrating national character, that although portraits of Napoleon have been extensively purchased in Great Britain, there is no instance of a portrait of Wellington having been sold in France. This statement appears almost incredible, but circumstances having directed our inquiries to the subject, we ascertained that the leading publishers of London had never received a single order from France for a print of the Duke, nor had they ever disposed of one to a Frenchman.—*Art Union.*

House of Commons.—In our last we gave a list of the ages of several members of the House of Lords as a remarkable instance of longevity. The following is a list of members of the present House of Commons who claim to be wholly excused from serving on election committees on account of being more than 60 years old—Col. Baillie (Honiton), Sir R. Bateson, Mr. Benett, Mr. Bunbury, Sir F. Burdett, Sir C. M. Burrell, Mr. Cartwright, Mr. Chapman (Whitby), Sir J. Chetwode, Mr. Clements, Mr. Clive, Mr. Crawford, Mr. Denison, Sir H. Douglas, Mr. Fielden, the Right Hon. Sir A. Grant, Mr. Gore, Mr. Hoskins, Mr. Irving, Col. Langton, Mr. Loch, Lord Manners, Mr. Marjoribanks, Mr. Ord, Mr. Oswald, Mr. Palmer, Mr. Pendarves, the Right Hon. Sir W. Rae, Bart., Right Hon. Sir G. Rose, Col. Rushbrooke, Mr. Sheppard, Mr. Wallace, Right Hon. C. W. W. Wynn, and Sir M. Wood, Bart.; 43 in all.

British Museum.—The following is a return of the number of persons admitted to visit this national institution:—Persons admitted to view the general collection from Christmas 1835, to Christmas 1841: From 1835 to 1836, 383,147; 1837, 321,151; 1838, 266,008; 1839, 280,850; 1840, 247,929; 1841, 319,374. Number of visits made to the reading-rooms, for the purpose of study or research: about 1,950 in 1810; 4,300 in 1815; 8,820 in 1820; 22,800 in 1825; 31,200 in 1830; 63,466 in 1835; 62,360 in 1836; 69,936 in 1837; 54,843 in 1838; 69,216 in 1839; 67,542 in 1840; 69,303 in 1841. Number of visits that were made by artists and students to the Galleries of Sculpture, for the purpose of study: 4,938 in 1831; 4,740 in 1832; 4,490 in 1833; 5,645 in 1834; 6,081 in 1835; 7,052 in 1836; 5,570 in 1837; 5,015 in 1838; 4,841 in 1839; 6,354 in 1840; 5,655 in 1841. Number of visits made to the Print Room: about 4,400 in 1832; 2,900 in 1833; 2,204 in 1834; 1,065 in 1835; 2,916 in 1836; 4,429 in 1837; 5,017 in 1838; 5,937 in 1839; 6,717 in 1840; 7,744 in 1841.

The Law relating to Seedsmen.—A decision was lately made by a barrister, which is of interest to the public, and especially to persons who sell seeds. A small farmer processed a shopkeeper residing in Westport, from whom he purchased Cabbage-seeds, for the sum of 6*l.*, alleging that be was at so much loss in consequence of the partial failure of the seed. The man who shook the seed deposed that about one-third of it came up, that the land was properly prepared for it, and that the amount of loss sustained by the plaintiff was about 2*l.* The barrister gave a decree for that sum. The defendant said he would appeal, as he gave no engagement with the seed, even if it were purchased from him at all, of which however there was no other proof than the swearing of the plaintiff, and a witness who saw him come out of defendant's shop.—*Exeter Post.*

The Affghan Insurrection.—It is reported that private letters have been received well authenticated, the contents of which are calculated in some degree to relieve the anxiety and alarm created in the minds of the public by the disastrous intelligence with respect to our affairs in Affghanistan communicated in a recent Number. Dr. Burnes has published a letter holding out a slight hope that his brother Sir Alexander, has not perished, and suggesting that he may have escaped, and be in the keeping and concealment of the Kussilbashes, who, it is thought, are friends of Dost Mahomed, and may have protected him. The official accounts reach only to the 19th Nov.; but these private letters state that on the 23d of that month the British troops shut up in the citadel and in the cantonments of Cabul had made a successful sortie simulaneously, had achieved a signal victory over the insurgents, and had recovered the city. The following extract from another letter alludes to the same fact, but in such a manner as to lessen very considerably the hope that Sir A. Burnes is still alive: "Two divisions of our troops, under Col. Elphinstone, having joined near Cabul, and the walls of that town being breached, the place was carried by storm, and the 44th Regiment, enraged by the murder of Burnes, were not to be restrained, and the consequence was, that all the Kussilbashes and part of another tribe were put to the sword." Advices through the same channel represent Gen. Sale's brigade to be still shut up at Jellalabad, but with ammunition and provisions, and in entrenchments sufficiently strong, to stand a siege until relieved by auxiliary troops from the Punjaub.

Law.

Court of Queen's Bench.—*In re Darbon* v. *Rosser.*—In reference to this case of a Breach of Promise of Marriage, which has already been reported in our Paper, it will be recollected that an application was made by Mr. Thesiger, on the part of the defendant last Term, to reduce the damages 1,000*l.* assessed by a special jury who tried the cause, or that the Court of Queen's Bench would be pleased to grant a new trial, when the Court suggested that the parties should agree amongst themselves, and granted time for that purpose, which led to an arrangement between Mr. Platt, Mr. White, and Mr. Pearson, counsel for plaintiff, and Mr. Thesiger, counsel for defendant, who at last agreed that the verdict should be entered for the plaintiff—damages 850*l.* The costs in the cause have been subsequently taxed at 588*l.*; making together the sum of 1,438*l.*

Court of Exchequer.—*The Bank of England* v. *Tomkins.*—*Exchequer bill Fraud.*—This case, which from its supposed connexion with the fraud in the issuing of Exchequer-bills appeared to have excited more than ordinary interest in the City, was entered upon at the sittings of the court. The facts of the case, as stated by Sir W. Follett, were simply these:—defendant Tomkins, in September last, borrowed 11,000*l.* from the Bank on the security of eleven Exchequer-bills for 1,000*l.* each, the advance being for a month only. At the end of the month the Bank called upon Tomkins to repay the advance, and take back his Exchequer-bills, and gave him a day beyond the time to which he was entitled for that purpose. The defendant took away three out of the eleven bills before the credit had expired, but intimated to the Bank that the state of the market, or some other matter, rendered it inconvenient for him to take the remainder, and that the Bank must realise the amount to secure themselves. The bills were accordingly sent into the market by the Bank, and were subsequently purchased for Coutts and Co., the bankers. The bills lay for some days in the hands of Coutts, when rumours prevailed that spurious Exchequer-bills had found their way into the Stock-market, and the bills in question were sent to the office of the Comptroller of the Exchequer for examination, and it was then ascertained that the bills were forgeries. Messrs. Coutts claimed the amount from the party from whom their broker purchased, and that party against his immediate vendor, and so on until these eight forged bills were returned again to the Bank of England, who claimed the amount from defendant, who deposited the bills with them. After Sir W. Follett's address, Lord Monteagle was examined, and stated at considerable length, and in detail, the manner in which Exchequer-bills were signed and issued. The only persons authorised to sign those securities were the witness and Mr. Perceval, the deputy comptroller. The paper was made with a peculiar water-mark. The bills were engraved from plates, engraved for and kept in the custody of the office, and there was an official seal attached. The bills came in a series of 560, which was called a book. Each bill was numbered, and had a counterfoil containing the number, and the counterfoils were retained after the bills were issued. His lordship pronounced the eight bills produced, in his behalf, to be forgeries. Mr. Perceval corroborated the testimony of Lord Monteagle in every particular. Witness signed the series of bills containing the numbers corresponding with the forged bills, on the 11th of March, 1841. The numbers ran from 8,001 to 8,501, and he signed his name to the book to indicate that he had attached his signature to that number of bills. The bills corresponding with the alleged forged bills which were placed in witness's hand, were signed by him on the 11th of March; they were genuine in every respect. The other bills produced, eight in number, were forgeries. The name of the comptroller was not in the hand-writing of the witness; it differed from his hand-writing in many respects. Comparing the bills, now produced, with the counterfoils, he was convinced which were the genuine bills and which the forgeries. Mr. Erle, for the defendant, contended that the question the jury had to dispose of could not be altogether separated from the claim which the holders of the alleged forged Exchequer-bills had on the Government. The Bank of England claimed a return of advances from defendant, on the ground that the Government refused to pay the amount of the Exchequer-bills, or acknowledge their validity. The Government said those bills were forged, and Mr. Perceval now proved that statement. He argued that it would be a grievous hardship, if the defendant, who purchased those bills fairly in the market as genuine securities, having all the indications of being genuine, should now be told that the security in which he had invested his property was worthless, and that the Government would not acknowledge his claim. Lord Abinger said the question as to the claims of the Exchequer-bill holders upon the Government was quite distinct from that which the jury had now to consider. There were a thousand circumstances which might induce Government to pay bills which were forged, when those bills were clearly shown to be in the hands of innocent holders, although such circumstances had no bearing on the present case. He had no difficulty, however, in saying, that in his opinion there was no legal liability on the Government to pay forged bills, although there were other considerations which might induce the Government to pay such bills. He could conceive that the Government might think it proper to pay Exchequer bills though forged, when it was ascertained that those bills were in the hands of innocent holders who had come by them fairly, and yet that they should refuse to pay other bills which the holders did not show had come fairly into their hands. He certainly should not put it to the jury that the Government was under any legal obligation to pay forged bills. He did not see how the Government could be obliged to pay forged Exchequer bills, any more than the Bank of England could be compelled to pay forged bank notes, or any one of the jury to pay a well-imitated forged acceptance. The question in this case, however, was simply, whether the jury believed the eight Exchequer-bills held by the Bank of England, and deposited by the defendant, were forged; and not whether the Government ought or ought not to pay. If they believed the Exchequer-bills were forged, they must find for the plaintiff; if they believed they were not forged, they should find for the defendant. He might add, however, that if the Government were bound to pay the bills in question, the verdict in this case would not prevent Mr. Tomkins from recovering against the Government; nor would it interfere with his claim in an equitable point of view, if he satisfied the Government he was an innocent holder. Indeed, in no respect could Mr. Tomkins's claim on the Government be prejudiced by the verdict in this action. The jury, without hesitation, returned a verdict for plaintiffs—damages, 8,343*l.*

Thornton v. *Portman and Another.*—This was an action arising out of the "Gurney affair," and notice having been duly given that it was expected to "come off" to-day, a great number of the patrons of the turf were congregated together, with others of lesser note, so that the court was at a very early hour inconveniently crowded. The Solicitor-General stated that this was an action to recover the sum of 1,250*l.* as money had and received by defendants for the use of plaintiff, an opulent merchant in the City, but a gentleman who had ever taken a lively interest in the turf. In answer to this demand the defendants had placed two special pleas on record, to the effect that they, together with another gentleman named Clarke, had been appointed to collect all debts due to one Gurney, who had betted largely at the Epsom meeting last year, and also to pay all his debts, and that the money in question had been paid to them by the plaintiff. Besides this, the defendants had pleaded that they did not promise, and upon that plea it was that the plaintiff supposed the case would turn, for it would appear abundantly that the money had been paid to the defendants by the plaintiff, upon a condition which, not being performed by the defendants, the money ought to be refunded to the plaintiff. The name of Gurney was no doubt familiar to the jury through the papers. If not, it might shortly be stated that that person, who kept a public-house in the Borough, was on the turf, that he betted largely in anticipation of the Derby and Oaks races, and had been a defaulter at the settling-day in consequence of the defalcations of other parties who had lost largely to him. It was a rule of the Jockey Club that no party was entitled to receive his winnings if he did not pay his losings, and accordingly various persons who had lost money to Mr. Gurney refused to pay him when the rumour reached them that he did not intend to pay others. Among these were Lord George Bentinck and the plaintiff, while Mr. Portman, a brother of Lord Portman, Mr. Beales, a corn-merchant at Cambridge, and Mr. Clarke, who had won from Gurney, were naturally anxious to receive their winnings. In furtherance of this wish, they resorted to a plan which was of a novel character on the turf, and took upon themselves the payment of all Gurney's losses, as a means of insuring his gains, so that in the end they might receive their share. This was, in some measure, sanctioned by the Jockey Club; but Lord George Bentinck opposed it, unless it was understood that the winners from Gurney should be paid in full with 20*s.* in the pound. The defendants accordingly, together with Mr. Clarke, took upon themselves the task of settling Gurney's affairs, and lodged with the Jockey Club an undertaking to the effect demanded by his Lordship, who thereupon paid his losses at a public meeting at Tattersall's, and recommended all others similarly situated to do the same. The day within which the undertaking limited the settlement by the trustees was the last day of the Houghton meeting; and in order to enable them to comply with it, it was of course necessary that they should call in all that person's winnings. They accordingly required Mr. Thornton to pay his loss, which was 1,350*l.*; but that gentleman having heard that certain parties had been settled with on terms of composition at various rates less than 20*s.* in the pound, demurred to meet the demand, and refused to do so unless the defendants would give him a personal guarantee to repay the sum due from him in the event of their not having paid all Gurney's losings in full, with 20*s.* in the pound, on or before the last day of the Houghton meeting. This guarantee the defendants, after some delay, gave to the plaintiff, who thereupon paid 1,250*l.* through his bankers, and gave them an order on one Atkins for 100*l.* There the matter rested till the day named in the guarantee, which had originally been left blank, as the day was not then known, but was ultimately filled up with the 1st of November, 1841. After that day, the plaintiff demanded back the 1,250*l.* (the 100*l.* never having been "extracted" from Atkins, to use the expression of Mr. Portman), on the ground that they had failed to fulfil the condition under which alone it had been paid to them: a compliance with this demand having been refused on the part of the defendants, this action was brought to enforce the payment of that sum, and various witnesses were called, among others the clerks of the plaintiff, Lord George Bentinck, and Mr. Hyde, who proved the above facts. Mr. Thesiger then addressed the jury, regretting that this, which was rather a proper subject for inquiry before a committee of the Jockey Club, had been submitted to a jury. It was a matter of regret that the plaintiff had thought it proper to bring this case into a court of justice, in order to expose transactions to the keen scrutiny of the law which ought only to be judged by those laws which are technically called the "laws of honour." The jury would not fail to observe that the plaintiff, and those who acted with him in this affair, had put themselves in a position which must appear rather startling to commercial men, for they claimed, being debtors of Gurney, to set up a rule of action by which the debtors would be able to dictate to their creditor whether they should pay their debts or not. This was an anomalous state of things, and however intelligible it might be to the sporting world, must create some surprise among the trading community. At the same time it must be said on the part of the defendants, that they were taken quite by surprise by that portion of the evidence which went to show that the guarantee produced by the plaintiff had been signed by them under the circumstances detailed by the clerks of the plaintiff. He, however, did not at any time feel inclined to make charges against witnesses without sufficient evidence to support them, and he therefore would abstain from making any statement, and calling witnesses to set up any such charges, as he was in a situation to do from his instructions. He would, therefore, yield that to the pressure of the law which he was confident his clients were not bound to pay by any law of honour, and admit that the plaintiff was entitled to a verdict.—Lord Abinger could not but congratulate the jury and himself, too, that they had been spared the necessity of entering upon an investigation of the laws of the Jockey Club, or an inquiry as to which construction was the more correct of the two which had been alluded to to-day. As a judge, he never could allow any such system to influence any case. He was bound to try this cause, as he would any other, by the laws of England; and whatever the opinions might be of Lord George Bentinck or the noblemen who had been named as having assented to the conduct of the defendants, he (Lord Abinger) must decide according to the law, though he might say that he had the pleasure of knowing most of those individuals in private life, and had no doubt of their respectability. The law upon this matter, therefore, must guide the jury, and it was very clear. There was no doubt whatever that the plaintiff had paid this money, which he need not have paid at all, on an express condition and understanding that all the winners from Gurney should be paid in full 20*s.* in the pound; and, whatever the laws of the club might be, it was beyond all question that by the laws of England a payment of 7*s.* or 10*s.* in the pound was no compliance with that condition. The plaintiff had protected himself as he might by the imposition of that condition, and the defendants having adopted it, are bound by it. The evidence was very clear that they had adopted it; indeed it was not disputed, for though Mr. Thesiger seemed to have been instructed to deny that the guarantee produced by the plaintiff had been signed by the defendants, yet he had most properly, and in the exercise of his usual discretion, abstained from offering any testimony in contradiction to that testimony. He was quite right, moreover, in that course, for no one could doubt, on comparing the signatures to the undertaking given to the stewards of the club and those to the plaintiff's guarantee, that they were made by the same parties: and there was no question at all as to the former one. The jury, therefore, would say whether the defendants were not bound to pay back the money so received by them on a condition which had been infringed by them. The jury at once found for the plaintiff—1,250*l.*; whereupon Sir W. Follett said, that his client, having acted on principle in enforcing this demand, was ready to test his motives by publicly declaring his intention to present the sum in dispute to the governors of Christ's Hospital—a statement which elicited applause from the auditory, and a remark from his Lordship to the effect that no one who knew Mr. Thornton could ever have imagined that he resisted the payment of his loss to Mr. Gurney from any lack of means wherewith to satisfy them.

TATTERSALL'S, THURSDAY.—The betting did not commence in earnest until 4 o'clock, and even then was not remarkable, either for its briskness or for its effect on the prices. We may observe, however, that 11 and 12 to 1 were laid outright against Chatham, 10 to 1 in conjunction with other horses, and that the feeling towards him was far from favourable. Wiseacre was also in the shade, 30 and 33 to 1 having been betted three or four times, followed by offers to go on. Palinurus was in high favour at 1,000 to 15, taken two or three dozen times, but did not advance. The Dirce colt, Mr. Batson's Acacia colt, and Mr. Forth's lot, were supported with some show of spirit, and may be looked upon as rising favourites. We have no other changes to record.

DERBY.

8 to	1 agst	Scott's lot	50 to	1 agst	Espartero (taken and afterwards offered)
28	1	Mr. Forth's lot (taken)	50	1	Policy (take 1000 to 15)
7	1	Attila	1000	15	Palinurus (taken)
11	1	Chatham	1000	15	William le Gros (tak.)
30	1	Ballinkeele (taken)	1000	15	Acacia colt (taken)
30	1	Dirce colt	1000	100	Chatham and Artful Dodger (taken)
33	1	Wiseacre	10	1	Chatham and Barrier (taken)
40	1	Auckland (taken and afterwards offered)	10	1	Chatham and Defier (taken)
45	1	Lasso (taken)			
50	1	Joanna colt (taken and afterwards offered)			

OAKS.

8 to 1 agst Passion	15 to 1 agst Adela filly (taken)

MARK LANE, FRIDAY, FEB. 25.—In consequence of the scarcity of fine dry English White Wheat it would fetch more money, but this improvement does not apply to any other sorts. The sale of free Foreign is exceedingly heavy, but prices remain the same, and we hear of no transactions in Bonded Wheat.—Barley sells on the same terms as on Monday: and our quotations are supported for Peas and Beans.—The Oat Trade continues in the same depressed state.—The Clover Seed market is exceedingly flat, and an increased desire evinced by the holders to press sales.

GAZETTE OF THE WEEK.

INSOLVENTS.—E. Rawlinson, Lancaster, share-broker—W. Holmes, Friday-street, Cheapside, silk-gauze-manufacturer—S. L. Lazarus, of the Kent and Sussex Tavern, Jermyn street, Westminster, coach proprietor—R. F. Burton, Cambridge-heath, coal merchant—J. Lockley, Bilston, Staffordshire, plumber—W. Barnes, Shincliffe, Durham, fire brick-manufacturer—F. Pratt, Saredon-mill, Staffordshire, miller.

BANKRUPTCIES SUPERSEDED.—T. Scudamore, Birmingham, chemist—J. S. Needham, Ullesthorpe, Leicestershire, banker.

BANKRUPTS.—J. D. Gandar, of the Old Drury public-house, Brydges-street, Covent-garden, victualler—J. Smith, Blenheim-street, Bond street, milliner—J. Cockburn, New Broad-street, City, merchant—G. Donaldson, 121, Pall-mall, watchmaker—C. Vandergucht, Quadrant, Regent-street, silk-mercer—J. P. Hope, Atherstone, Warwickshire, builder—J. Banks and J. Burgess, Manchester, dealers—J. Davies, Liverpool, oil-merchant—J. Parsons, Mansfield, Nottinghamshire, maltster—J. M'Lean, Liverpool, merchant—S. Flitcroft, Liverpool, ironmonger—E. Harper, of Steeple Claydon, Buckinghamshire, and of Bicester, Oxfordshire, grocer—J. Pilling, Lancaster, innkeeper—J. Drover, Three Cranes-wharf, London, merchant—T. Hurrell, Walthamstow, cattle dealer—J. Dakeyne, Edinburgh, lace-dealer—J. David, Laugharne, Carmarthenshire, maltster—J. Bate, Dudley, iron-merchant—R. Lamprell, Sherborne-lane, City, builder—H. Gouger, Great Winchester-street, City, merchant—G. Dodson, Boston, wool-dealer—V. Hare and J. Hare, Taunton, painters—J. Holroyd, Wheatly, Yorkshire, cotton-warp-maker.

SCOTCH SEQUESTRATIONS.—J. M. Russell, of Leith, and of Balgahatson, Stirlingshire, coal-merchant—T. Thomson, Bridgend, Perthshire, merchant—A. Johnston, Edinburgh, coach and harnesss-maker—R. Houston, Paisley, china, glass, and earthenware-dealer—J. Mitchell, jun., Blairgowrie, innkeeper and potato-merchant—P. Sinclair, Inverary, fish-dealer—A. Inverarity and G. Gow, Glasgow and Demerara, merchants—W. Grieve, Thornhill, near Ayr, farmer and cattle-dealer—W. Morrison, Edinburgh, ironmonger—M. Millar, Airdrie, wright and coal-master.

BIRTHS.—On the 8th ult., in the Island of Trinidad, the lady of G. La Coote, Esq., Judicial Referee, of a son—On the 20th inst., the lady of G. W. Chambers, Esq., of Clough House, near Rotherham, Yorkshire, of a son—On the 21st inst., at Putney, the lady of J. E. B. Curtis, Esq., of a still-born son—On the 21st inst., at Boreham House, Essex, the lady of W. M. Tufnell, Esq., of a son—On the 23d inst., at No. 1, Belgrave-square, Lady Fanny Howard, of a daughter—At Winchmore-hill, on the 22d inst., the lady of C. Radford, Esq., of a son—On the 22d inst., at Highgate, Mrs. J. Beaumont, of a son—On the 22d inst., at the Lawn, South Lambeth, the lady of P. I. Meugens, Esq., of a daughter.

MARRIED.—On the 22d inst., at St. Mildred's, Bread-street, S. Ridley, Esq., of Islington, to Eliza Ann, relict of the late A. Shirley, Esq., of Islington—On the 19th inst., at Charlton Kings, Gloucestershire, Capt. B. Riky, 48th Regiment, Joanna, relict of W. D. Horne, Esq., and daughter of the late P. Garland, Esq.—On the 22d inst., at St. James's, Westminster, J. Mure, Esq., of Woodford, Essex, to Emily Davis, second daughter of R. Heatley, Esq., of the same place—On the 24th, at Weymouth, W. Guise Brittan, Esq., to Louisa, third daughter of the late E. Chandler, Esq., of Farringdon-street.

DIED.—Recently, in Vienna, her Imperial Highness the Archduchess Herminia, of Austria, aged 24 years—At Paris, on the 21st inst., the Countess Sebastiani, sister of the Countess of Tankerville—On the 15th inst., at Frankfort-on-the-Maine, Sir Francis F. Vane, Bart., in the 45th year of his age—On the 20th inst., Mr. J. Hayes, of Milton-street, Cripplegate, aged 64—On the 21st inst., in her 87th year, Mrs. Urmston, relict of the late Capt. J. Urmston, of the Hon. East India Company's Maritime Service, and of the Grange, Chigwell, Essex—On the 22d inst., at Kensington-Gore, Mr. S. Dummer, of South Audley-street, aged 54—On the 22d inst., in her 19th year, Mary Ann Frances, eldest daughter of Mr. J. F. Allen, of Sise-lane, Bucklersbury—On the 22d inst., at his residence, Maida-vale, Mr. J. Wagner, aged 75.

INDEX OF THE PRINCIPAL HORTICULTURAL SUBJECTS IN No. 8.

Acacia, a work on, announced . 128 a
Amateur's Garden . . . 125 a
Beck, Mr., garden, noticed . . 128 a
Bicton, notes on . . . 128 a
Bone-dust, effects of . . . 126 a
Camellia, its cultivation . . 123 b
Celeriac, its treatment . . . 126 b
Clay, to plant trees on . . 126 a
Combretum purpureum, its propagation . . . . . 129 c
Draba verna described . . . 124 c
Edgings, plants for . . . 125 c
Evergreens, on transplanting . 125 c
Ferns, to raise from seed . . 124 a
Foresting, Shakespeare's . . 125 b
Fuchsia radicans . . . 127 c
Gooseberry caterpillars, their destruction . . . . 126 b

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the OFFICE, 3, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, February 26, 1842.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

No. 10.—1842. SATURDAY, MARCH 5. PRICE 6*d*.

SAMUEL GIRLING begs to inform his Friends and the Public that his General CATALOGUE of DAHLIAS, GERANIUMS, and PANSIES is now ready, and can be had on pre-paid application.—Danecroft Nursery, Stowmarket.

MYATT'S VICTORIA RHUBARB.

J. AND W. MYATT having a good Stock of Strong Roots raised by offsets from the original Seedling, can supply them at 10*l*. per hundred.—N. B. As various spurious sorts have been sold and are now selling under the name of "Myatt's Victoria," purchasers would do well to require them warranted. —Manor Farm, Deptford, Oct. 23, 1841.

JAMES MAY begs to inform all growers of PANSIES, that his new Descriptive List of Pansies, with a List of FUCHSIAS, may be had on application as below; at the same time he begs to call particular attention to his genuine imported German STOCKS, ASTERS, and ZINNIAS, in great variety.

N.B.—A large collection of fine Show Pansies, including many of last year's new varieties. 30 fine strong Plants for 21*s*., package included; all parcels delivered free in London.

Pansy Nursery, Edmonton.

TWITCHETT'S DON JOHN CARNATION—the finest Scarlet Bizarre in England. A few pairs of strong and well-rooted layers of this unrivalled Carnation remain for sale, price Two Guineas per pair. They will be sent by post, pre-paid, and carefully packed.—Twelve blooms of DON JOHN will be exhibited against any other Scarlet Bizarre in the world.

2, Coronation-street, Cambridge.

CHOICE FLOWER SEEDS.

LUCOMBE, PINCE, & CO., having an extensive and well-selected Stock of all the newest and choicest FLOWER SEEDS, to the cultivation of which they have paid considerable attention, and the quality of which they can confidently recommend, beg leave to offer them for sale, delivered carriage free to any part of the Kingdom, on the following terms:—

25 packets of distinct-named sorts . . 21s.
50 do. do. do. . . . 30s.
130 do. do. do. . . . 42s.

Amongst them are—Asters, Brachycome iberidifolia, Clintonia pulchella, Erysimum Perowskianum, Godetia Willdenowii and Schamanii, Lupinus Hartwegii, Martynia fragrans, Mesembryanthemum tricolor, Phlox Drummondii, Stocks, Zinnias, &c. &c. Catalogues of which may be had on application to them.

Exeter Nursery.

THOMAS WILSON, FLORIST, LAYERTHORPE, the raiser of William the Fourth Scarlet-Flake Carnation, intends to sell out this season, at 10*s*. per Pair, his celebrated Purple Picotee Patroculus, which is allowed by all competent judges to be superior to any flower in the trade. Whenever shown in condition, it has always taken the first prize. It has every good property a flower requires, excepting being rather an early bloomer. As the Stock is limited, an early application is requisite. Thomas Wilson, Florist, Layerthorpe, York.

N.B. No Plants will be sent without a remittance.

ONE HUNDRED AND FIFTY SHEPPARD'S "LAURA" PANSY, strong plant, price 5*s*.; Sheppard's "Princess" Pansy, 7*s*. 6*d*. Also, a fine large Scarlet Seedling Ribes—Sheppard's Ribes Grandiflora, price 3*s*. 6*d*. May be had immediately of James Sheppard, Nursery, Seedsman, and Florist, Winchester; or of Messrs. Warner and Co., 28, Cornhill, London.

HARDENBERGIA MACROPHYLLA.—This most splendid Climber, which is not to be excelled by any other at the present, a figure of which appeared in Paxton's Mag. of Botany in Jan., and Harrison's Floricultural Cabinet for Feb., is of free growth and a profuse bloomer. Plants to be had at 10s. 6d. at the following places, to wit:—Messrs. Loddiges, Hackney; Low, Clapton; Smith, Dalston; Fraser, Lea-Bridge Road; Pamplin, do.; Bunney, Stratford; Garvie, do.; Harrison, do.; Henderson, Pine-Apple Place; Wood, Maresfield; Rollison, Tooting; Chandler, Vauxhall; Catleugh, Chelsea; Knight, King's Road, do.; Gaines, Battersea; Paul, Cheshunt; Fairbairn, Clapham; Skirving, Liverpool; Lucombe and Pince, Exeter; Jackson, Kingston; Stewart, Salt Hill, Windsor; Lee, Hammersmith.

CHARLES FARNES, 128, ST. JOHN-STREET, LONDON, begs respectfully to call the attention of his Friends to the following select List of Annual Flower-seeds, &c. a general Catalogue of which may be had on application. Also his Catalogue of all the new sorts of Vegetable and Agricultural Seeds, &c.

NEW WHITE FUCHSIA—VENUS VICTRIX.—THOMAS CRIPPS, Florist, Tunbridge Wells, Kent, respectfully informs his Friends, Amateurs, and the Trade, that having purchased the entire Stock of the above Plant from Mr. Gulliver, Gardener to the Rev. S. Marriott, of Horsmonden, in this county, he will have Plants to dispose of in May at 21s. each, with the usual discount to the Trade, if three or more are taken at once. The flowers of this unique variety are White, sepals delicately tipped with Green, with a superb bright Puple corolla; the stamens are of a delicate Rose, and the pistil White. The plant itself is of an excellent habit, with foliage about the size of Gracilis, of which it is believed to be an accidental variety. In offering this beautiful new Fuchsia to the Floricultural world, J. C. feels assured of its giving entire satisfaction to those who may favour him with their orders. Any further information will be freely attended to.

Orders will be received by Mr. Charlwood, Seedsman, &c., 14, Tavistock Row, Covent Garden; Messrs. Wood and Son, Nurserymen, Maresfield, near Uckfield, Sussex; Mr. Ashdowne, Seedsman, High-street, Hastings; or addressed as above.

PINE PLANTS.

W. DAVIS, Gardener, Green-street, Marlborough-road, Chelsea, has several hundred Fruiting and Succession Pine Plants to dispose of, principally Ripley Queens. Warranted perfectly clean and healthy.

JAMES PAMPLIN, NURSERYMAN, WALTHAMSTOW, ESSEX, begs to inform the Public he has a few strong plants of his following splendid PELARGONIUMS to dispose of, viz., Enchantress, Camilla, Anna, Van Amburgh, Louisa, Alice, Superb, Prince Ernest, Fulgens, Duchess of Sutherland, Muckle Wonder, &c. &c. of which Catalogues may be had on pre-paid application.

N.B. Strong plants of Hardenbergia Macrophylla, at 5*s*. each.

Walthamstow, March 2.

TO DAHLIA GROWERS.

JAMES DUFFETT, JUN., respectfully offers to the Public his NEW SHADE, which will be found to be superior to any hitherto invented, from its being composed of Clay, which is of a cool nature to the bloom, and so constructed as not to be blown about by the strongest wind, protecting the Flower from frost, insect, &c.; and, from its simple construction, can be shifted from one plant to another in a few seconds; the top of which may be removed or replaced without disturbing the bloom, at the discretion of the grower. Reference as to the superiority of the Shade may be had at Messrs. Maule & Co.'s, Stapleton-road Nurseries, Bristol, who proved it last season, and pronounce it the best amongst the numerous plans they have adopted. A remittance or reference is respectfully requested from unknown correspondents.

N.B. Carefully packed and forwarded to all parts of the kingdom.

Barton-hill Pottery, near Bristol, March 1842.

FINE SEEDLING PANSIES.

J. HENCHMAN begs to inform cultivators of the PANSY, that he has now ready for delivery healthy young Plants of Twelve Superior Seedlings, including the "Prince of Wales," at 42*s*. the collection. These varieties will be found of superior merit in point of shape, size, and colour.

J. H. can also supply the choicest of last year's varieties, by all growers, at from 18*s*. to 30*s*. per dozen. 25 good named show-flowers, including many of last year's varieties, for 1*l*.

A few packets of seed at 2*s*. 6*d*. and 5*s*. each.

A plant or two sent gratis for carriage.

N.B. A remittance requested from unknown correspondents.

Edmonton, near London, Feb. 19, 1842.

HELICHRYSUM RETORTUM.

T. AND J. BACKHOUSE, Nurserymen, Seedsmen, Florists, &c., FISHERGATE, YORK, beg to recommend to the notice of the Nobility, Gentry, and Public in general, a rare and beautiful HELICHRYSUM, lately introduced from South Africa.

This elegant acquisition to our Floricultural stores is altogether different from any of this genus now in cultivation. The centre, a deep golden yellow, is surrounded by a profusion of bright silvery petal-like scales, the exterior of which are beautifully tipped with purple. The whole plant is covered with a silvery gloss, and when in full blossom it presents a very beautiful appearance. Like the other species of the genus Helichrysum, the flowers retain their colour and form perfect in a dried state, which renders them peculiarly adapted for a winter nosegay.

Fine Plants of the above, in pots, at 21*s*. each, will be carefully forwarded to any part of the kingdom on application.

J. KERNAN begs to inform his Friends that he has now completed his selection of FLOWER-SEEDS, among which will be found every novelty worthy of cultivation recently introduced, as well as the seeds from first-rate collections of Calceolarias, Mimulus, Ipomœas, Stocks, Asters, Balsams, Zinnias, Thunbergias, &c. &c.; as also all the better and more esteemed Vegetable Seeds: Grainge's Early White Broccoli, Mercer's Cauliflower, Brussels Sprouts (foreign seeds), Seymour's superb Giant Celery; Kerrison's Hothouse, Syon House, Roman Emperor, Horticultural, and Windsor prize Cucumbers; as well as Seeds of the very choicest Melons, all the better early and succession Peas, principally saved by the most select growers who supply this unequalled market.—4, Great Russell street, Covent Garden.

All the better kinds of Agricultural Grasses, separate or mixed. Selected Field Turnips, White Carrot, Winter and Spring Tares, Ash-leaved and Early Frame Potatoes, New Globe Mangold Wurzel, &c. &c., Mats, and Mushroom Spawn; Pruning and Budding Knives.

SEEDLING DAHLIAS to be sent out in May next, by N. GAINES, FLORIST, SURRY-LANE, BATTERSEA.

Gaines' ORANGE PERFECTION; beautiful orange, at times shaded. This flower was sent for the opinion of the Horticultural and Floricultural Societies of London; at both places considered first-rate. It is a fine grower, throwing its flowers well above its foliage. A good show flower. Awarded first Prize at Kingston, and 2nd Prize at Teddington. 4 ft. 10*s*. 6*d*.

Gaines' EMPEROR; beautiful rosy crimson, very superior petal, with great depth of flower, and well up in the centre. A constant good show flower. Awarded 2nd Prize at Kingston. 3 ft. 10*s*. 6*d*.

Gaines' COMPACTA; fine purple, very superior form, of excellent habit, throwing its blooms well above its foliage; its centre well up. A good show flower. Awarded 2nd Prize at Hammersmith. 5 ft. 10*s*. 6*d*.

N.B. The above were considered first-rate flowers by those that saw them growing. Plates of them will appear in "Wakeling's Amateur Guide," in April and May next.

N. Gaines' extensive List of first rate Dahlias, Geraniums, Pansies, Calceolarias, &c. may be obtained by post-paid application as above. His new Cineraria, Prince of Wales, is now ready for delivery.

VERBENA, "THE QUEEN;"

Flowers of a pure white, and sweet-scented.

WM. IVERY, Florist, Peckham, near London, begs most respectfully to offer this beautiful variety of Verbena, which has the habit of V. Tweediana, blooming equally vigorous and profuse: being, too, of a pure white, it produces a striking contrast with the other kinds. It was exhibited, and obtained a prize, at the Surrey Zoological Gardens last September, and at the Crown and Anchor, Strand, London; also at Salt Hill, where it was greatly admired. Highly favourable notices of it have been made too in the "Floricultural Cabinet," "Gardeners' Chronicle," and "Gardeners' Gazette."

Plants can be had after March 10 at 7s. 6d. each. Agents in London, Messrs. Warner and Warner, 28, Cornhill. A remittance or reference expected.

HENRY SPARE'S BENEFACTORS.

H. S. will feel thankful to be informed of contributions omitted or delayed, if any, which will then be acknowledged in a future Number.

SEED TRADE.

WANTED by a respectable Young Man, aged 24, who has been accustomed to both Town and Country trade, a SITUATION in a SEED-SHOP; unexceptionable references can be given. Address (paid) G. W. D., Mr. E. P. Dixon's, Seedsman, Hull.

WANTED, a GARDENER who understands his business, and who is capable of superintending the management of about 20 Acres of Land.—Letters, stating the amount of salary required, to be directed A. B., Patriot Office, Bolt-court, Fleet-street.

WANTED a SITUATION as UNDER GARDENER by a young Man, aged 24, who wishes to place himself under an experienced Gardener. He will be found very useful in the Flower and Kitchen Garden; and he has a practical knowledge of pruning and nailing. He can be well recommended. Wages 16s. per week. Direct, post-paid, to W. T., at Mr. Dennis's, nurseryman, King's Road, Chelsea, Middlesex.

WANTED a SITUATION as GARDENER or GARDENER and FORESTER by a Married Man, aged 30, without family. He has had great experience in every branch of Horticulture, Foresting, Laying-out of Grounds, &c. He can have four and a half years' character from the widow of his late employer. Direct Beta, Gardeners' Chronicle Office, 3, Charles-street.

WANTS a Situation as GARDENER, a Single Man aged 26, who thoroughly understands the management of Pines and forcing in general, &c., Kitchen and Flower Garden. Would have no objection to take the management of the farm (if not too extensive). Upwards of three years' character will be given from the last place, and most respectable reference for character and ability can be had from different families with whom he served. Has no objection to what country he goes. Apply personally, or by letter, to — Grant, care of Messrs. Loddiges, Nurserymen, Hackney, near London.

WANTS a Situation as GARDENER, a Married Man, aged 28, who understands Hothouse, Greenhouse, Early Forcing, Kitchen-garden: also Meadow-land, and Cattle, if required. Can have nearly two years' good character from the gentleman he has just left. Also a recommendation of nine years from his previous place in the country. Direct S.T., Mr. Cheshire's, No. 4, Norfolk-place, Lower Road, Islington.

WANTS a Situation as GARDENER a Respectable Single Man, between 30 and 40 years of age. It will be found on inquiry, that his practice from the earliest time in life has been varied, extensive, and of the best description; in every respect satisfactory reason will be given for leaving his present and former situations. Wages expected 40*l*. and Board. Address R.B., at Mr. Rayner's, Butcher, Shacklewell, Kingsland.

WANTS a SITUATION as GARDENER, a middle-aged married man, who understands Cucumbers, Melons, &c. No objection to milk a cow, look after a horse and chaise, and drive occasionally. Can have a good character from his last place, where he has been four years. Wages, expected 1*l*. a week. Address H. Forster, Mr. Whistle's Cottage, Twickenham-Common.

WANTED by a Steady Young Single Man, aged 28, a SITUATION as PROPAGATOR and FOREMAN in the houses. He perfectly understands his business; he has been employed in several first-rate establishments for these twelve years, and can have a good character. No objection to go far away. For further particulars apply by letter (post-paid) to G. B., 29, Manchester-street, Manchester-square.

TO THE NOBILITY AND GENTRY.

WANTED a SITUATION as GARDENER, by a steady industrious Man, who understands Forcing in all its branches, Cultivation of Plants, Management of Nursery Stock, Planting and Treatment of Forest-trees, &c. The Advertiser has for some years lived in the Channel Islands, where he carried on business as Nurseryman and Florist, and can be well recommended. Letters addressed to H. W., at the Office of this Paper, will be immediately attended to.

WANTS a SITUATION as GARDENER, a Married Man, aged 41, who has been in practice 20 years in all branches of Forcing, Kitchen-gardening, exotic and hardy Plants and their culture; is able to manage a small farm, and can have good recommendations: possessed of several years' good character from his late employer, and has just left on account of a family arrangement. Direct to A. Z., Mr. Fairbairn's, Nurseryman, Clapham, Surrey.

SECRETARY OR LAND-STEWARD.—A Gentleman of literary and scientific attainments, who has had great experience in correspondence and accounts, possessing considerable practical knowledge of husbandry, and of the most improved modes of fertilising land (derived from the study of agricultural chemistry), and fully competent to the management of estates, is desirous of obtaining the appointment of SECRETARY or LAND-STEWARD (or to officiate in both capacities) to a nobleman or gentleman. Letters, post-paid, addressed to W. M., to the care of Mr. Durham, 9, Upper Berkeley-street, Portman-square, will meet with immediate attention.

CHOICE AMERICAN TREE and SHRUB SEEDS. J. and C. WHALLEY, SEED and NURSERYMEN, ST. GEORGE'S CRESCENT, LIVERPOOL, beg to inform the Trade, that they have just received a consignment of the above, comprising, amongst many others, a quantity of that rare species of Quercus, Q. MACROCARPA (true sort); also Andromedas (of sorts); Bignonia radicans, Carpinus Americana, Ilex (of sorts); Inglans (of sorts); Rhododendron maximum, &c., &c., a Catalogue of which, with prices attached, will be furnished on application.

A SPLENDID NEW HYBRID FUCHSIA—MONYPENNII.

MORRIS TODD, ROLVENDEN, KENT, most respectfully offers to the Public this very distinct and highly-beautiful variety; the blooms are half as big again as Standishii; flowers in racemes in vast profusion; of a most beautiful rosy-carmine; it has been greatly admired by all who have seen it; it is a strong and magnificent-habited plant. It obtained a first Banksian Medal at the last Horticultural Society's Show, and a prize was given to it at the Weald of Kent Show in June last, and pronounced by the judges to be the best of all the Fuchsias. Strong Plants 10*s*. 6*d*. each, carriage free to London.—Orders will be thankfully received by Mr. G. Charlwood, 14, Tavistock row, Covent Garden; Messrs. Willmott & Chaundy, Lewisham, Kent; Mr. C. Weeks, Blackheath-park, Blackheath, Kent; Mr. T. Trinder, Forest-hill, Peckham, Kent; and Mr. Joseph Harrison, Downham, Norfolk. A remittance or reference from unknown correspondents.

"We had specimens of it sent us, and not more is said of its superior quality than it merits. It deserves to be in every collection,"—*Floricultural Cabinet of Nov. last.*

HUGH LOW & Co., NURSERYMEN, &c., UPPER CLAPTON, LONDON, beg to inform their Friends and the Public, that they will have Plants of the undernamed DAHLIAS ready for delivery in May, all of which they believe to be first rate show flowers :—

Monarch (Brown's), orangy buff	4	1	0
Mungo Park (Young's), maroon, shaded with purple	5	1	0
Ne Plus Ultra (Widnall's), maroon, shaded with purple	3	1	0
Nicholas Nickleby (Cormack's), salmon, shaded with crimson	4 to 5	1	0
Optime (Thurtell's), violet purple	4	1	0
Orange Boven (Catleugh's)	4 to 5	2	6
Painted Lady (Girling's), blood red, tipped with white	4	2	0
Penelope (Hedley's), primrose, with purple	4	1	0
Perfection (M'Kenzie's), red	3 to 4	1	0
Peruvian Chief (Harrison's), rosy salmon	5	1	6
Phenomenon (Whale's), white, edged with rose	4 to 5	1	6
Pickwick (Cormack's), fine purple	3 to 4	1	6
Pompous (Cowan's), red	4	1	0
President of the West (Whale's), crimson	5 to 6	1	6
Purpurea Alba (Harris'), purple and white	4	2	0
Queen (Ansell's), white, laced with pink	3 to 4	1	6
Queen (Widnall's), peach blossom	4	1	6
Regina (Gregory's), maroon	4 to 5	1	6
Revenge (Cox's), light yellow	4	1	0
Rienzi (Widnall's), deep crimson, shaded	4	1	0
Rival (Bannard's), dark maroon, veined with rose	4	1	0
Rival Lilac (Walters')	5	1	0
Rival President (Elliott's), crimson	4	1	0
Rival Sussex (Stanford's), dark maroon	4 to 5	1	0
Rosa (Bree's), light rose	4	1	0
Rouge et Noir (Ansell's), dark maroon, shaded with light crimson	5	1	6
Ruby (Walters')	4	1	6
Scarlet Defiance (Couzens')	5	2	6
Scarlet le Grand (Winfield's), cherry colour	5	1	6
Sir John Astley (Squibb's), purple	4	1	0
Sir William Middleton (Gaines')	4	1	0
Springfield, Purple (Gaines')	4	1	0
Springfield Rival (Inwood's), crimson	5	1	0
Stuart Wortley (Barratt's), rosy purple	3	1	0
Suffolk Hero (Girling's), maroon	5	1	0
Susiana (Girling's), scarlet, tipped with white	4	2	0
Tournament (Catleugh's), scarlet	4	3	6
Unique (Ansell's), yellow, tipped with bronze	4	1	0
Unique (Walters'), white, tipped with rose	5	2	6
Uxbridge Magnet (Catleugh's), mottled purple	3 to 4	2	6
Viola (Harris'), light purple	4	1	0
Wallace (Evans'), maroon, shaded with purple	4	1	0
Will Watch (Girling's), claret, shaded	3	1	6
Windmill-hill Rival (Mitchell's), white, tipped with purple	5	1	0
Windsor Rival (Begbie's), scarlet	4	1	0
Yellow Climax (Wildman's)	3	3	6
Yellow Defiance (Cox's)	4	1	6

MARNOCK & MANLEY beg to announce that their PASSIFLORA FRAGRANS will be ready to send out, in established plants, the first week in May, at 21s. each. This new and ornamental species is scarcely less remarkable for its beauty, than for its delightful and powerful fragrance; the latter of these qualities has scarcely been recognised in any of the previous species of Passion Flower, and it will therefore form a most desirable acquisition to climbing plants for conservatories and greenhouses. Also will be ready at the same time, plants of their new and splendid Annual, MARTYNIA FRAGRANS, at 21s. each (See figure and description in the "Botanical Register" for Jan. 1841, and in the "Floricultural Magazine" for Feb. 1842). The two following new and beautiful plants are now ready to send out:—HARDENBERGIA MACROPHYLLA, at 7s. 6d. each; this is a greenhouse climber of great beauty. (See figure and description in "Paxton's Magazine" of Botany for Jan. 1842). FUCHSIA GLABRA MULTIFLORA, 7s. 6d. Catalogues of their new and choice Flower Seeds may be had on application.

Wanted immediately a steady, active Man, who is experienced in budding, grafting, &c., and who can undertake the general management of out-door Nursery Stock.—Nursery, Hackney, Feb. 24, 1812.

NEW DAHLIA, "SATIRIST," MORTLOCK'S.

R. MORTLOCK begs respectfully to offer the above with confidence, as a real good variety; the colour is a lilac purple, fine-cup petals, of first-rate form, fine habits, and very free bloomer, large size, and constant. It obtained the second prize at the South Essex Show in September last; and also the second prize at Hampstead. Height four feet. Plants in May 10s. 6d. each. Orders thankfully received by Messrs. Warner, 28, Cornhill; Smith and Co., Cambridge Heath, Hackney; Green, Warner-place, Hackney-road; and of the raiser, Luton-place, Hyde Vale, Greenwich.

EDWARD BECK, MANUFACTURER IN SLATE, Isleworth, Middlesex, respecfully informs Horticulturists, that his IMPROVED SLATE TUBS for Orange Trees and Conservatory Plants, mounted upon rollers, Slate Cisterns, Shelves, and Edgings for garden paths may be seen in use at his house upon application to the gardener.

H. HAMMOND begs to return thanks to his numerous friends and the Public for their liberal orders for his new White Cape Broccoli, as advertised in the *Chronicle* of Oct. 16; and to inform those that are not supplied with that valuable article that he has a few packets left which can be had of Messrs. Flanagan, Seedsmen, Mansion-House Street, London, who know the stock.—Mundford Nursery, Feb. 10.

HUNDRED-FOLD POTATOES.—A New SEEDLING, selected for cultivation by the grower of 250 kinds from the Seed, as the most abundant and the best flavoured, is for SALE, in peck bags, at 5s. each, at Messrs. Flanagan & Co.'s, Mansion House-street; Mr. Gibbs's, 26, Down-street, Piccadilly; Messrs. Warner and Co.'s, 28, Cornhill; Mr. James Carter's, 238, Holborn; Messrs. Minier, Adams, and Co.'s, 63, Strand; Mr. F. Chatwin's, 6, Hungerford market; and at the "Gardeners' Gazette" Office, 320, Strand.

SPLENDID NEW POTATO—THE SWISS KIDNEY. This excellent Potato (the whole stock of which is in the hands of the advertiser) is now offered for sale. It produces an abundant crop, is of an excellent flavour, and has obtained several prizes at the Horticultural Shows as a superior vegetable. It may be obtained on application to Messrs. Beck, Henderson and Co., Seedsmen, 67, Strand, London, in peck bags at 4s.; half-peck do., 2s. 6d.

POTATOES FOR PLANTING.—F. CHATWIN, 6, HUNGERFORD MARKET, STRAND, respectfully informs the Seed Trade, Gardeners, and the Public generally, that he has for sale POTATOES of all the varieties in demand. Being himself a grower, all the sorts can be relied on. The Catalogue is now ready, containing 158 varieties, which may be sent post free upon a remittance of 1s. 4d.

ARTIFICIAL MANURES.—F. C. is sending out Manures, Nos. 1, 2, and 3, at 1*l.* per cwt. Two cwt. will dress an acre. No. 1 is recommended for heavy wet soils; No. 2 for a medium; and 3 for light sand or chalky lands. Guano, Rape Dust, Clarke's, Lance's, and all other Manures procured to order. Correct analysations of soils made, one pound weight of which must be sent.

Garden and Agricultural Seeds, Fruit-trees, Shrubs, Flowers, &c. &c.

CUCUMBER and MELON BOXES and LIGHTS— For SALE, one, two, and three Light BOXES and LIGHTS, of all sizes, ready for immediate use, warranted of the best materials, packed and sent to all parts of the Kingdom; two Light Boxes and Lights complete, from 1*l.* 8s. Garden Lights made, glazed and painted, from 1s. per foot. Sashes and Frames made, glazed, and hung complete, 1s. 8d. per foot.—At JAMES WATTS' Sash Manufactory, 8, Claremont-place, Old Kent-road.

THE CONICAL HOT-WATER BOILERS invented by J. ROGERS, Esq., may be obtained to any size of JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Sons' Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pineapple-place; Mr. Knight's, King's road, Chelsea; Messrs. Veitch and Son's, Exeter; and at the Gardens of the Horticultural Society of London.

TO NOBLEMEN, GENTLEMEN, FLORISTS, and OTHERS.—Messrs. PROTHEROE and MORRIS have received instructions to offer to public competition by Auction on the premises, on TUESDAY, the 5th of April, 1842, at 11 o'clock, the celebrated Stock of GREENHOUSE PLANTS, late the property of — Daubauz, Esq., deceased, near the church at Leyton, comprising fine specimens of Camellias, Oranges, Hybrid Rhododendrons, Ericas, Choice Geraniums, Acacia, Azalea Indica, Cactus, Neriums, Myrtles, Eutaxia, &c.

May be viewed by cards, Catalogues may be had of the principal Nurserymen and Seedsmen, and of the Auctioneers, American Nursery, Leytonstone.

BROWN'S MARQUIS of LANSDOWNE DAHLIA. —This most essential Show Flower will be sent out in May next. Colour, shaded salmon; fine cupped petals, which are beautifully arranged; and one of the most constant and successful Dahlias of the season, having obtained Seven Seedling Prizes, **three of which were first, and twice defeating "Conqueror of the Plain."** Also shown in three successful Stands of two 24's, and 12 blooms for three 20*l.* prizes. A drawing was made by Wakeling, which will appear in the *Florist's Guide*, March 1842.

T. B. has a few strong Plants on hand of his much-admired Seedling PANSIES the "Countess of Orkney" and "Jewess," at 7*s.* 6*d.* each.

A CATALOGUE, containing a choice selection of DAHLIAS and HEARTSEASE, is now ready, and may be had on pre-paid application.—Slough, March 2d, 1842.

SEA-SIDE.—MR. FURNER, OF THE ROYAL HOTEL and FAMILY BOARDING-HOUSE, HAYLING ISLAND, HAMPSHIRE, begs leave to inform the Public, that he has a choice of sitting-rooms commanding fine views of the Isle of Wight, Spithead, &c., with other necessary accommodations, that can be taken for any period, and, if wished, upon terms including every charge. Hot, Cold, or Shower Baths can be had in the Hotel.

Mr. F. can supply particulars of any houses to let furnished or unfurnished, having one or two detached residences with gardens at this time.

STANDARD ROSES.—A Consignment of 1000 of the choicest varieties ever offered to public competition has been entrusted to PROTHEROE & MORRIS for SALE at the Auction-Mart, Thursday 10th March, and following day. This selection consists of Hybrids, Bourbons, Perpetuals, Tea-scented, Provence, and others, both Standards and Dwarfs, of varieties too numerous to mention, and of rare and diversified beauty. Catalogues can be obtained of the principal Nurserymen, at the place of Sale, and of the Auctioneers, Leytonstone.

WARD'S PORTABLE GREENHOUSES.

TREGGON AND Co., ZINC MERCHANTS AND MANUFACTURERS, 22, JEWIN STREET, and 57, GRACECHURCH-STREET, City, beg to inform the Nobility and Gentry, that they are now manufacturing Portable Greenhouses on Ward's principle (see No. 49 of the *Gardeners' Chronicle*) with plain and ornamental stands. Also GALVANIC PLANT PROTECTORS AND BANDS, Zinc Fanlights, Skylights, and Gothic Frames for Conservatories, Hothouses, Forcing Frames, &c. Garden-stand Frames, Engines, Watering-pots, Flower Labels, Perforated Safes, and Dish Covers, Baths, &c. &c. Experienced workmen sent to all parts of the kingdom, for covering with Zinc, Churches, Spires, Houses, Terraces, Verandas, &c. &c.

ORNAMENTAL WIRE-WORK, &c., FOR THE GARDEN.
390, OXFORD STREET, LONDON.

G. B. THOMPSON having added to his General Stock of FURNISHING IRONMONGERY a large assortment of WIRE-WORK,

Suited to the Flower-Garden and Greenhouse, begs to submit for the inspection of the Nobility and Gentry who patronise Horticultural pursuits his numerous patterns of FLOWER BASKETS, TRAINERS, BORDERS and STANDS, with GARDEN ARCHES, SEATS, and VASES, which for variety, elegance, and utility stand unrivalled.

Also his Improved GARDEN and HOTHOUSE ENGINES, FUMIGATORS, SYRINGES, and PATENT WATER-POT, with every other Implement.

GAME and CATTLE FENCING in variety.

HEATING BY HOT WATER.

HOTHOUSES, and every description of Horticultural Buildings, Churches, Chapels, Public Buildings, Mansions, and large Rooms, fitted up with the above apparatus on the most improved and scientific methods.

W. WALKER and Co. (late of Mosley-street, Manchester), beg to announce that they continue to execute works of the above description, in which they have introduced a variety of important improvements of a satisfactory nature, especially to Horticulturists. They have applied this principle on a more extensive scale than has ever been hitherto adopted at the stupendous Conservatory and Hothouses of his Grace the Duke of Devonshire, and in numerous other extensive establishments, with the most complete success.

They have also successfully applied C. W. Williams' Patent Argand Furnace to their boilers, and have made arrangements with the Patentee for its general adoption. It economises fuel, and removes the nuisance and disfigurement of smoke, so much complained of by Gardeners, and is a new and valuable feature in these Apparatus.

Works executed in every part of the United Kingdom with punctuality and dispatch.—33, Brown-street, Manchester.

TO BE DISPOSED OF, (in consequence of the death of the late Proprietor,) an extensive and highly-respectable NURSERY and SEED BUSINESS, in one of the most fertile of the Midland Counties, which has been established and has possessed a first-rate connexion for nearly 50 years. The arrangements for conducting the business are unusually advantageous and complete.—For particulars apply to Messrs. Warner and Warner, Seedsmen, 28, Cornhill, London.

TO BE SOLD BY PRIVATE CONTRACT, a most Desirable PROPERTY, situate in the delightful Village of CHARLTON KINGS, within a Mile-and-a-half of CHELTENHAM. The Premises comprise a Substantial VILLA, erected within the last five years; containing Entrance-hall, Dining-room, 18ft. by 14ft., Drawing-room same size, Small Library, 2 Bed-rooms 16ft. by 12ft., 2 smaller do., Water-closet, and convenient Domestic Offices.

Also a good COTTAGE RESIDENCE; containing 2 Sitting-rooms, 5 Bed-rooms, Kitchen, Brewhouse, Cellar, &c.

Both standing in a GARDEN, for many years used as Nursery Ground, for which purpose it is peculiarly adapted, or may be converted into a Private Residence. An abundant supply of excellent Water. There is a Hothouse and Greenhouse, and convenient Pits, &c. The Stock-in-Trade to be taken at a Valuation. —For further particulars apply, free of postage, to the Owner, Mr. R. Arnott, as above. The Villa is let to 25th March, 1843.

[This will not be repeated.]

TO GENTLEMEN, FLORISTS, AND OTHERS.— Valuable LEASEHOLD PREMISES and NURSERY-GROUND, Three newly-erected GREENHOUSES, SHEDS, PITS, FRAMES, LIGHTS, a few lots of HOUSEHOLD FURNITURE, and sundry Utensils.

To be SOLD by AUCTION, by Messrs. PROTHEROE and MORRIS, if not previously disposed of by private contract, on the premises, FOUNTAIN NURSERY, Camberwell Grove, on THURSDAY, March 17th, 1842, at 11 o'clock, by order of the Trustees of Mr. Ferry, about 8000 GREENHOUSE PLANTS, comprising Geraniums of the first class, Camellias, Fuchsias, &c. Also the NURSERY STOCK, consisting of Standard and Dwarf Roses, Rhododendrons, Azaleas, Kalmias, Aucubus, Portugal Laurels, Laurestinus, Arborvitæ, Yews, Choice Pinks, Heartsease, a quantity of Bog-earth, Rotten Dung, Box-Edging, Garden Pots, &c.

May be viewed prior to Sale.

Particulars and Catalogues may be had of F. Brown, Esq., Solicitor, 23, Woburn Place; of the principal Nurserymen and Seedsmen, on the premises, and of the Auctioneers, American Nursery, Leytonstone.

HORTICULTURAL SOCIETY OF LONDON.
A NEW PART OF THE TRANSACTIONS OF THE SOCIETY, containing Figures of Achimenes longiflora, and the Ickworth Imperatrice Plum, forming the conclusion of the Second Volume of the New Series, is ready for delivery to the Fellows of the Society.

The Gardeners' Chronicle.

SATURDAY, MARCH 5, 1842.

MEETINGS IN THE ENSUING WEEK.

Monday	Entomological	8 P. M.
Tuesday	Zoological	8½ P. M.
Wednesday	Geological	8½ P. M.
	Medico-Botanical	8 P. M.
Saturday	Royal Botanic	4 P. M.

MAY we beg our readers to correct an important error of the press which last week crept into our leading article? In line 24 from the bottom of the first column, "67lbs." should have been "7lbs.," as is indeed evident from the context. We may take this opportunity of adding that other experiments upon the effect of various chemical agents, used as a top-dressing for Grass, are in progress in the Garden of the Horticultural Society, and that the ammoniated ground is already distinguishable from all the rest by the much deeper green of the young herbage. As some correspondents are desirous of knowing what quantity of ammoniacal gas liquor is required for an acre of ground, we will also observe that this is an uncertain point; if 160 gallons an acre can be afforded, such a quantity mixed with 1000 gallons of water will be ample; but we should anticipate great effects from half the quantity applied to Grass land at this season of the year. The farmer should consider what he can afford, and apply that quantity by way of experiment.

THE Potato is hardly second to Wheat in its importance to man; and although it has been reviled as the mother of pauperism, or stigmatised as the great cause of Irish misery, it will always continue to contribute to the nations of the earth a most essential part of their daily bread. Its cultivation is generally better understood than it was; and the skill of some persons may probably enable them to do all that ever will be done in its management, whether in the garden or the field. Nevertheless, there is so much bad management still to be witnessed, especially in rural districts, that we may be excused for devoting a small space to its consideration at this season, when the time for planting has arrived.

Good sets with single eyes, taken from partially ripe tubers, or small tubers undivided, furnish the best means of multiplying the Potato. Large tubers have been recommended, but it has been proved experimentally that no advantage is derived from employing them, while there is a great disadvantage in consequence of the large quantity required. It has been found, too, that if the tubers are over-ripe, that is to say, have acquired all the mealiness and solidity possible, they are apt to produce the curl. It is, therefore, the practice with some growers of Potatoes to take up in the autumn what they want for "seed" before the general crop is ripe, or to select for sets the worst-ripened Potatoes they can pick out.

The period of planting should be as soon after the 1st of March as circumstances will permit. "I have uniformly found," says Mr. Knight, "that to obtain crops of Potatoes of great weight and excellence, the period of planting should never be later than the beginning of March." This is in order to give the Potato as long a summer as possible. From experiments made some years ago in the Garden of the Horticultural Society, it appeared that a crop planted in the first week of March exceeded that planted in the first week of April by about a ton and a quarter per acre. It must be obvious, however, that the propriety of planting thus early will depend upon the nature of the soil, and that it is too early for wet, heavy land, although it is the best season for light soils. In reality, land cannot be advantageously cropped with Potatoes until all the superfluous moisture has drained way or evaporated.

In all cases the plantation should be made in open places, fully exposed to light. The quality of the Potato depends upon the quantity of starchy matter (mealiness) it contains. Now this starchy matter can only be formed abundantly by the action of light upon the leaves, which are the natural laboratory in which such secretions take place, and from which they are conducted by sure, though hidden, channels to the tubers where they are stored up. To plant Potatoes then in plantations or orchards, or under the shade of trees, is to prevent the formation of the mealiness which renders this plant so nutritious, and to cause the tubers to be watery and worthless. This is probably one reason why field Potatoes are usually better than those raised in gardens.

But the Potato may suffer by its own shade as much as by the shade of other plants. When its sets are planted too close, the branches shoot up and choke each other, the leaves of the one smothering the leaves of the other; so that the more sets are planted, the smaller will be the crop of this plant. Mr. Knight was the first to point out this common error, and to show that there is a certain distance at which the sets of each variety of Potato should be planted so as to ensure the greatest produce. By planting too close, the plants smother, and so injure each other; by planting at too great a distance, land is uselessly wasted. Practice and well-conducted experiments demonstrate what theory suggested, that the true distance at which Potatoes should be set is to be determined by the average length of the haulm. One kind of Potato is dwarf, and only grows six inches high; its rows should therefore be only six inches apart. Another kind grows three feet high, and its rows should be three feet asunder. The space from set to set in the rows appears to be immaterial; six or eight inches are sufficient for those which grow two feet high. An experiment formerly conducted by the writer of these observations showed that when the Early Champion, a sort whose stems are on an average 2 feet long, was planted in rows 2 feet 6 inches apart, the produce was 15 tons 19 cwt. 82 lbs net per annum; while by reducing the distance between the rows to 2 feet, the produce was increased to 24 tons; but by diminishing it still further to 1 foot 6 inches, the produce was reduced to 22 tons 16 cwt. 102 lbs.; and where the rows were only six inches apart, the produce fell to 16 tons 17 cwt. 110 lbs. Such an experiment seems conclusive.

The depth at which the Potato should be planted is not ascertained with the same exactness, nor perhaps can it be; for much will depend upon the nature of the soil. In warm dry land, we regard nine inches as not too deep; in cold, stiff soil, four inches would be better. Six inches is a good depth for average land. In one of the experiments above alluded to, different depths were also inquired into, when the rates of produce were nearly as follows:—Three inches deep gave 13 tons; four inches, 14 tons; six inches, 14½ tons; and nine inches, 13 tons. At so great a depth as nine inches, sets are apt to perish, unless the soil is dry, light, and warm. The deeper however the sets can be safely inserted, the better, for the following reason: Potatoes are formed on under-ground branches, as we have lately shown (p. 85); the deeper the set, the more branches will be formed before the shoots emerge from the soil, and consequently the more ample will be the means possessed by the Potato-plant of forming tubers. The important practice of earthing up is to effect the same end, by compelling the Potato-stem to grow as much as possible under-ground.

The best method of increasing a crop of Potatoes is to destroy all the flowers as they appear. The flowers and fruit of plants are formed at the expense of the secretions elaborated by the leaves; if of those secretions a part is consumed in the organisation of flowers and fruit, there is so much the less to accumulate in the tubers; but if no such consumption is permitted, the tubers will become the depositories of all the nutritious matter which the plant is capable of producing.

By means of this kind the quantity of Potatoes which has been obtained from *good* and *productive* varieties on fair arable land has been enormous—for such may six or seven hundred bushels per acre be called—and we entertain no doubt that the expectations of the late President of the Horticultural Society will ere long be realised. In one of his papers on the Potato he writes thus:—

"I stated, in a former communication two years ago, that I obtained from a small plantation of the early ash-leaved Kidney Potato a produce equivalent to that of 665 bushels, of 82 pounds each, per acre; and my crop of that variety in the present year was to a small extent greater. By a mistake of my workmen I was prevented ascertaining with accuracy the produce per acre of a plantation of Lankman's Potato; but one of my friends having made a plantation of that variety precisely in conformity with the instructions given in my former communication to this society, I requested that he would send me an accurate account of the produce; which I have reason to believe he did, for its amount very nearly agreed with my calculation upon viewing the growing crop about six weeks before it was collected. The situation in which this crop grew was high and cold, and the ground was not rich, but the part where the Potatoes to be weighed were selected was perfectly dry, and afforded a much better crop than the remainder of the field; which was planted with several different varieties. I calculated the produce of the selected part to be 600 bushels per acre, and the report I received, and which I believe to have been perfectly accurate, stated it to be 628. If this produce be eaten by hogs, or cows, or sheep (for all are equally fond of Potatoes), I entertain no doubt whatever that it will afford twenty times as much animal food as the same extent of the same ground would have yielded in permanent pasture; and I am perfectly satisfied upon the evidence of facts which I have recently ascertained that, if the whole of the manure afforded by the crops of Potatoes above mentioned be returned to the field, it will be capable of affording as good, and even a better, crop in the present year than it did in the last; and that as long a succession of at least equally good crops might be obtained as the cultivator might choose, and with benefit to the soil of the field. Should this conclusion prove correct, a very interesting question arises, viz.—whether the spade husbandry might not be introduced upon a few acres of ground surrounding, on all sides, the cottages of day-labourers, to and from every part of which the manure and the produce might be conveyed without the necessity of a horse being ever employed. A single man might easily manage four statute acres thus situated, with the assistance of his family; and if nothing were taken away from the ground except animal food, I feel confident that the ground might be made to become gradually more and more productive, with great benefit to the possessor of the soil, and to the labouring classes, wherever the supply is found to exceed the demand for labour."

IN our last Number, a Dahlia, called the Satirist, was advertised as having been pronounced first-rate by Dr. Lindley. Mr. Mortlock, the advertiser, has been requested to state when and where it was so characterised, but he has not yet done so. When he has supplied the information required, we will publish it. In the mean while, Dr. Lindley begs to disclaim all knowledge of this Satirist Dahlia.

IN another column will be found a communication from the Rev. D. Jenkins upon the subject of his brother's (Major Jenkins) claims connected with the discovery of the Tea-plant in Assam. It is accompanied by some observations of our own upon the supposed facts of the case, and we have only here to add the strongest possible disclaimer of any bias on our part for or against the various claimants. The important public services rendered by Major Jenkins, both officially and privately, in all matters connected with science, we should be among the first to recognise; but to whom the honour of first discovering the spontaneous existence of the Tea-plant within the British territory attaches, is a question which, we think, may be discussed without the faintest shadow of disrespect to this gallant officer.

THE DAHLIAS OF 1841.

THE following remarks upon the merits of the Dahlias sent out last season are the result of experience; and though they may differ partially from those of others, we nevertheless pledge our credit upon their general accuracy. The notes were made from an extensive collection, where the flowers received every advantage of good cultivation, and where in most cases more than one of each kind was grown.

Admirable (Sparey). Rosy purple. This flower appears rather too much quilled in the centre, from the petal being a little too long; it is a useful show flower.

Achilles (Smith). Crimson; too coarse.

Agnes (Harrison). Blush white, tipped with purple; useless.

Advocate (Brown). Buff, good petal, but too much sunk in the eye; useless.

Amethyst (Atwell). Lilac; worthless.

Aurantia variegata (Harris). Buff and white; worthless.

Beaumont Rose (Begbie). Delicate rose pink; too small for a show flower. From its dwarf habit, it makes a very pretty border variety.

Bethnal-green Rival (Tyler). Rose; useless.

Beauty (Gaines). White with purple edge; worthless.

Beauty (Parsons). White tipped with purple; very uncertain, but occasionally produces fine show flowers.

Bang-up (Girling). Purple; worthless.

Brilliant (Whale). Scarlet; very bad.

Britannia (King). Rose; a second-rate flower of little use.

Bridesmaid (Brown). White tipped with purple; a well-formed flower of good substance—a very useful and desirable variety.

Blackeyed Susan (Girling). Crimson; worthless.

Bronze Unique (Gaines). Useless.

Burnham Hero (Church). Dark crimson; a very constant and desirable flower, of good symmetry and well up in the centre: an excellent flower for exhibition.

Cardinal (Girling). Ruby; worthless.

Conservative (Low). Purple; occasionally very fine.

Constance (Cox). White tipped with rose; a constant showy variety, but the petals are too crumpled for showing.

Cicero (Girling). Purple; worthless.

Conqueror of the World (Stein). Primrose edged with rosy purple; a very pretty flower of good form; uncertain. We recommend it to be tried another season.

Constancy (Keynes). Purple; good second-rate flower.

Curate (Brown). Lilac; too coarse.

Cotswold Hero. Crimson purple; a second-rate flower.

Carno (Ansell). Scarlet; worthless.

Compacta perfecta (Gregory). Crimson; uncertain; good flowers occasionally.

Capt. Reynolds (Woods). Scarlet crimson; useless.

Colossus (Mortiboys). Worthless.

Camoise (Bates). Worthless.

Defiance (Brown). Rosy purple; worthless.

Duchess of Northumberland (Newton). White slightly tipped with purple; a pretty variety, but useless as a show flower from the petals being too narrow.

Duchess de Nemours (Gaines). Blush-white; useless.

Dowager Lady Cooper (Jackson). A very beautifully-coloured flower, being a delicate rosy lilac; extra fine petal and form; a hard-eyed flower, occasionally producing very fine show blooms.

Eclipse (Widnall). Scarlet red; a good and useful flower; the petals are sometimes slightly serrated. It has appeared in most of the winning stands during the past season.

Eclipse (King). Fawn; too coarse.

Eclipse (Catleugh). Vermilion-rose; this is a fine deep flower, with petal of first-rate quality; the centre is a little depressed; it is in the greatest perfection in the beginning of the season. The colour is very beautiful and distinct. It is worthy of being grown by every Dahlia-fancier, as it is a good show flower, and from its dwarf habit it makes an excellent border variety.

Emperor of China (Atwell). Purple; too coarse.

Euclid (Ward). Shaded purple; fine large and useful show flower.

Fama (Mountjoy). Dark shaded flower; petal too long and narrow.

Fanny Keynes. Shaded rose; a useful second-class flower.

Flora (Standens). Yellow-tipped; useless.

Garrick (Widnall). Crimson; a useful flower of good properties.

Grand Tournament (Turvill). Blush white, faintly tipped with purple; second-rate, and uncertain.

Haidee (Wildman). White, tipped with rose; too coarse.

Highgate Rival (Stein). Crimson; this flower resembles, and is an improvement upon the Marquis of Lothian; a useful second-rate variety.

Highgate Hero (Stein). Rosy lilac; bad centre; of no use as a show-flower.

Hudibras (Caulier). Deep rose; worthless.

Indispensable (Girling). Rosy purple; good general form, and fine petal; a flower of excellent properties.

Invincible (Smith). Crimson, second-rate, but occasionally useful.

Ivanhoe (Ansell). Crimson, worthless.

King of Roses (Thomson). Petals rather too broad, but a constant and useful second-rate flower.

Little Wonder (Parsons). Yellow; very bad.

Little Wonder (Willmer). Orange-red; too small, useless.

Lanceolot (Coudry). Dark; small, and useless.

Liacea (Girling). Crimson; worthless.

Lady Johnstone. Blush; useless.

Lady Flora Hastings (Willmer). Primrose; flowers among the foliage; useless.

Madeline Bray (Atwell). Primrose; worthless.

Marchioness of Breadalbane (Dod). White tipped with purple; too thin of petals, and flowering among the foliage.

Marquis of Waterford (Newton). Pale purple; worthless.

Maid of Bath (Davis). French white laced with purple; the petals are rather too broad and shallow, and not sufficient in quantity. It is, however, a very constant and useful flower, and has been a great favourite during the past season, having been shown in most of the winning stands.

Magnet (Edwards). Dark; worthless.

Mrs. Berkeley (Willmer). White edged with purple; too small.

Oxfordshire Hero. Blush; useless.

Orange Boven. Uncertain, sometimes producing fine show flowers.

Peruvian Chief (Harrison). Rosy salmon colour; a flower of good properties, and useful from its distinct colour: but rather uncertain.

Poole's White (Poole). Worthless.

Poundhill Rival. White tipped with purple; uncertain.

Queen (Ansell). White laced with pink; seedy eye; worthless.

Queen (Widnall). Colour peach-blossom; very constant, and occasionally very beautiful; general form of the flower very fine.

Queen Adelaide (Holmes). Scarlet; useless.

Regina (Gregory). Crimson; a constant and very useful show flower.

Revenge (Cox). Sulphur; worthless.

Rival Revenge (Cox). Sulphur; worthless.

Rival Lilac (Walters). Rosy lilac; a desirable flower, of good properties.

Rival White (Whittaker). Worthless.

Rosa perfecta (Whale). Too thin of petals.

Scarlet Defiance (Cousins). A desirable variety from the distinctness of its colour, being a bright orange-scarlet; it is a well-formed and useful flower.

Scarlet-le-grand (Wingfield). The petal of this flower is of first-rate form and quality; but it has a hard eye, and is never to be seen in showable condition; useless.

Scarlet Defiance (Coudry). Worthless.

Speedwell (Tyler). Primrose; bad.

Sultana (Taylor). Lilac; bad.

Tournament (Catleugh). Scarlet-red; a flower of good properties, rising well in the centre; a very constant and desirable variety.

Vesta (Hedley). Crimson; a pretty flower in its early state, but soon shows its centre.

Village Maid (Gaines). Blush white; useless.

Unique (Walters). White edged with lilac; a very useful flower.

Uxbridge Magnet (Catleugh). Purple; a flower of good substance; occasionally confused in the centre, but producing at times fine show flowers.

Will Watch (Girling). Shaded crimson; too coarse.

Xarifa (Oxer). Yellow; of no use.

Yellow Climax (Wildman). Fine colour; uncertain; occasionally produces good show flowers.

*** The most constant and best of the fancy *Border* varieties were the following:—

Butterfly (Girling). Crimson tipped with white.

Lady Catherine Jermyn (Girling). Scarlet and white.

Purpurea alba (Harris). Purple and white.

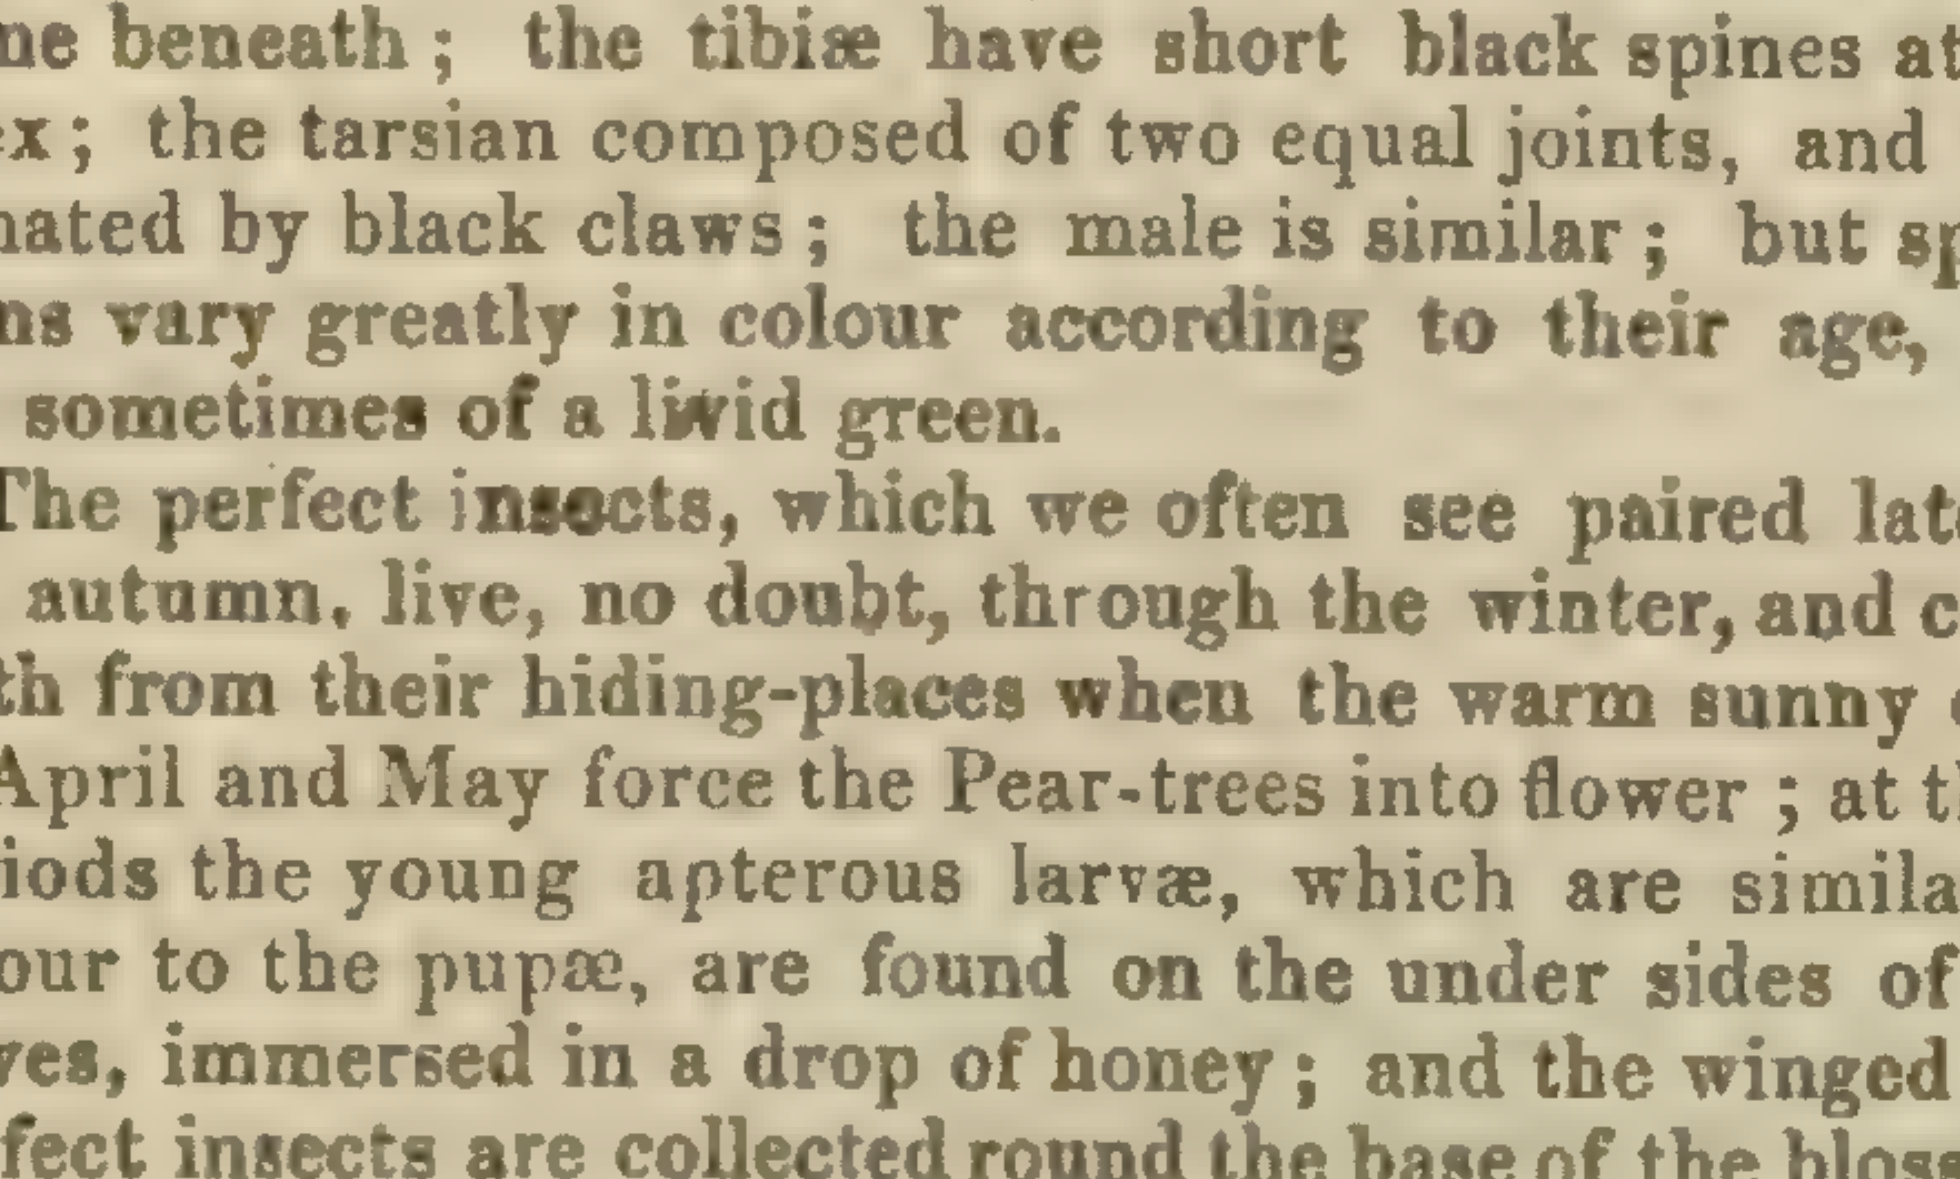
Modesta (Girling). Crimson and white.

Lady Rae Reid (Girling). Light purple, beautifully tipped with white.

ENTOMOLOGY.—No. XXV.

THE PEAR-TREE CHERMES.—There is a tribe of small insects which so much resemble the Aphides in size, colour, and mode of life, that the French have called them Faux-Pucerons; to the eye of a naturalist, however, they present many differences, and although sluggish, they can leap and fly away with a greater degree of activity than the Plant-lice. By Linnæus and the older school of entomologists they were called Chermes, the name by which they are generally designated in this country, but in scientific works they form the genus Psylla. The different species inhabit a great variety of trees and plants, flying off in little swarms when disturbed; in their first stage, however, they are minute apterous beings, and after changing their skins once or twice, they become flattish pupæ, with rudimentary wings, as most of the Cimicidæ or bugs do; and fixing upon a young shoot, they penetrate it with their rostrums, or rather the fine bristles which pass through them, and by pumping up the sap they cause the same mischief as the Aphides; when the pupæ have arrived at their full size the skin bursts open at the back, and the winged Psylla issues forth. The males have an obtuse apex to the abdomen, with several horny lobes; but that of the female is pointed, horny, and contains a sharp oviduct, protected by an upper and under, and two lateral sheaths.* Amongst the numerous species † of this genus is one which the late Mr. Knight considered so injurious to Pear-trees that it is well deserving of our attention: it is the Psylla Pyri, Linn.; the pupa is brown and depressed, the head large, subtrigonate, the base notched; eyes very prominent; antennæ rather long, slender, and ochreous, black at the apex, two basal joints globose, the others elongated; thorax pale and membranous, with several dark horny scales on the back; wings enclosed in large pitchy horny sheaths, forming two oval lobes on each side, one lying over the other; abdomen like a semi-ovate scale, with two distinct segments at the base striped with black, the margin producing a few long hairs (fig. 1, nat. size, 2 magn.); green or ochreous beneath, with six short stout legs, terminated by claws and a pulvillus. The rostrum, like that of the Aphides, appears to arise between the base of the anterior legs; it is three-jointed, and encloses four fine slender lancets, called setæ or mandibles and maxillæ. The female fly (fig. 3, magn., 4 the nat. size) is of a bright rusty orange colour; the head is short and broad, with two lobes in front; the eyes are prominent, and the three ocelli form a large triangle; the antennæ are slender and appear to be only nine-jointed; the two basal joints are stout and globose, the apical one is black and a little clavate; on the centre of the thorax are four broad black stripes; the body is velvety black, with the edges of the segments more or less scarlet; the apex of the ovipositor is ochreous; the wings, when at rest, are deflexed; the superior are much longer than the body, elliptical and slightly ochreous, with a few longitudinal nervures, three of them forked on the margins, and there is a brown spot near the middle of the inferior edge; the under wings are much smaller, ovate, and colourless; the nervures very indistinct, with a brown spot on the abdominal margin; the legs are equal, hairy, and ochreous, the thighs pitch colour; the posterior coxæ have a short spine beneath; the tibiæ have short black spines at the apex; the tarsian composed of two equal joints, and terminated by black claws; the male is similar; but specimens vary greatly in colour according to their age, and are sometimes of a livid green.

The perfect insects, which we often see paired late in the autumn, live, no doubt, through the winter, and come forth from their hiding-places when the warm sunny days of April and May force the Pear-trees into flower; at these periods the young apterous larvæ, which are similar in colour to the pupæ, are found on the under sides of the leaves, immersed in a drop of honey; and the winged and perfect insects are collected round the base of the blossom-buds; and as the humble-bees and wasps are then in search of food, they resort to the punctured branches for the honey which there stands in small drops, and it is very probable that this saccharine matter, spreading itself over the leaves and buds, causes them to appear black, as we often see them in the vicinity of London, owing to the smoky atmosphere adhering to the surface.



The female Psyllæ are, I believe, only oviparous, depositing vast numbers of elliptical eggs close to one another upon the young leaves, blossoms, fruit, and shoots of the Pear; being of a yellowish colour they look like the pollen of the flowers, and hatch in a few days. From the pigmy larvæ to the perfect Psyllæ, these insects are exhausting the sap with their beaks, which are at first thrust into the youngest and tenderest parts, preventing the development of the flowers; but as they increase in strength they attack the last year's shoots; if, therefore, the trees be young, they soon become sickly, the growth is checked, the leaves curl and turn yellow, and the shoots wither. It is the opinion of the most eminent horticulturists that the inferior quality of the Pears may often be attributed to the loss of sap which this little insect causes; and at Downton, many years since, it rendered the entire crop of Pears worthless. They are the cause also of further mischief to the fruit in gardens, by attracting wasps and ants, the latter being constant visitors to the infested trees; as soon as the Psyllæ become pupæ, and afford a copious discharge of saccharine fluid from their bodies, and being thus colonised, those destructive insects are ready at a later period to attack and injure the ripe fruit.

To get rid of the Psyllæ or Chermes is by no means an easy undertaking; washing the Pear-trees in the spring with an infusion of tobacco checked them for a time, but they reappeared in great numbers, and the frequent use of the engine did not prevent them from doing considerable injury. Mr. Knight, however, was of opinion that an infusion of the green leaves of Nicotiana tabacum or N. rustica would have proved more destructive. On the Continent they brush off the apterous Psyllæ with a stiff brush, using clay and water, or lime and soot; but when thus dislodged, unless they are caught in a cloth beneath and destroyed, vast quantities must escape and recover their stations; and the winged parents are still more difficult to deal with.—*Ruricola.*

ON THE TREATMENT OF THE TREE-PÆONY, WITH AN ACCOUNT OF ITS VARIETIES.

THE shrubby Chinese Pæony and its varieties, of which the Chinese are *said* to have above 300 varieties of all colours, even black and yellow, are among the most beautiful of hardy shrubs, and are great ornaments in a flower-garden when in bloom, during the early part of May. Like many other plants from the northern parts of China, Siberia, and Tartary, Tree-Pæonies are excited too early in the spring into a growing state; they are consequently frequently injured by the late spring frosts in England, which destroy the young shoots and flower-buds, so that they are seldom seen in their greatest beauty, and when planted in a conservatory or pit, where they can be protected during the winter and spring, the plants are excited still sooner, and consequently get drawn, which renders the flowers of short duration, and paler in colour, which is not the case if planted in the open border.

The Tree-Pæony (Pæonia Moutan), like all the shrubby plants belonging to the natural order Ranunculáceæ, requires a strong rich loamy soil, with plenty of moisture during the growing season, but by no means a swampy one; for though many of the plants belonging to the order flourish during the growing season in swampy situations, they will soon perish if they are in one when in a dormant state. A deep loamy or strong soil, with a dry subsoil, should be selected for planting the Moutan Pæony, and a light dry sandy or poor soil avoided, for in this they never flower well, as they always suffer from drought; but even in such a situation they may be made to flower by adding a quantity of well-rotted dung and a little fresh loam to the soil. In planting them in the open border the best time is the end of October, but they may be removed at any time except when they are either in flower or showing flower; but they will be liable to lose their flower-buds if they are transplanted after they commence growing. They seldom suffer much from moving, if it is carefully performed in the autumn—for they may then be taken up from the open border, and potted for forcing; but the forcing requires great caution as regards the heat applied; if not done gently and the plants allowed to make fresh roots before they are subjected to much heat, they will invariably lose their flower-buds during the time of forcing, and they must only be subjected to a moderate heat at any time (60 degrees), as they are very apt to get drawn up weakly; when properly treated they are beautiful objects, and particularly the double varieties. When the forced plants have done flowering, they should be again planted in the open border, cutting the principal shoots back at the same time; they will then be ready by autumn for repotting, and fit for forcing again the following spring; when potted, they must be well protected in a cold pit from the frost, but must not be placed where artificial heat is used.

When planted permanently in the border, they should have an open situation which is not in the least shaded by other plants, and they will require little more trouble, except shortening some of the longest of the shoots, before the spring, when they must be slightly protected to preserve the young shoots from injury by the frost, which is easily done by placing a single mat or canvas covering over them at a sufficient distance from the plant, so as not to hurt the young shoots by pressure. The covering should be removed on all fine days, but replaced during the night. If the plants are small, they may be covered with a handglass during the night; they will then flower freely during the early part of May, and the colours will be more brilliant.

The Tree-Pæony is easily increased, and in several ways, when the plants are rather large and old; but when they are small and young it is rather difficult, and should not be attempted; they should be rather encouraged by watering freely during dry weather in summer, and by mulching with a little rotten dung and covering with a hand-glass during the winter. When plants are of a sufficient size and strength, they may be increased in the following ways:—

First.—Take up one of the largest plants about the end of October, and after shaking all the soil from the roots, separate each of the stems, which have got any roots attached to them, with a sharp knife; then shorten the top of each and pot them in some good rich mould, placing them afterwards in a cold pit where they are tolerably secure from frost, and where they can be kept dry during the winter. In the spring, place them where a little artificial heat is used; they will then begin to grow and make good plants fit for planting out in the autumn.

---

* Curtis's Brit. Ent. pl. 565, fig. A.

† Curt. Guide Gen. 1050.

The second mode of increasing them is by layering, which is performed in the following manner:—Select, either in October or February, some of the bottom shoots which are of the preceding year's growth; tongue and peg them down in the usual way, covering the layers about three inches with a mixture of light sandy peat, leaf-mould and a little loam; they will then require no other care, except a little water in dry weather; but they must remain for two years attached to the mother plant. There is another way of layering the Tree-Pæony, which is by selecting early in spring some of the bottom branches or stems, ringing them with a sharp knife, about one inch above and below each bud upon the stems; every bud will then occupy two inches of the stem, which is obstructed above and below. In ringing, remove in the usual way a small ring of the bark all round the stem. The branches so prepared are then laid in the same way as the preceding, and the plants will be fit to separate in one year, but they will not be so strong as those raised in the preceding manner. The Chinese are said to practise budding the rarer ones on the more common kinds with great success, but that statement seems rather doubtful.

The third mode of raising them is from seed; but this can only be done to increase the single ones, as the semi-double ones do not produce perfect seeds, or at least very seldom. When perfect seeds are obtained, shortly after they are ripe they should be sown in pans filled with a mixture of fresh loam, and a small portion of leaf-mould and sand, which should be placed in a cold pit or frame, and protected from wet until the following spring, when the seeds will begin to vegetate. If the seeds are not sown until the spring, they seldom grow before the following year, and frequently many of the seeds perish before that time arrives. The seedlings must be allowed to remain in the seed-pans the first season, and be transplanted the following spring, either into the open border, or singly in pots; and the time they are afterwards before they flower depends upon the treatment they receive, but generally they require two or three years.

The fourth mode of increasing them is from single eyes, which is done in the following manner:—Any time when the plant is in a dormant state, cut off a branch of the two or three-years old wood which has a quantity of buds upon it, and cut it into pieces of about two inches in length, leaving a single bud on each piece; then pot and treat them in the same manner as Grape Vines are when raised from single eyes; that is, plant them about two inches deep in pots filled with good rich soil, and place them in a gentle moist heat. Plants raised in this way are good, but small.

The fifth mode of propagating them is by grafting them on the roots of the herbaceous kinds; but it is uncertain, and when it does succeed, the plants are generally short-lived, except when the grafted part is placed sufficiently under the soil, in which case it frequently emits roots from the base of the graft, and becomes a healthy plant supported by its own roots. The operation of grafting is performed in the following ways:—Select some good tubers of herbaceous Pæonies—the Chinese P. albiflora and its varieties are the best—any time early in spring, before the plant commences growing; then cut off a small portion of the crown, and slit the tuber from the top end downwards sufficiently deep to admit the scion of the Moutan Pæony, which must be of the last season's wood, fitting the bark of both well together as in the ordinary way of grafting, and bind them tightly with strong matting: then pot them singly in pots, deep enough to cover the graft about an inch with soil, and place them in a cold pit or frame kept quite close, and give them but little water at first. They may also be grafted about the end of July or beginning of August, using the young wood of the current year in the same way as the preceding; but when they are grafted and potted, they must be placed in a strong moist heat, and kept close with a bell-glass, as the wood, being rather soft, would soon perish if placed in a cold pit or frame.

There is but one species of Moutan or Tree-Pæony known, but of this there are the following varieties:—

1. P. M. papaverácea, Hort. Trans., vol. vi.—This handsome plant is, no doubt, the wild form of the species. It has large single white flowers, beautifully marked in the centre with rich purple, and forms a large bush. It is the hardiest of all the Tree-Pæonies yet in cultivation. The P. M. Ráwesii of Mr. Sabine (see Hort. Trans., vol. vi. p. 479) does not differ from this plant, although recorded in all catalogues and books on the subject.

2. P. M. álbida plena, Hort. Trans., vol. vi., p. 482; or Double papaverácea.—This desirable variety was raised at Arley Hall, the seat of the Earl of Mountnorris, in Worcestershire, from seed of the preceding kind, and not from those of the P. M. Bánksii, as stated by Mr. Sabine in the Hort. Trans., vol. vi., p. 482. It has very double white flowers stained at the base of the petals with purple, and differs from the preceding in nothing except in having double flowers and being much dwarfer in habit.

3. P. M. Bánksii, Hort. Trans., vol. vi. Sir Joseph Banks's Tree-Pæony.—This variety bears the largest and most double flowers of all, the flowers being eight or nine inches across when fully expanded; the petals are of a pale blush colour towards the extremity and purplish-red at the base when the blossoms are young, but becoming almost white when fully expanded; they are also sometimes jagged at the edges. The P. M. Húmei of Mr. Sabine (Hort. Trans., vol. vi., p. 475,) is identical with this variety. P. M. Bánksii varies much according to the soil and season, being in some years quite double and in others semi-double, with some of the flowers even single, which accounts for the different names applied to this and the following variety. The P. M. cárnea plena, Hort. Trans., is not distinguishable from this variety.

4. P. M. rósea plena, Hort. Trans., vol. vi., p. 477.—This is a beautiful variety, with self-coloured flowers of a deep rosy-pink colour, but becoming paler as they get fully expanded. It is the tenderest of all the Moutan or Tree-Pæonies, but one of the most showy when in good health. The P. M. rósea plena and P. M. rósea semi-plena, Hort. Trans., vol. vi., p. 476-7, are the same plant, the difference being entirely caused by the soil and season; and is not by any means permanent, as supposed by Mr. Sabine when he published his account of them in the Hort. Trans., but the error seems still to be retained in more recent publications.

5. P. M. lácera, Bot. Reg., July 1835.—This handsome variety was raised by Mr. W. Highlands, gr. to the Earl of Sandwich, near Huntingdon. It differs from the others in the bright rosy red of the petals, the innermost of which are very much torn and curled; they are also distinctly bordered with a narrow edge of carmine, which gives the whole flower a peculiar rich and finished appearance.

6. P. M. Anneslei, Hort. Trans., vol. vi., p. 482.—This distinct variety has rather small, single, rich purplish-pink flowers, with the petals slightly jagged at the margins. It was raised at Arley Hall.

There are some other seedling varieties, such as P. M. punícea, which is a handsome sort, differing from the preceding in little except in being semi-double and in the petals being a little more jagged; and P. M. variegata is another variety also raised at Arley Hall, with white flowers, nearly single, stained with purple, particularly at the base of the petals. It is rather dwarf in habit, and evidently only a slight variety of the Moutan papaverácea. There is also a Belgian variety with single flowers called P. M. Rosa Gállica.

THE AMATEUR'S GARDEN.—No. X.

THOSE who are fond of hardy fruit-trees should now procure scions of the most desirable sorts for grafting. In small gardens the space for the orchard is necessarily limited, and therefore it would be useless to attempt growing any more than a selection of the most approved kinds. Any old trees which produce fruit of a worthless character should therefore be headed down, and the good kinds grafted upon them. The operation of grafting is easily performed, and must be familiar to almost every one; it is plainly described, and accompanied with woodcuts, in the "Cottager's Calendar," lately presented to the readers of this Paper. Perhaps the easiest way to learn to do it well is to see it done by a good gardener, and always to bear in mind that success depends in a great measure upon choosing healthy stocks and fitting the stock and scion very nicely; and at the same time surrounding the whole with clay, which prevents the air from drying the different parts.

Amongst hardy fruits there are several new kinds which deserve a place in the most limited collection, and with which the amateur may not be acquainted. The following are the best new Pears:—The Dunmore—of which a sketch and description has already appeared at page 85—is a most excellent early variety, ripening before the Marie Louise. The Suffolk Thorn is another excellent fruit, which was raised from the Gansel's Bergamot, and ripens about the same time, but has the valuable property of bearing abundantly as a standard. Knight's Monarch is also a new Pear, little known, but of excellent quality; it is fit for the table about January: a spurious worthless variety under this name is now in many collections, but the true sort has fruited in the garden of the Horticultural Society, and grafts of it have been distributed to the Fellows. Hacon's Incomparable is another Pear of first-rate quality, ripening generally from December to January; and the Althorp Crassane, of which a good plate was published in the Horticultural Transactions, is another good sort, very hardy, and fit for use in October and November. Besides these, there are some others which are better known, and which should be in every collection, such as the Beurré Bosc, Winter Nelis, Glout Morceau, and Beurré Rance; the latter is by far the best late-keeping Pear which we at present possess. All these kinds succeed perfectly as standards in the climate of London, and for the table are far preferable to those of the same kinds when grown upon walls. In addition to the new kinds mentioned above, there are two others which by many are highly prized, namely, the Van Mons' Leon le Clerc and Monsieur le Curé.

The new Plums most deserving of a place in a small collection are, the Royale Hâtive, a fruit resembling the Purple Gage, but quite distinct from it, and which ripens amongst the earliest; and the Ickworth Impératrice, which ripens in October, and is one of the best at this late season; it keeps a long time after being gathered, and if allowed to be in a dry place will ultimately become a Prune. The purple Gage, or Reine Claude Violette, is also an excellent Plum, and, like the others, does as well as a standard near London. Collections of Cherries may be much improved by adding the Elton, Downton, and Knight's early and late black. With regard to Apples, I believe none are better than the old kinds which have been long in cultivation and are now well known. Where the amateur is making a general collection of fruit-trees, he cannot do better than refer to the numerous lists given in the answers to Correspondents in the last volume, where he will find kinds suited to almost every circumstance and locality.—*R. F.*

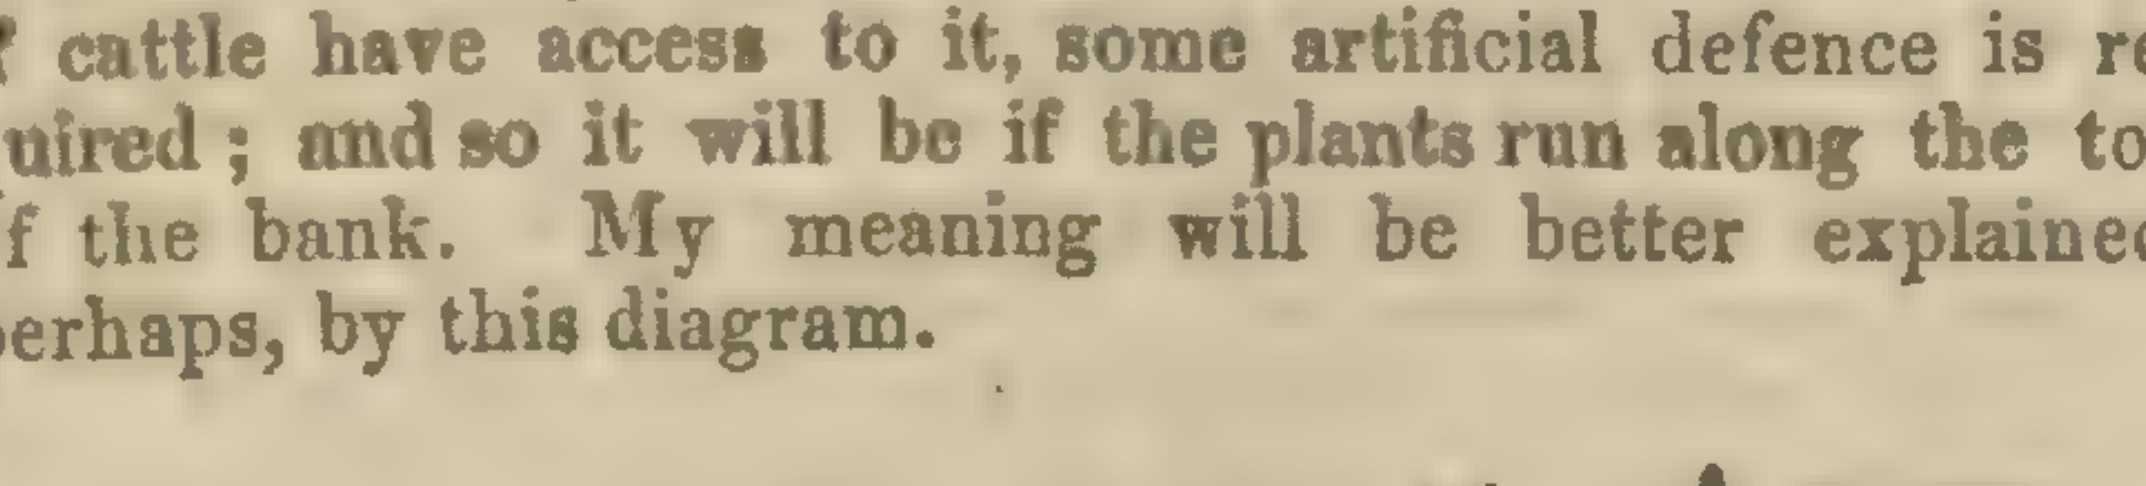
HOME CORRESPONDENCE.

Assam Tea Plant.—My attention having been drawn to a Leading Article in the *Gardeners' Chronicle* of Saturday, Jan. 29th, and to a communication inserted in the same Paper, from Mr. Griffith, on the subject of Assam Tea, I feel myself called upon in behalf of my brother, Captain (now Major) Jenkins, Commissioner of Assam, to offer you the following remarks in contravention of your own conclusion and that other gentleman's statements respecting the person entitled to the credit of having called into existence the present manufacture of tea in that province. You insert certain references to what you consider the facts of the case, and thence draw a conclusion in favour of Capt. Charlton's claims; one of the references in question is as follows:—"Dr. Wallich having had his doubts removed about the Assam plant being most unquestionably the real tea,' officially expressed himself (you say, Dec. 1834) in these words:—'A more interesting, a more valuable fact has never been brought to light in Indian agriculture, than has thus been established beyond dispute by Lieut. Charlton.' Now, sir, it happens that I am in possession of a copy of the original minute alluded to, sent me by Dr. Wallich himself, and attested by his signature; it bears date Dec. 1834, and is addressed by Dr. Wallich, as secretary of the Tea Committee, to the Indian Government; after acknowledging the receipt of reports from Captain Jenkins and Lieut. Charlton in the preceding months of May (7th, 17th, and 29th) and Nov. (15th), it proceeds thus—'It is with feelings of the highest possible satisfaction that we are enabled to announce to his Lordship in Council that the Tea-shrub is beyond all doubt indigenous in Upper Assam;' and then describing the localities, it continues—'We have no hesitation in declaring this discovery, which is due to the indefatigable researches of Captain Jenkins and Lieut. Charlton, to be by far the most important and valuable that ever has been made in matters connected with the agricultural or commercial resources of this empire.' This is evidently the minute to which you refer; but how comes it that my brother's name is altogether omitted in the extract given in the *Gardeners' Chronicle*? I fear that you have either had access only to imperfect copies of official documents, or that interested parties have supplied you with garbled portions of them; and in either case I trust that you will for a short time recal your decision, and invite the public to suspend their judgment on the subject till further information and evidence (which in the name of Major Jenkins I will venture to promise) shall be submitted to your consideration. In noticing the communication from Mr. Griffith, I must confess I cannot see, because a medal has been voted to Major Jenkins by so small a majority of the Agri-Horticultural Society of Calcutta, by what process of reasoning Mr. Griffith infers, that therefore it is the work of a party. Is it not possible, I would ask, that the cabal may be the other way? Nay, is not this as probable as to believe that Sir E. Ryan (the President), Dr. Wallich, Mr. Spry, and others—the distinguished heads and ornaments of the Society—should use their weight and activity to accomplish an unjustifiable purpose? Is it not possible that the vote of the former medal to Captain Charlton may have been carried by party intrigue, and that the Society, finding itself surprised, as it were, into a course of which it did not thoroughly approve, had rallied its strength to make reparation to my brother's services, and, if I may add, to the condemnation of the former proceeding? You say truly there has been much excitement in Calcutta on the subject; but during the whole commotion Major Jenkins himself has remained perfectly passive and silent—reluctant, it would seem, to thrust himself on the public in a matter of so much private concernment, and not unwilling, I infer, that Captain Charlton should benefit himself by making the most of whatever service he has been to the identification of Assam Tea; but since Captain Charlton, or his friends in his behalf, are now asserting that it was principally through Captain Charlton's exertions that the Tea was brought to light, and its present cultivation and manufacture established, I am persuaded that Major Jenkins will feel that these assertions are made at his expense, and at the expense of truth, and will come forward in self-vindication, in justice to the Society, and in justice to his friends in India and at home, and show to the satisfaction of his government and the public what are his claims to the award of this medal. I would appeal, then, through you, for a short suspension of opinion; the question cannot now be allowed to rest where it is, and my own conviction is that the facts will be found to be these:—That Captain Charlton having made the praiseworthy attempt referred to in 1831, had in fact on his part dropped all further exertion; that my brother being sent at the close of that year, 1831, to survey the province of Assam, and engaged therein in the years 1832-3, was finally appointed Commissioner there, and having found the Tea-plant, as others had done before him, growing naturally in various localities, resumed the discussion of that important question in 1834; that it was then resumed was wholly owing to his own energy and resolve; that for some months the scientific and other authorities resisted, as they had previously done, his offered proofs; that he still persevered, and at length succeeded in producing conviction of its being the genuine Tea-plant, and that throughout the whole of this latter proceeding, Captain Charlton's services were merely secondary—locally, if not officially, assistant—but not spontaneous. With respect, therefore, to the practical application of this discovery, I feel confident that the merits of Major Jenkins's services will ultimately be fully recognised and duly appreciated. I have to apologise for this delay in noticing the articles referred to, but my residence in an obscure corner of the land prevented my seeing them till a few days since.—*David Jenkins.* [Happily we are not called upon to answer that part of the foregoing letter which relates to Mr. Griffith and the disputes which have taken place in India with reference to Assam Tea; no one can regret more than ourselves the bad taste in which they have been carried on. We need only advert to that which concerns ourselves, and to the opinion we have formed from the evidence before us—an opinion in no way shaken by Mr. Jenkins's letter—for it is to be remembered that the question at issue is not who first forced upon the Indian authorities the investigation of the facts connected with Assam Tea, but who first satisfied them that the plant growing in that province was really Tea, and not a Camellia, as had been supposed. This can only be settled by dates. The extract given by us at p. 67, and which our correspondent supposes to be garbled, is from a letter signed "N. Wallich," Officiating Secretary to the Tea Committee, is dated Dec. 6, 1834, and has been published in the Proceedings of the Agri-Horticultural Society of India for July 1841, p. 14; it was addressed to the Chairman, &c., of the Tea Committee. The minute to which Mr. Jenkins refers is stated in the same place to bear date, not Dec. 1834, but Jan. 7, 1835, being No. 6, p. 32, of the Parliamentary Tea Reports, and was addressed by the members of the Tea Committee to Government; and it is a complaint on the part of Captain Charlton that the original letter from Dr. Wallich is not included among the documents supplied to Government. We do not ourselves see the force of this complaint, nor why Dr. Wallich should have been blamed by Captain Charlton's friends, because if that officer's claims depend upon the transactions of 1834, they cannot be sustained. It is the having brought to Calcutta Tea-plants in 1831, and the having at that time positively asserted that they were Tea-plants, that induced us to place him before Major Jenkins; but of course if the latter can show that his discoveries go back beyond 1831, which has not yet been done that we can find, our decision must be reversed. Those who are disposed to institute a minute examination of the evidence relating to this subject, will find it in the Parliamentary Reports, and in the Proceedings of the Agri-Horticultural Society for July and August 1841.]

Mr. Chapman's Potatoes.—In the *Chronicle* of the 19th, I find an article on the production of new Potatoes signed "George Gordon," in which the circular relative to our new Potatoes is unfairly dealt by. The writer puts a construction on the wording of it which it has no right to bear, namely, that it is the mere treatment of the sets, and not any peculiarity in the sort, which gives our Potatoes the properties they possess. We neither say so in the circular nor mean so, and it is a gratuitous assumption on his part to say we do. What we mean is, the sets will be exposed to the air, and, consequently, altered in their appearance and flavour from those kept in pits and covered with mould. If we had not stated this, a person receiving a sample of the sets in the greened condition might be disappointed at their appearance; but we pledge ourselves, if our instructions are followed, that the produce will be the same as the sample. The assertion that our Potatoes are obtained in the same manner as is described by Mr. Saul in the "Gardener's Magazine," we flatly contradict; and it is evident that the writer of the paper to which I am adverting knows nothing of the matter, although it might have been expected that he would have made himself acquainted with our practice before he ventured to write upon it. As to the Potatoes obtained upon Mr. Saul's plan, they are soapy rather than waxy; and it is for this reason that the method, which, by the way, is both old and well known, is never followed by good gardeners. Now, to show that there is no analogy between the two systems, and that the kind has something to do with the result, I will state what we did with ours last season. The largest piece which we grew was between five and six acres, planted with spring-planted Cabbage, which, when cleared, we ploughed with two horses. We then had the drills drawn by the horses as near together as they could be, not more than eighteen inches apart; the sets were planted from six to eight inches in the rows: when the Potatoes were high enough, we sent a boy and a donkey, and hoed them; when they were sufficiently high, we earthed them with a horse; and that was all the trouble we had with them until taking-up time, when, if the horses could have stood on the land, we should have ploughed them out as well as in; for a part of the land on which they grew was last February a bog, with the water lying on its surface all the year, and planted with Willows of a hundred years' growth; and at the time the Potatoes were taken up, the water was within six inches of the top. But still they are not waxy, but are all we say of them, and they will be so till July next. If Mr. Gordon will come and see me, I will show him how to grow Potatoes, so that if ever he should be asked again he may be able to tell. To convince him warm and dry borders are not necessary to the cultivation of our new spring Potatoes, we intend planting twenty acres of them this year; and as it would be rather too expensive and troublesome to cover that area with leaves, and too foolish to allow them to occupy any land that would grow another crop, I shall take the liberty of putting them into pits, in the same manner as any other Potato, and then challenge Mr. Gordon to produce anything like them for flavour, appearance, and crop, grown on Mr. Saul's plan. Mr. Gordon is likewise mistaken as to the growers of Devonshire and Cornwall supplying the London markets in the months of February and March—he should have said May and June; and that arises from their being much earlier and not exposed to spring frosts as we are in the neighbourhood of London. I beg to apologise to you for the length of this letter; but as the letter of Mr. Gordon was calculated to do me a serious injury, I wished to deny its accuracy emphatically and fully in every particular; and as your Paper has been the vehicle through which we have been attacked, I confidently expect you will insert our defence in justice to us.—*Charles Chapman, Brentford End.* [We have some other letters on this subject from persons who agree with Mr. Gordon, in stating that Messrs. Chapman's Potatoes owe their quality to the mode of treatment; but as the writers are anonymous and do not seem to know anything of their own knowledge, we cannot give them insertion. Our own opinion of Mr. Chapman's Potatoes has already been given at p. 40, and we will now add that we have never yet tasted any forced or retarded Potatoes anything like so good as theirs. It would, however, have been more satisfactory if Mr. Chapman had given some information as to the manner in which he obtained his new Potato originally, and also what the purchasers of his greened-sets are to do with their Potatoes when they wish to set them again next year.]

Manures.—In p. 142 (1842), there are some remarks on manures, and the use of guano, bone-dust, and nitrate of soda is advocated; but knowing from experience what destruction may be committed by the application of the former, even in small quantities, I would recommend parties using it to be cautious. A friend of mine purchased a collection of Cinerarias of the best kinds twelve months ago, and the plants being small, he used every stimulant he could think of, to get them into a blooming state; and, amongst other things, he used at the last shifting a little guano; the consequence was, in a few days the leaves became quite brown, and the stems shrivelled up. After this he took them all out of the pots, cut off the dead stems, shook the soil from their roots, and put them into small pots with earth free from guano; and they are now gradually recovering. With respect to bone-dust, twelve months ago we had a ton of it to mix along with the earth in a Vine border. I took two or three barrowfuls of the smallest, and mixed it with some compost in which I was potting some Pelargoniums, and the result was, that I lost every plant. I likewise tried it on some Chrysanthemums, and they grew and bloomed splendidly. The remaining portion of the compost I united with soil which I put to some Strawberries, and I had an excellent crop. When I had filled up my Vine border, I had about two doz. barrowfuls of the compost left, which I put into my Celery trenches alongside some that were well manured with cow-dung; and the difference was quite visible all the time the plants grew; and on taking them up, and comparing the largest heads of each, I found that those grown with bone-dust were the heaviest by two pounds a head.—*R. Towers, Aighburth.* [These statements do not show that such manures are unfit for use. They only show that they are extremely strong, and require to be applied in very small quantities. Guano acts like pigeons' dung and yeast. We should steep it in water, and apply it in a liquid state when the plants are growing.]

Hawthorn.—When a ditch is made and an embankment thrown up for the formation of a quickset-hedge, would you object to planting the row of quicksets along the bottom of the latter? In light soils, this appears to be a better line for putting in the plants than the top. I have practised it in a small way, and have seen it successfully performed in a larger by others. I prefer this mode of procedure, first, because the roots are not so easily denuded of earth by heavy rains in wet, and by high winds in dry weather, or by any other disturbing causes; secondly, because the plants thereby enjoy more moisture, from the drainage of the bank above them, and are at the same time sheltered from wind and weather; and, thirdly, because when the hedge is grown stout enough to make a fence of itself, the bank may be levelled, and the surface it and the ditch occupied may be restored to tillage, which cannot be done if the quicksets be planted on the top. I agree with you that a hawthorn fence is soonest and best grown on the level surface. But if a ditch is wanted for a fence, it will in this way, and with the intervening bank, prevent the necessity for any other protection to the young hedge on that side. On the other, if cattle have access to it, some artificial defence is required; and so it will be if the plants run along the top of the bank. My meaning will be better explained, perhaps, by this diagram.



The upright on the garden-side represents the post-and-rail paling or fence, necessary if cattle have access on that side, but otherwise not wanted at all. In wet soils it may be best to plant along the top of the bank. But in dry ones, I see no advantage in this method, except that the plants are there not so liable to be choked with weeds, for the very same reason that the quicksets do not thrive so well there—its superior dryness.—*P. P.*

Whitethorn Fences.—I have lately read in the *Chronicle* of several methods of producing a good fence; the following I have seen practised with success. The ground is double-trenched two spit deep, say 4 feet wide, according to taste; it is then planted with two rows of quick a foot or 1½ foot apart, and 6 inches in the rows, first trimming the tap-root, if any, and all long stragglers. In the spring each plant is headed down with a knife to within an inch or two of the ground, when each sends up two or three shoots, which are again shortened with a knife the following spring before they shoot. They then have a summer clipping with the shears about the middle of June on the top, only leaving 4 or six inches according to their growth. The sides are seldom cut, except a few long shoots which are shortened back: this method is pursued till the hedge gets to the required height, when you might actually walk along the top of it, and so thick from bottom to top that you can scarcely see through it.—*An Odd Fellow.*

On the Management of Cucumbers.—As the season for Cucumber-growing is now approaching, I beg to offer a few remarks on the subject, in the hope that they may be useful to amateurs. The bed, the size of which must be regulated by the frame, should be about six feet high. The dung should be well decomposed, and before being used should be frequently turned over and watered. In forming the bed, the dung should be well beaten down with a fork; but it should not be trod upon, or some portions will be pressed firmer than others, and consequently there will be an irregular heat thrown out. Horse-droppings or leaves may be advantageously used, both to keep heat longer and to make better manure. When the bed is thus formed, the frame should be placed on it, and a stick or two introduced into different parts of the dung, to ascertain the heat. After the rank steam has gone, the lights must be taken off, and the top of the dung well sodded, to prevent steam from future linings entering. This must be particularly guarded against, as rank steam is certain death to the plants. Cucumbers thrive best in a light, rich vegetable mould. The seed should be sown about half an inch deep, and covered over with a piece of glass, to prevent them from growing long and weak. When the first rough leaf appears, they should be potted as low down in the pot as possible; in fact, they should be earthed up to the first leaves. In watering, be careful not to water overhead, particularly in the morning, or the sun will be sure to scorch the leaves. A few days before it is intended to plant the Cucumbers out, there must be some hills made in the frames: this is to warm the earth, so that the plants may receive as little check as possible from shifting. They must be carefully knocked out, and planted in the centre of the light and near the glass. This is indispensable to success, for they should be kept as short-stemmed as possible. The temperature which Cucumbers thrive best in is from 66 to 70 degrees; and the more moist the heat is, the better. Water the plants well after planting, and keep them shaded, particularly if the days are inclined to be sunny. Air must be given cautiously; if too great a current be allowed to enter, the plants are blown about and loosened, and the leaves bent and sometimes broken. Some more mould may now be introduced into the frame, to warm. If the plants are growing well, the roots will be seen pushing through the hills, and then a little earth must be drawn round them, to induce the roots to keep growing, until they are pretty well established, when the rest of the soil may be put in, and the surface levelled for pegging down the shoots. The soil should be placed in the sunshine or some warm situation before being put into the frame, for fear of a check being given to the plants. In warm or sunny days the plants will be all the better for being shaded. In pruning, never make any cuts with a shears or knife, but always pinch off the shoots that require to be taken out, and give the remaining part of the branch so pruned a good squeeze, to prevent the sap from flowing. The large leaves should be thinned out as much as possible, and all mouldy or decayed pieces and misshapen fruit should be destroyed. In pruning, always try to make the plants fruit near the parent stem, and to accomplish this they must be stopped continually a joint before the fruit. All branches that seem unproductive must be cut away, and the fruit should rest upon something, as they are apt to gum if they lie on the soil. There are some boxes made on purpose, which are very good, to cause them to grow straight; but when all is said, there is nothing so good as trellises for training Cucumbers on. Canker generally arises from cold or too much water. So the plants may be treated accordingly. Dusting with sulphur is, I believe, the best cure for mildew. In frames infested with red spider, the following is a good remedy: Either mix with the paint sulphur, or wash the frame with a decoction of one gallon of tobacco-water, 2 lbs. of sulphur, and about a half-bucket of lime, well mixed together. The sun shining throughout the summer causes this to evaporate continually, and produces an atmosphere so disagreeable that no insect can live in it, and does not injure the plants. In matting down, care should be taken that the mats do not overhang the lining; for if so, they will be sure to lead the fumes of the dung into the frame, and thus to injure, if not destroy the plants. If the fruit is required to seed, the stem leading to it may be bent, or a piece of matting tied firmly round the fruit, which will invariably cause seed to be produced. The best time for watering is in the afternoon or evening, say about two hours before the sun is withdrawn from the frame. The softer the water is, the better. Rain is preferable to any other when it can be obtained; but where it cannot, take several panfuls of the softest water, and let it stand for a few hours in the sunshine, which will soften it, and make it of a nice temperature. The plants should then be well watered, particularly round the outside of the frame, and then shaded from the sun; and by this means a highly beneficial steam is raised.—*W. Payne, Wentworth Gardens.*

Lily of the Valley.—Your correspondent, Mr. Frost, at page 813 (1841), discredits my statement respecting Lilies of the Valley, though he cannot disprove it; for it does not appear that he ever tried growing the plant in the sun. All that he says goes no farther than to prove his own skill, or the excellence of his compost. Happening to call on an old lady some time ago who is fond of her garden, she pointed to some Lilies of the Valley, observing—"People generally plant their Lilies of the Valley in the shade, and then complain that they don't blossom; I have placed mine where they get plenty of sun, and they always blossom abundantly." I believe the fact to be, that people are led astray by the word valley; and, naturally enough, associate with it the ideas of coolness and shade. I have said more on the subject than I otherwise should, because the plant being a popular one, I think it desirable to explode a popular error in the treatment of it. —*A Salopian.*

Transplanting Firs.—As "Totty" wishes for some information relative to transplanting Fir-trees, perhaps the following may be useful. I have had considerable experience in transplanting Fir-trees, from 10 to 15 feet high, but cannot recommend the practice, particularly where handsome specimens are required. Firs transplanted at that size I have generally found to assume a sickly stunted appearance, and they probably lose a number of their lower branches. Of course a great deal must depend upon local circumstances, such as a sheltered situation for planting; and if the trees can be procured from a shallow moorland soil, they will remove with better balls. Where the situation is exposed, or the plantation of some extent, I should plant trees of a much smaller size, say from 3 to 6 feet; but where only a few trees are required for immediate effect, and a little extra trouble and expense are matters not to be considered, I have found the following to be the most successful method:—Towards the end of March or beginning of April is the season best suited for transplanting such, in this country (North of Ireland). Great care must be taken of the roots, and to retain as much earth as possible about them, for the ball protects a number of small fibres that might otherwise be destroyed. In planting, large pits are necessary, and the roots should be regularly spread out to their full extent: the soil should be light fresh loam. After the roots are covered to the depth of 3 or 4 inches, a temporary support should be given to the tree, and then it may be watered abundantly; but the earth must not be trod firmly round it till the water has subsided. I generally allow the trees to remain till the following day before finishing off, when they must be firmly supported to prevent their being shaken by the wind. Some years ago I planted a number of large Spruce Firs about 10 feet high at about 12 or 15 feet apart; in the intermediate spaces I planted others about 4 feet high. In the course of a few years the small plants had attained nearly the height of the large ones, and were much the handsomest. This I consider a good plan in an exposed situation, as the large trees afford an excellent shelter, and can be thinned out at pleasure.—*Hortus.*

Deodars.—I have now a glorious stock of Deodar cuttings only planted a month since, yet with callosities the size of a pea, and the roots bursting therefrom in great abundance.—*E.*

PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

March 1st.—Sir C. Lemon, Bart., V.P., in the chair. Grafts of the following fruits were distributed: Knight's Monarch Pear, an excellent kind, raised at Wormsley Grange, near Hereford. By an accident, in which neither Mr. Knight nor his gardener were concerned, a spurious kind was propagated and distributed; this has dark-coloured wood armed with strong prickles, almost as long as those on the Cockspur Thorn; but the true variety has shoots of a yellowish tinge: Althorp Crassane Pear, an excellent autumn variety, which succeeds well as a standard; Winter Crassane Pear, an abundant bearer as a standard, which has the flavour of the Old Crassane; and the Ickworth Imperatrice Plum, one of the best varieties yet raised—a plate and description of which is given in the forthcoming Part of the Transactions. A paper from Capt. Churchill, R.N., on the cultivation of Asparagus at San Sebastian, in the province of Guipuscoa, North Spain, was read. The Asparagus is grown in beds about 5 feet wide, and from 20 to 60 feet long; the beds have no previous preparation beyond digging and raking; in March the seed is sown in drills 18 inches deep, and about 2 feet asunder. When the plants are 6 inches high, they are thinned to about 1 foot apart; the thinnings are transplanted in similar beds and watered once a day by one of the never-failing rills that runs through the flat on which the beds are formed. In the following March, a layer of night-soil a few inches thick is laid on the bed, and dug in when the plants have done growing in the autumn. The Asparagus is fit to cut the third year after sowing; and in the spring, a layer of leaves, about 8 inches deep, is laid over the bed; and when the plants come through this, the cutting begins. By this treatment, Capt. Churchill stated that he had seen Asparagus from 3 to 6 inches, or even more, in circumference; he also observed, that at times the roots of the plants were at spring-tides under salt water, which the growers considered beneficial. Mr. J. Goode, gardener to Mrs. Lawrence, exhibited a large collection of plants, among which the most remarkable was a specimen of Franciscea Hopeana, covered with highly fragrant blossoms, which on first expanding are violet, and gradually become almost white: the others were Cinerária spléndida, a showy purple variety; Cœlógyne barbata, with a pretty drooping spike of white blossoms; Maxillária tetragona; Cérbera fruticosa, with long pink flowers, resembling the Madagascar Periwinkle; and a specimen of the Privet-leaved Jasmine scrambling over some twigs at pleasure. A Knightian medal was awarded for the Franciscea, and some others of the collection. S. Rucker, Esq., sent a specimen of a new kind of Læ'lia, with bright yellow flowers; a new Dendróbium, with dingy-coloured blossoms of no beauty; and Odontoglossum stellatum: for the former of these a Knightian medal was given. From J. Bateman, Esq., were cut flowers of Cœlógyne nítida, white with yellow ridges on the labellum; Cyrtochilum maculatum, and an Epidendrum called Clówesii, which proves to be a variety of E. fuscatum: a certificate was awarded for these. Mr. Green, gardener to Sir E. Antrobus, Bart., exhibited a specimen of the beautiful vermilion-coloured Habranthus pratensis, and a brace of Cucumbers, grown in pots, as described in the *Gardeners' Chronicle*, p. 35 (1841): for the latter a certificate was given; and one was also awarded to Mr. B. Fielder, gr. to W. Linwood, Esq., for a cut specimen of Cyrtopódium Andersónii. Mr. Errington, gardener to Sir P. Egerton, exhibited some so-called Newtown Pippin Apples, grown on a South wall; they were large and handsome, but did not possess the fine high flavour peculiar to the Newtown Pippin; and it was subsequently ascertained that they were the Dumelow's seedling. A Banksian medal was awarded to H. Hollist, Esq., for fourteen kinds of Potatoes; among them was a Kidney, the produce from one seedling tuber, weighing 2 oz., being 14 lbs. 2 oz.; and two tubers of another produced 15 lbs. 2 oz. Messrs. Chapman, of Brentford, sent a sample of their "new" Potato. Among the plants from the Garden were two singular Begónias sent from Guatemala by Mr. Hartweg; one named crassicaulis produces a number of flowering spikes from the top of its thick stems before the leaves appear; the other, the vitifólia, has singular-shaped leaves, but altogether is not so desirable as the first-mentioned. The others most worthy of notice were white and purple Chinese Primroses, with flowers more double than usual. The pretty scarlet Pentlándia miniata, and the beautiful purple Mirbélia ledifólia. There were cut specimens of Sálvia pulchella from Guatemala; the flowers are well suited for bouquets, but the plant, from its weedy growth, can only be grown in large greenhouses or in conservatories.

LINNEAN SOCIETY.

March 1st.—Dr. Horsfield in the chair. Mr. George Gardiner was elected a Fellow of the Society. Mr. Westwood exhibited a monstrous specimen of Chiosognathus Grantii, which had its left antennæ furcate; also several new species of Tetralobus, sent to Mr. Hope from Paris, and a number of new Goliathideous Cetonidæ from India. The Secretary announced the present of a collection of plants, chiefly Carices and Eupatoriæ from Dr. Barratt of America. A letter was read from Mr. Borrer, offering the Society his extensive collection of foreign phanerogamous plants, consisting of European plants from Mertens, Woods, Hooker, &c; American plants of Drummond, Gardiner, &c.; plants of the Unio Itineraria from Arabia, Abyssinia, the Caucasus, Pyrenees, &c; and Lippold's plants from Madeira. A paper was read on some rare and beautiful insects from Silhet (the major part of them belonging to the collection of F. Paley, Esq., of Cheltenham), and described by the Rev. F. W. Hope, F.R.S.

FLORICULTURAL SOCIETY.

March 1.—Mr. Mauger in the chair. Mr. Sandford was elected. Mr. Dickson read a paper on the Auricula, in which he remarked that of late years it had been less cultivated than most other Florist's flowers, which arose from the strong stimulants which had been adopted at the recommendation of Emmerton and others, in consequence of which many collections had been entirely lost. He could not at present enter into the details of his own practice, but in the mean time directed the attention of growers to the simple method of cultivation, given by Dr. Horner in our p. 396 (1841), and in the 3d, 4th, and 5th Numbers of 'Wakeling's Florist's Guide.' The object of the present paper was to have the properties of the Auriculas defined, and with that view he submitted the following: Pips.—Should be of an average size, flat, round, and smooth on the edge; the divisions which form the segments of the corolla should be but slightly indented. Tube.—Should be round, of a yellowish colour, and well filled with anthers. Paste.—Should form a circle, with a dense, smooth, pure white. Colour.—Violet, black, or any other; should be rich and bright, circular round the paste, of a proportionate breadth, and if possible equally distributed round the margin. Edge.—Should be a good green, grey, or white. Truss.—Should consist of not less than seven pips full blown, without overlaying each other. Stem.—Should be strong, and long enough to carry the truss well above the foliage, which should be healthy. Censors.—To give one mark to each property, perhaps some of them may deserve two. Mr. Dickson observed that the superiority of circular properties was so apparent that it has only to be seen once to be appreciated, and, he thought, it ought to take precedence of all others. He said that Colonel Taylor, and Page's Champion, when well grown, possessed more good properties than any other named kinds: the chief fault of the first was the paste being too thin, the other was the cracking of the paste, both of which could be remedied by good cultivation. As a pattern of a well-formed truss, without any art in dressing, he named Hedge's Britannia; the best coloured tube, Wood's Lord Lascelles, and Conqueror of Europe; paste, for fineness of texture and pure white, Fletcher's Mary Ann, and Scholes' Generalissimo." After the paper some conversation took place on the proportions of the tube, paste, and ground-colour necessary to form a first-rate flower. A discussion on the subject will take place on the 15th inst.

AGRICULTURAL SOCIETY.

Feb. 23.—The Duke of Richmond in the chair. Fourteen gentlemen were elected. J. G. S. Lefevre, Esq., F.R.S., presented, on the part of the Board of Trade, an American draining-machine, invented by P. D. Henry, of New Orleans, United States. The object of this machine is to raise water from a low place to a higher one; and the inventor proposes to accomplish this purpose by means of a hollow revolving hydraulic wheel, placed vertically at one-third its depth in the water, and divided into scooped compartments, provided with valves as the wheel turns round, admit the water and retain it until a certain elevation above the surface has been attained, when the enclosed water falls back along radiating compartments towards the centre of the hollow wheel, and is carried away by a cylinder in a continuous stream. Mr. Henry enters into a detailed account of the particular arrangements by which this effect is produced in the most economical and efficient manner, and claims as the peculiar merit of his invention, the tangential manner in which the compartments of the hollow wheel are arranged, in reference to the cylindric conduit through its centre, and the contrivance of the spoons for scooping up the water when the reservoir is low. Above the hydraulic wheel, when in use, is placed a man on a frame-work, who causes the great wheel to revolve, by turning the handle of cog-wheels acting on its circumference; and the inventor states that he found a wheel of six feet in diameter, constructed on this principle, and worked by one man, capable of raising 200 gallons of water per minute. The council directed that their thanks should be returned to Mr. S. Lefevre for this communication, and that the papers should be referred to the consideration of the journal committee.—T. Lawford, jun., Esq., of Peterstone Court, Brecknockshire, brought before the notice of the council the importance of inquiries connected with the wearing of rivers, and the most efficient modes of controlling their course, and of preventing, at the cheapest rate, their carrying away the land on their banks. Mr. Lawford stated that the present expenses in remedying this evil on a single estate under his management amounted to no less than 100*l.* every year. The Duke of Richmond informed the council that on his estates in the Highlands of Scotland, where many of the rivers were very rapid, and the banks much injured by the strong and irregular currents, resulting from obstructions met with in their course, the most essential service had been derived from the use of inclined planes, or large tables, having the two supports at one end lower than those at the other, stationed in the river at those points where the banks required defending against the action of the waters, or the currents diverted in the impetuosity of their course. Mr. W. Page also stated that on the Continent, especially in the Low Countries, he had observed that it was the practice of the occupiers of land intersected with winding streams, to defend their banks with wicker-work, interwoven with reeds and rushes. Mr. Miles, M.P., then gave notice, that when the subjects for the prize essays of 1844 came under the consideration of the council, he should move, "That a prize be offered for the best information for preventing the wearing of the banks of rivers, whether affected by tidal influences or streams, at the cheapest rate, and with the most permanent effect."—Mr. Hayter, M.P., submitted to the council a sample of the new manure for Wheat crops, discovered by Mr. Daniel, and advocated by Mr. W. Hall. The manure, on being opened for inspection, presented at first sight the appearance of a rich garden-mould, exhaling the disagreeable and strong odour of coal-tar; being found, however, on a nearer examination, to be more similar to decayed stable-manure, or a bituminous peaty mould, evidently containing a large proportion of woody fibre penetrated with the tar, and which rendered it specifically light and porous to the touch. Mr. Hayter stated, that he understood the price of this new manure was fixed at present at the rate of one shilling per bushel, and that the inventor recommended the application of 30 bushels per acre for Wheat and Barley, and half that quantity for Turnips; in the case of Wheat it being an essential condition, that the manure should not be brought into immediate contact with the seed.—C. Charnock, Esq., of Holmfield House, near Ferrybridge, Yorkshire, communicated to the council the results of his application of burnt blue shale, as a substitute for clay or marl on the hilly and thin soil of his farm. Mr. Charnock stated that in the coal districts a blue clay was brought up, and accumulated so rapidly near the mouth of the pits, as to become a great and inconvenient incumbrance to the owners; that this clay was similar to the "blue shale" of the West Riding of Yorkshire, and was frequently burnt, and when drilled along with crushed bones, was in this state found useful in promoting the growth of Turnips; but as the whole of the heated mass required frequently to be turned over before it could be thoroughly burnt, the operation was found to be tedious and expensive. Mr. Charnock having had some years' experience of the utility attending the application of the blue shale to the gravelly part of his own farm, was induced, from the success which had attended his trials of it, to select from the numerous experiments he had made on this point, one average experiment to be submitted to the consideration of the society, and to show to its members that even an article of this refuse character, considered by its owners not merely useless but an absolute nuisance, may become of value if rightly applied to its proper purpose, and, as in this instance, to soils of a gravelly and sandy nature. Mr. Charnock's experiment in question was tried upon a soil lying upon the magnesian limestone—a substratum proverbial for its natural poverty and inability to resist drought; and he enters into a detailed statement of all the particulars relating to his operations. The result of this experiment was found to be in favour of the system he had pursued, and that his Barley crop gave an increase of 27 3-7 bushels, and his Wheat crop 17 3-8 bushels, per acre, besides saving the expense of from 12 to 16 bushels of rape-dust crop. Mr. Charnock suggested that the society should publish correct analyses of bones (raw and boiled), Rape-dust, and Guano; and concludes his communication with the result he had obtained from a comparative trial of the merits of nitrate of soda and soot, on a dry grass field. He applied on one acre of the field a hundred weight of nitrate of soda (which cost 22*s.*), and on another acre of the same field 4 qrs. of soot (which cost 16*s.*), and the result was found to be very much in favour of the soot. This communication was referred to the journal committee, and the thanks of the council returned to Mr. Charnock for the favour of his statement.—His Grace the Duke of Newcastle conveyed to the council, through E. W. Wilmot, Esq., of Worksop Manor, the offer of Nottingham Park for the purposes of the annual meeting of 1843, should the society decide to hold their meeting of next year in that part of the north-eastern district. Mr. Wilmot stated that his Grace had not only great pleasure in making this offer, but that, should it be accepted by the society, the park should be placed at their disposal, free of all expense; Mr. Wilmot also placing his own personal services very handsomely at their disposal on the occasion. The Mayor of Maidstone addressed a letter to the council, informing them that the attention of the corporation of that borough had been drawn to the circumstance that the annual meeting of the Royal Agricultural Society of England would in the year 1844 be held at some place situated within the district comprising the south-eastern counties of the kingdom; and that he was directed by that body to offer the society every facility and assistance in reference to the arrangements for that meeting. The mayor assured the council that the corporation of Maidstone were most anxious to obtain the assembly of the society to be held at that town, which, both on account of its distance from London, and its hourly communication by steam-boats on the River, and good roads by land with the Metropolis, would have strong claims on the attention of the council when this question came before them for decision. The council directed their best thanks to be sent to the mayor and corporation of Maidstone, for this instance of their interest in the proceedings of the society, and a copy to be enclosed of the information required by the resolution of Dec. 8th, 1841, from all towns recommended as suitable for the occasion of the society's annual meeting in any particular year.—Mr. Theremin, of Berlin, informed the council of the favourable reception of the society's Journals by the Mecklenburgh Patriotic Union, and of their having deputed the Count Ostensacken, the principal director of their board, to take such steps in communicating with the society as would insure a continued reception of the work by that body. M. Theremin presented to the society, on the part of the author, a copy of a dissertation on the question of the education and proper training adapted for young farmers; by M. Gumprecht, principal farmer at Oelse, near Fryburg, in Silesia.—Mr. Miles, M.P., presented to the society, on the part of M. de Jenty, a collection of twenty-two of the most important works connected with the agricultural statistics of Belgium. Mr. E. F. Welles, of Hereford, presented six portraits of the most distinguished prize cattle at the Smithfield Show in 1841. The Rev. C. T. James, of Chelmsford, presented impressions of certificates of merit for labourers, awarded by the Roding Labourers' Friend Society, and the Surrey Agricultural Association.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

Brugma'nsia floribunda. Many-flowered Brugmansia. (*Stove Shrub.*) Solanáceæ. Pentándria Monogýnia.—Brugmansia floribunda is a small evergreen shrub, seemingly ranging from one to two feet in height, branching freely, having very handsome foliage, and bearing a profusion of deep orange-coloured blossoms, which continue perfect for many weeks. It is remarkable for the smallness of its flowers as compared with those of B. suavéolens, and hence it has obtained the appellation of B. parviflora at the Clapton Nursery. But besides this variation in the size of its inflorescence, instead of protruding it singly, as in the allied species, it is collected into a long raceme, comprising six or eight, or more blooms, which open in succession throughout a considerable period. From this last circumstance it has received the name of B. floribunda. Messrs. Young, though doubtful as to the precise district it naturally inhabits, have reason for considering that it is a South American plant. It was brought to their nursery two or three years back, and flowered abundantly in a stove during the months of June and July 1841. What renders the flowers particularly showy is, that the large inflated calyx, which is almost as long as the tube of the corolla, is of a similar and equally rich colour. It has been treated as a stove plant, and potted in a tolerably rich compost of nutritive loam and heath mould. In the winter it is placed in a cooler stove, and, since it retains its foliage, it has even then an ornamental aspect. It is just possible that it will ultimately succeed in a close greenhouse which is kept rather more confined and moist than such structures usually are. Cuttings of the young shoots placed in a sandy soil under a hand-glass, and assisted by a little bottom-heat, soon form rooted plants. The species, from the slow progress it makes, cannot be very largely increased; nevertheless this tardiness of growth renders it a most desirable plant for a shelf or stage.—*Paxton's Magazine of Botany.*

MISCELLANEOUS.

Pharmaceutical Bread.—To make this kind of bread, take flour, 3lbs. imperial; cold water, 1⅓ pint imperial; sesquicarbonate of soda, ½ oz. (Troy weight); hydrochloric acid, 5 fluid drachms; a small quantity of salt, if required. Mix the soda perfectly with the flour, and the acid with the water, then the whole intimately and speedily together, using a flat piece of wood or spaddle for that purpose, in preference to the hand. It may be made into two loaves, and put into a quick oven immediately. It will require about one hour and a half to bake. *Precautions.*—Let the soda be well mixed with the flour, for wherever a small lump of it is deposited unmixed, it is not perfectly acted upon by the acid, and causes a yellow spot in the loaf, which, however, is more unsightly than detrimental. The acid is the muriatic of commerce, and should have a specific gravity of 1·16. It should be mixed with the whole of the water to be employed. The water should be as cold as possible. Three pounds of flour require about a pint and a half to make it into dough of proper consistence; but as the quality of flour varies according to season and other circumstances, a little more or less water may be used as occasion may require. The dough should not be made stiff. The thinner it is, so that it may be conveniently handled, the lighter will be the bread. Much kneading is detrimental. The largest quantity of flour that can be conveniently mixed at one time is about 12 lbs.; where more is required, it is better accomplished by mixing it separately. It requires a hotter oven and more time to bake than fermented bread does. The advantages to be derived from this process are important. In all climates and under all circumstances it may be adopted; and by it is entirely obviated all difficulty of procuring yeast or ferment, which is frequently of an inferior quality, vitiating the bread, and rendering it more or less unwholesome. The bread being free of all yeasty particles, is more digestible, and not so liable to create flatulence, or turn acid on weak stomachs, as fermented bread is apt to do, even when of the finest quality. It is a great saving of time, trouble, and litter, and may be enjoyed at all seasons of the year, without reference to temperature or atmospheric variations. Economically, yeast may possibly have the advantage when plentiful and good; but when scarce and bad, a common state of things during the summer months, particularly in remote districts, the saving of time, trouble, and risk is invaluable. Where much bread is made for a family, as at some farm-houses, by purchasing the materials in large quantities, a considerable saving may be effected.—*Tea Cakes.*—Flour, 1lb.; sugar, 1oz.; butter, 1 oz.; hydrochloric acid, 100 minims; sesquicarbonate of soda, 80 grains; milk, 7 fl. oz.; water, 7 fl. oz. Rub the butter with the flour. Dissolve the sugar and soda in the milk, and the acid in the water. First add the milk, &c., to the flour, and partially mix; then the water and acid, and mix well together. Divide into three portions, and bake twenty-five minutes. Flat round tins are the best to bake them in.—*Pharmaceutical Journal.*

Effect of Galvanism on Plants.—Last year I made experiments upon two cuttings of the White Petunia. One which was left to itself in water threw out abundant roots; the other being placed in connexion with a slight Voltaic apparatus, lived as long as the first, about two months, but made not a single root. There is much to be learned on this subject.—*L. Vernon Harcourt, West Dean House.*

Agricultural Experiment.—A field, of a poor soil or clay, adjoining Hycemoor-school, and three acres in extent, belonging to Mr. Grice, of Millholme, near Bootle, was sown with Wheat in the autumn of 1840. The nature of the soil throughout the field was much the same, and no difference in tillage was used previously to the seed being sown. On the 2d of May following, one-third, or an acre of the field, was sown with a hundred weight and a half of nitrate of soda, and the produce of each is as follows :—

	st. lbs.		st. lbs.
2 acres produced	47 2	per acre	
1 acre with the nitrate of soda	81 11	"	or 34 9 extra

	£	s.	d.
The 34 st. 9 lbs. at 1*s.* 11*d.* per st.	£3	6	4
Cost and labour of sowing the nitrate	2	1	0
Leaving a profit of	1	5	4

Thus it appears that that portion of the field sown with nitrate of soda produced 34 stones 9 lbs. more per acre of Wheat than the other part which had not received the same tillage; the quality of the grain was also from eightpence to one shilling per stone better, besides giving an extra quantity of straw. We may here observe, that as soon as within eight days after the nitrate of soda had been sown, its effect was visible; the blades assumed a more healthy green, and continued to outstrip the other parts of the crop in a manner that could scarcely have been credited.—*Carlisle Patriot.* [The reader will observe that the nitrate was never employed when the Wheat was in full growth.]

Instances of Extraordinary Heat in March and April.—In 1807, soon after very cold weather and snow, a sudden burst into summer weather occurred; and on April 28th, the thermometer was 74° in Suffolk. This temporarily broke up on May 2d, when the temperature was 79° at Thwaite, wind E.; and at 4½ P.M. a dreadful hailstorm came on from W.N.W., passing over the northern portion of Suffolk, the hailstones measuring 4 inches in circumference, and breaking much glass. Lightning and thunder attended it.—March 31st, 1815, thermometer 73·5°!—In April, 1821, on the 8th, 9th, 23rd, 24th, to 28th, the heat was more like summer than spring. On 20th, night, and early on 27th, much awful thunder and lightning. The temperature on 25th, 26th, and 28th, about 74° in the free air, on the plain, in shade.—March 28th, 1822, thermometer about 70° in many situations.—On April 10th, 1825, and April 9th, 1826, a temperature of about 70° occurred; and on March 10th, 1826, thermometer 66°!—April 30, 1827, thermometer from 77° to 79° with us. This was quickly after frost and cold winds.—April 29th, 1828, a temperature of 75° at Thwaite.—March 26th, 1830, with a soft westerly wind, thermometer 71°!—In April 1840, a still more extraordinary instance of continued heat and clear skies. On the 15th and 16th, thermometer 72° and 73°; and on 25th, 26th, 28th, and 29th, from 79° to 80°!—In March 1841, on 15th, 16th, 25th, and 26th, thermometer 66° to 67°! And at the end of April 1841, a sudden increase of temperature, ushered in by a gale at S.S.W., thermometer 80° in shade on 27th and 28th days.—*Meteorological Journal.*

GARDEN MEMORANDA.

***Knight's Nursery, King's Road, Chelsea.*—Besides a great number of Camellias, which are in blossom, we noticed a specimen of** Enkianthus quinqueflorus with a number of beautiful pink and white bells of the most graceful form. In the stove the scarlet Jatropha panduræfólia was blooming with great freedom, and had been during the greater part of the winter. Near it was Rondelétia speciosa, the fragrance of whose flowers, combined with their fine orange colour, renders it worthy a place in every collection, however small. Franciscea latifólia, which has been received here under the name of Paraguay Jasmine, has expanded some lovely violet blossoms, which, like F. Hopeana, become almost white before they fall off; it is a handsome species, but apparently does not flower so freely as the old kind. A number of Dacrýdiums imported last year from New Zealand have been growing well, and have now formed very graceful plants, having shoots which hang down almost to the pot. In the Orchidaceous house were a number of the singular Sarracénia purpúrea, purple Side-saddle flower, in bloom. The most showy specimen in the house, however, was Oncídium ampliatum, with a profusion of fine bright yellow flowers. Several rustic baskets of rough Corkwood are here, with Orchidaceæ planted in them; the plants seemed to thrive quite as well, if not better, than those grown in moss in wire baskets.—*W. M., Feb. 28th.*

Review.

Rustic Architecture. Picturesque Decorations of Rural Buildings, in the Use of Rough Wood, Thatch, &c. Illustrated by Forty-two Drawings. By T. L. Ricauti, Architect. 4to. Carpenter, 1842.

THIS is a series of designs explanatory of the manner in which what is called rustic architecture may be applied to the construction of ornamental cottages. Each design is accompanied by plans and sections, with other details of building, so that a workman may execute it without further information. The estimated expense of each design is given, from which it appears that such cottages may be constructed at from 120*l.* to 600*l.*

To country gentlemen, who wish to decorate their property without the trouble of consulting an architect on all occasions, such works as this are extremely useful; and we doubt not Mr. Ricauti's designs will suit the taste of those who are to be pleased by a combination of boughs of trees, rough poles, and thatch, with the wood and brick walls still to be seen in the older villages and country towns of England. For our own part, however, we must confess that we have no mind to such a style of building; thatch is our aversion, crooked branches of trees we regard as fit for nothing but the faggot heap; and the things called rustic tables, and rustic chairs, and rustic benches, should, if they were our property, follow in the same direction. Others, however, will no doubt think differently; and, at all events, the work before us is not the less useful because the author has taken the rustic style of architecture for his model. It is easy to substitute flat tiles for thatch, and to knock off the fanciful decorations directed to be raised on the gabels and cornices, when the kernel of the work will remain behind, in the form of excellent ground plans and good directions for execution.

It is in internal disposition that Mr. Ricauti's talent is most conspicuous. The arrangements of design No. 6, of a cottage for a small family, are particularly good; and we may add that the exterior of the house itself is very agreeable, its superfluous rusticity being removed. We do not, however, understand why the chimneys should be collected into one central stack in the perspective view, while they are scattered about the roof in the elevations. The former is much the best arrangement, and we think it would have been better if it had been kept in view in the other designs also, by which means the heavy appearance of the chimneys would have been diminished, and a more satisfactory general effect produced. We are of course aware that practical difficulties exist in keeping the chimneys nearly in the centre of such buildings; but we apprehend they are such as Mr. Ricauti's talent for arrangement would readily enable him to overcome.

CALENDAR OF OPERATIONS *for the ensuing Week.*

WHATEVER may be the cause, the benefit of a rotation of crops is unquestionable. Although no regular system, the result of experience, by which alone the cultivator can be safely guided, has yet been devised, some approximation to such a system might be made in practice by never permitting two plants belonging to the same natural family to follow each other on the same ground without the intervention of some other crop not allied to them. Neither ought plants similar in habit, but having no natural affinity to each other, as Beet, Carrots, and Salsafy, to be grown successively on the same quarter. In gardens where there is plenty of ground, regularly subdivided into compartments, no difficulty will be found in carrying out this rule; but in a small garden, from which a large family is to be supplied, and which in consequence must necessarily be what is technically called "hard-cropped," some previous thought and calculation will be required. It is not intended, however, to enlarge here upon this subject, but merely to call attention to it before the principal crops are put into the ground.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

PINERY.—Should the heat of the beds in which late fruiting plants are plunged sink below 85°, measures must be taken for its renewal, either by a lining in the way described at p. 24, or by a quantity of warm bark worked into the surface of the bed: either method is better than disturbing the plants. Succession plants that have been repotted must be kept close and warm until they recover from the check. A minimum temperature of 70°, a bottom-heat of about 90°, a moist atmosphere, and partial shade in sunshine will soon restore them. If the soil was dry in which the plants were potted, they may have a very little water at the root.

VINERY.—The bunches that were first thinned should be again looked over, as it may be necessary to take out a few more berries. If it be found that too much fruit has been left upon the vines, it should be immediately reduced; and in doing this the crop ought not to be estimated by the number of bunches only, but their size and the probable weight they will attain should be taken into consideration. Support all the largest shoulders with strips of matting, not with the clumsy pieces of wood which are sometimes used. The temperature last mentioned may be continued.

PEACH-HOUSE.—As the shoots advance in growth, keep them neatly tied to the trellis, and do not retain more than are required. When necessary to take off any shoots that have fruit at their base, two or three leaves should always be left on a short piece of the lower part of the shoot, for the purpose of shading and feeding the young fruit. The artificial temperature must on no account exceed 60° at night, 55° will be better. Open the top sashes in good time on fine mornings, but never admit a strong draught of cold air. Give plenty of air likewise to the trees that are in bloom.

CHERRY-HOUSE.—As soon as the fruit in the early house is found to be stoned, fire-heat may be increased, but it is better not to do this hastily; one degree every night will not be an improper rate of increase. Fresh air must be admitted every day, freely when the sun has power to raise the thermometer to 70°. Give liquid manure as the fruit swells off. Introduce another set of trees if a succession is required.

FIG-HOUSE.—The young wood, whether the trees are in pots or in the borders, must not be allowed to grow into long unfruitful shoots, but be stopped by pinching off the ends when from four to six leaves are developed. By this practice the trees are kept full of bearing spurs, and little or no winter pruning will be wanted.

CUCUMBERS AND MELONS.—Where dung beds only are used, others should be made up for succession crops. If these beds are made of dung and leaves, and sufficiently massive, they will not require frequent linings. Uncover early on fine mornings, and keep the glass free from dirt, that no light may be lost.

STRAWBERRIES.—Plants that are swelling off their fruit would be assisted by waterings with moderately strong liquid manure twice a week. If worms are in the pots, use lime-water. As the fruit approaches maturity, admit all the air possible consistently with a proper temperature of the house, or it will have little or no flavour; at that period manure-water should also be withheld.

ASPARAGUS, SEA-KALE, and RHUBARB.—Keep up a succession, and also of Mustard and Cress.

CELERY.—The earliest crop should be pricked out as soon as large enough, keeping the plants near the glass. Sow a larger supply.

CAULIFLOWERS AND LETTUCES raised in heat should be thinned as required; and if the protection of a frame or hand-glasses can be afforded, the thinnings might be pricked out.

ONIONS sown in boxes will require to be hardened by exposure preparatory to transplanting.

Out-door Department.

If the ground is in good condition, the vegetables mentioned below may be sown; but in case the weather should be wet, it will be much better to wait another week.

ONIONS.—Sow in drills, wide enough to allow a hoe to be worked between them. If the larger sorts have been sown in autumn, or in heat last month, this sowing should consist chiefly of late-keepers, such as the Globes and James's.

LEEKS.—Sow a bed thickly, for transplanting.

RED BEET, SCORZONERA, AND SALSAFY.—Of these a few rows for drawing in autumn might be put in, but not the main crop; because, when sown early, Beet grows large and coarse, and the other two plants are apt to run.

CARROTS.—Sow on an open quarter for autumn use, and likewise Parsneps; but of these the principal crops had better be deferred till the end of the month.

PARSLEY.—Both curled-leaved and Hamburgh may be sown; the first sort makes a neat edging for kitchen-garden quarters.

LETTUCES.—Sow on a south border any preferred sorts.

TURNIPS.—A larger sowing of the Early Dutch and the Early Stone may be made.

Of the Cabbage-tribe, sow in a warm place Cauliflowers, Grange's Early Broccoli, Cape Broccoli, and a little Brussels Sprouts for an early supply.

Orchard.—As the weather is now favourable for nailing, it should be completed without delay; for if procrastinated till the buds become prominent, many of the best will unavoidably be destroyed. In very warm situations the blossoms of Apricot-trees are perhaps beginning to open; these should be protected from frost by a screen of canvas or netting; or where such materials are not procurable, leafy branches of trees may be substituted. Do not uncover protected Fig-trees, which often suffer from ill-judged haste in this particular.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

STOVE.—If it has been necessary to disroot any of the plants in potting, keep the air of the house rather more moist than usual; give a little air on fine days, but shut up early, and take the benefit of the sun to warm the house. Bulbs which are now beginning to grow should be liberally watered. Keep the soil in which the tubers of such plants as Achimenes longiflora and coccinea are rather moist, in order to start them. Many Orchidaceous plants will now be growing freely, and should therefore be well syringed when the weather is fine, particularly those which hang on blocks and in baskets; the house will not require any air yet.

GREENHOUSE AND CONSERVATORY.—Air must be freely given now, especially to Heaths and other hard-wooded plants. Encourage Cinerarias and Petunias to make vigorous growth, by supplying them with manure in a liquid state. Autumn-sown plants of such tender annuals as Ipomopsis, Trachymene, and Schizanthus retusus, should be placed in a light and airy situation in the house. Repot them as they require it, taking care not to bury the base of the stem, or they will most likely damp off. Give manure-water to Chinese Primroses that are in blossom, and sow more seed, to produce autumn-flowering plants. The Japan Lilies must have plenty of light and air as they grow, that their stems may not be drawn up weakly. Repot seedling Calceolarias, and be cautious in watering them.

PITS AND FRAMES.—Cuttings potted in autumn for bedding out should be separated, that the plants may grow strong and bushy before planting out. Spring-potted cuttings would also be better if potted off singly as soon as fit. Pot off spring-sown annuals, and keep them near the glass. Cockscombs and Balsams should be kept in the Cucumber-pits, or some equally warm place. Sow Globe Amaranthus and Browalia in heat.

Out-door Department.

The digging of flower-borders and the removal of flowers should be carried on with despatch whenever the ground is dry enough. In raking the borders, stir the open places deeply where it is intended to sow annuals. Overgrown box-edgings should be taken up, divided, and replanted. Repair gaps in edgings of all kinds; those which require much patching had better be destroyed and new ones made; Gentiana acaulis is well suited for this purpose.

NURSERY AND FOREST DEPARTMENT.

NURSERY.—Prepare clay for grafting. Seeds of stone-fruit, to raise stocks, may be sown. Head down budded stocks, and also maiden trees. If the ground is too wet to sow or plant, the finer species of Coniferæ, Rhododendrons, Azaleas, &c., may be sown in pans or boxes.

FOREST AND COPPICE WOODS.—Continue to plant, as directed last week. The outlets of water-courses and drains must be kept open carefully, and new ones made when necessary.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending March 3, 1842, as observed at the Horticultural Garden, Chiswick.

		BAROMETER.		THERMOMETER.			Wind.	Rain.

The highest temperature during the above period occurred on the 9th, in 1826—thermometer 68°; and the lowest on the 9th in 1839, and 8th in 1840—thermometer 19°.

REPORT ON COVENT GARDEN MARKET,

For the Week ending March 4th, 1842.

The Market continues gradually improving as the season advances; there have been good supplies of most articles during the week, and the prices have undergone no material alteration. —*Fruit.* Pines have been more plentiful this week than they were last, consequently the price is rather lower. Apples, both kitchen and dessert, fetch rather more than our last quotations. Pears remain the same. We observed a few forced Strawberries. A few Cucumbers are offered at from 2*s.* 6*d.* to 4*s.* each.—*Vegetables.* Savoys, Cabbages, and Broccoli, are all good, and the supply is tolerably abundant. Kidney Beans still continue scarce, but the quality has rather improved. The best Asparagus still commands a high price. Sea-kale is plentiful and good. Lettuces and other kinds of Salading is indifferent. Rhubarb of excellent quality is abundant. Mushrooms are more abundant.

PRICES, Saturday, March 5, 1842.—FRUITS:—

Apples, Kitchen, per bush. 3*s* 6*d* to 7*s* 6*d*
— Dessert, per bushel, 5*s* to 15*s*
Pears, dessert, per half-sieve, 5*s* to 16*s*
Strawberries, forced, per oz., 3*s* to 5*s*
Pine Apple, per lb. 6*s* to 10*s*
Cucumbers, each, 3*s* to 7*s*
Grapes, hothouse, per pound, 15*s* to 25*s*
— Spanish, per lb., 1*s* to 2*s*
— Portugal, per lb., 1*s* to 5*s*
Oranges, per doz., 6*d* to 2*s*
— per 100, 3*s* 6*d* to 14*s*
— Bitter, per 100, 6*s* to 18*s*
Lemons, per doz. 1*s* to 2*s*
Lemons, per 100, 5*s* to 14*s*
Almonds, per peck, 7*s*
Sweet Almonds, per pound, 2*s* 6*d* to 3*s*
Chesnuts, per peck, 5*s* to 8*s*
Walnuts, per bushel, 16*s* to 24*s*
Filberts, English, per 100 lbs., 140*s*
Cobb Nuts, per peck, 3*s* 6*d*
Nuts, per bushel—
— Brazil, 20*s*
— Spanish, 16*s*
— Barcelona, 20*s* to 24*s*
— Turkey, 16*s*

VEGETABLES.

Savoys, per dozen, 6*d* to 1*s*
Cabbage, White, per dozen, 1*s* to 1*s* 3*d*
— Red, for pickling, 2*s* to 6*s*
Cabbage Plants, per doz., 2*s* 6*d* to 4*s* 6*d*
Brussels Sprouts, per hf. sve., 1*s* to 2*s* 6*d*
Broccoli, White, p. bunch, 1*s* to 3*s*
— Cape, 6*d* to 1*s* 3*d*
— Brown, 8*d* to 1*s*
Turnip Tops, per bushel, 1*s* 6*d*
Kidney Beans, forced, p. 100, 2*s* 6*d* to 3*s*
Potatoes, per ton, 40*s* to 80*s*
— per cwt. 2*s* to 4*s*
— per bushel, 1*s* 6*d* to 2*s* 6*d*
— Kidney, per bush. 2*s* to 2*s* 6*d*
Artichokes, Jerusalem, pr half sieve, 10*d* to 1*s*
Turnips, pr. doz. bunches, 2*s* 6*d* to 3*s*
Carrots, per doz. bunches, 4*s* to 5*s*
Parsneps, per dozen, 3*d* to 1*s*
Scorzonera, per bundle, 1*s* to 1*s* 3*d*
Salsafy, per bundle, 1*s* to 1*s* 3*d*
Horse Radish, per bundle, 1*s* to 5*s*
Radish, per doz. hands (24 to 30 each) 3*s* to 4*s*
Spinach, per sieve, 2*s* to 3*s*
Leeks, per dozen bunches, 9*d* to 1*s*
Garlic, per lb., 8*d*
Shallots, per lb., 1*s*
Onions, Old, per bushel, 2*s* to 3*s* 6*d*
— for pick., per hf.-sieve, 3*s* to 4*s*
— Green, per doz. bunches, 3*s* to 4*s*
— Spanish, per dozen, 1*s* to 5*s*
Asparagus, per 100, large, 8*s* to 11*s*
— Second or Middling, 3*s* 6*d* to 4*s* 6*d*
— Sprue, or Small, 2*s* 6*d* to 3*s* 6*d*
Sea-kale, per punnet, 6*d* to 2*s* 6*d*
Lettuce, Cabbage, p. hf. sve., 1*s* 6*d* to 2*s*
Endive, per score, 1*s* 6*d* to 4*s*
Celery, Red, p. bdle (12 to 15) 6*d* to 1*s* 6*d*
— White, per bundle, 6*d* to 1*s* 3*d*
Small Salads, per punnet, 3*d*
Corn Salad, per half sieve, 9*d*
Watercress, p. dz. small bunch., 6*d* to 7*d*
Dandelions, per punnet, 9*d*
Parsley, per half sieve, 3*s* to 6*s*
Tarragon, per dozen bunches, 4*s*
Fennel, per dozen bunches, 3*s*
Thyme, per doz. bunches, 2*s*
Sage, per doz. bunches, 3*s*
Mint, per doz. bunches, 4*s* to 6*s*
Savory, per dozen bunches, 2*s*
Rhubarb Stalks, per bundle, 6*d* to 1*s* 3*d*
Mushrooms, per pottle, 9*d* to 1*s*
Truffles, per pound, 2*s* to 3*s*

Notices to Correspondents.

A Lincolnshire Clergyman.—We have copies remaining of Mr. Paxton's "Calendar;" if he will enclose us the money for as many as he wishes to distribute, they shall be sent him.

A. B. can have the back Numbers she requires to complete her last year's volume; but pray order them at once, as we are nearly out, having but two copies remaining of one of the Numbers she wants. This notice applies equally to all our other last year's subscribers who may require Numbers to perfect their sets.

K.—To explain the management of the GREAT CONSERVATORY in the Horticultural Garden would be to write a book on the art of cultivation.

A Constant Subscriber.—To INOCULATE LAND it is only necessary to prepare it as if to be laid down with grass seeds; then to scatter over it fragments of good fresh turf, and to pass a roller over them so as to imbed them in the soil.

Xn. Cm.—We know of no means of driving away the CATERPILLARS from trees except lighting a large fire of weeds and damp leaves, sticks, &c., to windward of the orchard, when the caterpillars are troublesome, choosing for the operation a time when the wind sets steadily across it. Great numbers will then fall off the branches, and may be killed with the spade before they can crawl again upon the stems of the trees.

J. D.—In such a situation as the leads of a room at the back of Connaught-terrace, a GREENHOUSE may certainly be maintained with success, and your plans are good. We should train the Vines across the rafters, planting them in wooden boxes with movable sides. The Black Hamburgh, the White Sweetwater, the Esperione, and the Chasselas Musqué are four of the best varieties for such a place. It would, doubtless, be desirable to enclose the cistern in the house, if only for the convenience of always having a supply of warm rain-water. It will, however, be necessary to have some shallow metal pans in addition, or the air will become too dry in summer. If you glaze with large pieces of sheet glass, so as to avoid laps, and will stretch canvas screens before the places where air is admitted, if that is practicable, you will also exclude the soot of London, which otherwise will soil everything in the conservatory.

Hibernia.—You will find the following CLIMBING PLANTS suitable for a south aspect:—Any of the climbing Roses; Wistaria sinensis; Clématis Hendersoni, grata, and floribunda; Caprifólium chinense; Jasminum revolutum and officinale; Ceanothus azúreus; Aristolóchia sipho; Ampelópsis quinquefólia, and Eccremocarpus scaber, which, however, should be slightly protected in winter. You will not be able to flower anything in your northern porch, but any plants while in blossom may be placed there. RHODOCHITON VOLUBILE is readily propagated by cuttings of the young shoots, whenever they can be procured; they should be set in light rich earth, round the edges of pots, which should be plunged in a gentle hotbed.

Rusticus expectans.—GUANO MANURE is the dung of sea-birds, and it comes from the islands in the Pacific Ocean. It will be advisable to use AMMONIACAL LIQUOR on Grass-lands now in the proportions mentioned in p. 139. We are not aware whether ashes and sand mixed in would be as beneficial. When used for Turnips, soak sawdust in it, and add lime till it dries, and afterwards drill it in with the seed. The best Grasses you can sow on an exhausted upland PASTURE on light soil are Crested Dog's Tail, Sheep's Fescue, Hard Fescue, and Poa trivialis. We shall be very much obliged to you for the Number.

A. H.—We recommend you to apply nitrate of soda to your GRASS, or a small quantity of salt. If, however, it is so rank, why manure it all?

T. M.—You may sow your CALCEOLARIA seed now in pots of light earth; as the seed is very small, it is better to mix it with a little sand, and sow it on the surface of the mould. The pots may be placed on a warm greenhouse shelf close to the light, or plunged in a gentle hotbed.

A New Subscriber will never obtain such gigantic ASPARAGUS as is sold in Covent-garden market, without strong plants, light moist land, and very strong manure in abundance. He will find some information upon this subject in our report of the proceedings of the Horticultural Society on Tuesday last.

An Odd-Fellow.—A MOWING-MACHINE costs from 7*l.* to 9*l.*, according to its size; it can only be used in dry weather, and when grass is very short. Where a lawn is to be kept extremely short, this machine is more effectual than a scythe, and it has also the merit of not requiring any dexterity in using it. We, however, prefer a scythe in the hands of a good mower.

A Londoner.—We apprehend all SEEDS will GERMINATE most readily if sown a little before they are quite ripe, for reasons explained in the Theory of Horticulture; but in practice this cannot be done, because unless a plant is very hardy it would be killed by the succeeding winter. The hardy species of Ceanothus is C. americanus and its varieties; the others are all more or less tender; but C. azúreus, montanus, and pallidus will live near London through mild winters. Neither Cobæa scandens nor stipularis is hardy; they will only live out-of-doors during summer. All the Chinese Chrysanthemums are hardy. We believe all soft plants, and many woody ones, will grow as well in damp Moss as in soil; the Moss, in fact, soon becomes a good soil rich in alkalies. Pelargoniums, bulbs, Roses, annuals, Verbenas, and such things, are well known to succeed under that treatment. Have no fear of our being imposed on by quacks.

Arenarius.—No doubt the Pear will be healthy on the Whitethorn, but its fruit will be small and bad; the cases you mention are not to the contrary. Your Leeks are, perhaps, over-manured, or else you have a bad sort; the latter is the more probable. Your plan of forming MANURE is excellent, and you will unquestionably find your account in the slate tank holding 500 gallons. There is no doubt that it is best to prevent as much as possible the loss of ammonia from liquid manure; any acid or gypsum will fix the ammonia, and there is no reason to expect that the value of the manure will be deteriorated by such additions, but the contrary. The acid should be used in a very diluted state. The objection to mixing caustic lime with animal manure is, that it absorbs carbonic acid, and is converted into carbonate at the expense of the manure. Now, as chalk, shells, &c., contain carbonate of lime, and not the caustic earth, they can do no injury by absorbing carbonic acid. Carbonate of lime when burnt loses its carbonic acid, and is converted into quicklime; whilst, on the other hand, quicklime greedily absorbs carbonic acid from the soil, manure, or air, and passes back again into the state of carbonate of lime. The lime in sand is already in the state of carbonate; it may, therefore, be advantageously mixed with animal manures and composts. Sea-sand will probably be sufficient dressing for the Grass-land. Cut back the shoots of the standard Roses, although only recently planted. As you do not say in what way your Onions are injuriously affected by liquid manure, we cannot suggest the cause of the injury they sustain.

A. G. M.—The best manure for ROSES, if the ground is poor, is well-rotted dung, particularly cow-dung; but if the soil is stiff and wet, it must be made friable, by adding either fine sand or lime-rubbish. Nitrate of soda, applied at the rate of 1lb. to the rod, when the Roses commence growing, will much improve their vigour, and seems to prevent their being attacked by the green-fly during the summer. You must take great care that none of the nitrate lodge on the leaves or young shoots, as it will destroy them, and particularly if applied in dry weather.

J. S. J.—LAURELS may be pruned, or cut back, any time between October and April; but to cut the large branches of a Laurel is very injurious, like cutting the top off any large tree; therefore in heading-down an over-grown Laurel hedge, cut part of the larger branches back one season, and when they have produced young shoots to keep the roots in action, remove the others. By this means you may regenerate your Laurel hedge; but if you cut the whole top off at once, you will find that no time of the year is suitable for such an operation, while if judiciously done, it may be done at any time, except when the plants are in full growth.

A Subscriber from the First.—The quantity of SEED required for any given space of ground varies very much; it depends upon the quality of the seed, the soil, and season of the year when sown; it is, therefore, impossible to state the exact quantity required; but the following may be taken as a medium:—ONIONS, if sown broadcast, about 1oz. to the rod, or 10lbs. to the acre; but if the seed is new and good, 8lbs. will do; while if old and doubtful, better sow 12lbs. to the acre. If sown in drills, one-sixth less seeds will do. For CARROTS, about the same quantity, if the seed is good and clean; but it is better to sow plenty, as it is easy to thin the crop.

A Subscriber, Limerick.—You can disroot your FUCHSIA FULGENS, or any of the other kinds, in the way you mention, and pot again in smaller pots. It will be rather beneficial than otherwise, and should be done now, just before your plants start into growth. PELARGONIUMS should be treated in this way in the autumn, shortly after they have been cut back; but if the pots in which you have yours are inconveniently large, you may reduce their balls of earth with perfect safety now. Keep the house close and warm for a few days after the operation. We do not think that any seed of the rarest kinds of Pelargoniums has been advertised in our columns at 2*s.* 6*d.* or 5*s.* per packet.

Discipulus.—Your Apples, such as are known of them, are,—Nos. 1, 8, New Golden Pippin; 2, Striped Holland Pippin; 3, Ord Apple; 7, Downton; 9, Margil; 10, Sam Young. The Breda APRICOT is the best for a Dwarf Standard, and next to it the Brussels. Any of the cultivated Nuts or Filberts will succeed on the common Hazel; there is no difficulty in grafting them. We would not advise you to disturb the roots of APPLES intended to be grafted this season; the check in the first instance would render the success of the operation of grafting precarious. The branches or stems of trees intended to be grafted should be cut back before spring.

Scotus.—The following TREES and SHRUBS are handsome, and well suited for a place in the Lowlands of Scotland, between 800ft. and 900ft. above the sea:—The different species of Maple, such as A. macrophyllum, eriocarpum, platanoides, striatum. Various Thorns, as Cratægus Arónia, odoratíssima, Oliveriana, orientalis, tanacetifólia, Douglasii, heterophylla, prunifólia, punctata, pyrifólia; Cotoneaster frígida, nummulária, and rotundifólia; Æ'sculus rubicunda; Bérberis aquifólium; Spiræa ariæfólia and flexuosa; Euónymus latifólius; Alnus cordata; Philadelphus speciosus and Gordonianus; Pinus Deodara, cephalónica, Pinsapo, and taúrica; Juníperus chinensis and oblonga; Quercus ambigua and coccínea; Magnólia purpúrea; Pyrus spectábilis; Tília rubra and alba; Syringa Josikæa; Ribes aúreum; Copper, Purple, and Cut-leaved Beeches; and Ulmus vegeta and rubra.

J. K., Essex.—It is certain that with regard to GARDEN-WALLS the quantity of solar heat absorbed and reflected must together be the same, whatever the colour of the materials may be, all other circumstances being equal. A dark-coloured wall absorbs more, and reflects less, than a light-coloured one; but in the case of either dark or light coloured, the amount of heating rays impinged is the same. Reflected solar rays, being of less intensity than those that are direct, do not scorch the bark of trees; and with still less reason can such an effect be attributed to the gradual radiation of heat from your blackened wall. Direct solar rays will raise a thermometer placed against a south wall as much as 100° Fah. above the freezing point, and the exposed parts only of naked stems are frequently injured. The parts of such stems as are next the wall, and consequently most exposed to its radiation, have not been noticed to be injured, so far at least as our observation has extended, nor is it likely, for the heat from this source will rarely, if ever, be equal to 50° above the freezing point, or half as much as that occasioned by direct solar rays. The fact of your trees against the blackened wall having declined in productiveness and vigour, must be referred to other causes than colour; at the same time, by saying so we would not wish to be understood as giving a preference to blackened walls.

Cadwallader.—For training on the NORTH aspect of your slate roofs, you may plant the Jargonelle, Marie Louise, Flemish Beauty, and Hacon's Incomparable Pears; and Morello Cherries. For the SOUTH aspect,—Glout Morceau, Passe Colmar, Ne plus Meuris, Easter Beurré, and Beurré Rance Pears; May-Duke Cherries; and Green and Purple Gage Plums. EAST and WEST aspects,—Beurré Diel, Hacon's Incomparable, Nelis d'Hiver, Thompson's and Louise Bonne (of Jersey) Pears; Ribston Pippin, Blenheim Pippin, Adams's Pearmain, Sturmer Pippin, and Nonpareil Apples, and Coe's Golden Drop and Ickworth's Imperatrice Plums. FRUIT-TREES, particularly PEARS, planted on the north side of a wall, and trained downwards on the south, answer very well, as was proved in Sir J. Banks's garden at Spring-grove. It is, however, essential that the border in which the trees are planted be made high and dry. Stout wire, well stretched and secured by means of some small bars, will do for training upon; but slips of wood will be preferable as regards the health of the trees, and we should use no more of these than is necessary to conduct the young shoots in a proper direction—horizontally, 1ft. apart, in the case of Apples and Pears; and for the stone-fruit a fan form with a centre summer shoot retained for several years for the purpose of being annually shortened in autumn, in order to furnish a supply of diverging branches. Thin canvas will protect the blossoms from frost, if not very severe. The effects of frost will also be partially counteracted by heat from the stock of cattle inside.

Rauz, in rather a cold part of Staffordshire, may plant on a wall facing S.S.W. the following PEARS: Beurré Diel, Marie Louise, Glout Morceau, Passe Colmar, Ne plus Meuris, Easter Beurré, and Beurré Rance. PLUMS—Royale Hâtive, Green gage, Purple-gage, Kirke's and Coe's Golden Drop; and CHERRIES—the Mayduke, Elton, and Florence. On a N.W. aspect the Jargonelle and Hacon's Incomparable Pears, Orleans Plum, and Morello Cherry. On this aspect, if a stewing Pear is required, the Catillac will succeed.

L. Mc.—In DRYING PLANTS, care must be taken not to press them so much as to crush them; succulents, and kinds that drop their leaves, such as Heaths, should be dipped in hot water before they are pressed. Each specimen should be placed between a sheet of brown or blotting paper, and between each filled sheet several empty ones should be placed; for the first day or two the pressure should be only just sufficient to prevent the leaves and flowers from shrivelling. When the papers are damp the plants should be placed in dry ones, increasing the pressure after every shift till the specimens are perfectly dry.

Clarence Matilda.—Of your SEEDS from the Himalayas all are hardy but the Prinsépia utilis; they may all be sown in pots or pans of light vegetable earth, except the Rhododendron, which should have peat, and they may be placed in a cool frame. The Rhododendron seeds being very minute should be mixed with a little sand and sown on the surface. All seeds from the Himalayas do not require the same management; as the climate varies exceedingly at different altitudes.

An Irish Subscriber.—CHINA ROSES do not require much pruning beyond cutting the longest shoots to strong eyes, which may be done in the course of the present month. They like good rich soil with plenty of manure, and form beautiful objects when trained on three stakes in a pyramidal form, or when growing over a wall or trellis.

Ipomæa.—As far as our own experience goes, we believe that so much does not depend upon the kind, in the production of large Asparagus, as upon the cultivation. IPOMŒA LEARII will answer in a greenhouse, but it requires plenty of pot-room, and should be planted in light, rich soil, and freely supplied with water during the summer.

A Kentish Man.—It is not usual for MULE plants to produce good seed, though they sometimes will do so; we had not before heard of its occurring with Passiflora cæruleo-racemosa. The seedlings will, we presume, have a decided tendency to return to one of the parents; but it is not improbable that some of them may remain true; if so, we should be curious to see whether, if they seed, their offspring would be true also.

Δ.—The following are the best BOOKS to commence studying botany with:—Lindley's "Elements of Botany;" Lindley's "Ladies' Botany," abridged edition; and the same author's "Synopsis of the British Flora."

Salopian.—No. 1 is Erica tétralix; 2, Calluna (or Erica) vulgaris; 3, a species of Bryum, not Sphagnum; 4, Sagina procumbens. So long as the water in which a Hyacinth grows is sweet, it is not necessary to change it. It should always have rain-water.

A Subscriber.—Your Deodar Cedar, struck from a cutting, will be as true as one raised from seed.

A Constant Reader.—The plants best suited for drawing off electrical matter from the atmosphere are Grasses, Fir-trees, and all such others as have the foliage produced into sharp points.

We must beg *Mr. Cowan* to give us the name of the island he speaks of. Without it, his communication loses its value.

W. B.—A gallon of gas liquor was applied to a rod in the experiment mentioned in p. 139. Now is a good time to use it.

C. D.—We shall be happy to know your mode of growing the Neapolitan Violet. We know no A'rbutus named Ukrainensis, or Uleranensis.

Clericus, F. U. S.—Zatropha Curcas is Jatropha Curcas; and Azadiræta índica is Mélia Azedarach, of which there is a notice in p. 829 (1841).

A Young Botanist.—If your dried plants are in the mouldy state you describe, you had best throw them away and dry others.

J. A.—Your request, with inquiries from other correspondents relative to the merits of the Dahlias sent out last year, have been complied with, and appear in another part of the Paper.

O. B.—Pooh!

Faversham.—The small conical Apple, like a much-russeted Cockle Pippin, is not known.

A Subscriber from the Beginning had better procure some evergreens in pots, such as Box, Aucuba, and Rhododendron, and during the summer mix Pelargoniums, Senecios, Fuchsias, and similar plants with them, for it is scarcely possible to flower anything properly in a situation on which the sun scarcely ever shines.

A Subscriber.—Your peat seems excellent.

T. S., Bradfield.—We are much obliged for the Numbers. Your question is answered in the leader of to-day.

J. C. D.—You had better dispot your Cactuses, and repot them in small pots in a mixture of peat and sand and brick-rubbish; place them in a warm part of the greenhouse, and supply them but sparingly with water till they begin to grow, after which they may receive a more plentiful supply. You should cut your Fuchsia close to the ground.

A Constant Reader.—Mr. Masters advertises the Grapes in p. 34.

Adam.—It is now too late to root-prune fruit-trees; and if it was not, we do not think it would be of any service to yours.

As usual, many letters have arrived too late for answers this week.

ERRATUM.—At the end of the paper upon Cape Heaths, in p. 140, read "*R. F.*," instead of "*a, e, i.*"

NEWS OF THE WEEK.

The arrival of an overland mail during the week has put us in possession of intelligence from India to the 10th Jan. The accounts from Affghanistan, which come down to Dec. 15th, are still of a very discouraging character; the forces in Cabul are said to have been reduced to great extremities for want of provisions, and all attempts to relieve them had failed, in consequence of the severity of the winter. Candahar was quiet; Sir R. Sale's division had routed the enemy in two engagements, and was considered to be secure. The disastrous condition of the troops had given rise to a variety of rumours, and it was stated that the forces at Cabul, daunted by the fearful odds against them, had proposed terms of capitulation; but it appears from the statement of Sir R. Peel in Parliament, that Government has received no confirmation of the rumour, still less of an actual surrender. The accounts from China by this arrival add little to the information brought by the last mail. The Chinese had made some show of a hostile movement at Amoy, and were actively engaged in restoring the fortifications of Canton. It was said to be the intention of Sir H. Pottinger to march upon Pekin as soon as the south-west monsoon had set in; and in the meantime hostilities on the part of the Chinese were considered probable. — From France we learn that the Slave-Trade Treaty is still the subject of much angry feeling towards this country, and the question of the right of search has been discussed in the Chambers at considerable length: during this debate, M. Guizot declared that Ministers withheld the ratification solely because they considered that the recent vote of the Chamber called upon them to do so; and that they had proposed to the other Powers such modifications as might allow the accession of France, consistently with the expressed feeling of the Chambers. The press unanimously approve of the conduct of the Government in withholding the ratification, but contend that the other Powers have insulted France by signing the Treaty after her refusal to be a party to it.—Our news from Spain confirms the accounts received last week relative to the republican movement at Barcelona, and to the assembling of the Christino generals and other leading members of the October insurrection on the French frontier. In consequence of this demonstration, the Government has strengthened the fortresses on that frontier; and adopted measures of a precautionary nature in other parts of the kingdom, in order to avoid being taken unprepared. Great excitement prevails in the Basque provinces, in consequence of the movement of troops and the conviction that a serious struggle is near at hand. In the Chambers the Government seems to have gained strength from recent events; the long-protracted debate on the Address has terminated favourably to Ministers, and the Senators and Deputies of all parties are said to evince a very general desire to support the Regent in resisting the threatened insurrection.—In Portugal everything is quiet; the country appears to have acquiesced in the change from the Constitution to the Charter; and the only question of public interest now unsettled is the composition of the new ministry.—From Turkey we learn that there is every prospect of a complete settlement of the dispute with Greece, and that the treaty of commerce, which has been for some time delayed, is now likely to be ratified. The accounts from Syria are unsatisfactory; the appointment of an Austrian renegade to the government of the Lebanon has created much discontent among the people, and it is apprehended that the mountaineers will lay aside their religious feuds and unite in opposing the appointment. Advices have been received from Jerusalem, announcing the arrival of Dr. Alexander, the Protestant bishop, who made his entry into the Holy City on the 21st ult., and was received with marked demonstrations of respect on the part of the authorities. The financial affairs of Egypt continue in a very critical state: the Pacha's tribute is largely in arrear, the pay due to the Syrians is unliquidated, and the Government servants are reduced to great distress in consequence of the non-payment of their salaries.

At home, several measures have been introduced in the House of Lords for the better administration of justice. In the Commons, the Ministerial resolutions for the modification of the Corn-laws have been affirmed by large majorities, and leave has been given to bring in a bill founded on them. A commission has been appointed for the purpose of inquiring into the circumstances connected with the recent issue of forged Exchequer-bills; and a bill has been introduced in reference to mixed marriages in Ireland. A conversation of some interest has taken place in both Houses on the affairs of Spain, and on the alleged sanction given by the French Government to the conspirators on the frontier. Lord Aberdeen, in explanation, stated that he had received distinct assurances from M. Guizot that the preparations on the frontier received no encouragement from the authorities, who had been instructed to intercept all persons against whom there were grounds for suspicion. In regard to England, Lord Aberdeen repeated his assurance that every assistance should be given to the Regent to enable him to maintain the existing Government.

Home News.

COURT.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal are well, and continue at Brighton. The Queen, accompanied by Prince Albert, the Duke Ferdinand, and the Princes of Saxe Cobourg, left the Pavilion on Monday for Portsmouth, and returned to Brighton on Tuesday afternoon. It is now announced that the Court will return to Buckingham Palace on Tuesday next. The Earl of Hardwicke succeeds Lord Rivers as Lord in Waiting; the Countess of Dunmore succeeds Lady Portman as Lady in Waiting; Mr. Ormsby Gore has arrived to take his duties as Groom in Waiting, as successor to Capt. Meynell; and Col. Berkeley has succeeded Col. Grey as Equerry in Waiting on her Majesty. Major-Gen. Sir E. Bowater has succeeded Col. Wylde as Equerry in Waiting to Prince Albert.

Foreign Postage. — With the view to greater facility of communication with Madeira and the Azores, the Post Office authorities have adopted a new regulation, which came into operation on Thursday, respecting the transmission of the mails to those places. The West India Contract Packets are in future to touch at Madeira in their outward voyage, so that letters intended to be delivered either there or at the Azores will be forwarded by that conveyance, and not by the Brazil packets, unless specially marked to be sent by other channels. The mails will be made up on the 1st and 15th of every month.

Foreign.

FRANCE.—*The Slave Trade Treaty.*—The ratification of the Treaty for the suppression of the slave trade continues to occupy the attention of the Paris journals, and is made the subject for much angry discussion. The question appears to have given rise to very general excitement in Paris, and to renewed ill feelings towards this country. The papers, however, do not appear to complain of the self-isolation of France in this case, since they universally agree as to the policy of the non-ratification on the part of the Government; but they regard it as a serious ground of grievance, and represent the public indignation in consequence as great, that the other Powers should have dared to sign it to the exclusion of France. Some of the Opposition prints indeed go so far as to assert that there is a *casus belli* in the conduct of the Great Powers. The anger of the Liberal organs is expressed in a variety of ways. Some of them maintain that M. Guizot's pacific policy, and his resolve to re-enter the European concert, have been a failure, because he is himself isolated on the right of search treaty. The papers which represent M. Thiers's opinion predict that M. Guizot will dissolve the Chambers, and that when he has obtained a majority in the general election, he will ratify the treaty. Against this course, however, a Parliamentary intrigue, it is stated, has been formed, to get if possible a vote of the Chambers against this ratification, in addition to the vote which it has already passed on the subject; and consequently at the close of Saturday's sitting of the Chamber of Deputies, M. Mauguin announced that he should put some questions to the Government, relative to the right of search treaty. M. Guizot, the Minister for Foreign Affairs, having assented, Monday was fixed for the interrogations. Considerable excitement prevailed in Paris respecting this debate, which will be found below in the proceedings of the Chambers. The *Moniteur Parisien* publishes the following curious notice: "It had been announced that 'the French Association for the Abolition of Slavery would hold on the 7th inst. a meeting at the Hotel de Ville,' and that 'the English Abolitionists would be invited to attend the meeting.' The planters of the French West India Islands, alarmed for their interests, assembled on Saturday at the house of M. Jollivet, the delegate for Martinique, who announced to them that 'the Government had taken measures to prevent the projected meeting at the Hotel de Ville.'"

Affairs of Spain.—The impending attempt to rekindle civil war in Spain, the plan of which is said to have been matured in Paris, is the only question besides the slave-trade treaty that at present engrosses the attention of the journals. A variety of rumours on this subject are current, which are made the subject of comment by the papers; but nothing authentic is known, and the only fact of interest connected with the subject is contained in a paragraph published in an Orleans paper, which has been copied by some of the Paris prints. The statement is considered to prove the intentions of the conspirators, and by the impunity with which those intentions have been manifested, the apparent connivance of the Government. The paragraph announces that the greater number of the Christino Generals who were domiciled in Orleans, such as Urbistondo, Piquero, Claveria, Campillo, &c., have left for the frontiers of Spain, some for Bordeaux, some for Dax, and others for Bayonne.

The Chambers.—In the Chamber of Deputies on Saturday the standing committees met to appoint the commission to report upon the Secret Service Money Bill, of a million of francs, an extraordinary grant. The Opposition obtained 2 members, and the Ministry got 7. The time of the Chamber was afterwards occupied with a discussion respecting the manner in which M. Isambert obtained possession of the famous letter of the Clermont Prefect, referred to in a previous Number, and which related to the packing of juries. M. Teste made a severe attack upon M. Isambert respecting the mode in which he obtained the letter, and the various accounts which he gave of that mode. M. Isambert declared that he had obtained cognizance of the letter in question by legitimate means, and in his quality as Councillor of Cassation. He took the opportunity also to complain that he had been summoned before the Assize Court on account of the former letter which he had revealed. He would not obey the summons, but pleaded exemption as Deputy. Some questions and warm language were put in the bureaux by M. Billauete and Jaubert relative to the right of search. M. Jaubert said that France was a country of somersets and sudden revolutions, and he feared that the present pacific slumber would end in a warlike awakening. In the sitting of Monday, M. Mauguin, who had given notice of his intention on Saturday, made his inquiry of Ministers relative to the signing of the slave-trade treaty. He said that an event of the most serious importance had lately taken place. A treaty on the right of search had been concluded between France, England, Prussia, Austria whose flag was scarcely known except in the Adriatic and the seas of Greece, and Russia whose vessels seldom quitted the seas by which its immense territory was surrounded. This treaty, he said, made England the magistrate of the ocean; no one could traverse it without being subject to her search. She might proscribe any nation at her will, and prevent her ships from navigating any sea she might point out. Should France consent to such pretensions, she would abandon every principle and abandon herself. He wished to call the attention of the Minister of Foreign Affairs to the situation in which he was placed, and to the serious difficulties with which he was surrounded. M. Guizot replied in the following words: In the lengthened discussion which has already taken place on the question which is again brought before you, I maintained in all its constitutional freedom the prerogative of the Crown, viz., its right to ratify the treaty which had been concluded; but, at the same time, I acknowledged that the feeling manifested by the Chamber was entitled to the serious consideration of Government. I have acted upon this principle. My language has formed the rule of my conduct. When the moment for ratification arrived, the Crown, upon the advice of the Cabinet, and particularly of the Minister of Foreign Affairs, instructed the Ambassador in London to declare that the Crown felt that it ought not to ratify the treaty. It declared, moreover, that it could not say at what period it might be able to do so; and at the same time reserved to itself to propose modifications in the treaty. The protocol remains open; France is not separated from the other Powers; France is not even upon this special question isolated from the rest of Europe. Grave, legitimate, and constitutional motives induced the Crown to refuse its ratification, as it had a right to do. The state of things is perfectly simple, perfectly regular. The ratification has not been given; a new negotiation has been opened with the powers, with a view to obtain modifications which would satisfy, as far as the honour of the Chamber will permit, the feeling which has been manifested by the Chamber and the public. What the precise object of these negotiations is, and what the result as to the proposed modifications may be, is a question upon which my sense of duty does not permit me to enter now. There is reason to believe that we shall attain the double object which we have in view. This is all that I can say.—M. Berryer followed, and said that the very simple and clear manner in which the Minister for Foreign Affairs had placed the question did not, in his opinion, permit them to prolong the discussion. The question then dropped; and an animated conversation ensued relative to Spain, during which a deputy, M. Glais Bizoin, said it had been declared, in the English Parliament, that a flagrant conspiracy was organising, and that the day and hour of the explosion were agreed upon. The Prime Minister of England, he added, had stated that the chief of this conspiracy was in Paris. M. Guizot replied with some warmth, that the person alluded to, Cabrera, for it was he who had been mentioned, had not come to Paris. Permission was even refused to him to enter France. The English Ministry was in complete error on this subject. The discussion then dropped.

The Navy.—Accounts from Brest state that a man-of-war and a frigate had been ordered to sail in all haste for Lisbon. A brig of war left Toulon for Barcelona on the 20th ult. The "Journal du Havre" announces that a frigate and brig of war sailed from St. Thomas's on the 22d Jan. for Port au Prince. It appears from the private correspondence of that journal that those vessels formed part of a naval division, commanded by Rear Admiral Arnous, which was proceeding to St. Domingo, at the request of the French Consul-General, M. Levasseur.

SPAIN.—Intelligence has been received from Barcelona fully confirming the news given in our last, respecting the serious aspect of affairs in that city, and the secret re-establishment of the Supreme Junta of Vigilance. Private correspondence from San Sebastian, dated the 24th ult., states that a strong conviction prevailed throughout the Basque provinces that a struggle was at hand, and intelligence received from Bayonne of the arrival of the celebrated Carrequerri at that city on the 22d ult. had materially increased the anxiety which previously existed. Carrequerri, it is added, travelled post from Bordeaux, and did not make the slightest attempt at concealment or mystery. Ribed, another capitalist, and native of Pampeluna, who took an equal share in Gen. O'Donnell's insurrection with Carrequerri, had likewise arrived at Bayonne. Gen. Alcala was taking every precaution to prevent the possibility of a surprise. The guns which had been removed from the battlements of San Sebastian have been replaced, and an additional quantity of every kind of ammunition has been prepared and got in readiness. General Alcala was to make in the first week of March a tour through the province of Guipuscoa, with two regiments and a company of sappers and miners, for the purpose of inspecting the few fortified places on the frontiers of France. A battalion in garrison at Irun had been removed, in consequence of the numerous desertions which had taken place from it into France. The same advices state that several Carlist chiefs, and amongst others Gen. Urbistondo, had been permitted by the French Government to take up their residence at Dax and Cambo, along the Pyrenean frontiers; that Carlo-Christino agents continued to be busily engaged, particularly about St. Jean de Luz and Orogne, in preparing the way for a new outbreak; and that they appeared to be plentifully supplied with money, and received, it was said, every assistance from the French authorities. Some serious disturbances had taken place at Olot, a manufacturing town, in the circle of Girona. The riot arose from the use of a steam engine by a manufacturer, whose place was destroyed. In the affray, the populace was fired upon, and two persons were killed and one wounded. We learn from Bayonne, under date the 23rd ult., that Gen. Rodil, commanding the troops in the Basque provinces, had ordered a movement towards the French frontiers, and that the valley of the Bastan was completely occupied. Irunta, Elisondo, Vera, Echalon, Urdax, and Zugarramundi were all garrisoned. The Regent had prohibited the fabrication of gunpowder in the Basque provinces until further orders. The Madrid correspondence of the 21st ult. announces the conclusion of the long-protracted debate on the Address in the Chamber of Deputies. Señor Gonzales, it is stated, had found himself so strong that he had refused to accede to a proposal made to him by Señor Lujah on the part of the Opposition. Private accounts add that there is a very general desire manifested, both by senators and deputies of all parties, to strengthen the hands of Government in resisting the threatened insurrection, but that Señor Gonzales defends the prerogative of Government, and resists the pretensions of committees of both houses to dictate to the executive. The official *Gazette* contains a project of law, to be presented to the Cortes, demanding that the Minister of Finance may be authorised to issue Treasury-bills to the amount of 160 millions of reals; but as the committee charged with the examination of this scheme is composed of the Opposition, it is doubted whether it will pass into a law. A committee which had been appointed to report on the calling into active service of 50,000 National Guards, was said to be in favour of the measure; and at a meeting of Deputies and Senators at a secret sitting on the 20th, it was resolved to recommend to Government the adoption of the most energetic measures to prevent the breaking out of any insurrection. At the sitting of Congress on the 19th ult., Gen. Mendez Vigo directed the attention of the Chamber to the affairs of Portugal. He said "the situation of that country may exercise a fatal influence on our cause. Our enemies are there openly conspiring against our liberty, and find partisans. It will require extraordinary exertions on our part to obviate the danger. In France, also, the conspiracy is flagrant. Let us prove that we are neither English nor French, and that the nation is able to brave all its enemies. I propose that auxiliary Juntas be established in the provinces, and that Government resort to every means calculated to show what our heroic nation is capable of." The President of the Council, in reply, said that the plan suggested by the General would be productive of general confusion. The *Gazette* of the 19th ult. orders several naval armaments. Troops were still marching from all sides towards the frontiers of Portugal. The provincial regiment of Malaga left that city on the 14th ult. for Badajoz, and a frigate had proceeded on a cruise along the Portuguese coast. Orders had also been given for a ship of the line to repair without delay from Ferol to Cadiz. A small naval division, consisting of one steamer, a brig, and a schooner, had been stationed at Santona, for the purpose of guarding the coast between that harbour and France; Government, it is said, on this occasion being determined not to be taken unprepared by events. Precautionary measures had been likewise adopted at Tarifa and Algesiras. The garrisons of those two places had been reinforced, and on the 11th ult., the British Governor of Gibraltar, accompanied by two of his aides-de-camp, had an interview at Algesiras with the Spanish General, and concerted with him a plan for defending the neighbouring coast. An English ship of the line was lying off Tarifa on the 13th ult., and the "Corresponsal" states that the Governor of Gibraltar had been instructed to afford the Spanish authorities any aid they might require in the event of a landing. The Portuguese General, Count Das Antas, had arrived at Cadiz, along with other emigrants; and the Duke de Palmella, Viscount Sa da Bandeira, and others, were expected to arrive by the next packet. A sum of 30,000*l.* sterling was transmitted from Madrid on the 19th ult. to London, on account of the indemnity bondholders.

Portugai. — We have received, by the Braganza steamer, intelligence from Lisbon to the 21st ult. Everything was again quiet in the Capital, and the country appears to have everywhere acquiesced in the change from the Constitution to the Charter. The Ministry had not been definitively arranged, and it was considered doubtful whether Costa Cabral, the hero of the Oporto movement, would form part of it or not. In the former case, Senhors Mousinho d'Albuquerque and Loureiro, it is said, would retire. Costa Cabral, and his colleagues of the Oporto Junta, arrived in Lisbon on the 19th ult., and had been presented to the Queen, and it was reported at first that the former, in conjunction with the Duke of Terceira, would form the new Ministry; but subsequently it was said that the Duke would remain with his present colleagues, that Senhor Figueiras would join them as Minister of Justice, and Count Lavradio was spoken of as Minister for Foreign Affairs, Costa Cabral being excluded. The Pope's Nuncio was about to be presented to the Queen. The Duke of Palmella had been appointed to negotiate with his Excellency, and some material concessions had been made, M. Capuccini giving up any claim as to the restoration of convent property. It does not, however, appear what had been done as to the establishment of the Ecclesiastical Court, which was said to be one of his demands. The Queen was expected to be confined in a few weeks, and prayers were put up in the churches for her safe delivery. Lisbon had been full of rejoicing for the restoration of the Charter. It was observed that Lord Howard and Baron Mareschal were not present at the levee, which was attended by all the other foreign Ministers.

Germany. — Intelligence has been received from Vienna, announcing the retirement of his Highness Prince Esterhazy from the embassy at the Court of St. James's. —A letter from Berlin, of the 19th ult., states that his Majesty had fixed for the 23d ult. the solemnity of the betrothing of the Prince Royal of Bavaria to the Princess Mary. The Queen has received an autograph letter from Queen Victoria, written in the German language, in which her Majesty expresses her joy and gratitude for the visit which she has received from the King. Private letters state that the feeling of hostility which prevailed throughout the German States, and particularly in Prussia, against the Russian Government, has begun to be manifested in the public prints since the Prussian system of censorship has been relaxed: and that it has been even publicly suggested that Prussia would do well to follow the example which this country has given in suppressing the slave-trade, and insist on a change being made in the treatment to which the population of the Polish provinces under the dominion of Russia are subjected, and place them at least on an equality with the inhabitants of the Prussian Duchy of Posen. The "Konigsberg Gazette" has two remarkable articles, unsuppressed by the censorship, on the necessity of completing the defence of that province against Russia by the fortifying of Lyck. There is no fortress on the Prussian frontier between Memel and Thorn, which in case of war would throw the eastern province of Prussia into the power of Russia. A Berlin letter says that Prince William, the King's uncle, would leave that city on the 20th or 21st ult. for Italy, and would be followed by his sons. Prince Adalbert would go first into Portugal and thence to Brazil. His Royal Highness, it is said, has a passion for the sea, and is well acquainted with naval science. By an official notice published on the 14th ult., the "Telegraph," edited by Dr. Gutzkow, and published at Hamburg, is prohibited in the whole of the Prussian dominions. This, it is said, is in consequence of the prohibition of every work published by Hoffmann and Campe. Since the beginning of this year, the names of Hoffmann and Campe are not announced as publishers, but simply Julius Campe; a change which has not induced the minister to relax the prohibition. It is announced that M. Eichthorn will succeed Count Maltzahn as Prussian Minister for Foreign Affairs; and a report prevailed at Berlin of a considerable reduction being about to be made in the Prussian army. —The German newspapers in general express their satisfaction at the settlement of the differences respecting Luxembourg. The hereditary Prince of Saxe Coburg Gotha will, it is expected, soon retire from the military service of Saxony, and leave Dresden; his marriage to the Princess of Baden, it is added, will take place at no distant time. The papers mention it as a circumstance somewhat remarkable that four hereditary princes are on the eve of marriage, viz., those of Coburg, Bavaria, Weimar, and Modena.—A letter from Thuringen, in Upper Saxony, dated the 12th ult., states that snow has fallen there to the depth of 5 or 6 feet; and that hares, deer, &c., unable to obtain food, enter the houses of the peasants, and eat out of their hands.—Accounts have been received from Carlsruhe, dated the 15th ult., announcing the unexpected dissolution of the Baden Chambers on that day.

Russia.—Letters from St. Petersburgh inform us that the legislature is about to look rather more closely than it has hitherto done into failures and bankruptcies, and that a ukase is shortly to be published on this subject. By the terms of this ukase, every bankrupt who cannot pay 40 per cent. is to be looked upon as a fraudulent defaulter, and as such is to be either banished to Siberia, or incorporated in a regiment as a private soldier. Between the months of Jan. and April of last year 160 great commercial houses have failed in Moscow. These extensive failures amounted to upwards of 80 millions of rubles banco; but the fair of Nishni-Nowgorod appears to have put a stop to this commercial crisis, as affairs were beginning to assume a more prosperous appearance, there being more than 300,000 buyers present at the fair. The honorary directorship of the Government railroad from St. Petersburg to Moscow has been accepted by the Hereditary Grand Duke of Russia.

Greece.—According to intelligence from Athens of the 10th ult., the National Bank commenced operations on the 3d. Government had been for some time endeavouring to collect funds to pay the interest of the loan, and had taken up for the purpose 500,000 drachmas, constituting the reserve of the War-office, and various sums belonging to other departments. M. Mavrocordato had accepted the embassy to Constantinople. The return to Athens of M. Theocaris, who had been specially sent for by the King, was considered by many as the forerunner of the formation of a new Cabinet.

Turkey.—By the arrival of the Levant mail, we have recent intelligence from Constantinople. The accounts from Syria which had reached the Turkish capital on the 6th ult. were unsatisfactory. The appointment of Omar Pacha, the Austrian renegade, to the Government of the Lebanon, seems to have created great hostility and resistance on the part of the population, and to have been regarded as an assumption of power never before attempted, even in the best days of Ottoman rule, over the Syrian people. Private accounts express some apprehension that all religious feuds and disputes will cease, and that the mountaineers will unite in one feeling of opposition to the Turkish administration. Mustapha Pacha, the commander-in-chief of the Ottoman troops, was at Damascus at the latest advices.—Private correspondence dated Jerusalem, 27th Jan., contains some interesting particulars respecting the arrival of Dr. Alexander, the Protestant Bishop of Palestine, in that city. The prelate, accompanied by Col. Rose, landed at Jaffa on the 20th, and was met at Ramleh by M. Nicolayson, a Danish gentleman, now a clergyman of the Church of England, who conducted him to Jerusalem, which they entered on the following day, amidst a large concourse of people, the authorities paying him every respect. On the 22d the Doctor and Col. Rose inspected the site on which the new church is to be erected, and on the following day the Bishop preached his inaugural sermon.—It is stated that the financial changes of Izzet Mehemet Pacha, the Vizier, had not been attended with happy results. It appears that there is now a prospect of a complete settlement of the Greek dispute, owing, it is said, to the active exertions of Sir S. Canning. It was expected that the treaty of commerce signed by Zographos, and rejected by his Government, would be ratified when Mavrocordato, the new Ambassador, had arrived in Constantinople, where he was daily expected. One of the Sultanas has given birth to a son, an event which had been hailed with more than ordinary rejoicings. Baron de Bourqueney, the French Minister, gave a ball on the 5th ult. Sir S. Canning was prevented from being present, owing to indisposition, from which, however, his Excellency has recovered.

Egypt.—By the Levant mail we have news from Alexandria to the 9th ult. It states that Mehemet Ali, instead of returning from Minie to Cairo as was expected, had gone towards Suit, in Upper Egypt. The state of his finances is said to be very critical. Said Effendi, the Sultan's Envoy, had been waiting for the last five months at Alexandria to receive the tribute due for Egypt for the last two years, amounting to 75,000 purses, independent of 40,000 purses due for the present year, which would expire on the 11th ult. The pay due to the Syrians, moreover, remained to be liquidated. The penury of the treasury, it is said, was so great, that the Pacha having sent three horses as a present to Nedjib Pacha, of Damascus, the sais who accompanied them from Egypt into Syria were to have received, by order of the Sultan, 25 piastres to defray their expenses, but even this small sum was not forthcoming. It is likewise asserted that the Government servants not having received any pay for a length of time, Lieut. Kaimakam sold one of his children at the slave bazaar of Cairo, in order to procure food for the other members of his family. The Appalt, or monopoly of wines and spirituous liquors, had been abolished with respect to all Europeans. They now pay 5 per cent. *ad valorem;* but the Ottoman subjects were not allowed this privilege. A notification had been made to the architects who prepared the plan of an English Protestant Church at Alexandria, that they might proceed with the building.

India.—We have received by the Levant steamer an Indian mail, with intelligence from Calcutta to the 10th Jan. The steamer India, by which this mail was brought, arrived at Suez on the 11th Feb.; her mails reached Alexandria on the 15th, and Malta, by the Gorgon steamer, on the 20th. She left Sandheads, below Calcutta, on the 11th Jan., touched at Madras and Point de Galle, losing thereby sixty hours, then took eleven days and seven hours to reach Aden, where she was detained fifty-six hours taking in coals. From Aden to Suez she took seven days and sixteen hours; thus making the whole voyage, 4,894 miles, in twenty-five days and fifteen hours under steam, which is the longest steam voyage yet made. The accounts thus received from Affghanistan, which are to the 15th Dec., are very discouraging, though from some other parts they are more satisfactory. Candahar is quiet, and Sir R. Sale's division at Jellalabad may, it is hoped, be considered in security. Two engagements, on the 15th Nov. and the 1st Dec., in which the enemy had been routed with great loss, had considerably depressed them, and proportionably inspirited our own men. As a consequence, it is said, of these two affairs, instead of two and a half days' provision, which was all they were stated to have on the 13th Nov., they had obtained at the date of the last accounts stores for three months; and a wavering tribe, the Khyberies, who had, it is supposed, nearly declared against us, and who had it in their power to close some important passes, have been steadied by the same successes.—The accounts from Cabul are very unsatisfactory. On the 8th Dec. provisions, it was said, were becoming more scarce, and the enemy more daring every day. An Indian paper, referring to news of the same date, says, "Our troops have only ten days' provisions at Cabul; and there are many officers of experience here (Calcutta) who have been through the Cabul campaign, and know the country well, who think that not a single individual will return to tell the tale, since starvation is staring them in the face." It has been attempted to push forward a brigade from Candahar to their relief, under Col. Maclaren; and it is said that those who are acquainted with the country and the changes of the seasons considered there was no doubt that Cabul could be reached without difficulty. Unfortunately, however, the heavy snows have set in, with unusually intense cold, at a season when a few snow-storms only are commonly looked for by the Affghans; and the brigade, after having, with much suffering and loss of camels and baggage, laboured as far as Khelat-i-Ghilzee, has been obliged, by mere force of the climate, without any opposition from the enemy, to return to Candahar as it went out, leaving the forces at Cabul and Ghuznee without hope of succour till the snows shall have broken up in March or April.—As stated above, all was quiet at Candahar to the 4th Dec. The troops were strong, consisting of Her Majesty's 40th and the 2d and 38th Native Infantry, and the Shah's 2d and 4th were sufficiently supplied to last till the spring. In Khelat-i-Ghilzee there were, one Shah's Regiment of European Artillery, and two 18-pounders, with provisions for nine months—a position it was thought no Affghan force could touch. Ghuznee, likewise, was well provisioned, and considered *safe*. The Belloochee tribes were quiet. Major-Gen. Pollock had received orders to proceed to Ferozepoor, and thence to Peishwar, to assume the command of a force assembling at that point, to consist of 10,000 men, the object of which was to relieve the troops in Affghanistan. Such are the accounts derived from private letters; but it is stated that the despatches received from the Indian Government give a worse account of the state of affairs in Affghanistan than that derived from private sources. The courage of the troops at Cabul, it is reported, was daunted by the fearful odds around them, and overtures had been made for capitulation; but it seems that the terms demanded by the native chiefs were nothing short of the surrender of Shah Soojah himself, and the abandonment of the guns of the British army. To accede to these conditions would be to expose the army to the almost certain violation of them; the artillery being the last resource which compensates for the disparity of numbers; and without it nothing could be foreseen but a massacre of the troops.—It will be seen, however, by our Parliamentary news, that Government has received no intelligence either of a negotiation for a capitulation or of a surrender.

China.—The Indian Mail brings no news of importance from China. It, however, confirms the reports already received regarding the operations of the expedition to the northward. Tinghae, the capital of Chusan, was attacked and taken on the 1st Oct., with considerable loss on the Chinese side. On the 10th, Chinhae, the seaport of Ningpo, was carried, and on the 13th, the city of Ningpo itself. At Amoy things had undergone a change, some symptoms of hostility beginning to manifest themselves; and Capt. Smith had written that he was in expectation of an attack upon his position. Sir H. Pottinger, it was expected, would winter at Amoy, and the Admiral was looked for at Hong Kong. No Chinese envoy, up to the 25th Oct., had been sent to Sir H. Pottinger. At Canton hostile preparations were in progress; the heights were fortifying, and the forts were rebuilding. A volunteer corps, 800 strong, from the Bengal 3d Reg. of Native Infantry, a troop of horse artillery, additional sappers and miners, and a corps of 500 gun Lascars, from the Madras Presidency, have been ordered on service in China. The force, it is said, is immediately to consist of 10,000 men, and to march on Pekin as soon as the south-west monsoon sets in. In the Chinese Sea there have been some serious hurricanes; and an insurrection is said to have broken out at Luzon, one of the Philippine Islands.

United States.—We have two arrivals this week, the packet-ships George Washington and United States, the former of which arrived at Liverpool on Sunday, and the latter on Wednesday evening. The New York papers thus received are to the 14th ult. In the Senate, on the 4th ult., Mr. Calhoun made a proposition to refer to the Committee on Foreign Relations the message of the President on the mutiny and murder by the slaves on board the Creole, and the liberation of those slaves by the British authorities in Nassau, New Providence. He considered that prompt action on this subject was necessary, as it involved important principles, paramount to any of those which are now the subjects of negotiation between the United States Government and Great Britain. Mr. Preston made some remarks, concurring with Mr. Calhoun on the importance of the principles involved in the question, but disagreeing as to any action of Congress in anticipation of the Executive. The message was referred to the Committee on Foreign Relations. The House of Representatives had been almost wholly engrossed by the debates arising out of the motion for a vote of censure on Mr. John Quincy Adams, for having presented an objectionable petition to the House. Mr. Adams was defending himself vigorously and ably, and was left speaking at the date of the latest accounts from Washington. The Philadelphia banks remained in the state they were in at the date of the previous accounts. Considerable distrust was felt after the failures of the Girard and Pennsylvanian banks; and hence money was exceedingly plentiful in private hands, who hesitated to invest it in stocks or to deposit it in banks. The Legislature of Pennsylvania, which was in session at Harrisburg, had before it a bill compelling the banks of the State to resume cash payments immediately. Several clauses had passed the House of Representatives by large majorities. The Governor of the State of Pennsylvania had, it is stated, succeeded in obtaining nearly 400,000 dollars from the Pennsylvania Bank, which, together with 100,000 dollars in possession of the State Treasurer, had been paid to the loanholders and their representatives, leaving 300,000 dollars to be provided by the other banks, under a requisition from the Governor.

Parliament.

HOUSE OF LORDS.

Monday.—Lord Brougham laid on the table of the House a bill for the establishment of local county courts to which the trial of all personal actions in which the damages sought to be recovered did not exceed 50*l.* should be confided; the judges to be appointed under the proposed bill would also have a voluntary jurisdiction in actions to any amount, if the parties should signify their consent in writing to abide by their decision. The measure, his Lordship said, had already been favourably entertained by the House several years ago, and he hoped that neither the lapse of time nor the change of circumstances would be found to have altered their opinion on it.

The Lord Chancellor announced his intention of laying before the House, in the course of a few days, a bill with the same object as that which Lord Brougham had introduced; and thus, including that brought in by Lord Cottenham, there would then be, his Lordship said, three bills upon the subject at once before the House, and it would be for their Lordships to say which they preferred, or whether an amalgamation of all three.

Lord Campbell briefly expressed his hope that the country would not be left much longer without local courts for the administration of cheap justice; and the bill was laid on the table.

Tuesday.—Lord Campbell introduced three measures for improving the administration of justice; and, after briefly deprecating a factious view of a subject wholly unconnected with party, proceeded to explain the objects of his three bills. These were, an improvement in the constitution of the House as a court of appeal, an alteration in the present system of appeal to the judicial committee of the privy council, and a reform in the practice of the Court of Chancery. Experience, he said, had shown the inconveniences which resulted from the existence of two co-ordinate courts of appeal—that of the Privy Council and the House of Lords, and he was of opinion that it would be better if the whole business now divided between the two courts were confided to the latter tribunal. His Lordship, after recapitulating the heads of his three measures, reserved all explanation as to the details until the time for the second reading should arrive.

The Lord Chancellor remarked upon the extraordinary success which had attended the measure passed last session to reduce the arrears of business in the Court of Chancery. In the month of November, his Lordship said, when the bill came into operation, there were upwards of 500 causes waiting for hearing; but at the present moment, including the new cases that had been set down, there were not more than .00 in arrear. His Lordship then defended the system on which the appellate jurisdiction of the House of Lords proceeded, as well as the constitution of the judicial committee, by which appeals to the Privy Council are decided and argued; and said that as these courts for the hearing of cases involving almost every kind of law on the face of the earth had hitherto given entire satisfaction, there was no reason for any change.

Lord Cottenham was rejoiced to find that in the measure now proposed was embodied one which he had himself brought forward, but without success, in 1836. At the same time, he could not help thinking that the present time was singularly ill chosen to bring it forward, as the act of last session had not yet had a sufficient trial.

Lord Brougham took credit for his prediction, on the appointment of additional Vice-Chancellors, that there would be more judges in the Court of Chancery than the amount of business would render necessary. He then went in detail through the different objections to the present system, on the necessity of removing which Lord Campbell founded his proposed bills, from which he drew a conclusion unfavourable to their chances of success. He thought that some of the evils complained of existed rather in theory than in practice, while others were quite inevitable.—Lord Campbell said a few words in reply, and the bills were laid on the table.

Friday.—In reply to the Earl of Clarendon, Lord Aberdeen expressed his belief that the Spanish conspiracy is less formidable than is supposed; he had received from M. Guizot the most distinct assurances that the proceedings on the frontier are without the sanction of France; and he assured the House that every measure should be taken on the part of England to give support to the Spanish Government.

Lord Monteagle brought forward his motion respecting the Exchequer-bill fraud; but on the suggestion of the Duke of Wellington and Lord Morpeth, who thought that no blame could attach either to Lord Monteagle or Sir John Newport, his Lordship withdrew his motion.

HOUSE OF COMMONS.

Monday.—A number of petitions on various subjects were presented, and several notices of motions were given. The Railways Bill was read a second time, and a conversation of some length arose on the Presbyterian Marriages Bill. In committee the 2d clause of the bill was opposed by Mr. S. O'Brien, and on a division it was carried by 159 to 63.

In reply to a question from Mr. Baillie, Sir R. Peel said he was happy to state that negotiations are now pending for the conclusion of a treaty between this country and Naples.

The House then resolved itself into committee on the Corn-laws.—Mr. Wodehouse, representing the county of Norfolk, a district extensively producing barley, contended for the continuance of the existing protection on that grain, and desired, therefore, that so much of the proposed resolutions as related to barley should be expunged from the plan of Government.

Sir R. Peel maintained that part of the Government measure which respects barley, as bearing a due proportion to that part which respects wheat. He had not expected so extreme an opposition, from the notice given by Mr. Wodehouse, in which that hon. Member proposed to vary the Government measure only by enacting, under 26*s.* per quarter, a duty of 13*s.* instead of a duty of 11*s.*—Mr. C. Bruce contended that the proposed protection on barley would be too low. He apprehended that at this duty foreign barley would be imported to an injurious extent. He wished that Government would reconsider this part of the subject.—After a few words from Col. Rushbrooke, who desired that a larger protection should be afforded to barley, Lord Worsley thought the existing duty by no means larger than was requisite for the due protection of the grower. The universal opinion of his county was, that the effect of the proposed reduction would be to add agricultural to manufacturing distress.—Mr. Christopher would willingly support Mr. Wodehouse in the object he had in view, if it would lead to practical result.—Mr. Shaw and Mr. Christmas said that apprehensions were entertained in Ireland, and they themselves feared, that under the Government proposition, the growers of Irish oats would be undersold by their foreign competitors. A long and desultory debate ensued, in which several Members joined; at the conclusion of which Mr. Wodehouse withdrew his motion, and the resolution of Government as to the duty on barley was carried without a division.

The Government resolution as to the duty on oats being next put, Mr. S. O'Brien expressed his apprehension that foreign oats might at the proposed duty be imported in quantities very hurtful to Irish agriculture.—Sir D. Roche also contended for further protection to Irish oats; and Sir R. Bateson and some other Members said each a few words to the same effect.—After some remarks from Mr. Redington, Mr. Gladstone contended that in the new modifications of the sliding scale, Government had preserved the old proportions between wheat, barley, and oats, at each point of the scale, as nearly as was consistent with the exclusion of fractional sums, and entered into calculations, showing the impracticability of obtaining any considerable quantities of either grain, except at prices too large to affect the home market. He felt the impossibility of allaying every fear; but the safest evidence to rely upon was, he thought, that which Government had had the opportunities of collecting from all quarters; and this evidence was such as convinced him that the proposed duties were an ample protection.—Mr. M. J. O'Connell, also considering the protection insufficient, called for explanation from Sir R. Peel as to the reasons on which he proceeded in making a change in the scale for oats.

Sir R. Peel retorted on Mr. M. J. O'Connell the fact of his having voted for a total repeal of all protective duties, and contrasted it with his recently-uttered sentiments. Members opposite, continued the right hon. Bart., were loud enough about that insult to the country which they alleged to be involved in the continuation of any protection at all; but they were equally loud on the other side of the question, as soon as any protection of their own constituents was affected. The longer these debates lasted, the more he was convinced that the measure he had framed was the safe and the just as well as the moderate course. After a long discussion, in which Mr. O. Gore, Dr. Bowring, and Messrs. Baring and Harford joined, the House divided, and affirmed the Ministerial resolution by a majority of 256 against 53.

Upon the resolution respecting the duty on flour, Lord Sandon, in behalf of the millers, pleaded for an ampler protection.

Sir R. Peel announced, that after giving the fullest consideration to this subject, he could not consent to alter the proposed rate of duty. If the protection of flour were increased, the foreign growers, who would be the most prejudiced, would be precisely those whom every man must admit that it would be most our interest to favour—namely, those of the United States. He proceeded to show that the existing protection was substantially sufficient.—Mr. Labouchere expressed his satisfaction at the determination of Sir R. Peel, and the resolution then passed.

Mr. S. O'Brien moved that "all sorts of grain, the produce of the colonial possessions of Great Britain, be admitted at all times at a duty of 1*s.* per quarter."

Lord Stanley admitted the importance of extending our trade with the colonies, but contended for the continuance of the 5*s.* duty on wheat imported from Canada, as a protection against an inundating importation of United States grain, which would be carried across the border, then ground in Canada, and be imported as colonial flour.—Mr. Labouchere and Mr. Gladstone addressed the committee, the latter disclaiming that the duty was for an English object, but simply for inter-colonial purposes, and the former expressing his astonishment at the reason assigned by Mr. Gladstone.—Mr. C. Buller and Mr. S. Wortley made a few observations, after which a division took place, when the motion was rejected by 135 to 38.

After some conversation as to the future mode of procedure, and some dispute respecting the proposition of the resolution for altering the mode of taking the averages, Col. Sibthorp brought forward a motion, that the duty on foreign corn should be paid at the time of importation, instead of when taken out of bond.

Sir R. Peel referred to the Speaker if the motion could be brought forward on another occasion, to which he replied in the affirmative, and Col. Sibthorp withdrew it.—The resolutions were then reported, and the House resumed.

Tuesday.—In reply to a question from Mr. Shiel, in reference to an allegation made some time since in the French Chambers by M. Guizot, respecting an admission of Lord Aberdeen,

Sir R. Peel stated his noble friend did not admit that he said he had no objection to the retention by the French of their possessions in Africa. He believed the expression made use of was, that he had no observation to make on the subject.

Mr. T. Duncombe brought forward a motion for an inquiry into the rules, regulations, and discipline of the several prisons and houses of correction in England and Wales.—Sir J. Graham objected to the appointment of a committee, being persuaded that the notoriety obtained through the visits and reports of the inspectors was a sufficient public check upon the mal-administration of prisons. The increase of crime, which had been going on at the rate of 45 per cent., was now reduced to 30 per cent. The principle on which Government were acting was, he thought, a merciful one, but still not carried to such an extreme of mitigation as to disarm punishment of the terrors properly belonging to it. The number of corporal punishments was much smaller than seemed to be supposed. In the year 1840 there were confined almost 70,000 male adults, and the whole number of corporal punishments was but 7—that is, 1 in 10,000. The right hon. Secretary more than once in the course of his speech gave ample credit to Lord J. Russell for the ability and attention devoted by him to the subject of prison discipline during his administration of the Home Department. A long discussion ensued, in which Lord J. Russell stated that he saw no good in a committee of inquiry; though he considered the law to be defective as respected the Roman Catholic prisoners. His Lordship was followed by Mr. Wakley, Sir C. Douglas, Mr. Hawes, Lord Mahon, Mr. O'Connell, the Chancellor of the Exchequer, Mr. Harford, and Lord G. Somerset. The debate presented, however, no feature of particular interest, and at its close Mr. Duncombe withdrew his motion.

Mr. V. Smith then rose to call the attention of the House, pursuant to notice, to the recent Order in Council respecting the emigration of Hill-coolies, and to move for a copy of the instructions given by the India Board to Lord Ellenborough on that subject.—Lord Stanley declared his belief that no instructions on this subject had been given to Lord Ellenborough, and intimated that Mr. Smith's motion, therefore, even if it were carried by a division, would not be very productive. He contended that in the measure which he had himself introduced he had guarded against the evils on account of which the House had disapproved the measure of the late Government. The old arrangement, he considered, was one of virtual slavery: for the Indian labourer was hired by a crimp, and brought to the Mauritius to work at fixed wages for one master whom he could not leave during a fixed term of five years. But Lord Ellenborough, with whom he had repeatedly conferred on this subject, concurred with him and with Lord Fitzgerald, the present President of the India Board, that measures could be effectually taken in India, by which the removal of labourers might be conducted on a principle of free migration. The noble Lord then stated the safeguards which the present Ministry proposed to establish, and of which the most material is the appointment of Government agents both in the East Indies and in the Mauritius, to see the labourers fairly treated in their shipment from India, and secured in a perfect freedom for their contracts at the Mauritius. And he argued that, as the latter colony is to pay the expense of transport from India, and, if the labourer should desire to return, the expense also of his conveyance back, it must be the interest of the Mauritius to treat them well, and keep them satisfied. The noble Lord concluded by referring to a variety of documents connected with the subject, alluded to by Mr. Smith, and trusted that he had, to the satisfaction of the House, rebutted the charge of inconsistency adduced against the present Ministers. After some discussion, Mr. V. Smith solicited and obtained leave to withdraw his motion. The Buildings Regulation Bill (No. 2) was read a second time, and ordered to be committed. The Borough Improvement Bill (No. 2) was read a second time, and ordered to be committed. The Marriages (Ireland) Bill was reported. The Apprentices Regulation Bill was read a third time and passed.

Wednesday.—After the presentation of a number of petitions, Sir R. Peel, in reply to a question from Mr. Mangles, said that there were no accounts direct from Cabul or Candahar in possession of Government of a later date than those already before the public; but Government had received accounts of a later date from Calcutta. Those accounts, however, were not founded upon direct official information from Affghanistan to Calcutta, but upon private letters conveying intelligence which he thought it very improbable would be called in question. As it was not official, he could not present it to the House; but there was every reason to believe, that in the course of a few days accounts would be received direct from Affghanistan. He supposed the hon. gentleman's question to have reference to the reports of a surrender on the part of the British army in Affghanistan. No such intelligence had reached Government.—Mr. Mangles asked whether any negotiations for a capitulation had been said to have taken place.

Sir R. Peel replied, that Government had received no accounts to that effect. They had received no account of a private negotiation having been entered into for a capitulation, and still less of a surrender having taken place.

The report of the Corn-law resolutions having been brought up, Mr. E. Buller rose, in pursuance of his notice, to move an amendment on the scale of Sir R. Peel, diminishing the duty on wheat per quarter at the rate of one shilling for every advance of one shilling in the price, without the admission of any rests, until the price should rise to 64*s.*, at and above which point he proposed to retain a fixed duty of 6*s.*

Sir R. Peel excused himself from answering this speech in full, since such an answer, he said, would be merely to go again over the ground already trodden so often. Without any disrepect, he could not help wishing that some limit should be put to these discussions.—Mr. Buller said he had understood that Sir R. Peel would be disposed to accept a compromise. Sir R. Peel disclaimed any such disposition; and Mr. Ward said, that any compromise like that of Mr. Buller would be as little acceptable to the Opposition as to Government. The amendment was negatived without a division.

Mr. Hastie conceiving it to be an established fact that the average crops of this country fall short of her average consumption by a million quarters of wheat, 250,000 quarters of barley, and 250,000 quarters of oats, proposed that those respective quantities of those several grains should be admitted for home consumption at 1*s.* per quarter in each year, before the Government scale of duties should come into operation for that year; priority being allowed to each cargo according to the date of its entry.

Sir R. Peel said that this was the most monstrous proposition yet suggested. Suppose 2,000,000 quarters in bond, and 1,000,000 suddenly let in at 1*s.* duty; the effect would be so to lower prices as to raise the duties in a manner most prejudicial to the remaining importers, whose cargoes had not been lucky enough to come within the privileged million. The plan, too, must be applied alike in all years, whether there were a scarcity or an abundance of home production. And when there was no corn in bond, at the year's end, the near countries would have a very unfair start over the distant ones in the race for the earliest supply of the year following.

Mr. Hastie explained, but forbore to divide. The resolutions were passed, and leave given for introducing a bill to be founded on them.

Thursday.—After the presentation of petitions and other miscellaneous business of little interest, the Chancellor of the Exchequer rose to call the attention of the House to the subject of the frauds connected with the issue of Exchequer-bills. A public officer, he said, having great and almost unbounded confidence reposed in him, abusing that confidence, carried on a system of issuing forged Exchequer-bills, calling in the old ones and issuing others in their place, thereby contriving for a long time to conceal his fraudulent transactions. An intimation made to the Chancellor of the Exchequer roused suspicion, and led to an investigation which promptly discovered the offender. On the part of the chief offender, Smith, offers were made of disclosures on condition of a remission more or less of punishment. But this offer Government could not, in duty, accept. Every application being refused, Smith pleaded guilty, and by so doing prevented a full development of the fraudulent system. The duty then devolved on Government and Lord Monteagle of calling in all outstanding Exchequer-bills, and testing their genuineness. From thence Government proceeded to institute a deliberate inquiry into the frame-work of the Exchequer-bill department, and the whole question arising out of that investigation would, he said, hereafter occupy the attention of Parliament. Great want of caution on the part of Government, arising out of long-continued security and all the circumstances connected with these transactions, demanded a searching investigation, in order that the whole case might be thoroughly understood. To admit, without cautious consideration, the claims of the holders of forged bills to compensation, would be to weaken the foundations of future security against similar villany; for if it should appear that these frauds were, in all instances, committed with accompanying circumstances, fairly warranting suspicion, there was ample reason for hesitation. To bring out, therefore, the whole matter in all its bearings, he proposed that a commission should be appointed by Act of Parliament to make inquiry into the subject of the late frauds connected with the issue of Exchequer-bills.—Mr. Kemble seconded the motion, but took occasion to vindicate the characters of the holders of these bills from what seemed to be a reflection cast on them by the Chancellor of the Exchequer. They themselves, he said, had asked for that searching inquiry now proposed by Government.

The Chancellor of the Exchequer explained that he did not mean to cast reflection on the whole body of the holders of the forged bills.—Mr. Leader commented upon the carelessness of the Exchequer-bill Office, upon which he thought the Chancellor of the Exchequer had not been sufficiently severe.—Mr. Blewitt objected to the use of the word forgeries in reference to these bills, as an assumption not sufficiently supported by evidence.—Sir R. Inglis supported the claim of the holders of the bills to compensation. The forged bills, he said, were issued from a Government office by a Government officer, and were on Government paper, and bore the Government seal.

Mr. F. T. Baring (the late Chancellor of the Exchequer) acquiesced in the propriety of a searching investigation. After some observations from Mr. Wakley, Col. Sibthorp, Mr. Ricardo, and Mr. S. Wortley, who supported the motion, Sir R. Peel cautioned the House against the adoption of the principle of compensation to the *bonâ fide* holders, or any general principle whatever, until they were informed of the facts of the case through the inquiries of the commission. After some remarks from Dr. Bowring and Mr. Turner, the Chancellor of the Exchequer, in reply to a question of the Hon. Member for the West Riding of Yorkshire, said that the Exchequer-bills which were found to be forged had been impounded under the best legal advice, in order to prevent subsequent confusion and injury to the public.—On the motion being put, Mr. Blewitt raised a conversation as to the propriety of leaving out the word "forged" in the title of the bill, or, at least, to qualify it by "*alleged* forged Exchequer-bills. The consideration of this point was postponed, and leave was given to bring in the bill.

Mr. French then brought forward a motion, for a committee of the whole House to prepare an address to her Majesty, praying that she would recommend Parliament to take measures for securing to Ireland the advantages of railway communication.—Mr. Shaw seconded the motion, but did not recommend his hon. friend to press it to a division. It was, he said, a question of finance, which might more advantageously be left to the consideration of Government.—Mr. Redington claimed the attention of Government to the subject.

Lord Eliot could not acquiesce in the proposal of the Hon. Gentleman opposite, and as he considered that by so doing he would be holding out, on the part of Government, delusive hopes to the people of Ireland, he should meet it by moving the previous question. After a few words from Mr. O'Connell, Capt. Jones, Mr. W. E. O'Brien, and Mr. Shaw, Sir R. Peel resisted the motion, on the ground that the proposed measure would be injurious, at once to the finances of the State, and to the interests of Ireland.—Mr. Wakley objected to the motion being withdrawn.

Lord J. Russell expressed his hope that the House would always, in reference to such motions as the present, act with a judicious economy.—Mr. French withdrew the motion.

Sir R. Peel said there was one point on which he desired not to be misunderstood—it was this, he wished to give Ireland the same advantage as England possesses, by the advance of Exchequer-bills on proper security, in order to enable the works to be completed.

Viscount Mahon obtained leave to bring in a bill to amend the law of copyright. He proposed to limit the extent of the period of protection to 25 years, and to give a discretionary power to the Privy Council to prevent the suppression of works by the survivors of the authors.

Lord Eliot obtained leave to bring in a bill to amend the Act 1 and 2 William IV., empowering landed proprietors in Ireland to sink, embank, and remove obstructions in rivers. The bill was read a first time and ordered to be printed.

On the motion of Mr. F. Maule, a select committee was appointed on the regulation and improvement of boroughs.

Friday.—Lord J. Russell stated his intention to divide the House on the second reading of the Corn Duty Bill.—Sir R. Peel expressed his anxiety to state the intention of Government respecting the finance and commerce of the country on Friday, and fixed Wednesday next for the second reading of the Corn Bill. The Navy Estimates were then brought forward, and a long discussion ensued on matters connected with the construction of ships of war, with the general management of the service. The main question was the appointment of a civilian to the office of First Lord of the Admiralty; and Sir C. Napier proposed a reduction in the vote for the Board, which was negatived without a division.—In reference to the Niger expedition, Lord Stanley said that no white sailors would be employed in any future expedition; but he thought that a vessel navigated by negroes, with whose constitution the climate did not disagree, might make occasional ascents of the river with advantage to the objects originally contemplated.

CITY.

Money Market, Friday.—Consols for money closed 89⅛ to ¼; ditto for the account, 89½ to ⅝; Three-and-a Half per Cents. Reduced, 99⅝; and New Three-and-a-Half per Cents., 99. Exchequer-bills have advanced to 27s. to 29s. premium.

Metropolis and its Vicinity.

Public Meetings.—On Monday a public meeting was held in Marylebone, the largest, it is said, ever known in that borough, for the purpose of denouncing the Government measure on the Corn-laws, and expressing a want of confidence in the present Administration. The placard calling the meeting announced that Mr. Hume would preside; but that gentleman not being present at the commencement of the proceedings, Mr. V. Sankey, the Chartist candidate for the borough at the last election, was called to the chair. Soon after, Mr. Hume, accompanied by Sir B. Hall, M.P., Sir C. Napier, and Mr. Wakley, made his appearance on the platform, and was received with loud cheers. The chairman, having briefly alluded to the object the meeting had in view, Mr. Savage moved the first resolution, and in a speech of considerable length detailed the sufferings of the people. He also went into the six points of the charter, and trusted, that as the Reform Bill was carried by the pressure from without, so would the repeal of the Corn-laws and the charter be carried, if the working classes would but unite with the middle classes. He concluded by moving the declaration, which was of great length, but the substance of it was that the tax on food cripples our commercial relations, and destroys the industry of the masses for the benefit of a few, and that the nation could not hope for justice until the people were better represented. The resolution having been seconded, Mr. Feargus O'Connor presented himself to the meeting, and was received with loud cheers. He said he agreed with all that had been said by Mr. Savage in his speech, but he should oppose his resolution. He denied that the corn and provision laws were first and foremost amongst the causes of distress, and said that their repeal would do but very little good unless they had the charter to back it. He would move an amendment to the effect, "That at present the repeal of the Corn-laws would not benefit the working classes, and that until they had established the charter they had resolved not to agitate for any other measure. He rejected all proposals of union between the Whig Corn-law repealers and the Chartists. Instead of going to foreign countries for corn, they could, he said, grow it all at home on the uncultivated land, and give employment to the surplus population. The people, he might say, were put up by auction; first Sir R. Peel bids, then Lord John Russell, but he trusted that they would persevere, and have nothing less than the charter. "Mr. Ridley seconded the amendment. Mr. O'Connell attempted to speak to the resolution, but the noise was so great that he could not be heard. Mr. Spur, a working man, supported the amendment, and said that the middle classes had sold them once for the Reform Bill, and he trusted they would not be sold again. The resolution and amendment were then put to the meeting, when the latter was carried by acclamation. Mr. L. Jones moved a resolution to the effect, "that instead of going to foreign parts for food, a well-organised system of home colonisation for the employment of the people on the waste land of the country would put them above the reach of poverty." He contended that the distress in the country was not owing to the competition between the manufacturers of this and foreign countries, but the competition among themselves in the home market. Mr. O'Connor seconded the resolution, which was carried. Several other speakers addressed the meeting on the subject before them, and also in favour of a national petition for the return of Frost, Williams, and Jones.

Wood Pavement.—On Saturday at the meeting of the Marylebone vestry, Mr. Low in the chair, a deputation of parishioners, supported by Messrs. Underwood, Bell, and Green, on the part of the inhabitants of Oxford-street, presented a memorial, signed by upwards of 3000 ratepayers, praying the vestry to carry out the principle of wood-paving, which they considered would be a saving to the parish and a great improvement on the present system. Messrs. Underwood and Green addressed the vestry at some length in support of the memorial, and the deputation having withdrawn, a petition was presented by a body calling themselves the parochial committee, against the wood-paving being adopted until it had been tested for at least five years. Mr. Joseph then moved, and Mr. Green seconded, a resolution, to the effect "That the vestry is ready to accept tenders for paving Oxford-street with wood from Wells-street to Vere-street." The Rev. Dr. Dibdin supported the resolution; after which Mr. Beers moved as an amendment, "That the vestry having already expended the sum of 3000*l.* in experiments in wood-paving, deem it prudent that no further expense shall be gone into till after the lapse of two years, when the durability of the wood already laid down will have been duly tested." This was seconded by Mr. Kirby; and on the question being put there appeared a majority of 14 in favour of the motion for the adoption of wood pavement, the numbers being 36 against 22. A long discussion ensued as to the appointing a committee to carry out the resolution, which was ultimately carried.

The Thames Tunnel.—On Tuesday the annual meeting of the proprietors of the Thames Tunnel Company was held, B. Hawes, Esq., in the chair. The report was read by the secretary, from which it appeared that this great work is now nearly ready for public use, there being only the entrances to be made. That on the Wapping side had been contracted for by Messrs. Grissell and Peto, to be completed in about three months, after which that on the Rotherhithe side would be undertaken. The works remained secure, and had not settled in the slightest degree throughout the tunnel, a length of 1,200 feet. The report alluded with gratitude to the assistance the company had received from government under various administrations, and the able manner in which the object had been advocated in the public journals. The balance sheet from the 1st Jan. to the 31st Dec., 1841, was receipts 5,352*l.* 19*s.* 4*d.* (in which were the sum of 1,699*l.* 15*s.* from visitors, and from the sale of books 125*l.*), and payments 1,990*l.* 14*s.* 3*d.*, leaving a balance of 3,362*l.* 5*s.* 1*d.* In the Bank of England the funds were 31,360*l.* 13*s.* 9*d.*, and the payments 21,124*l.* 8*s.* 4*d.*, leaving a balance in hand of 10,236*l.* 5*s.* 5*d.* The sums owing were 2,400*l.* The report and accounts were adopted. The chairman regretted the decease of Mr. Hyde Wollaston, who had been one of the first promoters of the undertaking, and stated in reply to a proprietor that he could not exactly say when the carriage-way would be opened to the public, the present arrangement being only for the foot-way, and that he hoped Government would be induced, on the work being opened to the public, to give up a portion of the toll, in order that some return might be made to the proprietors.

Metropolitan Improvements.—Among the various Metropolitan improvements in the west and north-western suburbs, it is said to be in contemplation to erect a number of elegant villas, for the formation of a road, with the title of the Prince of Wales's Road. The spot selected for this purpose is situated upon the brow of the hill leading from Haverstock-hill to Kentish-town.

Waterloo Bridge.—On Tuesday, a meeting of the proprietors of this bridge was held, the Rev. J. Rush in the chair. A report was read from the Board of Directors on the result of the adoption of the diminution of the toll for foot passengers, from which it appeared that the tolls received from foot passengers for the year ending March 1840 amounted to 712*l.* 9*s.* per month, whilst those for the year ending March 1841, after the adoption of the halfpenny toll, had produced but 625*l.* 3*s.* 5*d.*, making a defalcation in the monthly receipts of 87*l.* 5*s.* 7*d.*, or a daily average loss of 3*l.* 7*s.* 1½*d.* The report stated that there had been, taking all the differences in the receipts from the 1st March, 1841, down to the present time, a decrease of 690*l.* 7*s.*, or at the rate of 1*l.* 17*s.* 9¾*d.* per diem, or 3½ per cent. on the outlay. The decrease in the first six months after the reduction of the toll had approached 500*l.*, but that for the second six months had not exceeded 192*l.* 1*s.* 3*d.* The directors, therefore, seeing that the decrease in the receipts of the bridge had been daily diminishing, concluded their report by saying "that they saw no sufficient reason for resorting again to the original toll of one penny." The adoption of the report was then moved, but the proposition was met by a counter motion that the old rate of toll should be revived. Several gentlemen spoke on each side, but on a division the resolution that the present practice of exacting only a halfpenny toll from each passenger should be persevered in was carried by a large majority.

Mortality in the Metropolis.—The following are the number of deaths from all causes registered in the Metropolis during the week ending the 19th Feb. 1842: Males, 453; Females 454; total, 907. Weekly average, 1838-9-40-1; Males, 467; Females, 445; total, 912.

Robberies.—A few days since a robbery was committed in the Insolvent Debtors' Court. It seems that Mr. Commissioner Harris, who presided in Court, left his coat in the private room, and it was stolen in the course of the day. Numerous robberies, it appears, have been committed about the Court, and it is now decided that a policeman shall attend in future to prevent similar depredations.—On Saturday morning, as a gentleman was proceeding from the Bank in one of the Hammersmith omnibuses, he was robbed of a Russian leather pocket-book, containing three Bank of England notes, one for 500*l.*, another for 200*l.*, and the third for 50*l.*

Fires.—On Tuesday, a serious fire broke out in Mr. Davidson's printing-offices, Tudor-street, Bridge-street. Owing to some deficiency in the supply of water, the fire continued to spread with great rapidity, and at length the flames attained the adjoining premises of Mr. Priest's furniture warehouse. The engines, however, soon after succeeded in acquiring some power over the fire, and in two hours after its commencement it was so far subdued that there were no longer any fears for the safety of the surrounding neighbourhood, but the printing establishment was entirely consumed. The damage sustained is estimated at 7,000*l.*—A fire has occurred on the premises occupied by Mr. Bates, coffee-house-keeper, Thornton-street, Dockhead. The firemen, on their arrival, found that it would be useless to endeavour to save Mr. Bates's house, which was soon entirely destroyed. The flames, however, were prevented from reaching to the premises adjoining.—On Wednesday morning a serious fire broke out at the steam saw-mills belonging to Messrs. Eastcourt and Co., Coppice-row, Clerkenwell. The fire is supposed to have originated in the engine-house, and the damage done to the premises is extensive.—On Thursday an alarm of fire was given at the Custom-house. The fire was, however, found to exist only in one of the flues, and a number of labourers were sent upon the roof, and a plentiful supply of water handed to them and poured down. An engine was soon on the spot, but it was not put in use. No damage was done, but the room was flooded by the quantity of water poured down.

Lambeth.—On Monday morning the inhabitants of the southern districts of the Metropolis were greatly alarmed by a succession of violent explosions, similar, it is said, to the concussion of a park of artillery. In the neighbourhood of the Blackfriars-road, and at Kennington, Camberwell, &c., the force of the explosions was severely felt, and crowds of persons congregated on Waterloo-bridge and other exposed situations, anxious to discover the cause; which proved to be a serious explosion at M. D'Ernst's fireworks manufactory, Lambeth-butts, by which the whole of the premises were entirely destroyed, and four lives sacrificed. Great alarm prevailed among the inhabitants in the immediate neighbourhood, from a report that there were several hundred weight of gunpowder under the ground of the building; and though there was a speedy and numerous supply of engines, the firemen, through fear of the powder's exploding, hesitated to approach sufficiently near the house to render their efforts for its preservation effective. An abundant supply of water, however, having been soon obtained, and a number of large engines brought to bear on the angle of the building, it was covered with water to the depth of several inches, when the firemen, perceiving that there was no further danger of the gunpowder exploding, proceeded cautiously to the interior, and, with the hose of several engines, deluged the smouldering wood that lay scattered about. Their next duty, which was one of some peril, was to search among the ruins for the remains of whoever might have suffered. Four bodies were taken out, a boy seventeen years of age, the foreman of the works, the proprietor Mr. D'Ernst, and his sister-in-law; all the bodies being greatly mutilated and with difficulty recognised. It seems that there was not a large quantity of powder on the premises, as had been reported; the explosions, which were heard as far off as Greenwich, having been caused by the simultaneous explosion of various packages, which were, in the course of another hour, to have been started by the Southampton Railway to Portsmouth, there to have been fired in honour of her Majesty's visit to that port. No accurate information as to the origin of the explosion has been gained, though some inferences are drawn from the facts, that on searching the fire-place in the back room, to which there is attached a small oven, it was found that the fire had been recently lighted; and from its being known that shortly before twelve the deceased youth went across the road to fetch a light. In the oven was found an iron dish, which had contained some composition, and which had been placed there in order to facilitate the drying; and from the fact of the youth having been found in a crouching position, it is supposed that the composition in the oven must have ignited while he was stooping to light the fire. The neighbourhood in which the manufactory was situate is densely populated by the poorer classes, the building itself being little more than 200 yards distant from Lambeth-walk. Serious injury has resulted to many of the houses in the vicinity, and in one occupied by Mr. Smith, nearly opposite the southern end of the factory, the side wall was thrown several inches out of the perpendicular, and the family were compelled to make a hasty retreat. A rocket, propelled by the explosion into the air, forced its way into the window of a house, occupied by Mr. Inskipp, at three hundred yards' distance, where his wife was seated with an infant in her arms. The child's dress was burnt, and the curtains of the bed set on fire; but, through the presence of mind of Mrs. Inskipp, further mischief was prevented. An inquest has been held on the bodies, when several witnesses were examined, but no satisfactory evidence was adduced to explain the cause of the explosion. A firework-maker connected with the establishment, and who was on his way to it at the time of the explosion, said that he had not been on the premises on Monday before the explosion took place, but was at work on Saturday in forwarding an extensive order which Mr. D'Ernst expected from Portsmouth. There was a great quantity of manufactured fireworks in the dwelling-house, but not above 100 lbs. of gunpowder were on the premises. In his opinion the explosion arose from a spark falling from a piece of port-fire on some of the composition in the oven. Another workman deposed that he left the factory on Saturday evening, and at that time Mr. D'Ernst had received a letter from Portsmouth countermanding the order, but at the same time wishing a few articles to be sent. There was a great quantity of maroons then lying unfinished in the back parlour. He was on his way to work on Monday when he heard the report, which he knew to proceed from the ignition of a quantity of maroons. In his opinion the explosion arose either from the spontaneous combustion of the coloured fire, which, he said, it would do, or from something pressing on some of the maroons, an article made expressly for gamekeepers, which would ignite with the slightest pressure. After a lengthened investigation, the jury returned a verdict "that the deceased persons were accidentally killed."

Brentford.—The excitement created in the neighbourhood of Hounslow by the late explosion at the works of Messrs. Curtis and Harvey, noticed in our last, has been renewed by the occurrence of two fresh explosions in the same neighbourhood, both of which, however, were fortunately unattended with fatal consequences. The first took place in the afternoon of Saturday, in a powder-room near to the scene of the previous explosion. The building in question is used as a store for dry powder, but was at the time empty, it being supposed that there was in it not a single pound of gunpowder. Two men, named Irish and Fox, were sent in to sweep it up, and while so engaged, from some cause at present unexplained, except that they neglected first to damp the floor, the loose powder exploded, by the force of which the windows of the building were broken and the men severely injured. Both of them, however, are likely soon to recover. The second explosion took place on Monday morning, when the inhabitants of the country round, to a distance of several miles, were alarmed by a loud report, which on inquiry was found to have occurred at some powder-works, situated at Hatton, near Bedfont, about four miles from Hounslow, by which the roof of a green charged mill was, it is stated, blown off, but without any person being either killed or injured.

Provincial News.

Bath.—An attempt was made a few days since to destroy Marshfield vicarage by fire. It seems that some parties made a forcible entry into the house by night, the family being absent at Bath, and only two female servants sleeping in the house. Their object does not appear to have been plunder, as nothing was stolen. The flames were accidentally observed by a neighbour from his bedroom window: he gave the alarm, and prompt assistance being afforded, the flames were soon got under, and no great injury done, except that the back staircase was consumed, and the parts connected with that side of the dwelling. The servants were obliged to make their escape by a ladder through the window. No trace of the incendiary has been discovered.—A highway robbery, attended by circumstances of great violence, was committed on Monday on the person of Mr. James Popjoy, bailiff to J. Wiltshire, Esq., of Shockerwick. Mr. Popjoy was returning home from a sale at Batheaston, and when he arrived in Shockerwick-lane, was suddenly knocked down. He remained senseless for some time, and on recovering found that he had sustained several severe injuries, and that his pockets had been rifled of a large sum of money and his watch. On the following day, six men were seen making purchases amongst the Jews' clothes shops in the Pithay, in this city; and having displayed a greater quantity of money than labouring men usually possess, in addition to other suspicious circumstances, information was given to the police, by whom, after some difficulty, they were all taken into custody and examined before the magistrates, and from the evidence adduced they have been committed to take their trial for the offence.

Bolton.—At a meeting of the Statistical Society on Monday, a paper was read by Mr. H. Ashworth, a director of the Manchester Chamber of Commerce, on "the Statistics of the present Depression of Trade at Bolton," showing the mode in which it affects the different classes of the manufacturing population. In this paper, among other interesting matters of inquiry, it was stated, that in this town, which contains a population of about 50,000 souls, there are 50 cotton-mills which employ in the aggregate 8,124 persons. There are, however, 30 mills, and 5,061 working people, who are either standing idle, or employed only four days a week. A committee of the principal inhabitants had visited 1,003 families, consisting of 5,305 persons, whose net earnings per week amounted to 329*l.* 15*s.* 7*d.*, which was increased to 392*l.* 4*s.* by aid in parochial relief and donations from various funds and charitable institutions. From this, however, was to be deducted the weekly rent of rooms and houses, which, if paid, amounted to 82*l.* 3*s.* 4*d.*, leaving only 310*l.* 0*s.* 8*d.* for food, firing, and clothing, being, on the average, only about fourteenpence-halfpenny per week. Of the 1,003 families visited, 950 possessed beds. The entire number of beds counted was 1,553, of which 716 were filled with flocks, and 837 with chaff, straw, or cotton waste, and no such a thing as a feather bed was to be seen. The article of sheets were so few as to be left out of consideration, whilst in the whole there were but 416 blankets, or one to every 12½ persons. No less than 53 families were wholly without beds, and no fewer than 425 men, women, and children were in the habit of sleeping on the bare floors. Of these 511 families were accustomed to pay constant visits to the pawnbroker, and all the members of 609 families had no change of linen. Their articles of household furniture were equally disproportionate to their numbers, there being but 1,380 tables, 2,876 chairs, and 676 stools; so that 1,753 men, women, and children had no place to rest on but the floor, whilst the other 3,552 were seated.

Bridport.—Several serious fires attended with great destruction of property have occurred in the provinces during last week. One, which was unfortunately accompanied with loss of life, has happened in this place, whereby four houses in the southern part of the town have been destroyed. Amidst the confusion attendant on the first outbreak of the flames a young man named Patten lost his life whilst saving some property from one of the houses on fire, the roof and floors falling in upon him. The fire continued for two hours, but after great exertion was prevented from extending beyond the houses mentioned, which are, however, entirely consumed. The amount of property destroyed is not stated, but it is supposed to be considerable.

Bromsgrove.—A serious fire has occurred on the farming establishment belonging to Mr. Page, near the village of Prior, two miles and a half from this town. The flames burned with violence for several hours, and consumed a double granary, containing wheat to the value of 500*l.*, and did considerable damage to the buildings that surrounded it. It is supposed to be the act of an incendiary.

Portsmouth.—This town was during the latter part of last week the scene of great bustle and excitement, in anticipation of the proposed visit of the Queen on Monday. The Earl of Hardwicke and the Lords of the Admiralty arrived on Sunday to be present to receive her Majesty; and the arrival of the Duke of Wellington, late on the same night, was hailed by a large concourse of persons, who, notwithstanding the inclemency of the weather, had assembled to welcome him. Her Majesty and Prince Albert, accompanied by Duke Ferdinand of Saxe-Cobourg and his sons arrived about noon on Monday. From an early hour the inhabitants had been making preparations to welcome her Majesty, and flags and banners were suspended not only across the immediate streets through which the royal party would pass, but throughout nearly the whole borough. The weather being very fine, great numbers of persons assembled to witness her Majesty's arrival, and proceeded some distance out of town to meet the royal *cortége*. At Mile-end a triumphal arch was erected, and another at Charlotte-street. From Lion-gate to the Dockyard, the streets were lined by the 32d, 34th, and 73d Regiments; the guard of honour, consisting of a company of the Royal Marines, headed by the band of the regiment. The ropemakers of the Dock-yard, according to previous custom on the occasion of a royal visit, met her Majesty at Mile-end, and preceded the royal carriage on its route to the Dock-yard. Upon the arrival of the Queen at the Lion gates, which were closed, she was met by the governor of the garrison, Gen. Sir H. Pakenham, and the gates were opened upon the demand of her Majesty; when the royal standard was hoisted, and the guns of the forts and of the shipping in the harbour and at Spithead commenced firing a royal salute. The latter manned their yards. As her Majesty proceeded through the streets the cheering was enthusiastic; and all classes seemed anxious to testify their loyalty and attachment. Upon arriving at the Admiralty-house in the Dock-yard, the Queen was received by a numerous body of naval and military officers in full uniform, and proceeded to the suite of apartments specially fitted up for her reception. Shortly before three, Prince Albert went on board the Excellent gunnery ship; on his return from which he accompanied her Majesty to the St. Vincent with the Duke of Saxe-Cobourg and his sons and the Duke of Wellington. Upon her Majesty reaching the ship, the royal standard was hoisted, and the ships in port manned their yards and fired a royal salute. Her Majesty then went on board the Royal George yacht, where again, upon embarking, the royal standard was hoisted, and the shipping saluted. After leaving the Royal George, her Majesty returned to the Admiralty-house. The weather, which had up to the period of her going on the water been remarkably fine, changed to rain, which continued during the whole afternoon; in consequence of which her Majesty deferred inspecting the Dock-yard until the following morning. A numerous party of noblemen and officers had the honour of dining with the Queen in the evening; the whole town was illuminated, and numerous fireworks were let off in honour of the occasion. Early on Tuesday morning, Prince Albert, accompanied by Duke Ferdinand and his two sons, crossed over to the Victualling department, and went over the whole establishment, with which they expressed themselves much gratified. Having returned to the Admiralty-house, and breakfasted with the Queen, her Majesty and the royal party, about ten o'clock, embarked, and proceeded to visit the *Queen*, 110, which was lying at Spithead. The different ships and batteries fired royal salutes as her Majesty passed, and the yards of all the vessels were manned. The Queen went over every part of the ship, and expresed high gratification at all she saw. The Queen partook of a *déjeûné* in the ward-room; after which her Majesty returned to the Dock-yard, the same honours being paid to the royal procession as it passed. The mayor and corporation then waited upon her Majesty with a loyal address. The Queen left the Admiral's house about two, accompanied by the rest of the royal party, and returned to Brighton. The same enthusiastic cheering and popular feeling that was exhibited by the assembled inhabitants at the Queen's entrance into the borough, was again manifested at her Majesty's departure.

Rochdale.—A few days since two youths named Hoyle and Mills were charged before the magistrates with having set fire to a cotton-mill belonging to Mr. Haigh, of Broadley Wood, Spotland, near this town. It appeared from the evidence adduced, and from the confession of the boys, that on the 14th ult., during the stoppage for breakfast, two carding-engines were discovered to be on fire, but the flames were speedily extinguished. The manager tried the shafts, to see if the fire had originated from them; but finding them cold, was unable to account for it. On the following evening, however, the mill was again found to be on fire in the scutching-room; but it was again put out without any serious damage. This excited suspicion, and Mr. Haigh, on making search, found a lucifer match on the floor partly burned. The police were sent for, and they found footmarks in the clay near the mill, and lucifer matches under the window, in which a pane of glass had been broken. The officers then stopped the hands as they came out of the mill; and Hoyle's clogs were taken off, and found to correspond with the impression in the clay. Hoyle then confessed that he and Mills set fire to the premises on both occasions. The prisoners were therefore committed to take their trial.

Railways.—On Saturday the half-yearly meeting was held of the shareholders of the London and South-Western Railway. From the report it appeared that the amount derived from passengers, parcels, &c., for the six months ending the 31st Dec. was 130,878*l.* 18s.; and from merchandise, &c., 22,282*l.* 14s. 11d.; making a total of 153,161*l.* 12s. 11d.; an augmentation of 8,955*l.* 10s. 11d. over the same months in 1840. The line was opened to Southampton on the 11th May, 1840, since which time to the 31st Dec. there was an increase of 15,845*l.* 12s. 3d. over the corresponding period of the former year. A great portion of the traffic was derivable from pleasure travelling, for in July, Aug., and Sept., the passengers were about 70,000 monthly; but in the following months they had diminished to 38,000 per month. The total passengers for the six months was 333,854. The opening of the docks at Southampton, the West India mail-packet station there, the increasing steam communication with the south-western coast of England, the Channel Islands, and the rapid progress of the Paris and Rouen Railway, are regarded by the directors as offering prospects of a realisation of much future benefit. The slip of earthwork at the Fareham tunnel had rendered it expedient [illegible] make an open cutting of that portion of the tunnel, which made the Gosport branch-line not so soon available for traffic as was expected. These works and the whole line are at present in good condition, and the trains are going regularly. After deducting the various items of expenditure from the gross total of 153,434*l.* 1s. 6d., there remained a balance of 67,548*l.* 17s. 3d., out of which it was proposed to pay a dividend at the rate of 30s. per share, which would leave a balance of 8,750*l.* 14s. 9d. for future application. The total payments to the 31st Dec. were 2,522,393*l.* 18s. 2d., and the total receipts 2,480,056*l.* 3s., leaving a balance of 42,337*l.* 15s. 2d. The report was unanimously adopted.—A general meeting of the shareholders of the London Grand Junction Railway was held on Saturday. The report, which was read by the Secretary, stated that three directors went out of office by rotation, but were eligible for re-election; and that the accounts were: cash paid, 84*l.* 4s.; cash in hand, 3,925*l.* 10s. 7d.; together with various amounts for interest, &c., leaving a balance in the hands of the company of 4,007*l.* 7s. 11d. The Secretary said that 1,510 shares had been forfeited, and that there were 7,600 *bona fide* shares on which the call had been paid up. The original number of registered shares was 9,360. After some conversation, the report was agreed to unanimously.—On Monday the half-yearly meeting was held of the shareholders of the London and Blackwall Railway. The report showed that the number of passengers during the half-year was 1,186,351, and the money taken, 22,509*l.* 11s. 10d., being an increase of 40 per cent. on the previous half-year. Arrangements had been made for running boats from the Brunswick-pier to Herne-Bay, Margate, Ramsgate, and Dover, the first of which, the Eclipse, commenced on the 21st Feb. The directors felt confident that it would not be necessary to raise any further capital by shares, as they had introduced into a bill in Parliament for other purposes a clause enabling them to dispose of property (about 30,000*l.*) near the station. After the expenditure, there was a sum of 13,135*l.* 19s. 8d., which was proposed to be divided amongst the old shareholders, at the rate of 10s. per share. The report was adopted.—On Saturday an accident of a serious nature took place on the line of the Eastern Counties Railway. It appears that Mr. M'Intyre, an inspector of police on the line, went down with a view of instructing a newly-made inspector, Mr. Callaghan, in the various points and stations. On reaching Collier's-bridge, about 300 yards above the Romford station, a train from Brentwood was observed coming up. Mr. M'Intyre, imagining that Mr. Callaghan was on the up-line, crossed for the purpose of getting him off, when the train came up, and the engine struck him on the elbow with great violence, and threw him down the embankment, a depth of 24 feet. He was conveyed to the London Hospital, where it was ascertained that he had sustained several serious injuries, and he continues in a dangerous state.—A report has recently been presented to Parliament, which contains some interesting information relative to railways. From the returns of accidents it appears that during the year 1841 the number of casualties on various railways, which arose from causes beyond the control of passengers, amounted to 29. By these accidents 24 persons were killed, and 72 injured. During the same year there were 36 accidents, attended with personal injury to individuals, owing to their own negligence or misconduct, by which 17 persons were killed, and 20 injured; 60 accidents occurred which were attended with personal injury to servants of the company, under circumstances not involving danger to the public; by these accidents 28 individuals were killed, and 36 injured. Thus there were altogether 69 lives lost by accidents on railways during the past year.—On Tuesday an accident happened to two of the Metropolitan police on duty on the Blackwall Railway, but fortunately not attended by any serious consequences. It appears that they were proceeding along the line, between Limehouse and Blackwall, and the rope by which the trains are drawn being still at the time, they crossed from one side to the other. Whilst, however, in the act of stepping over the rope it was set in quick motion by the movement of one of the trains, and the consequence was that it struck each of them violently on the legs, and both fell heavily upon the rails, receiving some injury, but not of a serious character.

IRELAND.

Dublin.—It is stated to be the intention of Government to call out the present staff of the militia to augment their establishment, with the express object of recruiting for the line, and to break up entirely the present depôts of infantry, which are to be consolidated with the head-quarters of their regiments, whether on foreign or home service.—It is said that Prince George of Cambridge will return to this city, to rejoin his regiment (the 12th Lancers), the first week in April, in order to avail himself of being present with so large a garrison during the season of military exercise. His Royal Highness, it is added, will remain here until the autumn.—It appears that for some time a number of 1*l.* notes of the Bank of Ireland have been in circulation altered so as to resemble 30*s.* notes; a fraud which has been effected by cutting from genuine notes of the latter sum the words "thirty shillings", and pasting the slip so cut off neatly over the words "one pound," the body of the note remaining unaltered. From a private investigation held at the Bank a few days since, facts were elicited which threw suspicion on a junior clerk in the cancelled note department, named Mills; and information having been given to that effect at the head office, a warrant was granted to search Mills's residence. The young man, who had been two days confined at home from illness, at first denied all knowledge of the fraud, but ultimately confessed that he was guilty, and handed to the officer two of the altered notes, and several slips cut out of the 30s. notes, which he had in his pocket-book, and which he confessed having cut from the cancelled notes. He was taken before the magistrate, and committed for trial, but has since been admitted to bail in two sureties of 200*l.* each. The prisoner is young and respectably connected.—The Repeal Association held its weekly meeting on Monday, Mr. J. W. O'Callaghan in the chair. The secretary read a letter from the resident Irishmen of St. Stephen's, New Brunswick, enclosing a subscription of 20*l.* There was nothing else of interest in the proceedings of the meeting.

Down.—At the opening of the Assizes for this county a few days since, Mr. Justice Crampton, in addressing the Grand Jury, dwelt at some length on the serious state of crime which the calendar exhibited. His Lordship said, "I can congratulate you neither on the paucity of offenders, nor the absence of deep-dyed crime. There are no less than 64 prisoners charged with different crimes; crimes varying from the deepest malignity down to trivial offences. I am not aware of what number are out on bail to stand their trial for different offences; consequently I must again inform you that you must pay your most anxious care and attention to the several matters which will come before you, for your duties will be both tedious and laborious."

Longford.—The assizes for this county commenced last week, and on the Grand Jury being re-sworn, Mr. Justice Burton in the course of his address said, he felt greatly concerned at the appearances upon the calendar of several cases of secret societies, denominated Ribbonism. He regretted to say that their re-appearance in Longford showed but too plainly that there was a want of subordination to the laws of the country, and that there was not that security for life or property which should exist in a well-ordered state of society. The gentlemen whom he addressed ought not to be perhaps too sanguine in suppressing those illegal confederacies with precipitancy, lest the remedies applied should only increase the evils already existing. At the same time, he need hardly tell them that it was their duty, as good citizens and subjects, having a stake in the country, to do everything, both in their relations as private gentlemen, and in the fulfilment of their duties in the jury-room, to put an end to illegal confederations, which were so inimical to the peace and prosperity of their native land.

SCOTLAND.

Edinburgh.—It is stated that the minority of the shareholders of the Edinburgh and Glasgow Railway intend to present a bill of suspension and interdict to the Court of Session against a resolution recently passed by the majority sanctioning the running of a morning and evening train on Sunday. This application, it is said, will be founded on some of the old Scotch Acts, as to the compulsory observance of the Sabbath day, and is expected to open a wide field of discussion, as many of the statutory injunctions of that period on this subject have fallen into disuse.

Stranraer.—A few days since the Earl and Countess of Stair had a narrow escape from a serious accident. It appears they had proceeded, in company with another lady, from Culhorn in a pony phaeton for the purpose of viewing Croswell lighthouse. When at a short distance from the lighthouse, the servant who drove the vehicle, being uncertain of the road, got out for the purpose of making inquiry, and left the reins in charge of his lordship. The horses, two spirited ponies, having immediately set off at full gallop, the servant seized the reins and tried to stop them, but was dragged towards the wall on the roadside, which the animals leaped over, breaking the shafts and disengaging themselves, whilst the vehicle was turned completely over on his lordship and the ladies, all of whom, however, fortunately escaped without any serious injury.

Miscellaneous.

The Niger Expedition.—From advices just received from Fernando Po, we learn the distressing intelligence that the model farm established by the unfortunate Niger expedition has been finally destroyed; the blacks in charge of it having been murdered by the natives, and Mr. Carr the superintendent, who had returned to the farm from Fernando Po, having been carried prisoner into the interior.

Relics of the Steamer President.—The New York papers, brought this week by the packet-ship United States, contain the following statement respecting some pieces of the wreck of the President, said to have been fallen in with by an American vessel: "Capt. Jepson, of the schooner Mokina, from the Cape de Verd Islands, arrived at New York on the 12th Feb., and reports that the stern-boat of the President, and several water-casks bearing her name, had been picked up by a vessel and carried into St. Nicholas. This information the captain obtained from a respectable English gentleman, who had seen these remains of this ill-fated steamer. The latitude and longitude where they were picked up is not given, or any further particulars."

Singular Delusion.—Under this head the Morning Papers have published the following article:—"For some weeks past a singular impression has been entertained by the lower classes of Irish residing in the Metropolis and its environs, that London is to be destroyed by an earthquake, and the day fixed for this event, which is to swallow up the capital of the British empire, is the 16th inst. A great many Irish people have already left the Metropolis for distant parts of the country and for Ireland, and others are preparing to follow, to evade the earthquake; and the excitement among those living in the eastern part of the Metropolis is very great. They are daily receiving letters from their relatives in Ireland to return home, and save themselves from the destruction which is sure to await them if they remain here. Many have removed eastward of Stepney Old Church, on the supposition that the earthquake is not to extend beyond that venerable edifice, which, it is prophesied, is to fall, with St. Paul's Cathedral and Westminster Abbey. By some, however, it is believed the earthquake will not be satisfied with swallowing up the Metropolis and the "big churches," but that 15 miles of country are to go with it. A few days since, at the Thames Police-court, an Irishman was charged before the magistrate with beating his wife; and it appeared that the cause of the dispute was that the woman would not leave Shadwell, and proceed to Cork with her husband, to avoid the earthquake. The ushers of the court, it is said, have had no less than 100 letters put into their hands by persons who have been written to by their friends and relatives in Ireland, requesting them to avert the threatened calamity by leaving the Metropolis before the 16th March, or the sunshine of St. Patrick's day will never dawn upon them. The publicans in the Tower Hamlets and elsewhere are stated to have lost many of their Irish servants from the same cause. The prophecy is said to be an ancient one in Ireland, and implicit credence is given to it by many deluded persons.

Law.

Appellate Jurisdiction of the House of Lords.—By arrangements made between the Lord Chancellor and Lords Brougham, Cottenham, and Campbell, the appeals now waiting for hearing before the House of Lords will be much expedited. The Lord Chancellor has arranged to be at the House to hear causes four days in one week—Monday, Tuesday, Thursday, and Friday; and two days in the next week—Thursday and Friday. Lords Cottenham, Brougham, and Campbell have agreed to attend four days in each week, so as to be enabled to hear appeals on the two days that the Lord Chancellor is absent. Thus, four days every week being allotted to appeals, those interested in the causes will have not only the advantage of four learned judges to adjudicate upon their causes, but will obtain more speedy hearing than has hitherto been the case.

House of Lords—Appeals.—*The Lord Advocate, on behalf of Her Majesty and the Commissioners of Woods and Forests,* v. *Lord Dunglass.*—The question in this case was as to the liability of the Lord Advocate, representing the Commissioners of Woods and Forests, and appearing therefore on behalf of the Crown, to have a decree made against him, with costs. Mr. Hope maintained the decree of the court below, and contended that, as the land revenues of the Crown were transferred for the life of each Sovereign to the management of parliamentary commissioners, those commissioners could not be said to represent the Crown, but held a character totally different from one confirmed by its authority. They, therefore, had not the rights and privileges which belonged to the Crown, or which might attach to them if they were truly the officers of the Crown. The judgment of the court below was, consequently, right, and the interlocutory decree awarding costs must be affirmed.—The Lords held that the Commissioners of Woods and Forests so far represented the Crown as not to be liable to costs. For this reason they did not enter into the usual recognizances on bringing an appeal, for it would be useless to do so when no costs were to be paid by them. The interlocutor must therefore be reversed.

Court of Chancery.—*In re Styan, a bankrupt.*—The bankrupt had insured his life for a sum of 2,500*l.* in the Equitable Assurance Office, and afterwards assigned the policy as a security for a debt. The insurers in that office are partners receiving mutual advantages, and the question raised in the course of the argument was, whether the notice of the assignment to the insurance office was not a sufficient notice, on the ground that the bankrupt, as a partner, must be supposed to know it. A great number of authorities were cited in the court below, and, in the course of the argument, in this court also, as Sir John Cross had decided that no notice was required. The Lord Chancellor, having stated the circumstances of the case, observed that the argument on one side went to show that no notice of the assignment of the policy had been given until Styan committed an act of bankruptcy, while on the other side it was contended that there was a constructive notice, because Styan was a partner in the assurance company, and that there was therefore a good equitable assignment of the policy. A great number of authorities had been relied on, but in his lordship's opinion there was no necessity to take them into consideration in order to determine the question at issue. It was said that the bankrupt committed an act of bankruptcy in March, and that no notice of the assignment was given to the office until April; but, in his Lordship's opinion, there had been a clear *bona fide* transaction with respect to the policy which came clearly within the act of the 2d and 3d Vict., c. 29. The contract had been entered into long before the issuing of the fiat, and long before the bankrupt contemplated the probability of bankruptcy, and the dealing was therefore protected by that act. His Lordship therefore declared that the policy in question was the property of the petitioners, and not within the order and disposition of the bankrupt at the time of his bankruptcy.

Assize Intelligence.—*Hertford.*—At the assizes in this town on Thursday, a trial (*The Queen* v. *Webster*) came on which excited considerable interest. It was an information filed by the Attorney-General, in pursuance of a resolution of the House of Commons, imputing to the defendant that he had, at an election for the borough of St. Alban's, in Feb. 1841, when Lord Listowel and B. B. Cabbell, Esq., were the candidates, bribed a voter named Robert Adams, to induce him to vote for Lord Listowel; and that he had also bribed another voter, named John Stebbing, in order to induce him to refrain from voting at all at the election. The pleadings and examination of witnesses extended to great length, and occupied 12 hours, at the close of which the jury returned a verdict of "Not Guilty."

SPORTING.

A correspondence of some interest has appeared in the Morning Papers, having reference to the late trial of Thornton *v.* Portman and Beales, with respect to the "Gurney affair" given at length in our last. It is a protest of Lord G. Bentinck against the conduct of the stewards of the Jockey Club, in connection with this transaction. His lordship calls in question the right and justice of their taking on themselves to appoint assignees to receive the debts due to a defaulter, which his Lordship declared Mr. Gurney to be; more especially as the debts of that individual had not been paid in full. The stewards of the Jockey Club reply at considerable length to the different charges contained in his protest, declaring that the greater portion of them were unfounded, and the conclusions derived from them unwarranted. They state that Mr. Gurney was not a defaulter, and that all his debts had been paid in full; and that his Lordship himself had received 100*l*., the full amount due to him from Mr. Gurney. In connection, also, with this affair, the Jockey Club, since the trial of last week, have declared Mr. Thornton "a defaulter," for having failed to pay the sum of 100*l*., which, it seems, he owed to Mr. Gurney, on his Epsom account; and they conclude their notice to this effect, to that gentleman, by stating that, if disregarded by him, it will be enforced by legal process.

TATTERSALL'S, THURSDAY.—In consequence of the absence at Liverpool of several of the usual frequenters of the room, the betting in the afternoon was dull, and, in most respects, of slight interest. The two favourites were not mentioned at fixed prices. The Dirce colt at 25 to 1, and Wiseacre at 40 (in one instance at five points less), were in request in two or three places; and both Meteor and Auckland stood in better estimation than at the beginning of the week. Defier also had a strong party at an improved quotation, and Canadian was promoted exactly 50 per cent. upon the odds laid so freely on Monday.

DERBY.

25 to	1 agst	Dirce colt (taken freely)	50 to	1 agst	Palinurus
35	1	Wiseacre (taken)	50	1	Canadian
35	1	Defier (taken)	60	1	Joanna colt
40	1	Meteor (taken)	66	1	Lord of Holderness
40	1	Auckland	1000	10	Bro. to Phœnix
45	1	Espartero			

OAKS.

500 to 30 agst Lord Jersey's Adela filly (taken).

2,000 GUINEAS STAKES.

12 to 1 agst Mr. Bowes's Meteor (taken).

MARK LANE, FRIDAY, MARCH 4.—The small quantity of English Wheat left over was of inferior quality, for which there was no demand; and the business transacted in free Foreign was quite in retail prices may be considered the same as on Monday. Bonded was quite neglected.—Having a large supply of Barley, a decline of 1*s*. has been submitted to, without making much progress in sales.—Peas and Beans are a dull sale at our quotations. Inferior Irish Oats are unsaleable, and all sorts are lower.—There has been a considerable arrival of Clover Seed, and sales have been effected at 2*s*. to 3*s*. decline.

Vines, root-pruning . 142 *b*
Wiers, Mr. Brinsden's . 143 *c*

R. ORSON, FLORIST AND FLORISTS' AGENT, in returning his sincere thanks to the Gentlemen Amateurs, Florists, and others for the favours conferred upon him since his commencement, respectfully informs them that to the above business he has added that of AUCTIONEER, &c., and takes this opportunity of soliciting their kind support in that department, trusting by strict attention and punctuality to merit a share of the public patronage.

12, Hall-place, Kennington lane.

TO PARENTS and GUARDIANS.—A LADY, who intends remaining some months at BRIGHTON for the benefit of her children, would be happy to TAKE CHARGE OF A LITTLE GIRL OR BOY REQUIRING SEA AIR, and whose friends may not find it convenient to remain with them.

References can be given either in Brighton or London.

For further particulars, apply by letter (prepaid) to Y. Z., care of Mr. Gates, organ-builder, 19, Norfolk-square, Brighton.

ECONOMIC LIFE ASSURANCE SOCIETY, No. 34, BRIDGE-STREET, BLACKFRIARS, LONDON. Established 1823. Empowered by Act of Parliament, 3 William IV.

LOWER RATES OF PREMIUM THAN THOSE OF ANY OTHER OFFICE, that entitle the assured *to participate in the profits*, as follows:—

Age.	15	20	25	30	35	40	45	50
Annual Premium per cent.	1 10 8	1 14 7	1 19 0	2 4 3	2 10 11	2 19 9	3 11 9	4 8 0

The BONUS declared in 1834 amounted upon an average to 16*l*. per cent. on the premiums then paid; and in 1839 a second BONUS was awarded, amounting on the average to 31*l*. per cent. on the premiums paid during the preceding five years.

No extra charge for residence in any part of Europe, nor for proceeding (in a decked, sailing, or steam-vessel) from any one Port thereof to another during peace, to Assurers not being seafaring men by profession. Licenses are granted to go to any part of the world upon terms proportionate to the risks.

Policies on the lives of persons dying by suicide, duelling, or by the hands of justice are not void as respects the interests of parties to whom they may have been legally assigned.

Assurances may be effected on any and every day.

By order of the Board of Directors,
CAMPBELL JAMES DOWNER, Secretary.

ANNUITIES.—In the AUSTRALASIAN, COLONIAL and GENERAL LIFE ASSURANCE and ANNUITY COMPANY, Annuitants participate in the Profits of the Company, and receive a rate of ANNUITY much more favourable than can be granted by any Company making its investments wholly in England. The Company is enabled securely to grant these favourable terms from the advantage it possesses of investing a portion of its Funds at a high rate of Interest.

DIRECTORS.

Edward Barnard, Esq., F.R.S.
Henry Buckle, Esq.
John Henry Capper, Esq.
Gideon Colquhoun, jun., Esq.
John Edwardes Lyall, Esq.
C. E. Mangles, Esq.
J. B. Montefiore, Esq.
J. H. Ravenshaw, Esq.
Capt. Sir Jas. Stirling, R.N.
William Walker, Esq.

SOLICITORS.—Messrs. Swain, Stevens, and Co.

Prospectuses, with Tables, Forms of Proposal for the purchase of an Annuity or for making an Assurance, and every information, may be obtained by application at the Office of the Company, No. 126, Bishopsgate-street, City.

By order of the Board, CHRISTOPHER COUSINS, Accountant.

THE following communication (translated from the German), was addressed to Messrs. Rowlands' Agent at Cologne:—

13, Straitz Euggasse, Cologne
Mr. Th. S. Ditges, May 23, 1841.

Sir,—I have much pleasure in informing you of the extraordinary effects of "ROWLAND'S MACASSAR OIL." For above nine years I had not a particle of hair on my head, when I was casually recommended to give this celebrated Oil a trial. I accordingly purchased two bottles at your establishment, and strictly followed the printed directions: in the course of two months my head was covered with fine short hair, which I had cut off, and continued to persevere in the use of the Oil. The result is, that after five months' perseverance, I can now boast of as good a head of hair as any man in this city. In justice to the inventors I make this acknowledgment, and shall feel great pleasure in satisfying any inquiry.—I salute you with respect,

ADAM BAUER, 8th Artillery Brigade.

ROWLAND'S MACASSAR OIL prevents hair from falling off, or turning Grey; changes Grey Hair to its original colour; frees it from Scurf and Dandriff, and makes it beautifully soft and curly.

☞ Ask for "ROWLAND'S MACASSAR OIL."

The LOWEST PRICE is 3s. 6d.;—the next price is 7s.—10s. 6d. and 21s. per bottle.

HOT-WATER APPARATUS, upon the most improved and economical principles, for Horticultural and other Buildings.—STEPHENSON and CO., Agents for the Old Park Iron-works, and Manufacturers, 61, Gracechurch-street, London, annex the following list of prices of Hot-water Pipes of the best description, to assist persons desirous of adopting this mode of heating in their calculations of the probable expense, and respectfully solicit an opportunity of tendering their price for the completion of any work required. Socket-pipe for Hot Water, of two, three, and four inches diameter, at 2*s*. 3*d*., 3*s*. 3*d*., and 4*s*. 3*d*. per yard. Ditto, with Troughs for Orchidaceous-houses, three and four inches diameter, at 4*s*. 9*d*. and 6*s*. 9*d*. per yard.

The much-approved Conical Boilers made of strong plate-copper, and which require no furnace or setting in brickwork, from 5*l*. 5*s*. upwards. Also, every other description of Boilers of the most approved construction. Further particulars may be obtained at the Warehouses, Gracechurch-street, where also may be seen a variety of patterns of Iron and Strained-wire Fencing, Hurdles, Brass and Iron Bedsteads, &c. &c.

HEATING BY HOT WATER, WITH THE CIRCULATION OF ATMOSPHERIC AIR.

J. WEEKS & CO., Architects, &c., Gloucester-place, King's-road, Chelsea, Hothouse Builders, and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER; see the 3rd and 37th Numbers of the *Gardeners' Chronicle*.

References may be had, and their works seen, at Mr. Perry's Nursery, Banbury; Mr. Green's, Lower Cheam; Messrs. Henderson's, Pine apple Nursery; Messrs. Rollisson's Nursery, Tooting; Mr. Knight's Exotic Nursery, Chelsea; Messrs. Low's, Clapton Nursery; Mr. Catleugh's Nursery, Chelsea; Mr. Gaines's Nursery, Battersea; Mr. Buck's, Portland Nursery; Mr. Young's, Milford Nursery; Mr. Smith's Nursery, Dalston; Mr. Woodroff's Nursery, Kensall Green; Mr. Hopgood's Nursery, Bayswater; Mr. Willmer's Nursery, Chelsea; and at most of the Nobility and Gentlemen's Seats in the country.

Every particular to be had at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

Now ready, No. 3 (March 1842), price 2*s*. 6*d*., to be continued monthly, containing 56 pages of letterpress and two plates engraved,

THE LONDON JOURNAL OF BOTANY: being a new series of "The Journal of Botany." By Sir W. J. HOOKER, K.L., LL.D., F.R.A., and L.S., and Director of the Royal Botanic Garden of Kew.

London: H. Ballière, Foreign Bookseller to the Royal Society and the Royal College of Surgeons, 219, Regent-street.

Publishing Monthly, with Four coloured Engravings,
Price 2*s*. 6*d*.

PAXTON'S MAGAZINE OF BOTANY. The Number for FEBRUARY contains beautifully-coloured figures of *Cattleya Aclandiæ*, *Brugmansia floribunda*, *Mahonia aquifolium*, and *Loasa Pentlandica*, with the history and directions for the culture of each: also comprehensive Papers on the science of Gardening, including the phenomena of impregnation and germination in the seed of plants; the Culture of Gesnera rupestris; on Arranging and Planting Specimens in Conservatories; the Propagation of Tropæolum tricolorum; Notices of Plants figured in the floral periodicals for December and January, and of those flowering in the suburban nurseries; with a copious Calendar of Operations for the month.

This work comprises, monthly, four admirably-coloured plates, and twenty-four pages of interesting and useful letter-press. The admirers of flowers are requested to observe—

1. That all the drawings are taken from nature, and are consequently made from plants which have flowered in Britain.
2. That, with few exceptions, they are all done by one artist, whose abilities are of the highest order, and who travels himself to the places where the plants are in flower.
3. That they are lithographed on zinc by the same individual, and, being coloured in a superior manner, have all the spirit and elegance, and much of the finish, of the original drawing.
4. That about one-half of the drawings are from plants which have never before been figured in this country, the rest representing the most popular novelties, as well as the more neglected, though sometimes far handsomer, old species; the majority being such as can be cultivated by every one possessing a flower-border and a greenhouse or frame.

It may, in conclusion, be safely asserted that, both for the beauty of its embellishments, and the utility of its contents, this work is well adapted to the wants of all who delight in gardening; and as the improved system of having the plates lithographed commences with this Number, and as it is intended that each volume shall now be perfect in itself, the present is a desirable opportunity for those who wish to become subscribers.

London: W. S. Orr and Co., Paternoster-row.

In foolscap 8vo, price 1*s*. 6*d*.

COOLEY'S FIGURES OF EUCLID; being the Diagrams Illustrating the "Elements," with the Enunciations, printed separately for use in the Class-room.

⁂ Orders received by all Booksellers.

Whittaker and Co., Ave-Maria-lane, London.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their manufactory.

SLOUGH, BUCKS.

To the Nobility, Gentry, and Public in general.

IMPORTANT SALE OF PART OF THE SUPERIOR NURSERY STOCK of the highly-respectable Firm of Messrs. T. and E. BROWN, dissolving Partnership.—To be Sold by Auction, by Mr. TERBOTT, upon the premises, within five minutes' walk of the Great Western Station, on Tuesday, March 8th, 1842, and following days, each day at 12 o'clock, in Lots (without the least reservation) suitable to every description of purchasers, a part of the superior Nursery Stock growing on 14 acres of ground, called the "Hencroft Nursery," being part of the land belonging to Mr. E. Brown (who is retiring from the business), and which is required for other purposes, comprising very fine and valuable plants, in healthy condition, and will move well. The Ornamental Trees, varying from 6 to 10 feet, will consist of Laburnums, Elms in collection, Scarlet and Turkey Oaks, Poplars in collection, Ailanthus glandulosa, Liquid Amber, Deciduous Cypress, Scarlet Maple, Sumach, Catalpa syringifolia, Fern-leaved Limes, Pinus Cembra, Æsculus bicolor, rubra, and parviflora, Mountain Ash, Norway Maple, Planes, Spanish Chesnuts, Acacia, and Tulip Trees. The Ornamental Shrubs will include China Arbor Vitæ, large variegated Hollies, Green Hollies of sizes, Portugal Laurels, Common Laurels of sizes, from 1 to 4 feet, about 8000 Evergreen and Yellow-berried Privet, Syringas, Brooms, Dogwood, Judas Tree, variegated Box in quantity, Gum Cistus, Striped Elders, Irish Yew, Spireas of sorts, Euonymus, Gueldres Roses, Lilacs, Snowberries, Tartarian Honeysuckle, Ribes sanguinea, Calycanthus florida, Rose Acacia, Daphne, &c. &c. A few Standard Pears; 3000 Currants, of sorts; 500 Gooseberries, under names; Raspberries of sorts; Walnuts; Standard Quinces. The Forest Trees consist of about 2000 English Oaks, 4 feet; 1000 Beech, 2 to 3 feet; 2000 Hazel, 2 to 3 feet; Ash, 2 feet; 2000 Larch Fir, 3 feet; 15,000 Spruce Firs, 1 to 3 feet; 1000 Scotch Firs, 4 feet; 1500 Silver Firs, 1 foot; 2000 Berberries, 1 foot; 2000 Privet; 2000 Mountain Ash, 4 feet; 200 Sycamores, 4 feet; 1000 Laburnums, 4 to 6 feet; 500 Snowberries; 400 Poplars, 3 feet; 500 English Elms, 5, 6, and 7 feet; Horse Chesnuts, 4 feet. About 2000 Dwarf Roses, in fine collection, under names.

May be viewed three days prior to the sale, when Catalogues may be had on the premises; Hatchett's Hotel, Piccadilly; George, Hounslow; Chequers, Uxbridge; White Hart, Beaconsfield; Crown, Marlow; Bear, Reading; Rose, Wokingham; King's Head, Egham; Swan, Chertsey; White Hart, Maidenhead; Crown, Slough; and at the Auctioneer's Office, Windsor.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the OFFICE, 3, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, March 5, 1842.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.
THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.
No. 11.—1842. SATURDAY, MARCH 12. PRICE 6*d.*

HEARTSEASE SOCIETY.

Under the Patronage of Sir J. Sebright, Bart.

AT a MEETING of the COMMITTEE of the above SOCIETY, it was resolved that the FIRST EXHIBITION should take place in MAY next at Mr. Lidgard's, Thatched-house Inn, Hammersmith.

A Schedule of Prizes will shortly be submitted to each Member, but it will be necessary for all those who may wish to join the Society previously to forward their annual subscription of 10*s.* to any Member of the Committee, or to Mr. R. S. Mountjoy, Hon. Sec., Ealing, Middlesex.

N.B. Amateurs and Nurserymen to compete in separate classes.

FOURTH ANNUAL CUCUMBER SHOW, HAMMERSMITH, open to all England, will be held at Mr. Lidgard's, Thatched-house Inn, Hammersmith, on Monday, March 21st, 1842. Prizes will be given to those Persons who produce, of their own growing, the best and most complete Leash of Fruit, to be placed in rotation. Subscribers 5*s.* each to exhibit, Non-Subscribers 10*s.* each. The Fruit must be in the Show-room by One o'clock on the day of show.

Dinner as before, at Two o'clock.

SAMUEL GIRLING begs to inform his Friends and the Public that his General CATALOGUE of DAHLIAS, GERANIUMS, and PANSIES is now ready, and can be had on pre-paid application.—Danecroft Nursery, Stowmarket.

MYATT'S VICTORIA RHUBARB.

J. AND W. MYATT having a good Stock of Strong Roots raised by offsets from the original Seedling, can supply them at 10*l.* per hundred.—N. B. As various spurious sorts have been sold and are now selling under the name of "Myatt's Victoria," purchasers would do well to require them warranted. —Manor Farm, Deptford, Oct. 23, 1841.

JAMES MAY begs to inform all growers of PANSIES, that his new Descriptive List of Pansies, with a List of FUCHSIAS, may be had on application as below; at the same time he begs to call particular attention to his genuine imported German STOCKS, ASTERS, and ZINNIAS, in great variety.

N.B.—A large collection of fine Show Pansies, including many of last year's new varieties. 30 fine strong Plants for 21*s.*, package included; all parcels delivered free in London.

Pansy Nursery, Edmonton.

CHOICE FLOWER SEEDS.

LUCOMBE, PINCE, & CO., having an extensive and well-selected Stock of all the newest and choicest FLOWER SEEDS, to the cultivation of which they have paid considerable attention, and the quality of which they can confidently recommend, beg leave to offer them for sale, delivered carriage free to any part of the Kingdom, on the following terms:—

25 packets of distinct-named sorts . .	21s.
50 do. do. do. . .	30s.
100 do. do. do. . . .	42s.

Amongst them are—Asters, Brachycome iberidifolia, Clintonia pulchella, Erysimum Perowskianum, Godetia Willdenowii and Schamanii, Lupinus Hartwegii, Martynia fragrans, Mesembryanthemum tricolor, Phlox Drummondii, Stocks, Zinnias, &c. &c. Catalogues of which may be had on application to them.

Exeter Nursery.

THOMAS WILSON, FLORIST, LAYERTHORPE, the raiser of William the Fourth Scarlet-Flake Carnation, intends to sell out this season, at 10*s.* per Pair, his celebrated Purple Picotee Patroculus, which is allowed by all competent judges to be superior to any flower in the trade. Whenever shown in condition, it has always taken the first prize. It has every good property a flower requires, excepting being rather an early bloomer. As the Stock is limited, an early application is requisite. Thomas Wilson, Florist, Layerthorpe, York.

N.B. No Plants will be sent without a remittance.

CARNATIONS AND PICOTEES.

MESSRS. W. and F. YOUELL have a few pairs to spare of that most beautiful Rose Flake, Wilson's Harriet, which is considered by the first judges in the kingdom to be decidedly the most perfect flower of its class ever raised. Also that splendid Picotee, Anacreon. The above will be forwarded by post, free, to any part of the kingdom by inclosing a post-office order for 18s.—They also offer from their superb collection,

12 pairs fine Show Carnations and Picotees	£1	10*s.*	0*d.*
25 do. do. do.	3	0	0
12 do. first-rate extra fine do.	3	10	0

Great Yarmouth Nursery.

BROWN'S MARQUIS of LANSDOWNE DAHLIA. —This most essential Show Flower will be sent out in May next. Colour, shaded salmon; fine cupped petals, which are beautifully arranged; and one of the most constant and successful Dahlias of the season, having obtained Seven Seedling Prizes, three of which were first, and twice defeating "Conqueror of the Plain." Also shown in three successful Stands of two 24's, and 12 blooms for three 20*l.* prizes. A drawing was made by Wakeling, which will appear in the *Florist's Guide*, March 1842.

T. B. has a few strong Plants on hand of his much-admired Seedling PANSIES the "Countess of Orkney" and "Jewess," at 7*s.* 6*d.* each.

A CATALOGUE, containing a choice selection of DAHLIAS and HEARTSEASE, is now ready, and may be had on pre-paid application.—Slough, March 2d, 1842.

CHARLES FARNES, 128, ST. JOHN-STREET, LONDON, begs respectfully to call the attention of his Friends to the following select List of Annual Flower-seeds, &c. a general Catalogue of which may be had on application. Also his Catalogue of all the new sorts of Vegetable and Agricultural Seeds, &c.

J. KEYNES' CATALOGUE OF FIRST-RATE DAHLIAS is now ready, and may be had on application. Extra fine Plants may be depended on early in May.

J. Keynes having received Catalogues quoted at much lower prices for some varieties than his own, begs to state that, although he does not wish to underrate good SHOW FLOWERS, he will not be *undersold* by any Nurserymen in the trade.

Salisbury, March 10, 1842.

JAMES PAMPLIN, NURSERYMAN, WALTHAMSTOW, ESSEX, begs to inform the Public he has a few strong plants of his following splendid PELARGONIUMS to dispose of, viz., Enchantress, Camilla, Anna, Van Amburgh, Louisa, Alice, Superb, Prince Ernest, Fulgens, Duchess of Sutherland, Muckle Wonder, &c. &c. of which Catalogues may be had on pre-paid application.

N.B. Strong plants of Hardenbergia Macrophylla, at 5*s.* each.

Walthamstow, March 2.

DAHLIA CHALLENGE.

HEADLY'S PHŒNIX, superb dark scarlet, great depth of petals, beautifully cupped, extra fine, 10*s.* 6*d.* See fine coloured plate of PHŒNIX in "Wakeling's Florist's Guide" for December last.

HEADLY'S SATIRIST, rich shaded orange, fine back row flower, 7*s.* 6*d.*

J. HEADLY, Florist, London-road, Cambridge, will show Twelve Blooms of Phœnix for 10*l.* or 20*l.* against any other Scarlet Dahlia, at the ensuing show of the London Floricultural Society, and will deposit 10*l.* in the hands of the Secretary, p. p. Strong and well-rooted plants of the above will be sent out the last week in April, if required. His catalogue for the season may be had immediately.

SCARLET PELARGONIUMS.

PHILIP CONWAY, Florist, Seedsman, &c., Old Brompton-road, near the West London Cemetery, has the honour of offering to the Nobility and Gentry the following variety of the above, viz.—Frost's Compactum, a very excellent variety, raised at Dropmore, distinct from every other, having a dense cluster of flowers of a globular form and a peculiarly pretty tint; good plants at 3*s.* 6*d.* King, a first-rate scarlet, fine large truss, and free bloomer, 2*s.* 6*d.* Shrubland, 2*s.* 6*d.* Towards Pre-Eminent, 2*s.* 6*d.* Scarlet Nosegay, very desirable sort for pots or beds, excellent habit, and very free bloomer, 2*s.* 6*d.* Frogmore, for bedding, (vide *Gardeners' Chronicle*, No. 39, p. 631), 18*s.* doz., or 2*s.* each. Ingram's New Dwarf, for bedding, a decided improvement on Frogmore, 30*s.* doz., or 3*s.* each. The dwarfishness and brilliancy of colour of the two last-named will ever insure them a place in the flower-garden.

The most approved varieties of Geraniums, Fuchsias, Verbenas, &c. &c., on very moderate terms.

RANUNCULUSES, ANEMONES, AURICULAS, CARNATIONS, PICOTEES, AND GERANIUMS.

H. GROOM, CLAPHAM RISE, near London, (removed from WALWORTH), by Appointment Florist to Her Majesty, respectfully informs the Nobility, Gentry, and the Public, that he has a fine Selection of the above Flowers, which he can offer at the following very moderate Prices:—

	£	s.	d.
RANUNCULUSES.			
100 Roots in 100 superb sorts, with their names .	5	0	0
100 ditto very fine sorts, ditto . .	2	10	0

12 superfine sorts, with their names, 1 pair of each	2	2	0
GERANIUMS.			
25 superfine sorts, with their names, 1 plant of each	3	10	0

A Catalogue of Geraniums can be had on application.

A SPLENDID NEW HYBRID FUCHSIA—MONYPENNII.

MORRIS TODD, ROLVENDEN, KENT, most respectfully offers to the Public this very distinct and highly-beautiful variety; the blooms are half as big again as Standishii; flowers in racemes in vast profusion; of a most beautiful rosy-carmine; it has been greatly admired by all who have seen it; it is a strong and magnificent-habited plant. It obtained a first Banksian Medal at the last Horticultural Society's Show, and a prize was given to it at the Weald of Kent Show in June last, and pronounced by the judges to be the best of all the Fuchsias. Strong Plants 10*s.* 6*d.* each, carriage free to London.—Orders will be thankfully received by Mr. G. Charlwood, 14, Tavistock-row, Covent Garden; Messrs. Willmott & Chaundy, Lewisham, Kent; Mr. C. Weeks, Blackheath-park, Blackheath, Kent; Mr. T. Trinder, Forest-hill, Peckham, Kent; and Mr. Joseph Harrison, Downham, Norfolk. A remittance or reference from unknown correspondents.

"We had specimens of it sent us, and not more is said of its superior quality than it merits. It deserves to be in every collection."—*Floricultural Cabinet of Nov. last.*

⁂ The usual allowance to the Trade if two or more plants are ordered.

VERBENA, "THE QUEEN;"

Flowers of a pure white, and sweet-scented.

WM. IVERY, Florist, Peckham, near London, begs most respectfully to offer this beautiful variety of Verbena, which has the habit of V. Tweediana, blooming equally vigorous and profuse: being, too, of a pure white, it produces a striking contrast with the other kinds. It was exhibited, and obtained a prize, at the Surrey Zoological Gardens last September, and at the Crown and Anchor, Strand, London; also at Salt Hill, where it was greatly admired. Highly favourable notices of it have been made too in the "Floricultural Cabinet," "Gardeners' Chronicle," and "Gardeners' Gazette."

Plants can be had after March 10 at 7s. 6d. each. Agents in London, Messrs. Warner and Warner, 28, Cornhill. A remittance or reference expected.

CHAPMAN'S EARLY NEW KIDNEY and EARLY NEW ROUND POTATOES are warranted equal to the best forced Potatoes; and, without more trouble than a common outdoor crop, are in the finest order for table from October to June, reversing, as it were, the season of ordinary sorts. Sample baskets fit for table may be had on a remittance of one shilling. A few more orders for sets at one guinea per bushel, to be delivered in May, with full instructions for their culture, if immediate application is made, by letter, postage free, to T. and C. Chapman, Market Gardeners, Brentford End, Middlesex.

WANTS a SITUATION as GARDENER, or GARDENER and FORESTER, a Married Man, 33 Years of Age, who has lived in some of the first gardens in England. Can be highly recommended for ability and sobriety by the Gentleman he has just left: as also by some of the first horticulturists of the day. Address Y. Z., P. Newman, Hosier, 102, Quadrant, Regent-street.

WANTED a SITUATION as GARDENER, or GARDENER and BAILIFF. The Advertiser offers Ten Guineas to Nurserymen and others who can procure him a situation. He is a Married Man, a native of Northumberland, and thoroughly understands his business in all its branches: also the breeding and rearing of Stock, Road-making, measuring and valuing of Timber, and the whole management of any nobleman or gentleman's estate. He can be highly recommended, and an unexceptionable five years' character from the gentleman he has just left. Direct to W. S., Mr. R. Scott, Corn Merchant, 4, King's-row, Pimlico.

WANTED immediately a GARDENER to take charge of the garden of an English Gentleman residing at Marseilles. He must be an intelligent well-informed person, well acquainted with English Gardening, unmarried, and with an unimpeachable character for honesty, sobriety, and good temper. He need not be acquainted with the French Language, as he would find many Englishmen in the same establishment. He must agree to stay for two years at least. His travelling expenses will be defrayed. Wages 30 francs, about 24*s.* 2*d.* per week. Apply, by letter, post-paid, to R. T., 3, Charles-street, Covent Garden.

WANTED by a Steady Young Single Man, aged 28, a SITUATION as PROPAGATOR and FOREMAN in the houses. He perfectly understands his business; he has been employed in several first-rate establishments for these twelve years, and can have a good character. No objection to go far away. For further particulars apply by letter (post-paid) to G. B., 29, Manchester-street, Manchester-square.

WANTS a Situation as GARDENER, a Single Man aged 36, who thoroughly understands the management of Pines and forcing in general, &c., Kitchen and Flower Garden. Would have no objection to take the management of the farm (if not too extensive). Upwards of three years' character will be given from the last place, and most respectable reference for character and ability can be had from different families with whom he served. Has no objection to what country he goes. Apply personally, or by letter, to — Grant, care of Messrs. Loddiges, Nurserymen, Hackney, near London.

WANTED a SITUATION as HEAD GARDENER in a Nobleman or Gentleman's Family, by a Single Man in the prime of life, who feels confident in his business, and is competent to undertake the management of Woods and Plantations if required. Any Nobleman or Gentleman in want of a confidential Servant would not find himself disappointed in the advertiser. He will be well recommended from a very high family he is just about leaving. Address H. H. *Gardeners' Chronicle* Office.

WANTED by a respectable Person, 36 years of age, a Situation as GARDENER in a Nobleman's or Gentleman's Establishment. The advertiser has had many years' experience in his profession in all its branches, and begs to state his lowest terms will be 75*l.* &c., per annum. Letters addressed to A.B., Post-office, Hackney, will meet with prompt attention.

WANTED in a Nursery in the Neighbourood of London a Steady, Active Young Man, who thoroughly understands the Propagation and General Management of Plants, both hard and soft wooded. A handy method with Plants and respectable address would be indispensable. One who has had some practice with florists' flowers would be preferred.

Apply (if by letter, prepaid) to J. H., *Gardeners' Chronicle* Office, Charles-street, Covent Garden.

TO HEAD GARDENERS.—A premium will be given by the advertiser, a young Married Man, to any one that will procure him a Situation as UNDER-GARDENER, or a single-handed place, from 18*s.* to 1*l.* per week. He has served his time to the business, and can have a good recommendation. The strictest secrecy may be relied on. Apply to A.B., 22, Hill-street, Peckham, Surrey.

THOMAS CRIPPS, FLORIST, &c., TUNBRIDGE WELLS, respectfully informs his Friends, that Plants of the NEW WHITE FUCHSIA—VENUS VICTRIX, will be ready in May at 21s. each, with the usual discount to the Trade, if three or more plants are taken at once. For particulars, see "Floricultural Cabinet" for March, or "Gardeners' Gazette" or *Chronicle* of 5th inst.

Orders for which will be received by Mr. George Charlwood, 14, Tavistock-row, Covent Garden; Messrs. Cormack and Co., New Cross Nursery; Mr. Harrison, Downham, Norfolk; Mr. Jos. Ashdowne, Seedsman, High-street, Hastings; Messrs. Wood and Son, Maresfield Nursery; or addressed as above.

SEEDLING DAHLIAS to be sent out in May next, by N. GAINES, FLORIST, SURRY-LANE, BATTERSEA.

Gaines' ORANGE PERFECTION; beautiful orange, at times shaded. This flower was sent for the opinion of the Horticultural and Floricultural Societies of London; at both places considered first-rate. It is a fine grower, throwing its flowers well above its foliage. A good show flower. Awarded first Prize at Kingston, and 2nd Prize at Teddington. 4 ft. 10*s.* 6*d.*

Gaines' EMPEROR; beautiful rosy crimson, very superior petal, with great depth of flower, and well up in the centre. A constant good show flower. Awarded 2nd Prize at Kingston. 3 ft. 10*s.* 6*d.*

Gaines' COMPACTA; fine purple, very superior form, of excellent habit, throwing its blooms well above its foliage; its centre well up. A good show flower. Awarded 2nd Prize at Hammersmith. 5 ft. 10*s.* 6*d.*

N.B. The above were considered first-rate flowers by those that saw them growing. Plates of them will appear in "Wakeling's Amateur Guide," in April and May next.

N. Gaines' extensive List of first rate Dahlias, Geraniums, Pansies, Calceolarias, &c. may be obtained by post-paid application as above. His new Cineraria, Prince of Wales, is now ready for delivery.

TO THE NOBILITY, GENTRY, NURSERYMEN, and others, who are inclined to purchase by Private Contract a Cheap Bargain: about two acres of Freehold Nursery Ground, in a beautiful situation, about one mile from the sea; half a mile from Portsmouth or Portsea; 1¼ miles from Gosport, South Western Railway Terminus. On the Ground—a Dwelling house, a Greenhouse, 2 Bricking-pits, all well stocked with Pot-plants, Shrubs, Fruit trees, &c.

For particulars, apply to Mr. John Nobes, on the premises, or to Mr. Purchess, builder, near the Bush hotel, Southsea.

WILLIAM MASTERS, Exotic Nursery, Canterbury, having collected a great variety of curious ORNAMENTAL TREES and SHRUBS, in addition to the more common kinds, begs to submit the following List, and to solicit commissions.—March 11, 1842.

HARDY TREES AND SHRUBS.

Acer, a fine genus, 18 species
Æsculus, showy flowering trees, 16 kinds
Ailanthus glandulosa, or Tree of Heaven
Alnus cordifolia, a noble tree, and 5 other kinds
Amelanchier, pretty low shrubs, 4 sorts
Amorpha fruticosa
Amygdalus, beautiful flowering trees, 6 sorts
*Andromeda, 20 species, very pretty
Androsæmum, useful under-trees
Aralia, 2 species
Arbutus, fine evergreens, 5 sorts
Arctostaphylos, 2 kinds
Artemisia Abrotanum
Aucuba japonica
*Azalea, 100 kinds
Baccharis halimifolia, Groundsel tree
Berberis, including Mahonia, 20 kinds
Betula incisa, the most elegant of trees, and 6 other kinds
Borya ligustrina, or Adelia
Broussonetia papyrifera, Paper Mulberry
Buddlea globosa, a distinguished plant
Buxus, useful evergreens, 10 kinds
Calycanthus, 3 kinds, all sweet-scented
Caprifolium, or Honeysuckles, 18 kinds
Caragana, dwarf trees, with pretty foliage, 10 sorts
Carpinus, or Hornbeam
Castanea, or Chesnuts, 5 kinds
Catalpa syringæfolia, a tree with oriental character
Ceanothus, 3 kinds, feathery and pretty
Cephalanthus occidentalis, Button-wood
Cerasus laurocerasus, or Laurel, of several variations
—— of 6 species, good flowering trees
Cercis, or Judas tree, 2 species
Chionanthus, or Fringe Snow tree
Cistus, 15 species, very beautiful
Clethra, 2 kinds, sweet and pretty
Colutea, or Bladder Senna
*Comptonia asplenifolia, fragrant
Coriaria, or Myrtle Sumach
Cornus, or Dogwood, 5 kinds
Coronella Emerus, neat and floriferous
Cotoneaster, 8 species, all pretty
Corylus, 9 sorts, the purple and cut leaf curious
Cratægus, 50 kinds, the most beautiful of trees
Cydonia japonica, 3 varieties
Cytisus, including Laburnum, 30 sorts
Daphne, sweet-smelling and low shrubs, 12 kinds
Edwardsia, 2 kinds
Elæagnus, singular leaves, 3 sorts
*Empetrum, 8 species
*Erica, or Heaths, very pretty, 26 kinds
Euonymus, 11 sorts
Escallonia, 2 sorts
Fagus, or Beech, 7 ornamental kinds
Ficus, or Fig, 12 kinds
*Fothergilla alnifolia, feathery and pretty
Fraxinus, or Ash, 18 sorts
*Gaultheria, 2 species, both pretty
Genista, pretty low plants, 10 species
Gleditschia, or Honey Locust, 5 sorts
Halesia, or Snowdrop trees, 2 species
Hedera Helix, tree dry, 2 kinds
Helianthemum, pretty and abundant flowering, 25 kinds
Hibiscus Althæa Frutex, beautiful, 20 varieties, which are ornamental in autumn
Hippophae, or Sea Buckthorn, very singular foliage
Hypericum of 5 species
Hydrangea of 3 kinds
Ilex, or Holly, of 25 varieties
Itea virginica, elegant white racemes
Jasminum, 6 species, all fragrant
Juglans, or Walnut, 4 species
*Kalmia, beautiful flowers
Kerria japonica, or Corchorus
Kölreuteria, an elegant tree
Laurus nobilis, or Bay, 3 variations
*Ledum, dwarf shrubs, 7 var.
Ligustrum, or Privet, 5 kinds
Liquidambar, handsome tree
Liriodendron, or Tulip tree, a noble species
Lonicera, or Fly Honeysuckles, 4 kinds
Lycium, or Box-thorn, 3 species
Maclura aurantiaca, Osage Orange
Magnolia, a superb race, 20 varieties
Medicago arborea, or Moonseed
Menziesia, pretty Heath-like plants, 5 kinds
Mespilus grandiflora, and 4 other species
Morus, or Mulberry, 4 species
Myrica, or Sweet Gale, 2 kinds
Negundium, 2 kinds, fine foliage
Ostrya, or Hop Hornbeam, 2 species
Pæonia Moutan, several splendid kinds
Paliurus, or Christ's Thorn
Persica, double Peach, a beautiful tree
Philadelphus, a beautiful race, 7 kinds
Phillyrea, 6 varieties, useful evergreens
Phlomis fruticosa, singular
Platanus, or Planes, 4 species
*Polygala Chamæbuxus, pretty, and early-flowering
Populus, or Poplar trees, 13 kinds
Potentilla, 2 shrubby species
Prunus, Double Sloe, and 4 other kinds, all showy
Ptelea trifoliata, a singular plant
Punica, or Pomegrantes, fine plants for walls, 4 kinds
Pyrus, Double Crab, a beautiful tree, and 18 kinds, remarkable either for their berries or flowers
Quercus, or Oak family, 21 species
Rhamnus, or Alaternus, 5 varieties, useful evergreens
—— 4 species, with distinct foliage
Ribes, or Currant family, 20 kinds, a few with beautiful flowers
*Rhododendron, as a family beautiful and grand, 55 varieties
Rhus, or Sumac tribe, 6 species
Robinia, or Thorn Acacia, elegant trees, and some with beautiful flowers, 15 kinds
Rosa, or Rose tribe, a superb collection of 600 kinds
Rubus, or Bramble, 14 kinds
Ruscus, 3 evergreen species
Salix, or Willow family, 40 species
Sambucus, or Elder, 5 varieties
Sophora japonica, 2 kinds, fine trees
Spiræa, a genus remarkable for abundance of flower, 30 kinds
Staphylea, Bladder-nut, 2 species
Symphoria, Snowberry and St. Peter's Wort
Syringa, or Lilacs, 13 variations, very showy
Tamarix gallica, a pretty fine-leaved shrub
Thermopsis laburnifolia, a fine Nepalese species
Tilia, or Lime-tree, of 7 varieties
Ulex, or Furze, 4 kinds, the Double and Irish remarkable
Ulmus, or Elm-tree family, 20 kinds
*Vaccinium, 18 species, Heath-like flowers, with berries
Vella pseudo-Cytisus, a shrubby plant, in an order mostly herbaceous
Viburnum, the Laurestine, and 2 varieties, evergreens
—— the Gueldres Rose, and 7 deciduous species
Vitex, the Chaste-tree, singular foliage and neat growth
Yucca, Adam's Needle, 8 species, architectural plants of rare beauty
Zanthoxylum fraxineum, or Yellow-root

N.B.—The Genera marked * succeed better in peat earth.

NEW AND SUPERIOR SEEDLING DAHLIAS FOR 1842.

JAMES EDWARD, Florist, Layerthorpe, York, begs most respectfully to invite the attention of Cultivators of the Dahlia to the following Three Seedling Varieties (raised in 1840, and fully proved in 1841), which are quite distinct from any hitherto produced; of very superior habit, and constant in producing good Show Flowers throughout the season; in proof of which J. E. begs to state that he has shown above 200 blooms of the three, during the season, at various Exhibitions open to all England, and has had nine Seedling Prizes awarded for them, namely,—four 1st prizes, three second ditto, and two third ditto; they have also been shown in the following winning trays:—

In the 1st Tray of 24 at the Horticultural Society, York, Aug. 18,
2d ,, 24 ,, ,, ,,
1st ,, 18 ,, ,, ,,
2d ,, 36 at the Botanical Gardens, Hull, Sept. 2d;
2d ,, 12 ,, ,, ,,
1st ,, 24 at the Horticul. Soc., Scarborough, Sept. 3d;
1st ,, 12 ,, ,, ,,
1st ,, 6 ,, ,, ,,
1st ,, 48 at the Yorkshire Philosophical Soc., Sep. 9th;
1st ,, 36 ,, Botanical Gardens, Sheffield, Sept. 15th;
1st ,, 36 ,, Horticultural Soc., Barnsley, Sept. 21st;
1st ,, 24 ,, ,, ,,
1st ,, 48 ,, Botanical Gardens, Leeds, Sept. 22d;
1st ,, 48 ,, Horticultural Society, York, Sep. 24th;
2d ,, 24 ,, ,, ,,

Besides having taken other Prizes in addition to the above.

Premier.—Fine bronze salmon, very superior form, of excellent habit, throwing its blooms well above the foliage, and always to be depended upon in producing good show flowers. This variety obtained the first prize, in its class, at the York Ancient Florists' Society, September 20th, and had also the premier prize awarded, as the best Dahlia of any colour.—Height 4 to 5 feet.—Plants 10*s*. 6*d*.

Mary Jane.—White ground, very deeply tipped and edged with purpled carmine—constant throughout the season, well up in the centre, of excellent habit, and never fails in producing good flowers. This variety obtained the first and second prize at Scarborough, as the best light-ground flower tipped or edged, and has justly been pronounced the most distinct and attractive Dahlia ever produced in its class.—Height 4 feet.—Plants 10*s*. 6*d*.

Duke of Richmond.—Fine light pink and yellow, colours beautifully blended together, with a light-yellow tip at the end of each petal, similar to the Duchess of Richmond, but quite distinct from that variety; very superior habit, always constant, and will prove a noble and excellent show flower.—Height 5 feet.—Plants 10*s*. 6*d*.

Good strong plants will be sent out the first week in May; and for the convenience of parties at a distance, orders will be received, and plants supplied, by Mr. George Charlwood, Seedsman, Covent Garden, London: and Messrs. Henderson, Nurserymen, Brechin, Scotland. No allowance to the trade unless 12 plants are ordered, and a remittance or respectable reference will be required from unknown correspondents. J. E. can also supply plants of all the best Dahlias in cultivation, of which a catalogue is annually printed, and can be had on application.

We the undersigned, members of the Committee of the York Horticultural Society, do attest the correctness of Mr. Edward's description of the above Dahlias; and we strongly recommend them as distinct varieties from any yet sent out, and well worth a place in the most limited collection.

Report of the York Amateur Florist Society, held on Monday, August 9th, 1841.—The Judges and Members of this Society consider it their duty to notice a seedling Dahlia of last year (sent for inspection) raised by Mr. Edward, Nurseryman, of this city. The colour is pure white, with a dark tip of purpled carmine; the form, depth of petal, and above all, good eye, require no consideration to pronounce it one of the best Dahlias yet seen of its class; and from the evident superiority of this distinct variety over such flowers as Glory of Plymouth, Beauty of the Plain, &c., there is no doubt but the year 1842 will cause these flowers to fall in the rear when brought into competition with the seedling exhibited this day, as it may safely be pronounced a gem of the first water, and will reflect the greatest credit on the fortunate raiser, for so long as Dahlias remain in cultivation this flower must form a prominent feature in a stand of six.—*York Courant*.

GEORGE CHARLWOOD, 14, Tavistock Row' Covent Garden, begs to inform the public and his correspondents that his Catalogue of American Seeds is now published, and can be had on application, or sent, postage free, to any part of the country.

G. C. likewise begs to draw the attention of his friends to the undermentioned, which he can with confidence recommend to their notice, and for a more extensive assortment he refers them to his general Catalogue.

BRITISH SHEET GLASS FOR HORTICULTURAL PURPOSES.—Noblemen, Gentlemen, and Horticulturists generally are respectfully informed that they may be furnished with lists of prices, and particulars regarding the above article, which has in every case in which it has been adopted proved itself to be by far the most economical material for Horticultural Glazing: upon application to Drake and Bromley, 315, Oxford-street, London.

J. DRAKE, late of 100, Edgware-road, and 8, Jermyn-street, begs to notify that he has removed his business to the above address, for the convenience of more extensive premises, and solicits for himself and partner, a continuance of the support he now gratefully acknowledges. French and every description of Glass Shades, Stained and Ornamental Glass, Patent Plate and British Plate Glass supplied in any number or quantity, at wholesale prices.

HEATING BY HOT WATER, WITH THE CIRCULATION OF ATMOSPHERIC AIR.

J. WEEKS & CO., Architects, &c., Gloucester-place, King's-road, Chelsea, Hothouse Builders, and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER; see the 3rd and 37th Numbers of the *Gardeners' Chronicle*.

References may be had, and their works seen, at Mr. Perry's Nursery, Banbury; Mr. Green's, Lower Cheam; Messrs. Henderson's, Pine-apple Nursery; Messrs. Rollisson's Nursery, Tooting; Mr. Knight's Exotic Nursery, Chelsea; Messrs. Low's, Clapton Nursery; Mr. Catleugh's Nursery, Chelsea; Mr. Gaines's Nursery, Battersea; Mr. Buck's, Portland Nursery; Mr. Young's, Milford Nursery; Mr. Smith's Nursery, Dalston; Mr. Woodroff's Nursery, Kensall Green; Mr. Hopgood's Nursery, Bayswater; Mr. Willmer's Nursery, Chelsea; and at most of the Nobility and Gentlemen's Seats in the country.

Every particular to be had at their Horticultural Manufactory, Gloucester-place, Chelsea, near Sloane-square.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. Bailey having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. Bailey also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. Bailey were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. Bailey have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their manufactory.

TO GENTLEMEN, FLORISTS, and others.—Mr. T. Ansell, Jun., is instructed to submit to Public Auction, at the Auction Mart, Bartholomew-lane, on Tuesday, March 15th, 1842, a splendid collection of Standard and Dwarf Roses, new varieties of Azalea Indica, Fuchsias, miscellaneous Greenhouse Plants, &c. &c. May be viewed the morning of sale, and Catalogues had of Messrs. Warners, Cornhill, Messrs. Flanagan and Co., Cheapside, Conservatories, Covent-Garden, at the Mart, and of the Auctioneer, Camden Nursery, Camden Town.

TO BE DISPOSED OF, (in consequence of the death of the late Proprietor,) an extensive and highly-respectable NURSERY and SEED BUSINESS, in one of the most fertile of the Midland Counties, which has been established and has possessed a first-rate connexion for nearly 50 years. The arrangements for conducting the business are unusually advantageous and complete.—For particulars apply to Messrs. Warner and Warner, Seedsmen, 28, Cornhill, London.

TO BE DISPOSED OF, A NURSERY and SEED BUSINESS in an improving part of Essex, eighteen miles from London, and six from a good market-town. The lease is 25 years unexpired. The extent of Nursery is about three acres; two Greenhouses and Pits. To any one with small capital this offers an excellent opening. For further particulars apply to Messrs. Protheroe and Morris, Leytonstone Nursery, Essex.

TO GENTLEMEN, FLORISTS, AND OTHERS.—Valuable LEASEHOLD PREMISES and NURSERY-GROUND, Three newly-erected GREENHOUSES, SHEDS, PITS, FRAMES, LIGHTS, a few lots of HOUSEHOLD FURNITURE, and sundry Utensils.

To be SOLD by AUCTION, by Messrs. Protheroe and Morris, if not previously disposed of by private contract, on the premises, FOUNTAIN NURSERY, Camberwell Grove, on THURSDAY, March 17th, 1842, at 11 o'clock, by order of the Trustees of Mr. Ferry, about 8000 GREENHOUSE PLANTS, comprising Geraniums of the first class, Camellias, Fuchsias, &c. Also the NURSERY STOCK, consisting of Standard and Dwarf Roses, Rhododendrons, Azaleas, Kalmias, Aucubus, Portugal Laurels, Laurestinus, Arborvitæ, Yews, Choice Pinks, Heartsease, a quantity of Bog-earth, Rotten Dung, Box-Edging, Garden Pots, &c.

May be viewed prior to Sale.

Particulars and Catalogues may be had of F. Brown, Esq., Solicitor, 23, Woburn Place; of the principal Nurserymen and Seedsmen, on the premises, and of the Auctioneers, American Nursery, Leytonstone.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE and MORRIS have received instructions to offer to Public Auction, on the Premises, Lamb Farm, Dalston, near the Swan, Kingsland Road, on Wednesday, March 23rd, 1842, at 11 o'clock, by order of Mr. F. Bryant, in consequence of the land being let for building, the entire Stock consisting of about 14,000 Greenhouse and other Plants in a very healthy condition, viz.: Geraniums, Myrtles, Fuchsias, Verbenas of sorts, Cactus, Mesembryanthemums, Hyacinths, Tulips, &c. Also four newly-erected Greenhouses, several Pits, 1, 2, and 3 light Boxes, about one hundred Hand-glasses, and sundry utensils in trade. Also about 400 strong Roots of Myatt's Victoria Rhubarb, remarkable for its size and quality, and lotted suitable for private buyers and the trade. May be viewed prior to sale. Catalogues may be had of the principal Nurserymen and Seedsmen on the premises, and of the Auctioneers, American Nursery, Leytonstone.

HORTICULTURAL SOCIETY OF LONDON.

A NEW PART OF THE TRANSACTIONS OF THE SOCIETY, containing Figures of Achimenes longiflora, and the Ickworth Imperatrice Plum, forming the conclusion of the Second Volume of the New Series, is ready for delivery to the Fellows of the Society.

The Gardeners' Chronicle.

SATURDAY, MARCH 12, 1842.

MEETINGS IN THE ENSUING WEEK.

Tuesday	Horticultural	3 P. M.
	Floricultural	7 P. M.
	Linnean	8 P. M.
Wednesday	Microscopical	8 P. M.
Friday	Botanical	8 P. M.

VERY lately Mr. Webb Hall described Mr. Daniell's manure, to which we have so often invited attention, in these mysterious words: "It consists of the materials of combustion, used otherwise than by combustion to promote the growth of plants." Inasmuch as all plants live principally upon the materials of combustion, this was like stating that the manure consists of the food of plants; not a very explicit declaration, it must be confessed.

A more precise statement having now been made by the same gentleman in the *Bristol Mercury*, and we having ourselves examined the manure, we are in a condition to lay some further observations before our readers.

Mr. Hall states the ingredients to be—1st, Wood, ligneous matter of every kind reduced to a state of fine division; 2nd, bituminous matter of various kinds; 3rd, soda and quicklime; 4th, sulphur in minute quantity. The use of the first ingredient, the woody fibre, is tolerably evident; and in some soils it alone would, no doubt, be a valuable addition. Its action in producing carbonic acid, in retaining ammonia, and in improving the texture of the soil, is readily perceived; and it is probable that it is also useful in forming a base or substance to mix with the more active ingredients of the manure, and to facilitate their equal and regular distribution over the land.

The object to be gained by the addition of bituminous matters is less evident, and is more open to doubt. We had at first supposed that the "bituminous matters" meant the tar-water of the gas-works—a liquid certainly containing alkali and bitumen, and no doubt constituting a most valuable manure. It is, however, possible that the tar itself may have some influence, either directly or indirectly, on the growth of plants, and that the good effects produced by such water is not merely due to the ammonia present in it. It has long appeared to us very likely that some forms of hydrocarbon might be capable of affording nutrition to plants, and that plants might possibly absorb carbon combined with hydrogen, as well as with oxygen, in the form of carbonic acid: and if this be the case, it would explain several facts connected with the use of decaying woody fibre, and similar substances, which do not seem quite clear when we consider it merely as supplying carbonic acid.

The office performed by caustic alkalies in promoting the decomposition of the woody fibre, and other organic matters, is plain, or at least in perfect accordance with well-known facts. They may likewise increase the solubility of the bituminous substances present, as well as assist in the decay of woody matter. This is, however, merely a theory or supposition, the truth of which we hope shortly to prove or disprove.

The sulphur added to this manure is probably in combination with some substance, and not in its free and simple state. We can hardly imagine that the addition of sulphur would be useful; but either in the state of sulphuric acid, or some other compound, its addition would be beneficial in many points.—*E.*

IF there is one fact supposed to be better established in Vegetable Physiology than another, it is the existence among plants of organs equivalent to the sexes of animals. The experiments of Linnæus, repeated by hundreds of observers in every possible way, are admitted to be conclusive evidence upon the subject, which, one would suppose, will scarcely admit of further argument. Nevertheless some facts have been put on record of late years, which it is very difficult to reconcile with the supposed necessity of stamens to the fertilisation of the pistil of a plant.

It is now several years since M. Girou de Buzareingues, an ingenious French gentleman, published the account of many experiments made by him upon the Hemp and the Diœcious Lychnis, the result of which was, that the females of these species are capable of ripening fruit perfect in all respects, without the application of pollen to the stigma. The difficulty, however, of ensuring experiments with such common plants against access from pollen brought by insects or winds from a distance, prevented M. Girou's experiments from being regarded as conclusive.

At a later period, Mr. John Smith, Curator of the Royal Botanical Garden at Kew, published an account of a New Holland plant, which he called Cœlebogyne, and which we will translate Virginwort, which was brought from New Holland by the late Mr. Allan Cunningham, and of which the female only is known in this country. The most careful examination of this plant year after year satisfied Mr. Smith that it has no pollen whatever, and yet it bears fruit with perfect seeds, which have themselves become young plants —and this too not on one occasion, but for several years. The absence of pollen, in this case of the Virginwort, may be regarded as an undoubted fact, for Mr. Smith's observations were confirmed by the examination of Mr. Francis Bauer, and others, whose eyes a male apparatus was not likely to escape; especially since the plant itself, in the Garden at Kew, is quite a small bush in a pot.

We do not pretend to be able to explain these singular facts; but we introduce them for the purpose of illustrating a communication on the Cucumber by Mr. W. P. Ayres, which will be found in another column. This correspondent is a well-known cultivator of Cucumbers; he has written well upon it, and must therefore be supposed familiar with the practical facts connected with it. It will be seen that he asserts fertilisation to be unnecessary when Cucumbers are forced, and that he appeals to the experience of himself and others in support of his opinion. If this be really true, that is to say, if future experiments, guarded against all possibility of error, shall confirm the opinion Mr. Ayres has formed upon what he believes to be facts, we shall have something more added to the curious evidence we have here adverted to.

For our own parts, however, we must express our incredulity as to the Cucumber not requiring fertilisation; it was, we think, one of the plants operated on by former observers (by Mr. Girou himself, if we mistake not), and for the express purpose of disproving, if possible, the necessity of contact between the pollen and stigma; but it was found that unfertilised flowers would not set. There are, indeed, so many causes of error in such investigations, and the results arrived at by Mr. Ayres are so contrary to probability and the nature of things, that very conclusive evidence indeed would be required to induce us to acquiesce in the justice of his conclusions.

ON THE CULTIVATION OF GLADIOLUS PSITTACINUS & OTHERS IN THE OPEN BORDER.

GLADI'OLUS psittacinus or natalensis, is one of the most ornamental of the Cape Gladioli, and from its easy cultivation deserves to have a place in all flower-gardens, where a brilliant display is required during the autumn. Its large dense spikes of curious-shaped bright orange and scarlet flowers are produced for two or three months. By planting the bulbs at different seasons, and protecting the late planted ones from the frost when in flower; by potting some bulbs in the spring and forwarding them either in pits or frames (where a little artificial heat is used), and planting them out early in May, a succession of flowers may be obtained from the middle of July to the end of October. Like all bulbs, it makes a more splendid appearance when planted out, than when grown in pots, and in masses than singly in the borders; it therefore is much better planted like Tulips in beds, which should be prepared some time during the winter, or early in the spring, by digging up the soil deep, and leaving it rough, adding at the same time a good portion of well-rotted dung and a little sand, if the soil is of a stiff nature; but if light, sand is not required. About the middle of April mark out the bed into rows, one foot apart, and four inches deep, putting a little sand along the bottom of the rows, then place the bulbs in the rows, about nine inches or one foot apart, taking care to separate all the bulbs, and only plant one in each place; then having a little sand (any refuse from cutting-pots or bank sand will do), put a small portion round each bulb, and fill in the rows. After this the plants will require no further trouble, except keeping clean and tying up, which latter is easily done by driving a few sticks round the outside of the bed, and running a couple of tiers of tar-twine round it. With this treatment the Gladioli will begin flowering about the end of July, and will continue blooming for nearly two months, particularly if they are freely supplied with water once or twice (as the season may require), just before they begin to expand their first flowers. Care must, however, be taken, not to water them overhead, as the water will be retained at the base of the leaves, and if a little dull or very hot dry weather should intervene, they are liable to be scalded, and lose the bottom leaves, which makes them unsightly.

The bulbs will require to be taken up about the end of October, or as soon as the stems and leaves become brown or damaged by the frost; they must be well dried and placed in some situation secure from frost or damp until the next spring, when they must be divided and again treated as before. The larger bulbs will also produce numerous offsets round their root-end, but these are of little value, for they will be two or three years before they flower; and as every flowering bulb (planted in the spring) produces three or four bulbs, of sufficient size to bloom the next season, from the crown of the old one, there is always enough for all purposes. The plant also seeds freely; but like the small bulbs the seedlings will be so long before they flower, that they are not worth the trouble of raising, except for the sake of obtaining new varieties.

Gladíolus cardinalis and its hybrids are the next in beauty to psittacinus, but they are not so hardy nor so vigorous, and consequently require to be brought forward earlier in the spring, and treated in the same manner as those for the first flowering-bed of the preceding kind; but they are worth all the trouble, for nothing can be more splendid than a good bed of Gladíolus cardinalis with its bright scarlet flowers, relieved by a white centre. They require taking up every season, for if left in the ground and protected with a covering they always suffer from damp, and never start early enough to flower well the next season, however they may be protected. This species of late years has been the parent of some of the most beautiful hybrids, which vary in colour from scarlet to nearly white; they have been obtained principally between it and G. blandus; the most showy ones are those raised by Mr. Herbert, such as G. pudibundus, with large brownish-purple flowers, slightly marked in the centre of the upper petals with white, G. Spofforthianus with its various-coloured varieties, and G. Collvíllii with scarlet flowers marked with pale yellow. These, and many other intermediate varieties again raised from them, are very desirable for being either planted out in pits or grown in pots.

Gladíolus ramosíssimus is the next most beautiful kind for growing either in pots or in a bed; it is a fine tall species, with pale rosy-pink flowers, which are produced in great abundance. Among the more hardy kinds Gladíolus byzantinus (the Turkish Sword Lily) is worthy of notice; it has fine long spikes of deep crimson flowers, which are produced in great abundance during the months of July and August; and is a much more ornamental plant than the Gladíolus communis with its flesh-coloured variety, and quite as hardy: both these are, however, desirable plants for a flower-garden. The bulbs of these hardier kinds should be taken up every two years, divided, and replanted, as they will not flower so finely if left too long in one place. They require a rich soil, made rather free by adding a little sand to it when the bulbs are being planted. By this treatment nearly all the Cape Gladioli may be made to flower beautifully, and far finer and better than if retained in pots. They are easily increased by offsets or by seeds, but the latter way is rather tedious, and only worth resorting to for the sake of raising new varieties. When this is intended the seed should be sown about the end of February, in pans filled with a mixture of sandy peat and a little loam, and leaf-mould. The seeds should be planted about half an inch deep in the soil, and the pans placed in a greenhouse; they will soon vegetate, and require little trouble for the first season, except watering and keeping free from slugs and weeds, taking care, however, that they are kept growing as vigorously and as long as possible, by freely supplying them with water during the growing season. When they have done growing for the season, care must be taken not to dry the soil in the pans too quickly, or too much; for the young bulbs being very small, are apt to become much exhausted, and frequently perish if kept very dry the first winter. They should be, if possible, placed in some cool dry situation where they are secure from frost. In the spring they should be again placed in a greenhouse or warm pit, and when fairly started they should be carefully removed into fresh pans or pots, using rather a richer soil than that used for the seeds, planting them still rather thickly in the pots or pans, and keeping them shut up close, and rather moist, for a few days, until they begin to grow again; after which treat them as before, and encourage them to grow as long as possible in the autumn, then rest them as before. The next spring they may be potted in smaller pots, and treated like Gladíolus cardinalis, when many of them will flower.—*G.*

THE OXLIP.

A NOTICE in the *Gardeners' Chronicle* (Oct. 9, 1841), upon the respective relations of an old and long-disputed family, the Primrose, Cowslip, and Oxlip, although correct in the main, requires a few observations to make the state of the case perfectly clear.

It is probably true that the English Primula elatior or Oxlip (not that of Linnæus and the Continental botanists) is a hybrid between the common Primrose (P. acaulis) and the Cowslip (P. officinalis). Two reasons may be adduced for this belief: 1st, That England is almost the only country in which the Primrose and Cowslip are found in company with each other; the former being on the continent rather a southern plant, ranging from France to Calabria and Asia Minor; the latter a northern one, ranging from Finland to the top of the Alps.

Both species may, indeed, be found in mountainous parts of the south of Europe; the P. officinalis on the higher parts of the Apennines, and the P. acaulis in the low warm grounds of Florence and Naples—but not together, nor does the English Oxlip seem to be known in those countries. The union of the Cowslip and Primrose in our banks and meadows is no bad type of the climate of England, in which the representatives of the northern and southern flora are found side by side, and what wonder if a hybrid be the result?

In confirmation of this view of the true place of the English Oxlip, it must be familiar to every gatherer of wild flowers that Oxlips differ greatly from one another, as seedling varieties and their descendants often do. Some are more like one parent, some like another, and perhaps their produce may be neither pure nor constant. Some Oxlips are scarcely anything else than larger-flowered Cowslips, and others appear to be merely coalescent, or rather scapescent Primroses. We look in vain for a specific character.

But with regard to the German Oxlip, the true P. elatior of Linnæus and of the German botanists, and which is not yet known to be a native of England or of north-western Europe, the case is different. It is found in great abundance throughout Germany, south of the Neckar, and as far as the Italian side of the Alps, in the pastures of the Tyrol. It seems to be subject to no varieties, and is found not intermixed with other species, unless, perhaps, with some of the Alpine species in their peculiar localities. It has a peculiar cramp habit of leaf, a rough scape, nodding flowers, swelling calyx, and is scentless. In beauty it is inferior to either our Oxlip or Cowslip, or to P. Columnæ or suaveolens of Italy. It may rank, perhaps, with P. Pallasii. The English Oxlip is only known on the Continent by its garden varieties, namely, the Polyanthus tribe.

Perhaps the north and west of France, where the climate is the same as in England, should be excluded from these observations regarding the Continent; as it is possible that Brittany and Normandy may possess both Primrose and Cowslip, and consequently the Oxlip.—*S.*

FAMILIAR BOTANY.—No. III.

The Daffodil.—In a few days our dells will be enlivened by a plant with narrow fleshy grass-like leaves, which spring from a bulb, and surround the stem of a gaudy yellow flower, which some call Daffodil and others Narcissus. Its nodding blossom does not droop its head for nothing; some say it is in sorrow for its misdeeds when a man; but we are of opinion that the real cause is its shame for its roguery when a flower. It is very well for thoughtless people to admire the Narcissus, and to be poetical about its vernal charms, and to dote upon its fragrance. It is well for poets to talk of

> Narcissi, the fairest among them all,
> Who gaze on their eyes in the stream's recess,
> Till they die of their own dear loveliness.

We, on the contrary, who know it well, regard it as the prince of cheats, a base traitor, a syren leading to death; a wicked flower fit only to decorate the button-holes of Burke and Hare, and their confederates.

Who would suspect mischief beneath so fair a form? who would dream of taxing so gay a flower with homicide? and yet we regret to say the evidence against it is strong; the crime has been proved against the Daffodil over and over again. It is but a year ago since an attempt, that had nearly been successful, was made by this treacherous plant within our own knowledge, upon a poor child who thought no harm in admiring the Daffodil, and proving his affection for it by devouring it, not with kisses but with teeth. The little fellow was a boy of a friend of mine,* very healthy and strong, and rather above two years of age. The following is the account I have of the attack:—"The nursemaid had given the child a large Daffodil flower to play with, which, during her absence for a few minutes from the nursery, he completely consumed and swallowed. In the space of about half-an-hour his uncle was called up to see the little fellow, and found him labouring under the following symptoms:—These were, extreme depression of power, with coldness of the surface, which was covered with a clammy sweat; the pulse was very rapid, the pupils dilated, the eye glassy, there was some delirium, and the tongue was swollen. He had previously vomited up a yellow fluid, showing traces of the flower, partially digested; a fact which inclines one to think that more than half an hour must have elapsed, at the time my brother saw him, from that at which he swallowed the flower. The symptoms enumerated above gradually abated after the stomach had been emptied by the administration of three or four emetic doses of antimonial wine.

Be careful then, ye mothers, how you let your children play with daffodils. "That deaf and viperous murderer will crown life's early cup with a full draught of woe." But after all this plant is only a sign, and a warning by which you may know others of its poisonous breed. It has a bulb; its leaves are long and narrow; the flower has an ovary below the yellow-coloured sepals and petals, of each of which there are three. They enclose six stamens, the anthers of which look the stigma full in the face. Now these characters are peculiar to a set of plants called the Amaryllidaceous order, many of which, under the names of Pancratium, Crinum, and Amaryllis, are common in gardens. Even the Snowdrop and Snowflake, for all their demure looks, are of the same vile race, and are no more to be trusted than the Narciss. This latter plant, indeed, derives its name from a Greek word signifying stupefaction, and has the same origin as Narcotic.

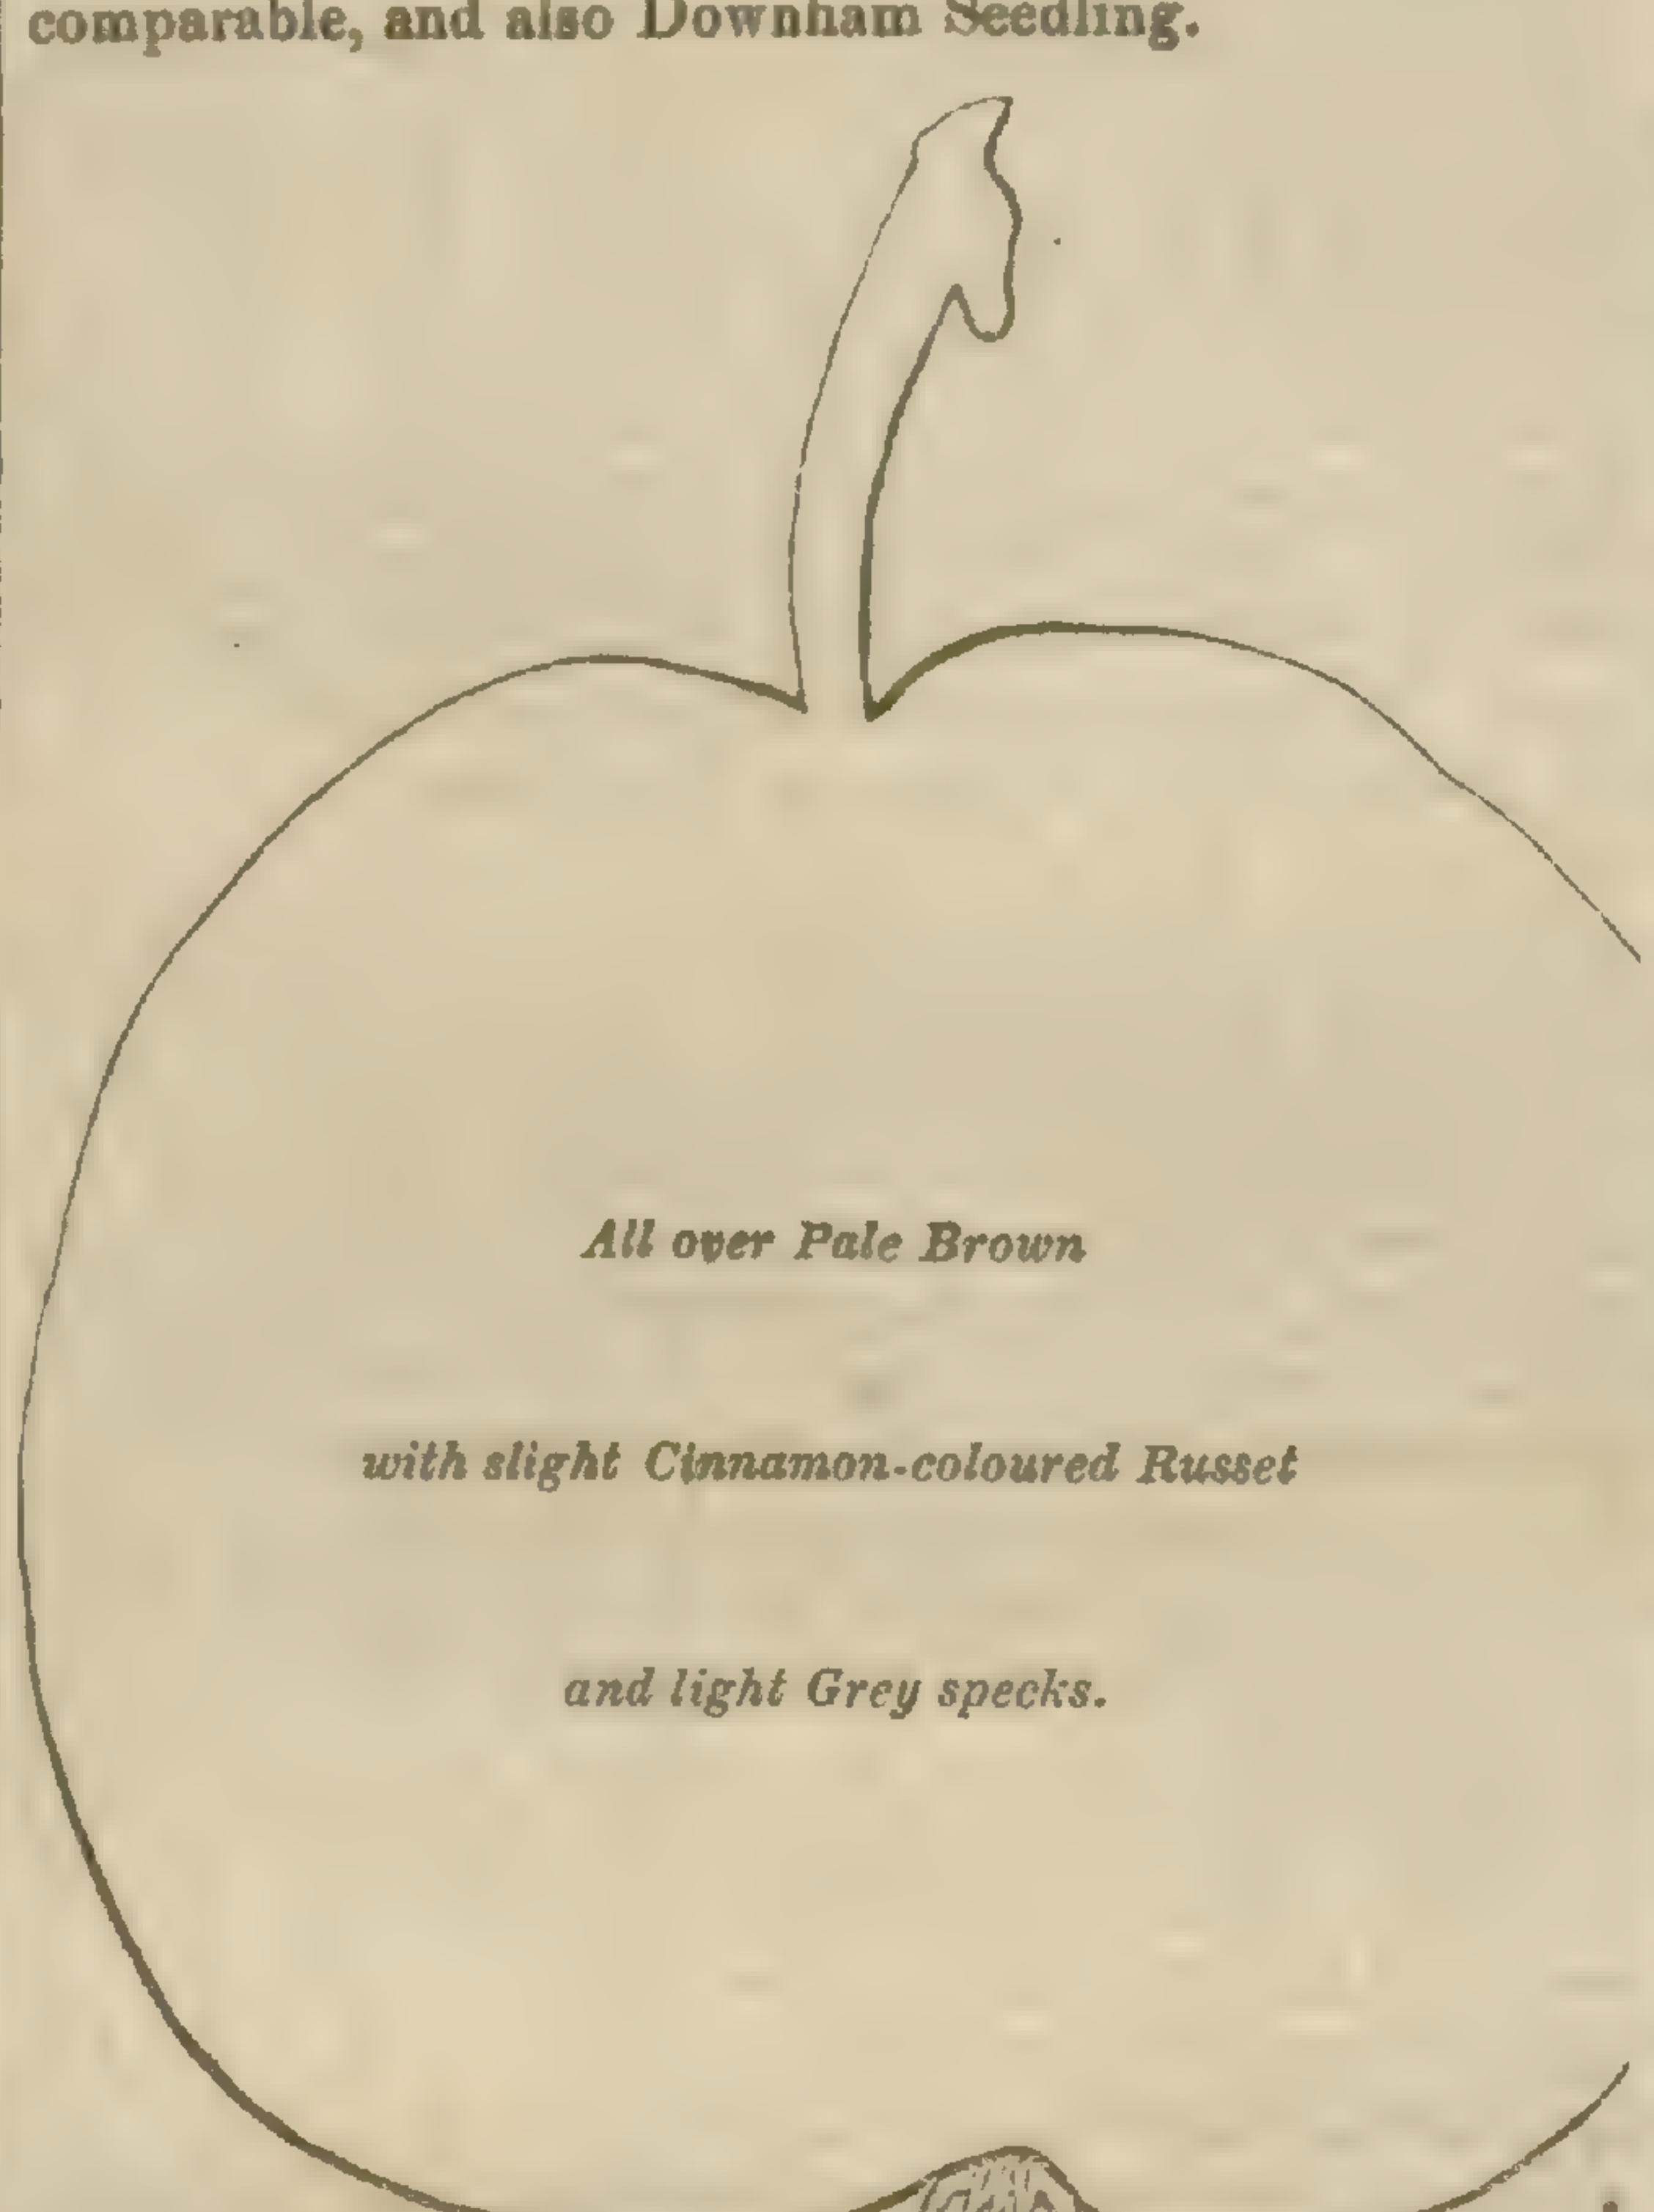
Among these poisonous bulbs the Hæmanthus smears the arrows of the Caffrarian huntsman, and gives him an easy conquest over the lions of his African desert. In like manner the Carib prepares a deadly ointment from the Belladonna Lily; and in Ceylon the Crinum zeylanicum is applied to similar use. But if such plants are fatal in unskilful or savage hands, they, like arsenic and other poisonous substances, become important medicines under the guidance of science.

> Demande à l'humble fleur quelques sucs salutaires,
> La fille du printems ne les refuse pas;
> Car souvent ses bienfaits égalent ses appas.

Hooping cough is cured by the extract of Narciss bulbs; Snowdrops, Snowflakes, and Daffodils are good emetics; the Sea Pancratium emulates the Squill in its utility for coughs, and all of them form excellent poultices for troublesome tumours. So true it is in the natural as well as the moral world, that the bitterest things are often the most conducive to our welfare, and that the danger of to-day is the salvation of to-morrow.—*R. E.*

HACON'S INCOMPARABLE PEAR.

THIS variety was raised about twenty-eight years ago by Mr. James Gent Hacon, of Downham-market, Norfolk, from seed of Rayner's Norfolk Seedling. In addition to the handsome form and rich flavour of the fruit, the hardy and productive nature of the tree renders it particularly valuable for the climate of Britain. The medium size and usual form are represented by the accompanying outline, drawn from a fruit grown on a standard. It has, however, been grown to a much larger size. The eye is open in a broad shallow depression; stalk about an inch in length, with a moderately deep cavity at its insertion; skin partially russeted, interspersed with distinct pale grey spots; flesh yellowish-white, melting, and buttery, with a rich saccharine flavour. It ripens sometimes in the end of November, and it has been seen in good perfection in the middle of January. The branches are inclined to grow in a pendulous direction, and the tree is well adapted for standards. It ought to exist in every collection. It is sometimes called Hacon's Norfolk Incomparable, and also Downham Seedling.



MEDIUM SIZE FROM A STANDARD.

AMATEUR'S GARDEN.—No. XI.

CAMELLIAS are now coming fast into bloom, and their great beauty is sufficient to make every one anxious to possess them. There is a method of growing them practised in the Garden of the Horticultural Society of London, which is peculiarly well suited to those who have not the convenience of a greenhouse or conservatory, and which proves that these plants are really much more hardy than is generally supposed. They are planted out in a common brick pit, which is not heated in any way, and have no other covering all the winter, except a mat thrown over the glass; in summer the sashes are removed and the plants fully exposed to the weather. They have been in this situation for many years; and in a severe winter, such as 1837-8, the temperature must have been frequently at zero, yet they have remained in perfect health, and are covered with flowers every spring. Those persons who complain of the buds dropping before they expand, or who cannot succeed with them in the greenhouse, should put a few young plants in a situation of this kind, taking care to drain the pit if the ground is wet, and water them well until the roots strike into the soil; afterwards they will require scarcely any attention, except the protection in winter above described.

If the directions have been attended to respecting the potting and growing of things intended to ornament the flower-garden during summer, many of them will now be in a state from which cuttings can be taken. Nothing is more splendid than masses of Verbenas, Heliotropes, Anagallis, Petunias, Salvias, and such-like plants, which, after being planted out in May, produce a succession of flowers all the autumn until the frost destroys them. The stems of Salvia patens will now look withered and dead, but upon examination, the roots will be found either growing or ready to start, and will soon send out a quantity of excellent cuttings. Dahlias which have been put into heat will have cuttings ready to take off, which can be put singly into small pots and grown as strong as possible before the time when they can be planted out with safety. After keeping them close and warm for a short time, give them gradually a little air in order to harden them, keep them near the glass, and take care that they do not get long-jointed and weak. Annuals which have been sown in pots for early flowering should either be thinned or potted off, and gradually hardened in order that they may be planted out soon, and flower in the beds or borders before other things which are more tender. A few of them can be sown in the open ground; beds or masses of each produce the best effect.

The shifting of greenhouse plants should be finished as soon as possible, in order that the roots may get hold of the new soil before the summer. Those which it has been necessary to disroot should be kept rather close and warm for a few days after the operation. Pelargoniums which have not been shifted since the autumn should be repotted now, and where the leaves are too thick, some of the worst may be removed and the stems staked out in order to give the whole more room to grow. Plants generally will require a greater supply of water, and will be much benefited by a shower over the leaves with the syringe early in the afternoon. These directions apply equally to such as are grown in rooms, and the whole must be kept free from the Green-fly by using the means formerly pointed out.—*R. F.*

HOME CORRESPONDENCE.

Mortlock's Satirist Dahlia.—We, at last, have heard from Mr. Mortlock. He says his Satirist is the same as a flower sent us anonymously last year, and noticed under the signature of *A. S., Cambridge Heath*, on the 25th of September last. We perfectly remember that flower, which was, as far as we could judge from a single bloom, a very fine sort. It was, also, accompanied by a far inferior variety. Our readers will, however, observe that we have no means of identifying "the Satirist" Dahlia with either of these varieties, nor do we know anything further about the matter than is here stated.

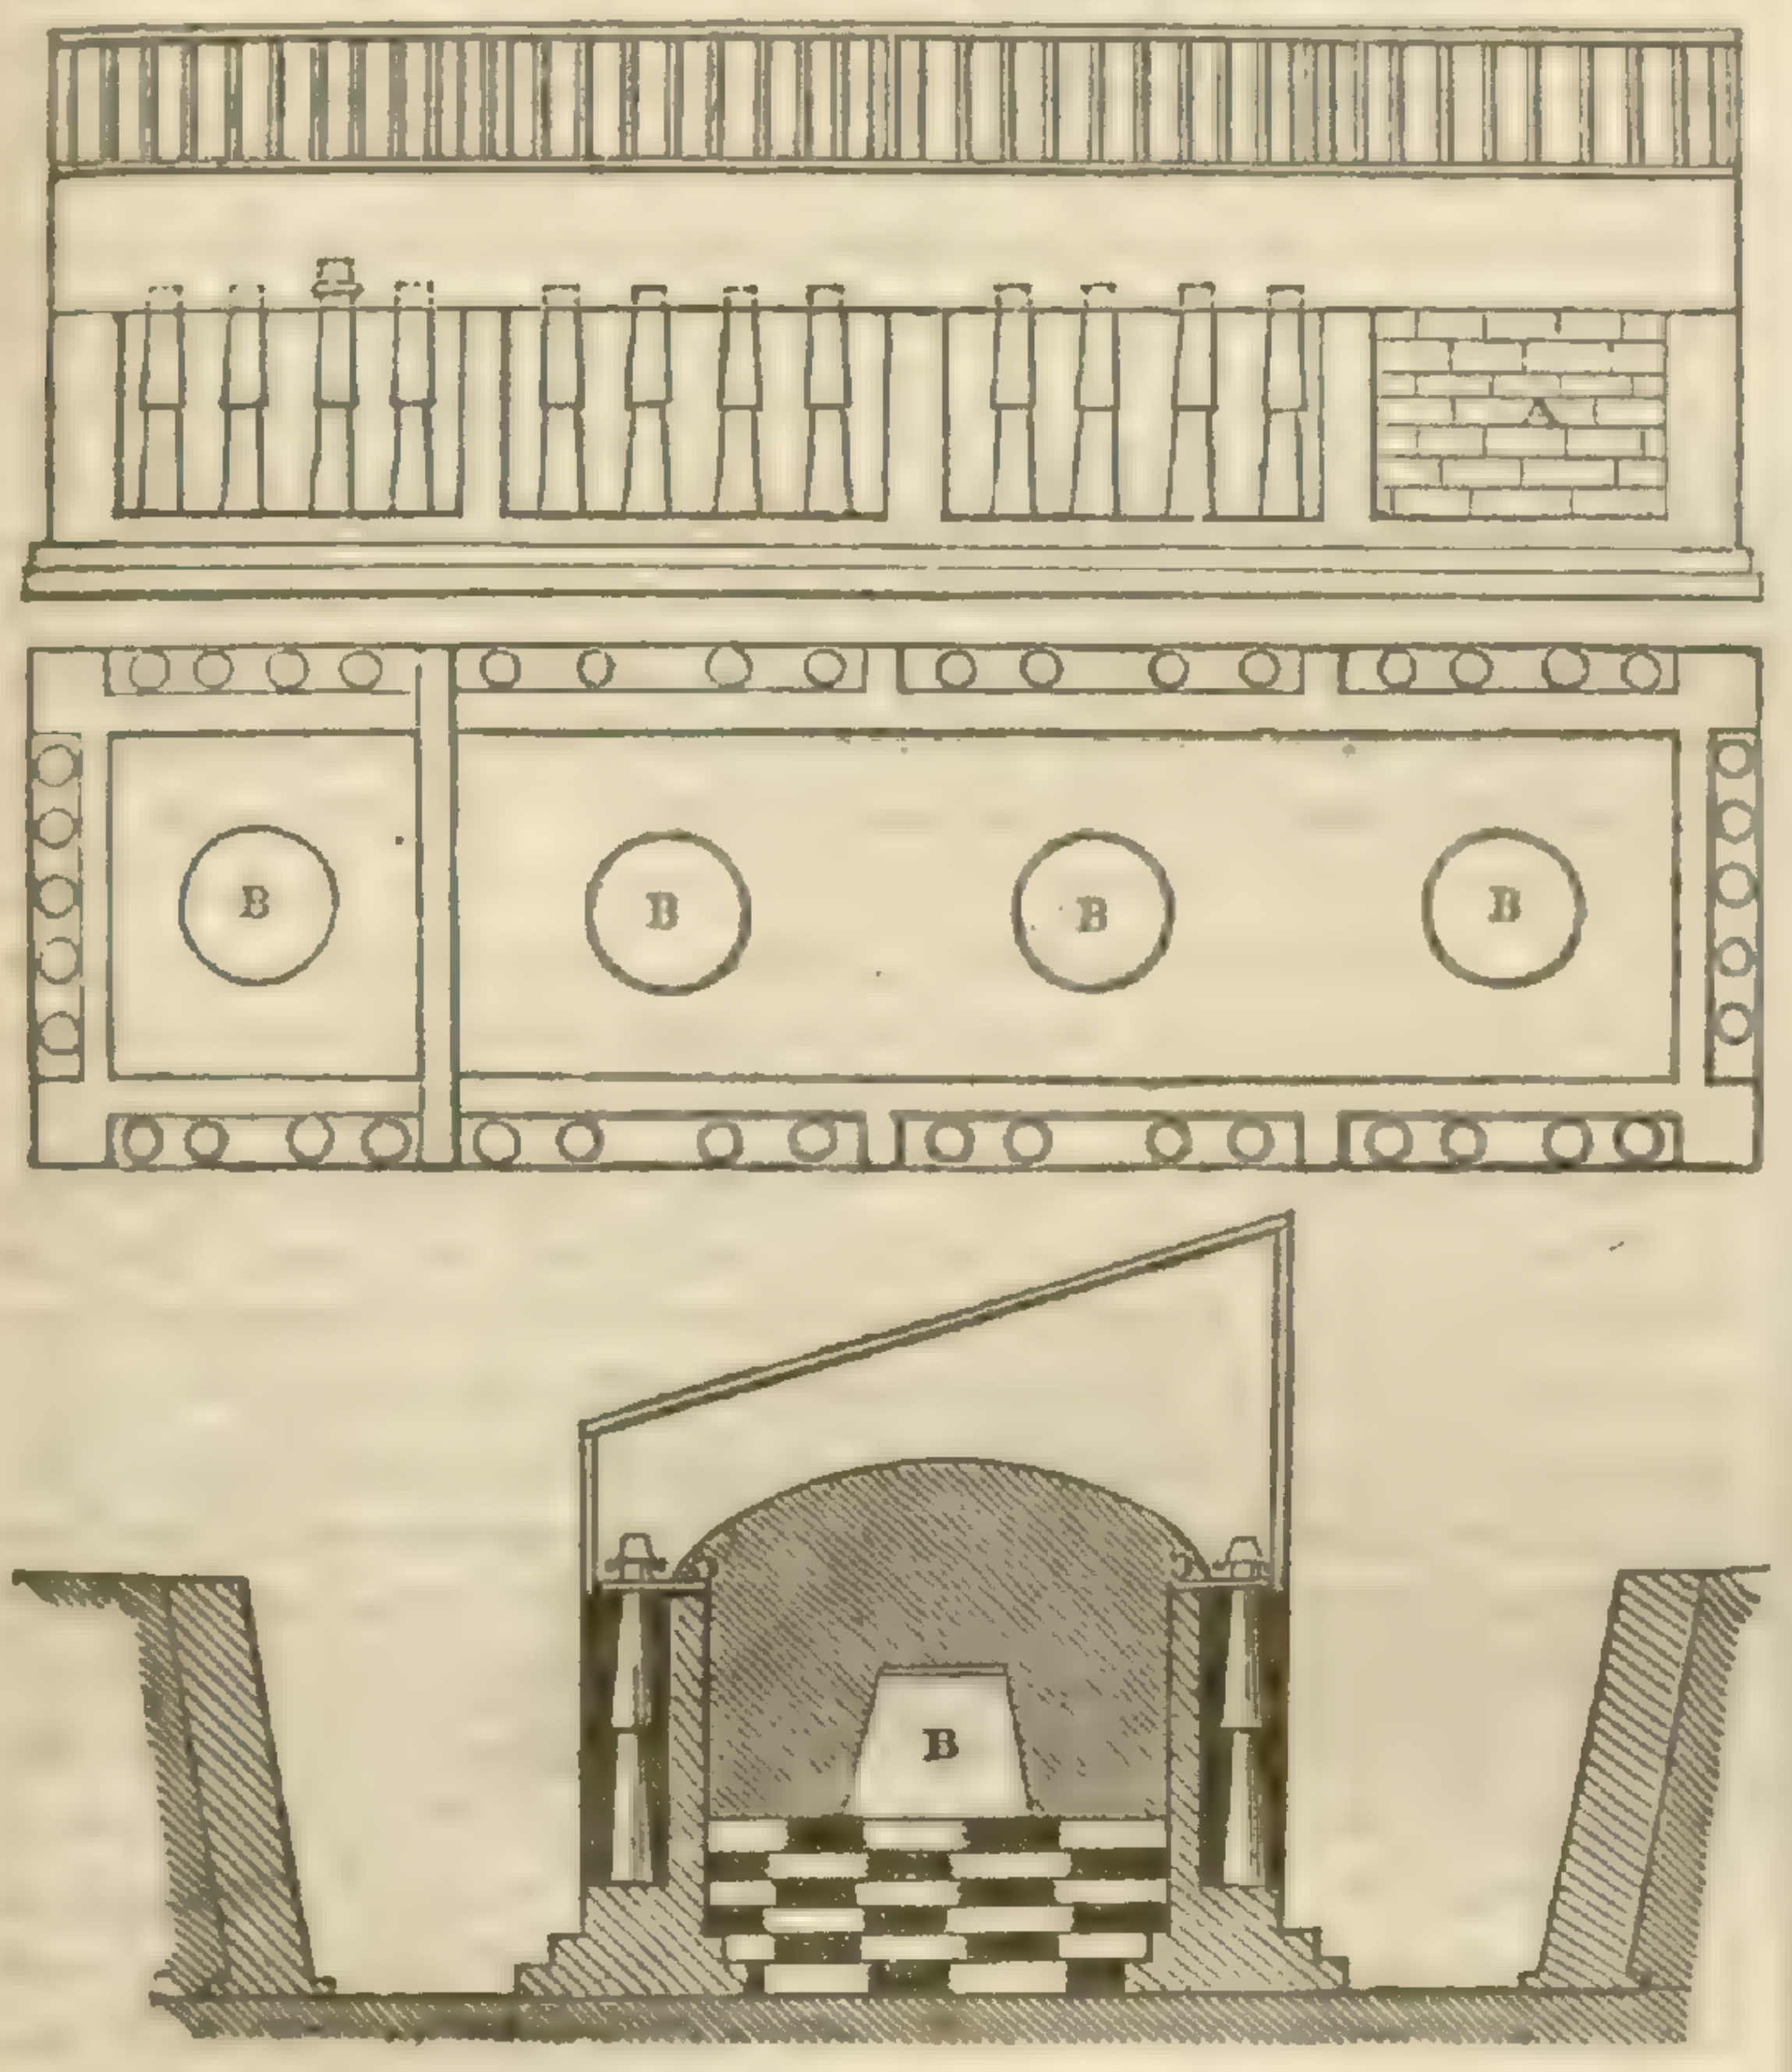
Impregnation of Cucumbers.—I perceive that you insist on the necessity of impregnating Cucumbers. In this opinion I have the misfortune to differ from you. In my treatise on the Cucumber, pp. 16, 17, I have stated my conviction that, in so far as the production of fruit is concerned, impregnation is "neither good nor harm;" and I have cited in proof of this a brace of fruit which I cut on the 8th of February, 1840, each nineteen inches long, which had never been impregnated, for this all-sufficient reason, viz., that at the time the female flowers were expanded, I had not a male blossom on the premises, and consequently no impregnation could take place. I have cut since that time hundreds of fruit, the flowers of which never expanded, and the same has been done by several of my acquaintances. In fact, so convinced am I of the uselessness of impregnation, that I, Mr. Wilson, Mr. Spivey, Mr. Judd, and my father, will undertake to produce at the May fête of the Horticultural Society from ten to twenty brace of fruit, as good as can be obtained by impregnation, the flowers of which shall be removed from the fruit before there is any chance of their being impregnated. I mention a number of gardeners, in order to show that I do not make this statement on my own experience only, but on the corroborative evidence of gardeners of considerable experience. All the fruit that I have cut this season, which had been impregnated, have been deformed, while those which have been left to themselves have been perfect in every respect. When I called upon Mr. Wilson on the 18th Feb., he told me he had cut three fruit from one joint, one $13\frac{1}{2}$ inches, the second 12, and the third $11\frac{1}{2}$ inches in length, none of which had been impregnated; and he pointed out to me several fruit swelling at that time, the flowers of which were mere abortions. On the contrary, Mr. Spivey, gardener to J. Tharp, Esq., Chippenham Park, with the finest plants I ever beheld in January, and the most careful impregnation, could not get a fruit to swell. How was this? I will not say that impregnation was the cause of Mr. Spivey's fruit not swelling; but this I will say, Mr. Wilson's swelled perfectly where impregnation was impossible. But to investigate the case more closely, and to trace effects to their causes: if impregnation is perfect, that is, if there is a cohesion of the fructifying particles, without which, I opine, there can be no impregnation, ought not the result to be the production of seed? But how often do we find that after the most careful and reiterated impregnation, no seed is produced, and yet the fruit will attain, according to the kind, from one to three feet in length! For my part, I am disposed to think, that where long fruit is desired, impregnation is positively injurious, because if seed is the result of impregnation, the energy of the plant will be expended in perfecting the seed, instead of in the production of fruit, as every practical man knows that the production of one seed from it will weaken the plant more than a dozen of fruit fit for table. There are instances in nature of plants perfecting their fruit without impregnation, as in the different varieties of Figs; and why not the Cucumber do the same? I have not taken up this subject for the sake of cavilling, but merely to elicit the truth, and if it can be proved that I am in error, no one will more thankfully stand corrected. *W. P. Ayres, Place Garden, Soham, Cambridgeshire.*

Cobæa scandens, hardy.—In the last number you state that Cobæa scandens is a tender plant, and will not survive our winters out of doors. I know that this is generally the case; but were it protected a winter or two, until the stem had become properly hardened, and acquired a woody consistence, it would be converted into a perfectly hardy plant. In proof of this, I may mention that at St. Feock, near Falmouth, the front of the Vicarage House is entirely covered with a gigantic Cobæa, which never receives the slightest protection, and annually produces thousands of flowers and fruit. The stem of this specimen is as large as a man's leg, and the flowers are brighter coloured than is usually the case. Intertwined with the common Passion-flower, it produces a very beautiful effect during the summer and autumn months.—*Boughton Kingdon.* [No doubt, if the stem was preserved in the manner described, that Cobæa would live for many years out of doors near Falmouth; but we doubt if such a result would be obtained in other parts of England, where the climate is not so mild.]

Cucumber Frame.—The frame described below is one of the best for forcing Cucumbers in with dung that I know of. The plans show the pit I have now in use, the frame being carried on pillars of brickwork; and in the divisions between these pillars are pipes or tubes of common earthenware, 4 inches in diameter, which may be made larger or smaller, as may be required; and on the top of the pipes I place a small garden-pot, when it is necessary to alter the soil: this prevents the admission of soil into the pipes. I find that the introduction of these pipes causes a considerable increase of heat, and when I uncover the frames now in the morning, the thermometer stands always about 80 degrees, the variations of heat being very slight. The brickwork behind all the pipes should be made open at the end joints, for the first four or five courses of bricks. I would have made the openings in the brickwork much larger than shown, had it not been that I am troubled with rats. The circles, B, on the ground plan, are Sea-Kale pots, 18 in. diameter at bottom, and 9 in. at top, which stand upon open brick-work, as shown by the section, the whole of the bottom part of the frame to the height shown on the section being filled with open brick-work for the admission of heat.—*P. Watson, Stoke Rochford, Colsterworth.*

---

* Mr. J. F. Clarke, Princes-street, Soho.



On Protecting Material for Frames, &c.—Every one is aware of the singular unfitness of the common mat for the use to which it is generally applied of covering frames, and protecting trees on walls, &c. It is so open in the texture, that in windy weather I have had considerable doubts whether the plants were not injured by the draft of air through the interstices of the weaving. Mats are heavy, easily wet, rot and decay, and are in every way so perishable, and consequently expensive, although the first cost is not much, and their qualities are so deficient in what they should be, that it is surprising that the gardening portion of the community should not have sooner thought of other substitutes for them. The asphalte felt is no doubt admirably suited to the purpose, where much warmth is required, and where weight is no object; but the fixed frame necessary for nailing it on, is disadvantageous and cumbersome to move about or put away when not wanted, and the expense rather heavy, between the material and the joiner's work. I have made some experiments in finding a lighter substitute, and find that common rick-cloth, as made by the village weaver in this part of the country at 1*s.* the square yard, is well suited to the purpose, when prepared in the following manner:—It is nearly waterproof in itself, and a coating made of nearly equal parts of resin and melted fat, with a small proportion of bees-wax—say one fourth, and laid on hot, will make it completely so; and at the same time prevent the air passing. This mixture dries almost as fast as it is laid on, and from the nature of the ingredients the cloth remains supple, and may be rolled up on sticks, and put away in any manner required. The use of the resin is an antiseptic to protect the canvas, which the fat alone would soon cause to decay. The bees-wax is to give consistency to the other substances, and prevent their running in hot weather, and also to keep the canvas pliant. The expense of these ingredients is trifling, as common kitchen fat purified will answer the purpose, the only expensive part being the bees-wax; but the whole ought not to cost more than 3*d.* to 4*d.* per square yard; for the doing which at 1*s.* the yard for the cloth will make 1*s.* 3*d.* This is rather more than the first cost of mats, but the duration will be at least ten, or perhaps twenty fold, if the cloths be taken care of, and a light coat be given at times. Paint has considerable disadvantages; not only the cost is considerable, but it requires great care and attention, consequently expense in the laying on. Cloths done with it decay at no distant period, owing to the oil. They are extremely liable to heat, and even ignite when put away in quantities; and by moving the cloths about the paint scales off: nor, if well covered, are they more than moderately pliable. In fact the mixture above-mentioned has the advantage over paint in every respect. I have tried mineral pitch, but it does not amalgamate well with the other ingredients. I have doubts whether it be not of too caustic a nature, and also prejudicial to the canvas. I have taken 1*s.* per yard as the price of the best cloth, but a very good kind may be made at 10*d.*, or even 9*d.*, probably good enough for the purpose. This material is admirably adapted for protecting Peas and other vegetables by nailing it on light frames, with copper or composition tacks; and when used for covering hotbeds or other frames, it should be so placed as not to be in contact with the glass, but to allow an interval between the two coverings and the glass—say 3 or 4 inches, in order to benefit by the non-conducting power of the atmosphere. It will answer admirably for protecting hand frames for tender plants in the borders; and when used for this purpose should be fixed on the frame, previously to applying the composition. From the great pliability of it, rollers can easily be used on the top of frames, for uncovering during the daytime; and no breakage of glass should take place, which so constantly happens with the Russian mats, and is so difficult to avoid. Lastly, were the material no better than the common ones, it has the advantage of employing our own industrious poor in the fabrication.—*S. J. W.*

Potatoes.—In the latter end of July, 1834, I had a quantity of small Potatoes or Chats, of the kind called Shaw's; and about 60 rods of land on the farm being vacant, of a stiff clayey soil, well known in this neighbourhood as the Low Grounds, it was ploughed and planted with them. They were taken up about the 1st of Nov. following, and housed along with other sorts for the use of the family, no particular attention having been paid to their culture. When sent to table in December, they were found to possess the qualities and flavour of excellent New Potatoes, and which they retained. I was frequently complimented by visitors in January, February, and March, on the goodness and fine flavour of my New Potatoes. What was done by chance the first year was done by design the following one, and with the same results. Where it is desirable to have Potatoes of this description in winter, they may be abundantly obtained by planting whole sets late on a cold damp subsoil, allowing sufficient time in the autumn, before frosts set in, for the formation of tubers, of sufficient size and texture; and when taken up, to be kept at a sufficiently low temperature, in a dark, moist situation, during the winter, to prevent the ripening process. I do not mean to say that any kind of Potato will answer for this purpose; but such is the fact with regard to the Shaw.—*James Falconer, Cheam.*

Chapman's Potato.—In the *Chronicle* of March the 5th there are some remarks by Mr. Chapman, in answer to an article on the production of New Potatoes, by Mr. Gordon. Those remarks are, in my opinion, written in such bad taste, and cast such a censure on me and some other gardeners, that I think it incumbent on me to reply to them. With the dispute as it stands between Mr. Chapman and Mr. Gordon I have nothing to do, and from what I know of the latter he is well able to fight his own battles. However, as Mr. Chapman complains of an assertion of Mr. Gordon's as a "gratuitous assumption," I would beg to ask him, whether it is not a "gratuitous" as well as an unjust "assumption" on his part to assert that the plan in question is never followed by "good gardeners." Does Mr. Chapman mean to assume that because a person produces new Potatoes by a different method from that recommended by him, he is consequently a bad gardener? Now, as far as I am able to judge from what I have read of Mr. Chapman's Potatoes, his round one is nearly identical with one which I saw cultivated some ten years ago in Lincolnshire; if so, I believe we can produce as good Potatoes by this old method as by Mr. Chapman's, and that with as little trouble and expense. The objection as to the trouble and expense of covering them with leaves &c. in the open ground can, I think, also be avoided, as they may be taken up and stored away in nearly the same manner as the general crop. I have, however, only done this to a small extent, and then they were mixed with mould. I beg also to deny the accuracy of Mr. Chapman's assertion, that Potatoes produced after the method recommended by me in the "Gardener's Magazine" are "soapy," unless that assertion applies to them when grown upon ground of Mr. Chapman's description. I beg also to state that the Potatoes produced by me according to this method, have not only been eaten, but admired, both by my late and my present employers.—*A. Saul.*

Potato Salad.—In your Cottage Gardening, when you are giving directions as to the cooking and use of sundry vegetables, perhaps you might add a mode of making a Potato salad, much used in some parts of the Continent, and which would not only be useful to the cottager, but is thought by many to be delicious eating, particularly with salmon, or fish in general, or, indeed, anything else. The mixture of vinegar, oil, mustard, salt, and hard egg, is the same as for common salad, and, according to taste; the Potatoes are sliced when cold, with Beet-root also sliced. The cottager may merely use the vinegar, salt, and mustard, and add sliced Onions.—*J. D.*

The Martin.—There is scarcely anything more pleasing or innocent in itself, more calculated to impress upon the human mind the wisdom and goodness of Providence, than the study of Ornithology; and the thanks of your readers are due to Mr. Beck for having broached the subject. I am, nevertheless, conscious that it will be impossible, in a paper dedicated to horticultural pursuits, to enter fully into all the descriptive minutiæ of the feathered tribe; still it is probable many contributors, during a life of either toil or pleasure, have some anecdote or fact to relate, illustrative of the habits of the British songster, and calculated to show in what manner and to what extent these little depredators levy their contributions upon the produce of our gardens, and the benefits we derive from them in return. Let me take the Martin, or Window Swallow; a bird which does no harm to either man, fruit, blossom, or flower; whose arrival is the harbinger of a period dear to the florist; whose domestic habits and social disposition demand our utmost care and protection—and amply will any attention to their welfare be repaid by the destruction of myriads of gnats and other noxious insects. The Martin is easily distinguishable from other species of Hirundo by the snow-white patch upon its rump, and neither soars so high nor flies with such velocity as the swallow, but may be seen taking a middle course, and, as it were, gracefully floating through the air, with expanded wing, in search of food. The Martin arrives in this country about the end of April, and commences building in the middle of May, always choosing the eaves of houses or corners of windows for this purpose; and the careful mode in which these industrious architects perform their labours is truly astonishing and well worthy the observation of every individual. Its love for the habitations of man is predominant; White mentions that "upwards of fifty years ago he had seen their nests in the Borough, Fleet-street, and in the Strand," and although "the light of other days has faded," numbers may be observed busily employed in the Regent's Park and its vicinity. When once established, they frequent the same abode year after year, and are very tenacious in maintaining their position; and many amusing anecdotes are related of their sagacity in repelling the attacks of the sparrow, who is at all times but too willing to avail itself of a ready-furnished residence. The Martin lays from four to five white eggs, and has two broods in a season; whilst in motion their note is indicative of pleasure, and White says they "twitter in a pretty inward soft manner in the nest." They leave this country in vast flocks about the beginning of October, and for a few days previously may be seen collecting in swarms. What becomes of them, however, is a matter of doubt, but certain it is immense numbers must be destroyed, or do not return, for the arrivals in April bear no proportion to the birds that quit us in the autumn. I will conclude with one more remark: I know it is customary for the embryo sportsman, on his return from school, to wage incessant war against these harmless and most useful birds; should this meet the eye of such a one, let him but reflect for only one moment on the cruelty of the pastime, and I feel assured he will at once display his own skill and the excellence of his Manton upon some other bird whose habits are really destructive.—*C. K.*

Stopping Vines.—Vines may be stopped close to the fruit without receiving any injury, indeed, it is the best system for pot culture; the peduncles are strengthened, the berries produced are equal in flavour to those Grapes which are grown on Vines stopped one joint above the fruit; and it seems to lessen the liability of portions of the bunches to die before they ripen.—*W. Brown, Merevale.*

The Preservation of Peas from Mice.—I have rubbed some Peas with powdered rosin, as was sometime since recommended, and I do not find that they have been touched by mice.—*A North Devon Amateur.*

Violet-coloured Glass.—This being the seed-time of floriculturists, I beg to impress upon them the importance and utility of violet-coloured glass in promoting (and in some instances, as it would appear, as the almost necessary agent in effecting) the germination of seeds. The effects of this discovery have already been fully detailed in the first volume of the *Gardeners' Chronicle*, many striking instances of its effects have been transmitted to me; and I now beg, *en passant*, to record an interesting one, recently communicated by Mr. Smith, the curator of the Hull Botanic Garden. He sowed the seeds of the Teak-tree (naturally of difficult germination), which remained between two and three years in the seed-pan, without showing any signs of growth; he now placed over them a shade of the coloured glass, and in two or three weeks every one vegetated. Stained glasses of the common form may be employed; or, when the slight additional expense is an object, a single square of the violet-coloured glass may be placed on the top of the flower-pot in which the seeds are sown. I am anxious to draw the attention of the cultivators of Orchideæ to the effects of violet-coloured glass, since many of these plants, extraordinary in their habits, as they are in their beautiful and endless forms and colours, naturally growing in genial climes, and under warm, tinted skies, seek the shade, now lying dormant and now quickly starting into all their gay luxuriance; should we not greatly enhance our success in their treatment here, did we attempt more to imitate, more to supply, as it were, the influences which naturally surround them? To this end, were the lights of the Orchidaceous house glazed, partially at least, with this glass, the effect would, I feel confident, be as beneficial as it would be beautiful; not only as affording partial shade, but as transmitting a light which possessed a subtile action in exciting vegetation; and thus proving, in all respects, an admirable auxiliary to the artificial heat and moisture necessarily employed in their culture.—*F. R. Horner, M.D., Hull.*

Charcoal Dust, a Preventive of the Grub in Onions and the Club in Cabbages.—In the *Chronicle*, 1841, is a paragraph, stating that charcoal-dust will prevent the grub and mouldiness in Onions and the club in Cabbages, but no experiments are mentioned nor any reasons given; the advice, therefore, was not likely to be generally acted upon. It would seem, however, from a paper in the Horticultural Society's Transactions, that there is little room to doubt the value of charcoal as a prevention of these evils. The author (Mr. T. Smith, of Walsington) had nearly the whole of his crops of Onions destroyed by the grub for several years. He tried several experiments to prevent this, and found charcoal-dust the best or only remedy. He tried it on half a bed, on different beds near to each other, and in different parts of the garden, and wherever it was applied (and he had then used it six years) his crops of Onions were good, and free from the grub; but the produce of the beds on which no charcoal was laid was more or less affected, and in some instances nearly destroyed. Mr. Smith found that Cabbages planted on the charcoaled beds were comparatively free from the club. If charcoal is found to be thus efficient in all soils, it is, doubtless, highly desirable that a fact so useful should be generally known; the depredations of the grub being neither few nor far between, and attended with great loss and disappointment. I wish, therefore, to inquire if any of your readers have used charcoal in the culture of Onions and the Cabbage tribe, and what were the results; and also whether any one can give a satisfactory explanation as to how the charcoal acts. On reading Mr. Smith's Paper, it occurred to me that as charcoal gives out carbonic acid gas in burning, it might probably be decomposed when laid on the soil, and that a quantity of carbonic acid would thereby be generated and exist in the layer of charcoal and soil, sufficient to kill or annoy the insects; and, therefore, to prevent the deposit of eggs in the Onions and the stems of the cabbages. On referring, however, to Liebig, I find that "carbon" (and I suppose charcoal will be included in this) "never combines at common temperatures with oxygen, so as to form carbonic acid;" but "charcoal," he observes, "is known to possess the power of condensing gases within its pores, and particularly carbonic acid. And it is by virtue of this power that the roots of plants are supplied in charcoal with an atmosphere of carbonic acid and air, which is renewed as quickly as it is abstracted." So that, although it is doubtful whether the charcoal is decomposed as I imagined, still it is probable that the insects are prevented from depositing their eggs by the presence of carbonic acid in the soil. If I am not mistaken, it will be generally found that the eggs are deposited in parts below the surface of the soil, both in Onions and the stems of Cabbages. If the observations of Lucas, in Liebig's work, be correct, that charcoal in which plants have been grown becomes in time reduced to a soft brown substance, it is evident that it must by some means or other have been decomposed. And Liebig observes, "the decay of woody fibre is very much accelerated by contact with alkalies or alkaline earths, for these enable substances to absorb oxygen which do not possess this power themselves." Mr. Smith's garden was a wet, stiff soil upon a strong clay; he laid the charcoal on the beds about half an inch thick, and mixed it with the top soil by scuffling with the spade. Is it not probable that the charcoal would be decomposed to some extent by being mixed with this soil? All clays are said to contain potash.—*John Townley.*

Celery.—Mr. Paxton, p. 90, recommends Celery to be grown in double rows in one trench; this may suit the cottager who has but a small plot of ground for that purpose, but he who intends growing Celery to the weight of 5 lb. each plant, must plant in single rows, and 10 or 12 in. apart. The rows ought not to be nearer to each other than four feet, to afford sufficient soil for earthing. When Red Celery is full-grown, before it is much earthed, it is impossible to blanch it sufficiently for the table in less than twice the time Mr. Paxton states. If early Celery is to be well blanched, it must undergo the operation as it grows, always taking care to keep the heart free and open. Care is seldom taken, when transplanting into the trenches for the general crop, to remove the minute suckers which frequently surround the plants; they should always be examined a second time, and trimmed, if required, before the first earthing. The suckers weaken the plants, spoil their appearance, and ought to disqualify them for exhibition when shown in that state. The first embankment raised in earthing Celery should be about 18 inches broad on each side of the row, inclining towards the plants at an angle to suit the wetness of the season; by this means most of the rain falling upon the embankment may be drained towards the plants. The breadth of the earthing must be contracted as it advances in height. The too common mode of earthing has a contrary effect.—*A Constant Reader, Sheffield.*

Gesnera elongata.—The statement that Gesnera elongata was a greenhouse plant has excited several remarks. I ought perhaps to have said that it succeeds better in a medium temperature between a stove and greenhouse than in the former; I was careful, however, to mention the degree of heat, 55°, to prevent any misconception. I tried the experiment, because having only one small forcing-house, I have little room for stove plants. The greenhouse is divided into two by a glass partition; the largest is kept about 40° or 45°, and contains some fine Orange-trees and other greenhouse trees and plants; the other is smaller, and communicates with the library by glazed doors; it is kept much warmer, and this is the kind of place which suits the Gesnera. It is an object to fill the latter partition with gay flower-plants in winter, and the following is a list of what it contains, most of them having been in flower during the last two months:—Cacti, Camellias, Cinerarias, Daphne ordorata, Epacris, Fuchsias, Gnidias, Heliotropes, Hóvea Celsi, Ipomœa Leárii, Jasminum grácile, Kennédias, Lobélia cærúlea, Magnólia anonæfólia, Myrtles, Myrtle-leaved Oranges, O'lea fragrans, Prímula sinensis, Neapolitan Violets, with forced Hyacinths and other bulbs; Azálea índica and póntica, and some Rhododendrons. Chamærops húmilis is in high health in the same house, but I confess that Euphórbia fulgens and splendens do not succeed at so low a temperature.—*C. D.*

Feeding Bees.—If "A Young Bee-keeper" will refer to pages 197 and 202 (1841) of "the Honey Bee," he will find that I have cautioned apiarians against feeding their bees in cold weather; and at p. 205 I have recommended that all families requiring to be fed should have the quantity needed made up to them, soon after Michaelmas: but where necessity makes winter-feeding imperative, I have in p. 199 warned my readers against allowing their bees to have admission into any of the grooves of my feeding-trough, and have described a method of preventing it. If this precaution had been attended to, none of the bees would have been drowned, though they might have been chilled to death in severe weather. Of Dr. Dunbar's feeder I cannot speak from my own experience, but during my long-continued correspondence with him, he has never once dropped a hint at such a consequence from the use of it as your correspondent mentions; I attribute it therefore to its having been had recourse to in cold weather, and having been allowed to remain too long over the bees.—*E. Bevan, Llanferry.*

Whitethorn.—Your correspondent "P." states among other rules for making good hedges, that where the hedge has reached its full height you should trim it level at the top, &c. A friend of mine was telling me some time since, that his neighbourhood (Tunbridge Wells) was famous for its hedges, and that was attributable to the prevailing mode of trimming them, more especially as to the tops, which were cut slantingly, so as, as much as possible, consistent with beauty, to resemble the roof of a barn, by which means no lodgment was afforded to snow or rain, which so often will weigh down and disfigure the picturesque forms of trees and shrubs upon a level top. Perhaps you will be so good as to say who is in error, "P." or my friend, or neither.—*R. W.* [We do not attach much importance to this part of the management of hedges; perhaps slanting sides are better than upright ones. See a paper by "W. K.," at p. 110.]

Whitethorn.—With reference to a correspondent's account of Whitethorn propagation by roots, which appeared in the *Gardeners' Chronicle* of 22d Feb. last, I beg to say in the year 1825, a local paper announced that a Mr. Taylor, near Manchester, had communicated to the Society of Arts a precisely similar method, and probably both allude to the same gentleman; be that as it may, I followed Mr. Taylor's plan, growing a considerable quantity, and found that though grubbing up and preparing the roots occupied a great portion of time, vegetation commenced forthwith; while the seeds lie dormant nearly two seasons, one in the sand and one in the ground. Yet I do not think, though root pruning is a popular system, old fences would be improved by depriving them of a portion of their roots every two or three years; upon a small scale it may answer, but certainly not extensively employed, or in the trade. The ends of the cuttings must be marked, or many will be planted invertedly; this is tedious; they must also be duly watered. But, after all, many will fail, at least such has been the case with me.—*Cratægus, Hereford.*

Planting.—I perused with great satisfaction the observations contained in the last week's *Gardeners' Chronicle,* upon the injudicious method of planting timber-trees thick upon the ground—a method both injurious to the trees themselves, if not thinned regularly every year, and, in an economical point of view, very extravagant. But lest your observations should lead planters into an opposite error, namely, that of placing their young plants, just removed out of a nursery, too far apart, I venture to submit the result of my own experience, which has now extended over thirty-five years. There are, of course, two ways of raising a wood, either by sowing the seeds or by transplanting from the nursery; the latter is the most usual, and to it I shall confine the few remarks I am about to make. In the limited space of a nursery ground, the plants must, of course, have been raised from the seed-bed in a crowded state, and although they may have been removed several times, yet still it must be admitted that they were thickly planted whilst in the nursery; now, if these plants are placed very far apart in the situation where it is intended that they should grow permanently, and the intervals between them not filled up with some other plants of a different kind, I fear that one-half of them will scarcely endure beyond the first year that sudden change of temperature to which they have been subjected. I have found that as many trees have been lost by this plan as by that of too close planting, and to remedy the evil I have occasionally planted Potatoes in the intervals between them; but there again another inconvenience has arisen, from the disturbance of their roots at the time that the Potatoes have been taken up. I am convinced that the best mode of planting is to place the plants, intended for timber, three or four yards distant from each other, and to fill up the vacant ground between them with shrubs and under-shrubs. In dry soils, Hazels, Thorns, and Furze, are well adapted for this purpose; and in moist ones, Alders, Willows, and Privets. The latter I have found very well adapted for a covert for game; but if it is an object to make the underwood profitable, of course that sort of underwood must be cultivated for which the best market can be found. The young timber trees, thus surrounded in their infancy, grow rapidly, and generally overtop their more humble companions, even although the proper thinning should be for some time neglected. But, after all, plantations, if they are to be either profitable or ornamental, must be regularly inspected every three or four years; and the Oaks and other valuable timber trees must constantly have room for their heads and trunks if any ultimate advantage is to be expected from them. In corroboration of the benefit arising from underwood to a certain extent, we generally find hedge-row timber both the stoutest and most valuable of any.—*O. Mosley, Rolleston Hall.*

Heating by Hot Water.—"A. W.," in p. 86 (1842), makes some inquiries respecting the cooling power of glass under different circumstances in houses heated by hot water; and I am happy to give him what information I possess upon the subject. From Mr. Hood's treatise on heating buildings by hot water, I, in common with "A. W.," have derived great advantage; for in all that is touched upon in it relating to this subject, I find it surprisingly accurate. I do not, however, find in it any mention of the subjects your correspondent inquires about; nor do I see how any very precise results can be obtained. The inquiry is, how much less heat is lost by covering the glass of a house with boards, straw, mats, &c.? Now the only answer to this is, that if the covering be sufficiently thick, it will obviously prevent all loss of heat, the same as a brick-wall would do. Dr. Wells, in his experiments on dew, found that a cambric handkerchief supported six inches above the ground, caused the ground at that spot to be 8° warmer in a clear frosty night than the surrounding ground which was not so protected. But with glass the cooling process arises from two causes, viz., radiation, which is increased by a clear sky; and conduction, which is much affected by the force of the wind. By placing the covering as close as possible to the surface of the glass, the greatest saving of heat will be effected; because, by this means, both radiation and conduction by the air will be, in a great measure, prevented. By a good covering of wood, or thick straw, I have no doubt fully two-thirds of the ordinary loss of heat may be prevented; and I think it may safely be assumed in practice that the saving will be quite equal to one-half—that is to say, that the loss of heat from glass so covered will only be one-half what it would otherwise be, provided such covering fits tolerably close to the frames, without allowing any circulation of air between the glass and the covering. Of course, also, if the top only of a pit or house be so covered, the saving must only be calculated for the portion so treated, and not for the whole house. As regards your correspondent's second question, as to what is the difference in "the cooling effect of glass under different angles to the horizon?" it appears to me that he labours under a misapprehension. The loss by radiation must be the same at all angles; but the cooling effect of the wind will be greater on a high pitched roof than on one that is flatter, though I believe the difference in this respect (except inasmuch as it increases the length of the rafter, and, therefore, the cooling surface of the glass) will, generally, be too small to be of any practical importance. The effect appears to me to arise in this manner: the wind being supposed to move horizontally, the force with which it strikes the glass will be as the sine of the angle which the roof forms with the horizon; and the greater the force of the blow, the more particles will there be brought into contact with the glass; and this effect will be the same as that from an increased velocity of the wind. On this latter subject, Mr. Hood has given some interesting and ingenious illustrations in his book; and I think his rules for the cooling effect of wind at different velocities will apply to this question. He has shown the cooling effect of wind on glass to be as the square root of the velocity—or that the velocity must be increased four times to produce twice the cooling effect. Now, the force of a blow being as the square root of the velocity of the striking body, and as the sine of the angle of incidence conjointly, we shall find that if two glass roofs be severally pitched at 30° and 40°, the force of the wind upon them, at equal velocities, will be simply as the sines of these angles, or as ·50 is to ·64; this will be equivalent to increasing the velocity of the wind from 1·0 to 1·28, and the cooling effect will, therefore, be as the square root to these numbers, or as 1 is to 1·13. But this will only apply to that part of the heat given off by conduction—the radiation not being affected by this cause. And Mr. Hood has shown in his book, p. 85, that at common temperatures the loss by radiation from glass is nearly two-thirds of the whole effect; therefore, the loss by increasing the angle of the roof 10° will be one-third of the above amount, or about one-thirtieth more than a flatter roof would be. This effect of course is only on the roof—all the rest of the house being unaffected by this cause: therefore we are justified in concluding that the pitch of the roof makes but little difference in the cooling effect except by the increased length of the rafter.—*Richard Purceval.*

Heating Greenhouses.—Although so much is said in favour of the hot-water system for heating greenhouses, I am inclined to think that for small houses, and where fires are only occasionally wanted to exclude frost, the old plan of heated flues is more generally adapted. Such certainly is the case in this neighbourhood, as, with the exception of large establishments, and hothouses where fires are constantly wanted, there is no house that I am acquainted with heated in any other way. Probably this arises from the greater expense incurred from heating with hot water, which requires not only a greater outlay for boiler and pipes, but, where few fires are required, an after expense likewise, I should think, from the effects of rust on the iron. Believing, therefore, that heated air flues will be used still in many greenhouses, I send you an account of a simple alteration I have made in the construction of my fireplace, which has proved of the greatest benefit, consuming a smaller quantity of coals, and giving less trouble in lighting and attendance, as a good fire will keep in without any attention being paid to it for 12 or 14 hours. My fireplace was originally of the common construction, with a large iron door before the fire, and an open ash-pit below. It was situated outside, at one end of the back wall, from which a flue passed round the greenhouse, and terminated in a chimney by the side of the fireplace. The alteration I have made is the substitution of a cast-iron plate, tightly fixed into the brickwork in front of the grate, having in it a small door above the fireplace for supplying the fire with coals, and a small door near the ground for the ash-pit, with a hole in the centre so contrived that the air may be excluded or admitted as the fire requires, on the principle of Dr. Arnott's stoves. I have made no change in the flues; but the fireplace itself is surrounded, as in the Arnott stoves, with fire-bricks, and instead of burning the common coal I use stone-coal, which is the same kind as is burnt in lime-kilns and malt-houses, with this difference, that what is here called stone-coal is the large knobs, while culm, which is used in malt-houses, is the small particles of the same coal. The wall is excavated two or three feet above the fireplace, and the external air is excluded by a thin partition instead, which is built up with brick on edge, so that the top of the fireplace is chiefly within the greenhouse; and here I generally place large pans of water, to prevent the dryness of the air in the greenhouse when the fire is lighted.—*a. β. γ., Cornwall.*

PROCEEDINGS OF SOCIETIES.

AGRICULTURAL SOCIETY.

March 2.—H. Handley, Esq., in the chair. Eight gentlemen were elected. Col. Challoner, chairman of the finance committee, laid before the council the state of the society's funds at the end of the previous month, reporting the current cash balance in the hands of the bankers on the 28th of Feb. to be 1,340*l.* 2*s.* 8*d.*; and the amount of funded property, at the same date, 6,711*l.* He further reported, that the facilities of transmission and direct communication afforded by Post-office orders in the payment of subscriptions, had been found so satisfactory to all parties, that the committee having communicated with Mr. Pusey, had decided to recommend to the council the insertion of a slip-leaf in the next journal, pointing out to the members of the society the advantages of this simple mode of payment.—Mr. Pusey, M.P., then detailed to the council his views on the subject of the regulations for the exhibition of agricultural implements at the meeting at Bristol. The council then resolved "that the exhibition at the meeting at Bristol should be open to the admission of agricultural implements of every kind; all of which should be equally qualified, whether they had previously obtained prizes or not, to obtain any prizes which the judges may decide to award them, agreeably with the prize-sheet of the society."—The Duke of Richmond reported the progress already made by the house committee on the subject of a residence adapted to the purposes of the society, and the transaction of its official business. The noble duke said that the committee, not thinking that the society would be setting a good example to its members in making improvements until they could pay for them, had unanimously decided that it would be advisable to abandon all intention of undertaking the erection of such a building as would be worthy of the society and its objects, until their reserved fund was equal to so extensive an expenditure and outlay of capital, and recommended that a suitable house should, in the mean time, be selected and rented by the society.—Earl Spencer then brought forward his motion on the subject of the future mode of electing the council, and the confirmation of a new by-law for defining the terms and prescribing the form of the election; his lordship entering into a preliminary detail of the motives which had induced him to recommend this measure to the notice of the council at the present time. The noble earl expressed his perfect satisfaction at the result of the elections of council which had already been made at the general meetings, and with the united and devoted interest the members of these councils had evinced in promoting the objects and carrying out the business of the society; and his lordship therefore selected the present time as one in every point of view best suited to the important change in the mode of election and transfer of power to the members at large, he now recommended to the council for their adoption. However satisfactory might have been the result of the present mode of election, he considered the principle on which it was founded to be too narrow and restrictive for an executive department, entrusted with powers so extensive as those conferred by the charter on the council, and for the representative body of so numerous an assemblage of members, many of whom were so willing and capable of devoting their attention to its immediate interests by their attendance at its council meetings.—The Duke of Richmond expressed the satisfaction it gave him to second this important proposition of Lord Spencer, and instead of his grace's entertaining doubt as to the policy of the measure, he should have experienced even still greater satisfaction to have had this freedom of election supported and corroborated by some salutary restriction, self-enacted by the council itself on the exercise of its own powers, precluding the recommendation to the anniversary meeting of the re-election of so many of those members who went out of the council by rotation for the year, in order that new blood might be infused into their system, and the wants and wishes of the members at large of the society brought successively into notice by their representatives, who would thus from time to time be brought into office, and have their seats in the council. The president then put the question of the following new by-law, which was carried unanimously:—I. That the words in the present by-law, which direct that all elections shall take place by a show of hands, shall be omitted.—II. That the election of the president, vice-presidents, and trustees shall take place by a show of hands.—III. That the election of the twenty-five members of the council, who are to replace the twenty-five members who retire by rotation, shall take place in the following manner:—1. A list of the members of the council who retire by rotation, but who may be re-elected, shall be prepared on or before the 1st of May, for the inspection of members at the rooms of the society.—2. The council shall prepare a list of the twenty-five members whom they propose for election or re-election, which shall be printed on paper large enough to admit of additions being made to it; and a copy of this printed list shall be given to any member who applies for it of the secretary, either on the day of the anniversary meeting, before 12 o'clock, or on any of the three days (Sunday excepted), previously, between the hours of 10 and 4.—3. The voting shall take place by each member who wishes to vote giving in one of these lists, signed by himself, with such names struck out or added as he thinks fit, to the president at the anniversary meeting, before the commencement of any other business. When the lists have been given in, three scrutineers shall be appointed by the president, who will retire into another room, and inspect the lists which have been given in, and report forthwith to the meeting, in writing, the names of the twenty-five members who shall have the majority of votes; after which the papers shall be immediately destroyed by the scrutineers. If any of the lists should contain the names of more than twenty-five members, it will not be counted as a valid vote. No member will be allowed to vote who does not personally deliver his list to the president. In the event of an equality of votes, the election to be decided by the meeting on a show of hands.—Mr. Shaw brought forward his motion on the subject of carrying out the objects of the society in the most extensive and useful manner in the successive districts of the country in which the annual meetings were in future to be held; and having stated to the council the precise nature and bearings of his propositions, he moved that a committee should be appointed to consider the expediency of the plans he then laid before the council in reference to this subject.—The Duke of Richmond, having seconded Mr. Shaw's motion, the following gentlemen were appointed to form a committee for considering and reporting to the council their opinion on the expediency of adopting the suggestions thus proposed for their adoption on this subject, namely, Mr. Shaw, Duke of Richmond, Earl Spencer, Mr. Pusey, M.P., Mr. Miles, M.P., Mr. Pym, Mr. Baker, Mr. Gibbs, Mr. Hobbs, and Mr. Jonas:—1. To consider and report upon the expediency of the society's contributing a sum equal to any sum which may be raised by subscription in any district in which the society may hereafter meet; such whole sum to be given in prizes within the district, for cattle and implements especially required in that district; and to promote any other object, consistent with the objects of the society, which, in the opinion of the council, may be calculated to benefit that particular district. 2. To consider the propriety of offering a prize for the best cultivated farm in the district in which the society may meet; sufficient notice to be given to enable the competitors to go through the rotation—as, for example, that in 1842 a prize be offered for the best cultivated farm in the district in which the society may meet in the year 1846; in the year 1843 for 1847, in 1844 for 1848, and so on. That competitors be required to give a statement of the course of management and cropping during the two years previous to the commencement of the rotation, embracing the period of competition; to render a detailed account of the whole system of management as regards cattle and sheep, tillage and manure, produce, expenses, and proceeds during the rotation, with the value of the land and stock at the commencement and conclusion of the rotation. 3. To consider the propriety of offering prizes or medals, or both, for the best ploughing, and for the best performances in any other branches of agricultural labour, as sheep-shearing, hedging and ditching, drilling grain, rick-making, thatching, &c., improvement in which may be most needed in any district, such prizes or medals to be given in the year in which the society may meet in that district; general good conduct to be taken into consideration in awarding the prizes.—The secretary announced to the council that he had received numerous essays sent in by the 1st of March, to compete for various premiums offered by the society for the prize essays of the present year, on the several subjects selected by the council for competition; namely,—1. On the Drill Husbandry of Turnips; 2. On the Natural History, Anatomy, Habits, and Economy of the Wireworm; 3. On the Mechanical Properties of the Plough; 4. On Prognostics, or Natural Signs of Changes in the Weather; 5. On Cheese-making; 6. On the Rotation of Crops best suited for Light Lands; 7. On the Rotation of Crops best suited for Heavy Lands; 8. On the varieties of Wheat suited to different soils, in order to ascertain what is the best Wheat which each soil is capable of producing; 9. On the Food of Plants. The council decided that the journal committee should be requested to nominate the judges whose duty it would be to examine the different essays in each of these classes, and, after a careful scrutiny and mature investigation of their comparative merits, to award the prize to the most deserving, or withhold it altogether in case none of the essays of a class should be thought worthy of the premium. [The essays "On the best mode of curing butter for future consumption, and preservation in foreign countries," having been allowed an additional three months for their being sent in—namely, till the 1st of July—in order that the samples of butter might be obtained from grass-fed cows, milked between the 20th of May and the 20th of June of the present year, were not received on the present occasion.]—Mr. Pusey, M.P., announced to the council the desire of the Earl of Lincoln, her Majesty's Chief Commissioner of Woods and Forests, to promote by every means the objects of the society and the advancement of the agricultural prosperity of the kingdom; and that it had especially occurred to his lordship that it might be within the province of his department, in connexion with the office of Woods and Forests, to have an opportunity of evincing practically, as a first step, the interest he felt on this subject in rendering the museum of economic geology, already under the control of the Government, instrumental in effecting a great and essential work to the cause of agriculture, interesting alike to the geologist and the cultivator of the soil, as well as of national importance, from its influence on the resources of the country; and this was, to obtain at the expense of the Government, but under the immediate direction of the Royal Agricultural Society of England, a complete and systematic analysis of the soils of the kingdom; the various soils of the same geological formation in different parts of the country, and particularly those which had been found by experience to be best adapted for particular crops (as Wheat soils, Bean soils, fertile or barren soils, &c. &c.); to be taken in succession from one end of the kingdom to the other, obtaining 20 analyses of each particular soil, and thus procuring in the course of one year about 1,000 such analyses, all made by chemists of the first-rate character for analytical investigations of this kind, who would report not only the chemical constitution, but the mechanical texture and properties of each soil, and the whole published from time to time in the pages of the journal of the society. Mr. Pusey concluded by expressing his assurance that such a work would not only be of the highest interest and importance in an agricultural point of view, but would be a national undertaking worthy of the Government. The council then agreed to the following resolution, a copy of which they requested the President to communicate on their part, and with their best acknowledgments, to the Earl of Lincoln, for this proof of his interest in the promotion of the national objects of the society:—"Resolved,—That the council of the Royal Agricultural Society of England return their thanks to Lord Lincoln for the communication he has made to them of his desire to render the museum of economic geology useful to the advancement of agricultural knowledge; and beg to express their opinion, that a full examination and analysis of the various soils of the country, conducted systematically, as well with regard to their mechanical texture as to their chemical constitution, with reference to known similarity of their agricultural nature, and to any distinctive agricultural character which different geological formations may be supposed to possess, would be likely to produce a body of recorded facts, to which scientific inquiry might be applied with a reasonable hope of arriving at the determination of some general principles of cultivation."—Mr. R. Barker expressed to the council the satisfaction it gave him, as chairman of the Thames commission, to confirm Mr. Lawford's view of the desirableness of making inquiries respecting the wearing away of lands adjacent to rapid and other streams, such injurious effects being so peculiarly observable throughout the whole line of the river Thames under the management of the commissioners, that complaints were continually made to them of loss of land from the force of the stream operating against the banks; while on the other hand they scarcely less frequently found deposits of lands and shoals growing up where hitherto none had existed: and Mr. Barker adduced a striking instance of this change of place and surface effected by the Thames in its action on the adjacent lands. Some few years ago the commissioners had sold a small meadow of a certain extent, with the reservation to themselves in perpetuity of 18 ft. in width for the public towing-path: under which provision, while they continued to enjoy an adequate path, the owner's residue had decreased in extent by (he believed) nearly one-third. Mr. Barker could not pledge himself to the accuracy of the detail of this proportion, but he would obtain from their general surveyor, and have the pleasure of laying before the council, further facts confirmatory of the damaging effects of the river; as a very recent instance of which, Sir C. East, Bart., a member of the society, owning a considerable property in Berkshire, bounded by the Thames, had just had occasion to complain to the commissioners of extensive injury from this cause.—Mr. Blacker, of Armagh, having communicated to the Duke of Richmond, the Marquis of Downshire, Mr. Pusey, Mr. Shaw, and other members of the society, as well as to the council, a statement of the successful operation of his plan for improving the management of agricultural property in Ireland, consisting in the engagement of district agriculturists, or persons who shall be employed on estates, to ride over them and suggest improvements, especially in draining, giving confidence both to landlords and tenants in the expenditure of money; the papers connected with this subject were laid before the council at that meeting. In Ireland infinite service had been rendered to many of the districts, by placing Scotch and English stewards, at the request of the landowners, to go over constantly a certain number of acres, from 200 to 10,000, according to the size of the property and the views of the proprietor; the sum of 25*l.* to 75*l.* being given to each steward, and a horse allowed for the purpose of getting over much ground in a short time. Mr. Blacker intended that these stewards should act as agricultural teachers of the Irish tenantry, and proceed in the districts of the Poor-law unions, conceiving "that the agriculturist who has made himself acquainted with all the modern improvements in agriculture, must be a better judge of what they ought to do, in the cultivation of their farms, than what they can possibly be themselves, situated as they are in a remote part of Ireland, where modern improvements have not yet reached."

The council expressed the satisfaction it gave them to learn that this mode of improvement had been attended with so much advantage in Ireland, but they much doubted whether it would be favourably received or could be successfully applied in the agricultural districts of England.—The President laid before the council a letter he had received from Mr. J. Hall, 2, Mersey-court, Liverpool, stating, that two further cargoes of Guano had arrived in that port, and that if the President or his friends were disposed to buy 100 tons, he could procure the article of the best quality at 14 pounds or guineas per ton, or perhaps at even a less rate. Mr. Hall thought it probable that the dark-coloured Bolivian Guano might shortly be bought at 10*l.* per ton, and stated that the Bolivian had probably more phosphate of lime, and the Peruvian Guano more ammonia in its composition.—The President communicated a paper "on sod-draining, drainage with the mole-plough, and thorn-draining," by Mr. H. H. Brown, of Heckington; and a paper "on destroying the turnip-fly by means of cream of lime applied to the plant, by Mr. Huckvale, of Over-Norton, Oxfordshire.

The Duke of Richmond presented a copy of the premiums offered by the Highland and Agricultural Society of Scotland for the present year, and to be awarded at the society's annual meeting to be held at Edinburgh on the 2nd of August next; and also copies of plain and intelligible instructions on "The Farm," and "The Kitchen Garden," selected from "Loudon's Encyclopædia of Agriculture," and the "British Almanac," (by permission of the respective publishers,) and adapted by a member of the society to the comprehension of his cottage tenantry in Kent, and the children who attended the schools of Dow, Northend, and Farnborough. Col. Wright Vaughan, President of the Peterborough Agricultural Association, transmitted a communication on distinct judges of sheep being appointed in future—one for the Buckley breed, another for the Burgess breed, and a third favourable to the form of the Buckley breed on an extended scale. Mr. Stephens presented the third part of his "Book of the Farm;" and Mr. L. Walrond, of Hardwicke, the second report of the Gloucester Farmers' Club, suggesting the expediency of the society's collecting the reports of all the country clubs, and binding them together for circulation, Mr. Walrond conceiving that by this means many advantages would be obtained, and the local discussions rendered more extensively useful. The thanks of the council were ordered for these communications, which were referred to the journal committee.

SOCIETY OF ARTS.

March 9th. B. Rotch, Esq., V.P., in the chair. At this meeting the new plan of proceedings intended to be adopted in future at the Wednesday evening meetings of the Society was for the first time tried; and if we may judge from the numbers present, and the interest excited, it is likely to effect a very great improvement in the Society. Two communications were brought forward and discussed, the first on a new method of forming raised ornamental work in wood; and the second on earthenware stoves for warming rooms. The former was explained by Mr. E. Solly, jun., and the latter by Mr. Domville, both members of the new Committee of Superintendence. In introducing to the meeting the new process for imitating wood carvings, Mr. Solly stated that the great expense of good carvings prevented their being employed in architectural decoration, except in palaces and the houses of the rich. The process now brought forward, and for which Mr. Brathwaite has a patent, was likely to diminish very greatly the expense of carvings, and therefore proportionably to extend their use. The principle of the operation was stated to be briefly this: in place of the wood being cut or carved away, so as to leave the pattern in relief, it is burnt or singed away by the application of hot irons. Mr. Solly stated that very great sharpness and accuracy were attainable by this process; that the wood did not appear to be at all weakened in strength; and that, so far from injuring the wood or rendering it liable to decay, the process of burning would probably preserve and render it more durable. Exceedingly beautiful specimens of carvings and bas-reliefs made by burning were exhibited to the meeting. Mr. Domville, previously to describing the terra-cotta stove of Mr. Green, which he had undertaken to explain to the meeting, adverted to the numerous forms and varieties of stoves which had been lately brought before the notice of the public, and commented on the advantages and objection of some of the most important. He stated that there was no new principle in Mr. Green's stove, which was, in fact, a modification of Dr. Arnott's stove; but that its chief merit consisted in the substitution of earthenware for iron as a material, and similar points, by which some of the objections to other stoves were obviated.

MISCELLANEOUS.

Transplanting Evergreens.—"Clareinch" states that the time mentioned in the *Chronicle*, p. 125 (which should have been from the middle to the end of April, in England) for transplanting evergreens, admits of two weeks, to allow for the difference of early and late situations; if the former, the middle of the month—if the latter, the end of the month is the best time.

Stephenson's Conical Boiler.—Mr. Rogers's conical boiler has suggested the idea of this useful contrivance, which, like his, consists of a hollow cone, whose sides are filled with water, and whose centre holds the fuel. It is made of copper, domed over, and has a very neat appearance. The fuel is supplied from a door near the top, and the water flows from the top of the dome, and returns at the bottom of the cylinder. The boiler is merely placed in a hollow iron stand, with a revolving grating on the top by which the cylinder can be instantly emptied, and the refuse and cinders taken away. The advantages that this boiler seems to possess are, its portability, its neat appearance, and particularly its suitableness for small houses and pits, or for large houses as an auxiliary boiler; it may also be taken away at any time by merely unscrewing the union pipes, and when it is again reset it requires no brickwork. The boilers can be made of any size; one that we saw was 2 ft. high by 14½ inches in diameter, outside measurement. We are informed that a boiler of these dimensions will heat 200 or 300 feet of three-inch pipes.

Maxillaria Skinneri.—We understand that a specimen of this beautiful species is expected at the next exhibition of the Horticultural Society on Tuesday next.

GARDEN MEMORANDA.

Royal Gardens, Kew.—The forcing department is at present very interesting; and from the state of the various crops, few persons would suspect that we have just passed through so dull a season. The Cherries in the first house are in full bloom, and there is every appearance of a large crop; in the second house the buds are just bursting. The earliest Peaches are setting, and there are others in full bloom, and some just coming into flower. The Vines in pots raised from eyes have most of them one or two bunches with berries bigger than Peas; the early Vineries are in a good state of forwardness, and the fruit in most cases has set well. On a shelf along the back of one of the Pineries, there are pieces of turfy peat placed, in the centre of which French Beans are growing, and they have produced an abundant crop; and on another shelf, close to the glass, Strawberries are fruiting plentifully. Many pots of Peas have been raised, and will soon be ready to plant out for an early crop. A few new Potatoes have been obtained in a frame heated by hot water, but they have not forced well; the tops having grown vigorously, but tubers have not been produced in proportion. A good supply of Asparagus has been obtained from beds heated by linings and covered with wooden shutters. A bed has just been made up for Melons, and some plants are put out. Cucumbers have been produced for a long time in frames heated by linings, the shoots being trained over a trellis fixed about one foot, or rather more, from the ground. —*March 7.*

Messrs. Lucombe and Pince's Nursery, Exeter.—The Camellia-house is the chief attraction. The building itself is remarkable for its extent and proportions, it being upwards of 200ft. in length by 24 in width, and 18 in height, with a span-roof of singularly light and elegant character. Among the specimens which particularly attracted our attention, were the following:—Two very beautiful plants of Camellia Bealii, one nearly 9ft. high, and another of still higher growth, bedecked with a profusion of its double richly-tinted crimson flowers; imbricata with a number of roseate blooms just expanded. Of Reticulata, we noticed a superb specimen; it is 15ft. high, and the flowers are 18in. in circumference; and Colvillii striata, a new and beautiful striped variety attracted our admiration. We noticed a specimen of Woodsii, the flowers of which are remarkably large, and of a beautiful colour; and a plant of Fórdii, 12ft. in height, with most chaste and perfect flowers. Of white varieties, the specimens are exceedingly fine and numerous, some plants of the old Double White, 12ft. high, and bearing a profusion of flowers, were very handsome. Triumphans and Coronata were in full bloom; the former presented the most delicate gradations of colour. We also saw the remarkable Picturata, distinguished by the beautiful striæ on its flowers. There is a plant of Chandlérii, bearing more than 100 flowers; and another of Conspicua, profusely laden with double red blossoms. Of the rose, red, and crimson-striped varieties, specimens of the Queen Victoria, or Pressleyii, and of the Donkelaerii, attracted our notice; and also Ochroleuca, which opens of a yellow colour, like the Rosa Devoniensis. It is impossible to conceive anything more beautiful than the *tout-ensemble* of this collection. We noticed also in the Camellia-house a beautiful variety of Rhododendron arbóreum, and a stately specimen of Araucária Cunninghámia. In the Arboretum the specimens are fine. Araucária imbricata was planted 10 years ago, and has attained a height of 15ft.; the stem is perfectly straight, and beautifully true to the form of a cone, gradually lessening from the ground. There is a remarkable plant of A'bies Douglásii. Pinus austriaca attracted our attention from its remarkable character; and the fact that this plant flourishes where the Scotch Fir will not grow, and has, therefore, been introduced into this county, and on exposed situations in Cornwall, where the Scotch Fir will not withstand the Atlantic influence, with every prospect of becoming valuable and permanent. —*Abridged from Woolmer's Plymouth Gazette.*

Review.

The Transactions of the Horticultural Society of London, 1842. Part VI., vol. II., 2d series.

This Part contains, among other papers, a note upon Achimenes longiflora, by Mr. Fortune, accompanied by a beautiful plate; on a System of Pruning Fruit-trees. by Mr. Crace; Experiments upon the Effects of Kyanized Wood and Mercurial Vapour upon Plants, by Mr. R. Fortune; an Account of the Ickworth Imperatrice Plum, by Mr. R. Thompson, with a coloured figure; and On the Cultivation of Grapes on flued walls in the open air at Glasgow, by Mr. G. Shiells, accompanied by a sketch.

To persons who delight in ornamenting their drawing-rooms with flowers, the note upon the Achimenes, from which the following extract is made, will be very interesting:—

"Every one who has a warm greenhouse or Cucumber or Melon frame to start it in, and enable it to form its flower-buds in summer, may have it in full bloom in the common greenhouse or sitting-room in autumn. The lovers of drawing-room plants may introduce it there and grow it as easily as they now do the Achimenes coccinea. Those who have sufficient accommodation may produce a fine effect by planting a quantity of the roots in a large flat box, and so forming a bed of flowers, which will contrast beautifully with the green foliage of the surrounding plants."

This lovely species is as easily cultivated as the old A. coccinea, and requires nearly the same treatment.

The paper by Mr. Fortune on "the Effects of Kyanized Wood and Mercurial Vapour upon Plants," is one of general interest, and the following are the conclusions arrived at:—"1st. That the vapours which arise from mercury in a warm and moist atmosphere are very injurious to the health of the plant with which they come in contact. 2nd. That muriatic acid has probably a contrary effect, because plants which were placed under the same circumstances otherwise were destroyed in mercurial vapour, while in the atmosphere of muriatic acid they grew with great luxuriance. 3rd. That corrosive sublimate mixed with moistened sawdust produces exactly the same bad effects as shavings of Kyanized wood, provided they are placed in the circumstances above described; that is to say in a warm and moist atmosphere."

To fruit growers the Ickworth Imperatrice Plum will be very acceptable. It was raised by the late T. A. Knight, Esq., from the Imperatrice Violette, and pollen of Coe's Golden Drop.

"The fruit is middle-sized, or somewhat larger than its female parent, and obovate; the stalk is of medium length and thickness. The Skin is purple, richly traced, as if embroidered, with golden brown lines, some like straight pencillings radiating downwards from the insertion of the stalk, while others are wavy or disposed circularly. The Flesh is greenish amber, partly adhering to the stone, juicy and very rich when allowed to hang till it begins to shrivel and part from the tree. The stone is rather small. The tree is of a hardy vigorous growth, and appears likely to be an abundant bearer as a standard; the shoots are glabrous; the leaves oval or obovate, crenated, smooth, shining, dark green. The fruit ripens in the beginning of October, and forms one of the finest late Plums for the dessert; more especially as it may be kept in a fresh state for a considerable time, if placed in a dry situation, ready for use, and secure from the storms or even frosts, which frequently render the maturity of later hanging varieties, such as Coe's Late Red, very precarious. It will moreover ultimately attain the condition of a prune, for a fruit enclosed in paper when gathered and laid on a shelf was found in that condition the following Midsummer. It is easily distinguished from other varieties by the unusually abundant tracing on its surface, which likewise indicates a superior amount of richness.

CALENDAR OF OPERATIONS *for the ensuing week.*

When a few fine days occur in this month, they often lead the young gardener into error, by persuading him that summer is come, and thereby inducing him to lay open protected plants, such as Fig-trees and tender shrubs and young trees, too hastily to the weather. As the shelter afforded by a warm covering is likely to have set the sap in motion, or at any rate to have made such plants more susceptible of cold, great caution ought to be exercised in this matter; and the coverings should be removed by degrees, instead of exposing the plants at once to our proverbially uncertain climate. So also of the borders of forcing-houses, which by premature uncovering are frequently made liable to danger from late spring frosts. Deeply-covered borders may have part of the litter taken off, but enough should be left, especially round the stem of the trees, to defend them effectually from injury by cold. In order to dry the surface of the borders, the remaining litter could be thrown into ridges on some fine drying day, to be again levelled down upon the first indication of frost.

I.—KITCHEN GARDEN AND ORCHARD.

In-door Department.

Pinery.—The young plants that have not yet been shifted ought now to be done, for if allowed to remain unpotted till they begin to grow, the check they receive in that operation will be much greater, especially if the disrooting system be followed. In the latter case, use as small pots as the stumps can be conveniently got into. Keep a constant supply of water for evaporation on the heating apparatus, and frequently wet the paths in the house. In clear weather the plants, whether in houses or in dung-heated pits, should be daily sprinkled over their tops with a syringe; not through a coarse rose, like a heavy shower, but as a gentle dewing, just sufficient to moisten all the leaves. Sprinkle them morning and evening on sunny days.

Vinery.—Vines that are advancing towards flowering should have a minimum temperature of 65°; keep them rather warmer if the branches are weak. If those last introduced are breaking, look over them and pull off all useless buds.

Peach-house.—During the critical period of stoning, which most likely will have commenced in the first house, great attention will be necessary in the general management, and particularly in the proper regulation of the artificial temperature, which should vary as little as possible from 55°. When there is a prospect of a fine day, give a little air betimes, especially if the flues or pipes are warm, increasing the quantity in proportion to the sun's power. Syringe the trees regularly, but take care that the borders are not made too wet. If the fruit is set in the second house, increase its temperature slowly to 55°, and resume the morning and evening washings; a slight fumigation would do no harm, although no green-fly may be visible. Shut up the latest house at night.

Cherry-house.—The trees must not be suffered to want water whilst the fruit is swelling. They will now bear more heat if necessary, but it will be injudicious to increase the temperature very rapidly. Close the house while the sun is on it.

Fig-house.—Keep the temperature about 60° at night. By sun-heat it may rise to 70° or 75°, with plenty of air. Shut the house up warm, and at the same time sprinkle the trees.

Strawberries.—Plants in small pots that are stinted for root-room may be advantageously set in pans or boxes of rich mould, into which the roots will penetrate through the holes in the pots. Keep the ripening fruit free from dirt, and the blooming plants in any airy place; also be careful that no aphides harbour upon the foliage.

Kidney-beans.—Sow a successional crop.

Cucumbers and Melons.—Forward Cucumber plants that are sterile should be stopped at every other joint till they show fruit. If the plants are weak, cover a joint on each of the main-shoots with mould, into which they will strike roots. Renew the linings a portion at a time as required.

Mushrooms.—Continue to collect droppings for new beds. Where there is not a house devoted to this purpose, short dung may be got ready for making ridge beds in the open air.

Sow Capsicums, Tomatoes, and Egg-plants.

Out-door Department.

Finish the transplanting of forwarded Peas and Beans. Some patches might be put in at the foot of warm walls if there are any blank spaces between the trees.

Onions.—Plant out those sown in heat. When very large bulbs are desired, plant on a warm, well-manured border, in rows a foot apart, spreading the roots evenly in the drill, and not covering them too deeply.

Cauliflowers.—Transplant the extra ones from the hand-lights, leaving four plants under each glass, to flower early. Those that are removed should be protected in cold nights by inverted flower-pots.

Cabbages.—Plant out a good breadth of those sown in autumn, regulating the distances by the size of the varieties, and the purposes they are intended for. If to stand for sprouts, more space must be given them. Likewise plant Red Cabbage and autumn-sown Savoys.

Potatoes.—Put in the chief crop of early ones. Of these, the Ash-leaved Kidney is, perhaps, the most serviceable. Plant also some second early varieties.

Jerusalem Artichokes.—Plant for winter use. These should occupy the back slip, in company with Horse-radish, &c.

Asparagus.—If the ground for the new plantation is properly settled, the roots should be put in. Four rows a foot apart, and then a vacant space of three feet, will be found an economical distribution of the ground. Edge off the beds six inches from the outer rows, which will give two feet clear for the alleys. Lettuces or Cauliflowers might be planted along the middle of these, and upon the beds Onions may be sown in drills between the rows of Asparagus. Sow seeds to furnish stock for future plantations. Make new plantations of Sea-kale and Rhubarb, and sow seeds to raise plants for forcing.

Radishes.—Sow in a drill at the foot of a south wall.

Turnips are frequently destroyed, when just appearing above ground, by chaffinches, who pull up the young plant in taking the remains of the seed which adheres to its top; these, therefore, should be guarded against, or they will ruin a whole crop in a few days.

Orchard.—See that the protective coverings of wall-trees do not hang loosely, so as to be blown about by the wind, or they will destroy more blossom than they preserve. Wall and orchard-trees of bad sorts may be grafted, beginning with Plums and Cherries; large trees of the latter, however, seldom thrive well enough after grafting to repay the trouble. Pear-trees trained in the pyramidal manner produce excellent fruit, if well managed. The last year's shoots, and any branches that are loose, should now be bowed down, with their points towards the ground.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

Stove.—In the Orchidaceous house Cýcnoches and Catasetums which have been resting will now be showing signs of growth; give them gradually more water, but take great care that it does not lodge about the young shoots, as they are easily rotted. Keep Dendróbiums in the warmest part of the house, and give them plenty of water, as they will now begin to grow. Take care that stove shrubs are not injured by bright sunshine; keep the atmosphere very moist on warm days.

Greenhouse and Conservatory.—The long shoots of straggling Epacrises which have done flowering should be cut back before they commence a new growth: and such as require it may be repotted. Tie out the branches of strong growing Heaths, to give them a symmetrical form. Sickly plants of the Citrus tribe should have the old soil cleared from their roots, and be repotted in light rich compost. Keep them in the Vinery, under the shade of the Vines, and frequently sprinkle their tops. Cereuses and Epiphyllums must have an increased supply of water as their blossom-buds swell. Other succulents will also bear a little more moisture now that the sun has power to dry them quickly. If not already done, shift Alstrœmerias into their flowering pots, and be cautious in administering water.

Pits and Frames.—The lights should be drawn off half-hardy shrubs every tolerably fine day, to inure them to the free air. Propagate a stock of Verbenas, Salvias, Petunias, and similar things, for a reserve to supply the places of other temporary plants, such as annuals, when their bloom is over. Carefully protect fine Auriculas and Polyanthuses from wet as their flowers advance. Pot the roots of Fuchsia fulgens and Salvia patens which have been kept through the winter in sand.

Out-door Department.

Annuals may be sown at any time in the mixed flower-borders. Sow the seeds thinly and cover the smallest very lightly. Inverted flower-pots, or seed-pans, put over the tenderest kinds, will shelter them from frosts and heavy rains.

NURSERY AND FOREST DEPARTMENT.

Nursery.—If time can be spared from other business, or if the ground be too wet for sowing and planting, grafting may be done, commencing with those species which are earliest in vegetating. Whip-grafting is the best method for small stocks; saddle-grafting is a good mode when the stocks are between one and two inches in diameter. Graft quite close to the ground for dwarf trees, and use plenty of clay.

Forest and Coppice Woods.—Use diligence now to bring planting to a conclusion. Take especial care that the fences are in good order before the usual time for turning out grazing stock arrives.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending March 10, 1842, as observed at the Horticultural Garden, Chiswick.

March		Barometer.		Thermometer.			Wind.	Rain.
		Max.	Min.	Max.	Min.	Mean.		
Friday	4	29.957	29.918	48	29	38.5	W.	
Saturday	5	30.036	30.008	54	27	40.5	W.	
Sunday	6	29.992	29.813	54	26	40.0	S.E.

Thursday	10	30.018	29.463	47	31	39.0	N.W.	.01
Average		29.833	29.607	51.7	33.0	42.3		.67

March 4. Overcast; cloudy and mild in the evening.
5. Clear; very fine; clear with slight frost at night.
6. Slight frosty haze; very fine with bright sun; clear.
7. Overcast; cloudy and fine.
8. Very fine; heavy rain at night.
9. Fine in the morning; stormy with hail-showers in forenoon; very heavy rain at night, the wind increasing to a hurricane.
10. Boisterous; fine with drying wind; clear and calm at night.

State of the Weather at Chiswick during the last 16 years, for the ensuing Week ending March 19, 1842.

Mar.		Aver. Highest Temp.	Aver. Lowest Temp.	Mean Temp	No. of Years in which it Rained.	Greatest quantity of Rain.	Prevailing Winds.							
							N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.

The highest temperature during the above period occurred on the 19th, in 1836—thermometer 69°; and the lowest on the 14th, in 1829—thermometer 21°.

REPORT ON COVENT GARDEN MARKET,

For the week ending March 11, 1842.

Little difference has taken place since our last Report. The supplies have been well kept up, and the trade in some articles has been rather brisker. *Fruit.*—The supply of Pines has been pretty good; the prices have not changed. A few hothouse Grapes may be obtained; foreign are becoming scarce. Apples are rather advanced in price; good samples of Nonpareils are worth from 20s. to 25s. per bush. Pears remain the same. Strawberries are brought in small quantities, and Cucumbers are becoming more plentiful. *Vegetables.*—The supply of Cabbages and Broccoli has been pretty large, and the quality good. Kidney Beans are more abundant than they were. Asparagus still fetches rather a high price, though it is not scarce. Sea-kale is abundant and excellent. Lettuce and most kinds of salading are indifferent. Celery has almost passed; that still offered is not very good. Rhubarb abounds. Mushrooms are more plentiful than they were.

PRICES, Saturday, March 12, 1842.—FRUITS:—

Apples, Kitchen, per bush. 3*s* to 6*s*
— Dessert, per bushel, 3*s* 6*d* to 14*s*
Pears, dessert, per half-sieve, 3*s* to 12*s*
Strawberries, forced, per oz., 3*s* to 5*s*
Pine Apple, per lb. 6*s* to 10*s*
Cucumbers, each, 3*s* to 6*s*
Grapes, Spanish, per lb., 1*s* to 2*s*
— Portugal, per lb., 1*s* to 5*s*
Oranges, per doz., 1*s* to 2*s*
— per 100, 3*s* 6*d* to 16*s*
— Bitter, per 100, 7*s* to 18*s*
Lemons, per doz. 1*s* to 2*s*

Lemons, per 100, 6*s* to 14*s*
Almonds, per peck, 7*s*
Sweet Almonds, per pound, 3*s*
Chesnuts, per peck, 5*s* to 8*s*
Walnuts, per bushel, 16*s* to 24*s*
Filberts, Eng., per 100 lbs., 130*s* to 140*s*
Cobb Nuts, per peck, 3*s* 6*d*
Nuts, per bushel—
— Brazil, 20*s*
— Spanish, 16*s*
— Barcelona, 20*s*

VEGETABLES.

Savoys, per dozen, 6*d* to 1*s* 6*d*
Cabbage, White, per dozen, 1*s* to 1*s* 3*d*
— Red, for pickling, 2*s* to 6*s*
Cabbage Plants, per doz., 2*s* to 5*s*
Brussels Sprouts, per hf. sve., 1*s* to 2*s*
Broccoli, White, per bunch, 6*d* to 2*s* 6*d*
— Cape, 9*d* to 1*s* 3*d*
— Purple, 6*d* to 1*s*
Turnip Tops, per bushel, 6*d* to 1*s*
Kidney Beans, forced, p. 100, 2*s* 6*d* to 4*s*
Potatoes, per ton, 50*s* to 70*s*
— per cwt. 2*s* 6*d* to 3*s* 6*d*
— per bushel, 1*s* 6*d* to 2*s*
— Kidney, per bush. 2*s* to 2*s* 6*d*
Artichokes, Jerusalem, pr half sieve, 10*d* to 1*s*
Turnips, pr. doz. bunches, 1*s* 6*d* to 3*s*
Carrots, per doz. bunches, 4*s* to 5*s*
Parsneps, per dozen, 6*d* to 1*s* 3*d*
Red Beet, per dozen, 6*d* to 1*s* 6*d*
Scorzonera, per bundle, 1*s* to 1*s* 3*d*
Salsafy, per bundle, 1*s* to 1*s* 3*d*
Horse Radish, per bundle, 1*s* to 6*s*
Radish, p. dz. hands (24 to 30 each) 2*s* 6*d*
Spinach, per sieve, 1*s* 6*d* to 2*s* 6*d*
Leeks, per dozen bunches, 9*d* to 1*s*
Garlic, per lb., 8*d*

Shallots, per lb., 1*s*
Onions, Old, per bushel, 2*s* 6*d* to 4*s*
— for pick., per hf.-sieve, 3*s* to 6*s*
— Green, per doz. bunches, 2*s* to 4*s*
— Spanish, per dozen, 1*s* to 6*s*
Asparagus, per 100, large, 6*s* to 8*s*
— Second or Middling, 3*s* to 4*s*
— Sprue, or Small, 2*s* to 2*s* 6*d*
Sea-kale, per punnet, 1*s* to 3*s*
Lettuce, Cabbage, per half sieve, 1*s* 6*d* to 2*s* 6*d*
Endive, per score, 2*s* to 4*s*
Celery, Red, p. bdle (12 to 15) 1*s* to 2*s*
Small Salads, per punnet, 3*d*
Corn Salad, per half sieve, 9*d* to 1*s*
Watercress, p. dz. small bunch., 6*d* to 8*d*
Dandelions, per punnet, 9*d*
Parsley, per half sieve, 3*s* 6*d* to 5*s*
Tarragon, per dozen bunches, 4*s*
Fennel, per dozen bunches, 3*s*
Thyme, per doz. bunches, 2*s*
Sage, per doz. bunches, 3*s*
Mint, per doz. bunches, 4*s* to 8*s*
Savory, per dozen bunches, 2*s*
Rhubarb Stalks, per bundle, 6*d* to 1*s* 6*d*
Mushrooms, per pottle, 8*d* to 1*s*
Truffles, per pound, 2*s* to 3*s* 6*d*

Notices to Correspondents.

We have such constant applications for the prices of books, plants, and other articles, and for information as to where they can best be had, that we find it necessary to state for the information of all inquirers that it is not our practice to recommend any tradesman in particular, and that if persons interested in selling do not advertise their goods we cannot do it for them. We beg our readers will look to our advertising columns for all information of this description.

Thanks to *F.*, *Berks*, and *T. W.*, but there are many difficulties in the plan proposed.

A Twelve Months' Subscriber.—We cannot answer his first question. He can have Nos. 1 to 8 inclusive, and Nos. 10, 11, and 12. He may fumigate his Vinery without danger, if he is cautious. The air should be moist until the Vine flowers; it should then be much drier till the berries are set.

A correspondent asks what is the best means of obtaining a ROOKERY. Will any one have the kindness to tell him?

A North D. Amateur.—The Moss (or rather Lichen) ON YOUR TREES flourishes because you live in a damp climate, and probably where the soil is ill-drained. Drainage of land thoroughly is the only remedy for this disease, for so it may be called, inasmuch as it results from trees being out of condition. The Holly-leaved Berberry is hardy; and one of our best evergreen bushes.

An Old Subscriber.—RAIN-WATER in any state, if not putrid, is fit for greenhouse plants. Scotch Firs and Larch will stand wind as well as anything, and if a screen is once obtained of them, others will grow beneath their protection.

A Shrewsbury Constant Reader must beware of QUACK MANURES. We know nothing of that he mentions, but the account of it is so manifest a puff that we have no faith in it. Besides it is too dear.

Agricola.—We have stated what the LAW is concerning ENCROACHMENT BY TREES; but it would not do for us to give a legal opinion upon the particular application of it. You had better consult your solicitor, showing him the article upon the subject signed "C. K." No opinion on your case could, we apprehend, be safely given without an inspection of the land and the surrounding trees.

A.—For the cultivation of CELERY consult Mr. Paxton's Cottage Calendar, and a communication in the Home Correspondence of to-day.

G. H., Wexford.—The SEED CAST ASHORE on the West of Ireland is that of a climbing plant called a Dólichos, and is brought by currents from the tropical parts of America. The larger kind, of which you also make mention, is probably the seed of a West Indian plant, resembling a Mimosa, and now called Entada.

One of Our Subscribers.—The COLOUR OF A WALL for fruit trees is practically of no importance whatever, although in theory it may seem to be so. The most agreeable colour to *our* eyes is that employed by the bricklayers when finishing off cement-work. Do not think of tarring your wall; you will find it ugly, unsuited to your trees, and incurable afterwards.

E. F. L.—No doubt "OLD FOGGY PASTURE-LAND" will be renovated by the ammoniacal liquor of the gas-works. See a leading article last week. It may, however, be necessary to add nitrate of soda, if the effects are to be very permanent. In that case we should give the ammoniacal liquor first, and the soda a fortnight afterwards. But the ammoniacal liquor alone will produce a great effect. We will take care that the *Chronicle* is forwarded to you regularly through a London news-agent, if you favour us with a post-office order. We do not supply subscribers ourselves.

Mr. Pamplin begs us to correct what he considers a MISREPRESENTATION (at p. 140) OF HIS PELARGONIUM, the Enchantress, where it is stated to resemble the Queen of the Fairies; he begs to say it is not at all the colour of that flower, it being a deep rose, whereas the Enchantress has no rosy tint in it. We are not disposed to make any such correction. No comparison was instituted between these flowers; had the question of colour been entertained, we should have described the Enchantress as inferior in that respect to the Queen of the Fairies. Both flowers have a white ground, with the colour nearly covering the entire surface of the upper petals, and *in this respect* they were characterised as being alike. The words in Italics were, however, omitted by the printers.

Œconomicus.—The original MANGEL-WURZEL was, we believe, red ringed with white. The yellow kind is of more recent introduction for agricultural purposes. The latter seems now to be the favourite, because it is sweeter. A couple of ounces of seed is enough for your piece of land. We do not know what proportion of WAX AND OIL is used in preparing calico, nor is it of much importance. All that is requisite is to use wax enough to render the oil as firm as jelly when cold.

A Young Hand.—It is of little consequence whether you grow your MELONS in one or two-light frames, provided there is plenty of room for the plants; but if you wish to save seeds true from your Melons or Cucumbers, only one kind should be cultivated in a frame; for although you may plant them in one-light frames, they are still liable to be crossed by bees or other insects in an artificial manner, which cannot be prevented by a gauze division or the sides of the frames. A gauze covering, when air was given, might, however, protect them. The soil for growing Melons in should be a rich loamy one, and, if good, may be used directly after being chopped small.

E. A.—When your seedling PANSIES have several leaves they should be carefully transplanted into a bed of loam, sand, and rotten dung well drained; during hot weather they should be shaded and plentifully supplied with water.

W. D.—Do not be alarmed at meeting with thorns occasionally on what you have received for KNIGHT'S MONARCH PEAR, for yours is the true sort. You will observe the bark has a yellowish tinge, and the buds, when they begin to push, exhibit a fawn-coloured down on the scales. The shoots and strong, often curved prickles, on the spurious sort, are of a dark violet colour, and the buds are glossy.

G. W. Burneside.—PELARGÓNIUMS are readily propagated by cuttings, which in July should be planted round the edges of pots filled with a mixture of leaf-mould and well-rotted dung, plunged in a gentle hotbed; when rooted the young plants should be potted off singly; or if raised for planting out in the summer, they may remain during the winter in the cutting pots. When CALCEOLARIAS have done flowering, about the middle of July is the best time to increase them; the herbaceous varieties being propagated by dividing the roots, and the shrubby ones by cuttings. The cuttings should be planted in pots filled with very sandy loam, and plunged in a hotbed; they must at all times be sparingly watered.

R. W. B.—Your seeds of SEDUM SIEBOLDII should be sown now in pots filled with very sandy peat; water must be sparingly given, or the young plants will be liable to damp-off. LIQUID MANURE formed of horse-dung is the best for general purposes; if very strong is required, add a little pigeon's dung, or some ammoniacal liquor, in the proportion of a teacupful to a gallon of water. Nitrate of soda would perhaps assist your Roses; though if you have applied plenty of stable-stuff, it will hardly be necessary to give anything else to them this season.

W. D.—The bottom of my CUCUMBER-BED, as shown in the section of pit, p. 124 (1842), is formed by laying pieces of timber, 3in. thick, across the troughs, which are covered with any rough boards or slates. The back, front, and ends are also boards or slates, which are placed on the bottom, and rest against the two flow-pipes. The bottom so formed will have a cavity from the troughs round the back and front of the beds, which will allow the heat and moisture to rise. W. D. will find this explained in p. 36 (1841). Four rows of cemented bricks, on edge, laid on a good foundation, would surely support any moderate Cucumber or Melon bed in the world with safety.—*J. Green.*

?—It certainly is a bad practice to cut all the young shoots and leaves off your IVY in the spring, for although it does not destroy the plants, it makes them look unsightly for a considerable time; it would be better to clip it two or three times a year, or procure the creeping varieties, which never branch out from the wall. RHODODENDRONS will do well on any subsoil except a very dry one. They only require to be planted in peat of sufficient depth for their roots (about 1 ft. deep), and if some loam and a small portion of well-rotted cow-dung are added, it will be found of great benefit, particularly if the situation is a dry one. They should be planted thickly at first to cover the ground, and may afterwards, as they become established, be thinned out.

A Reader of the Chronicle states the following particulars relative to planting a small ORCHARD, in lat. nearly 56½, and wishes for information with regard to the propriety of his mode of procedure; the ground, which formed part of a ploughed field, and is of a hard clayey loam, averaging no more than 8in. or 9in. deep, upon a retentive bottom, consisting however of a good tough reddish clay, mixed with a few stones. "Last autumn pits were dug for the trees, 16in. or 18in. deep, and about 2ft. or 3ft. in diameter. A stone flag, 20in. square, was laid in the centre of each pit; and as the pit then held water like a dish, a small drain was made from each to the field furrow drains, the pits being left open all winter, and the stuff thrown out exposed to the weather. In the third week of February the trees were planted, first putting some inches of earth into the pits, then dung, then a little mould again, upon which were placed the roots of the trees carefully spread out, then earth well pulverised, and dung again, taking care not to bury the roots too deep. I finished by laying earth over all, gently pressing it, the same forming a small knoll, and mulched with long litter, held down by a sprinkling of earth. The trees are principally two or three years from the graft, and have stems some two or three feet long. A stake was then driven into the ground at each tree, and as the situation is as yet exposed, I wrapped a straw rope round the stake, and close round the stem of the tree from the base nearly to the branches. I next trenched the whole ground two spits (about 16 or 18 inches) deep, turning the stiff clay or bottom spit mostly to the top, and leaving it in large rough lumps, to be meliorated by the weather. The ground has, of course, at present, a very rugged aspect; but as it has got drying weather, with night frosts, since turning it over, I expect it will be greatly benefited, and will become of a kindlier nature by-and-by." [The bottoming, draining, trenching, and exposing a rough surface to the action of the weather, are all approvable. Wrapping the stems with straw-bands will do no harm at present; on the contrary, such may prove beneficial till the drying winds of March are over; but if the stems are kept enclosed for any great length of time, the bark will, in consequence, be rendered too tender for affording the degree of protection for which it is naturally adapted. Instead of disposing the dung in alternate layers with the soil, the substances should be well mixed. Supposing the pits had been entirely filled with dung, the roots would increase rapidly, but would prove unsubstantial and unfit for penetrating the common soil, to which they must soon extend. Roots will run in layers of dung in preference to those of soil; but, as in the case just mentioned, they will experience a check when they meet with a totally different substance. Besides, canker is most apt to occur in such portions of roots as are imbedded in masses of dung unmixed with soil. Readers of the *Gardeners' Chronicle* will doubtless bear this in mind when they are about to plant fruit or other trees. The ground should all be trenched; the surface may be left rough, but the undisturbed bottom should form a plane or planes sloping regularly towards drainage.]

J. O., Preston.—BOX-EDGINGS may be clipped at any season of the year, but the best time is the end of June; after the operation the edging should be well watered, to induce the Box to produce a second shoot, to obliterate the marks left by the shears.

A Novice.—Your plant of Chimonanthus fragrans is probably a seedling, and if so you must wait patiently for a year or two.

A. B.—The atmosphere of the stove in which you keep Tabernæmontana is probably too dry, and that causes the flowers to fall before they expand. During the time the plant is growing and forming flower-buds it should be liberally watered.

Un Compagnon.—The price of "Reid's Chemistry" is 18*s.*; it is an elementary book teaching the science. "Liebig's Organic Chemistry" does not pretend to do this. "Valpy's Latin Grammar" is a very good popular book.

A Young Melon-grower.—Always keep the LAPS of your glass well puttied; you may do it at any time when the glass is dry, but it will now be troublesome. Cover the dung that surrounds your hills with a little soil. It will be very difficult to prevent the pollen of two plants mixing which are planted in the same hill.

J. L.—The plant is Billbérgia iridifolia.

J. W. B.—Such specimens as you have sent for answers are so many riddles. 7, is the Cornelian Cherry; 2, the Candleberry Myrtle; 6, the Tartarian Honeysuckle; 3, some sort of Dogwood or Viburnum. Can't say anything about the rest.

Clarimb.—Always glad to hear from you.

Cratægus.—Baxter's "British Flowering Plants" goes on steadily, and is almost completed. Our last Number was the 116th. It is a very useful book. We believe the "Florigraphia" also continues to appear.

X. Y. Z.—The quantity of four-inch pipe to each saddle-backed boiler in the great iron conservatory of the Horticultural Society is about 850 feet, and there is no difficulty in heating it. If you cannot manage yours it must either be from want of skill, or because of some defect in the setting of the boiler; very likely the latter.

Ammonia.—A sack contains four bushels.

H. C.—We regret to say we do not know with certainty, and cannot at present learn.

W. C.'s plant is Fernandézia lunífera.

Anonymous.—You may grow Grapes well in a fruiting Pine-house, if you take the branches outside every year after the fruit is ripe, and leave them outside till you begin again to force. This may be done by having holes in the front wall, with a moveable portion of the wall-plate just over them, so that by lifting off the sashes and removing the piece of wall-plate the whole of the head of the Vine may be lifted out.

Wellwisher.—Smith's "English Botany" is published with coloured plates; there is a cheap edition of it. For garden plants the most extensive collections of figures are the "Botanical Register," the "Botanical Magazine," and the "Botanical Cabinet" (now complete in 20 volumes); all expensive works. There is no cheap work on foreign botany, with plates, nor is it possible that there should be; of exotic plants the name is legion, and a mere list of their names occupies two octavo volumes in double columns, and about 1,600 pages.

F. C.—No two gardeners seem to agree about the cause of shanking and shrivelling in Grapes. One assigns it to the coldness and wetness of the soil, another to cold currents of air, and a third to something else. We believe the first is the real cause, and that if the border is kept drained and warm the malady will disappear. Some Grapes are particularly subject to it.

M. W. H.—If you are confident in your taste, you might construct a piece of rough rockwork with any waste materials, and it would be a much prettier object than a dead wall. The best way of making it will be to take a base of at least 20ft., and to terrace it irregularly all the way to the top. If you prefer a wall, plant on it the following Pears:—Marie Louise, Glout Morceau, Beurré Rance, Winter Nelis, and Brown Beurré.

S. E. W.—Both Pines are from Guatemala, from the height of 3000 or 4000 feet. We do not know whether they are hardy or not; we fear, however, that they will not bear the climate of Durham.

A Subscriber.—We believe the best of the remedies for the Caterpillar on Gooseberries is the Hellebore powder, recommended by some of our correspondents.

A Constant Reader.—The best mode of using soap-suds as a manure seems to be to let them accumulate in a tank with urine, until they become putrid; then to mix gypsum with them, or sulphuric acid, until the putrid effluvium ceases, and then to employ the mixture in any way that may be most convenient. Next week, or the week after, we shall have some very important information to give as to the manner of forming manure efficiently and economically. The manure now described should be suitable to all kinds of crops; a correspondent, however, says it does not suit his Onions, but he does not state why.

Conrad.—The best time to plant out new FIRS is during the month of May, but they should never be put into the open ground until they are two or three years old. They are all planted in the open ground in the Horticultural Society's Garden, and the more rare and young ones only were covered with a common hand-glass the last winter, and not one of them has perished, although some of them were very small. The Ocoté Pine (Pinus oocarpa) is the tenderest, not being hardier than the Canary Pine (P. canariensis). The new PINES should be planted in an open situation, but never in a low or very exposed one; place them, if possible, in a sandy loam, where the subsoil is rather dry. P. palustris (australis of some authors) is hardy, and was only killed in some low damp situations by the severe winter of 1837-8. The following Pines in your list are quite hardy, having stood 4½° below zero in 1837-8. P. Brútia, Llaveana, Gerardiana (the true one), Lambertiana, Monticola, Amábilis, Grandis. The following were injured or killed by the severe winter of 1837-8: P. halepensis, insignis, australis, Pithyusa. The others in the list are all too new, and consequently the plants too small, to decide upon their hardiness. Probably your plant called P. Gerardiana was not true, as P. longifólia has been frequently sold for it. The soil best suited for P. Lambertiana is a sandy loam.

J. S. S. S.—Your pit will do very well for all the purposes you mention.

A Lady.—It is rather too late for root-pruning; it should be done during the winter. We do not think the Cyclamens can be had with certainty of the nurserymen.

Messrs. Chapman.—When you state that your Potato was obtained by skill and perseverance you state nothing worth knowing. We cannot insert letters full of words without meaning. If your Potato is really a distinct sort there can be no occasion for mystery.

J. A.—Laurels may be planted now, but there is no time to lose; it does not matter in what soil, provided it is not chalk.

Col. Mason.—The Auvergne Pea is an excellent dwarf variety for summer use. The Black Melon of Carmes is one of the best of the red-fleshed varieties.

A Constant Reader.—The quickest remedy yet found for destroying SLUGS is nitrate of soda and water; say 1lb. to a watering-pot full of water, applied in the evening about nine o'clock, and in the morning before daybreak. You must not, however, apply this mixture overhead, or you will bring off all the young leaves of your Strawberry plants. Lime-water will answer the same purpose, if applied in the same manner, and persevered in for some days; and it is more convenient to use, because it will not hurt the leaves.

A Clerical Inquirer.—The promised answer did not escape us. You will find it at p. 737 for 1841.

Discipulus.—Your Apples, Nos. 1 and 8, agreed with what is called the New Golden Pippin, in having flesh not so yellow as that of the Old Golden Pippin, and not so high flavoured. You should have severed the portions of roots which you intend to graft before vegetation commenced; but you may do it immediately, and graft upon them as you proceed.

J. R.—You must learn to distinguish between popular and scientific language. In the former minute accuracy is not to be looked for. You are right in supposing that the flowers of Dendróbium speciosum form a raceme, and not a spike.

A. B.—Your lime is now chalk, and will not make lime-water. For that purpose fresh quicklime is indispensable.

A Lady's inquiry about Vines is answered elsewhere to-day among these notices. Syringing will assist the buds to break. Any Grape may be forced in Mr. Knight's way, but try the Black Hamburgh.

R. A. and *J. H.*—We can give no opinion about Cinerarias without seeing the plants. The first is handsome, but very like some we have in London; the second is coarse, and a bad colour, but it may have compensating properties. R. A.'s Gourd seed we should be glad to receive.

Atob—The mode of growing Potatoes mentioned by you is old. We are not aware of the Mole Cricket being luminous. Lindley's "Synopsis of the British Flora and Elements of Botany" will set you going. A microscope for botanical purposes varies in price from 5*s.* to 5*l.*

A Subscriber will find the information he wants at p. 142 of the present volume.

Ilex is answered in the Home Correspondence to-day.

A Constant Reader.—No. 1 is Jasminum revolutum; 2, Pittósporum Tobira; and 3, Saxifraga oppositifólia.

A Young Gardener.—There are several monthly works, price sixpence.

If *A Friend at Exeter* will refer to our last year's volume, pp. 19, 227, 649, and 753, he will find some good directions on the cultivation of Dahlias.

X. Z.—You will not be able to grow two kinds of Cucumber in the same frame unmixed. For your Melons it is of little consequence whether you use a one or a two-light box.

R. H.—From the state in which your specimens were in, we could not name them all with certainty. Those which we have made out are, 1, a Paliurus of some kind; 11, Schinus molle; 14, a Gnaphálium; 15, a Casuarina; 16, a Melaleuca; and 17, apparently a leaf of the common Holly.

ERRATUM.—P. 160, col. 1, line 36, for "the nitrate was never employed when," *read* "was here employed when."

As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

SIR ROBERT PEEL last night laid before the House of Commons the views of Government in reference to the financial and commercial policy of the country. In a speech of nearly five hours' duration, the Rt. Hon. Baronet developed the present condition of the revenue, and stated that the deficiency amounts to no less than four millions seven hundred thousand pounds. To meet this he said that he would propose no tax on articles of consumption, and would add to none of the existing taxes; that he believed we had arrived at the limits of taxation, and that whatever might be the financial difficulties in which the legislature is placed, they must so adapt their measures that they will not bear upon the comforts of the labouring classes. He then proposed to adopt a property tax for three years, so that the incomes of this country should bear a charge not exceeding three per cent.; any income under 150*l.* to be exempt; and that all funded property, whether held by foreigners or by British subjects, should be included within the operations of this measure.

The Overland Mail from India and China, which left Marseilles on the 1st Feb., reached town on Tuesday. It was partly anticipated by the arrival of the India steamship last week, and the public were, therefore, prepared in a great measure for the distressing intelligence it conveys. We regret to state that the reverses of the army in Cabul are confirmed in all their melancholy details; the first advices announced that the murder of Sir Alexander Burnes had been followed by that of the Commander-in-Chief, Sir W. H. Macnaghten, who was treacherously shot by Akhbar Khan, son of Dost Mahommed, under circumstances of great atrocity; but they gave us reason to believe that the troops in the intrenched camp, amounting to nearly 6000 men, had been able to resist successfully the attacks of the insurgents. Private letters, however, have been received, which, if we may rely on their authority, unhappily remove these hopes, and leave no doubt of the fate of the troops. It is stated by these accounts that the troops evacuated Cabul under a convention, and were attacked as soon as they quitted their cantonments. Their march is described as one continued fight against an overwhelming force; the native troops which had hitherto borne all the privations of the campaign with exemplary loyalty and fortitude, are said to have been disorganised and scattered; and if we can believe these letters there would appear to be little probability that the main body escaped annihilation. Some doubt, however, exists as to the accuracy of the source from which the morning papers have derived this melancholy intelligence. Sir R. Sale was still in a strong position at Jellalabad; a large body of our troops is stationed at Candahar, and Ghuznee is well garrisoned. Our news from China comes down to Dec. 13th; no event of importance had occurred subsequently to the occupation of Ningpo, but an advance against Canton was expected in consequence of the repeated infringements of the truce on the part of the Chinese.—From France we learn that considerable excitement prevails in Paris on the subject of the recent debates in the British Parliament, during which Lord Aberdeen declared that his opinion remains unchanged respecting the French conquests in Algiers; and it is expected that the question will give rise to another manifestation on the part of the Opposition, which may seriously embarrass Ministers. The projected conspiracy for renewing civil war in Spain is said to be suspended for a time in consequence of the preparations made by the Regent to resist the movement.—Letters from Madrid confirm this statement, and announce that an immediate outbreak is no longer apprehended. The Government, however do not relax in their precautionary measures; and troops continue to assemble on the frontiers and on the coast, in readiness for active service. — We learn from Lisbon that the new Ministry has been definitively organised, Senhor Costa Cabral, the abettor of the Chartist movement at Oporto, being admitted to a seat in the Cabinet. Public affairs are beginning to assume a more settled aspect, and the troops are gradually returning to their allegiance.—The accounts from the Levant are not of great importance; the disputes between Turkey and Greece are not yet satisfactorily arranged, but the claims of the Porte have been strengthened by the declaration of the French Cabinet, expressing its disapprobation of the proceedings of Greece. The five great Powers have offered a protest against the changes in the government of the Lebanon, and have expressed their hope that these arrangements are not definitive.

Home News.

Court.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal, continue in the enjoyment of excellent health. The Queen and Court left Brighton on Tuesday, and arrived at Buckingham Palace on the afternoon of the same day, where her Majesty still continues. Her Majesty and Prince Albert, accompanied by the Prince of Wales and the Princess Royal, visited the Queen Dowager on Wednesday at Marlborough House; and on the evening of the same day the Queen honoured Covent Garden Theatre with her presence. Her Majesty held a Court at Buckingham Palace on Thursday. The Queen has caused cards to be issued for a grand dinner at Buckingham Palace on Wednesday next, on which day her Majesty holds her first levee this season. The Countess of Charlemont will succeed the Countess of Dunmore as Lady-in-waiting on the Queen on Tuesday. His Serene Highness the Duke Ferdinand, and the Princes Augustus and Paul Leopold, took their departure on Monday from the Pavilion, Brighton, for Dover, on their return to the Continent.

Parliamentary Movements.—A requisition has been presented to Lord Alfred Hervey, inviting his Lordship to become a candidate for the representation of Brighton, vacant by Mr. Wigney's bankruptcy. It was presented to his Lordship on Thursday, to which he returned an answer of compliance.

Foreign.

France.—*Algeria.*—The papers are occupied at great length with the subject of Sir R. Peel's reply to Mr. Sheil's question in the House of Commons a few nights since, as to whether the account given by M. Guizot, in the French Chamber of Deputies, of a conversation between Lord Aberdeen and M. de St. Aulaire, the French Ambassador at London, on the subject of the French conquests in Africa was correct. The question appears to have excited the greatest sensation, not only among the journalists, but the public generally. The anxiety of the government to show that the British Cabinet no-longer thought of "objecting" to the presence of the French in Africa, and which it assumed was declared by Sir R. Peel, is proved by a summons issued by the Prefect of Police to the editors of the opposition newspapers to insert a rectification of the version of the right hon. Baronet's speech. The Prefect complains of the omission in the report published in France, of "the principal sentence used by Sir R. Peel, and which proved the falsehood of the assertions of those journals." It appears that the version of the speech in question first reached Paris on Thursday, as published in a London evening paper; but this differed from the correct version in the morning papers, by the omission of the words "he did not know that there was any substantial difference between them," meaning the two versions of the conversation between the French Ambassador and Lord Aberdeen. The "Messager" and "Moniteur Parisien" of Friday night printed the reports as given in the morning papers, and the government fearing that the opposition prints would not copy the correction, applied the summons of the Prefect of Police, by virtue of the September Press Laws. It is expected that the question will cause an explosion on the part of the opposition in the Chamber of Deputies, which may serve seriously to embarrass ministers: and the papers already assail M. Guizot on the subject, with great violence. They contend that it is in vain for him to draw conclusions from the similarity of "observation" to "objection," so long as England shall continue to withhold its recognition of the right of France to her African conquests.—Accounts from Algiers of the 25th ult. announce the return of Gen. Bugeaud to that city from Oran. The "Journal de St. Etienne" of the 4th inst. states that the Duke of Nemours had passed through that city on his way to Africa: but no mention is made of his Royal Highness's departure in the Paris papers.

Affairs of Spain.—The projected conspiracy to rekindle civil war in Spain is said to have failed, and to be given up, at least for a time. The subject, however, still occupies much space in the journals, and various reports relating to it are published by them, though little authentic seems to be known. The "National" states that the following was the plan of attack meditated by the Spanish emigrants, and it does not consider that it is even yet entirely abandoned. "Instructed by the experience of the last defeats, and by the error which they committed in concentrating all their efforts on one point, they determined on this occasion to make the attack on three different points. By this they expected to obtain a double advantage—the Regent would be either compelled to remain at Madrid to protect the seat of government, and then the insurrection would have time to be consolidated in the provinces; or, repeating the manœuvre which proved so successful in the month of Oct., he would advance rapidly upon one of the threatened points, and then the other two invading parties would have marched straight to Madrid, re-established Queen Christina's government, and fallen simultaneously upon the Regent, who would have been taken between two fires. The points designed for attack were Catalonia, the Basque provinces, and the frontiers of Portugal; and the three generals who were to direct the attacks on those points had even been appointed: one of whom had set out furnished with a large sum of money; taking the road to Perpignan through Montauban and Toulouse." The "Constitutionnel" says that Gen. Ramon Narvaez, whose arrival in Paris was lately announced, had gone, towards the close of Feb., to London, and thence to Falmouth, with the intention of embarking for Lisbon: that on reaching Falmouth, however, he received a letter from London, recalling him to Paris, where he is at present. That the day after his arrival in the capital he was joined by a person named Angelo, coming from Gibraltar, who was lodged in the same hotel. The same journal adds that several Christino chiefs have been summoned to Paris, where they are now holding a sort of council of war. The French journalists comment with some severity on the debates in the Houses of Lords and Commons a few nights since on the affairs of Spain.

The Chambers.—The law for raising the usual number of 80,000 men in 1842 has passed the Chamber of Deputies. Marshal Soult declared that his law, organising the reserve, was not yet ready, but that it would be soon prepared. The general opinion, however, appears to be, that it will not be discussed this year. The marshal said that he had no need of a law to term the reserve the portion of the 80,000 men that he pleased. The proposal to inquire into the formation of the jury lists was rejected by the bureaus of the Chamber of Deputies on Monday. M. Guizot, though suffering from influenza, attended in his bureau to oppose it. The report on the Secret Fund had been read. The commission approve the grant, but recommend that next year it be included in the regular budget. The debate on the Secret Fund was fixed for Thursday.

Spain.—Our intelligence from Madrid is to the 2d inst. The 27th ult. being the birthday of the Regent, deputations of both Chambers waited on him with addresses of congratulation. The Regent's address in reply concluded with an assurance that "whenever Her Majesty should attain her majority, he hoped to resign into her royal hands the government and the constitutional institutions of the country, which he trusted would then be firmly established; when he would again merge among the people, and consider himself happy in having contributed his mite towards insuring the independence of his country." He concluded his address to a deputation from the National Guard as follows:—"I repeat it, National Militia, I stand in no dread of all the despots in the world, because, what can they do, when a nation wishes to be free, and is influenced by a love of liberty?" The Queen sent him a bouquet of flowers on the same occasion, with an autograph note to the following effect:—"My dear Espartero, allow me to offer you my congratulations upon your saint's day, and to wish you every happiness and many returns of the day. Believe in the esteem of your Queen Isabella." Government is said to be in possession of positive proofs of the Carlo-Christino conspiracy for an insurrection in Spain, but the danger of an immediate outbreak as stated under our French news seems to have passed. The President of the Council, in reply to a violent speech of Gen. Vigo in the Cortes, on the 1st inst., stated that he had no fault to find with the French Government. He was well aware of the conspiracy of the Spanish refugees in France; but he added that the Cabinet was on the alert, and that it made representations on the subject to the French Ministry. In the Chamber of Deputies on the 26th ult. the bill containing the modification of the *fueros* of the Basque provinces was presented by the Minister of the Interior. This appears to be regarded as an indication of strength on the part of Government. It is stated that Sir R. Peel's reply in the House of Commons to Col. Fox, and the declaration in the Senate of Señor Gonzales, that the British Government had declared in favour of the Regency in respect to the affair of the Salvandy credentials, had caused a favourable impression in the Spanish capital. The journals inform us that the hopes entertained at Madrid of an amicable arrangement with the Holy See have ceased, the Pope having published an apostolic letter, in which, after enumerating his several causes of complaint against the Spanish Government, he alludes to the law recently presented to the Cortes, which he terms execrable, and represents it as threatening the Catholic religion with complete destruction. The apostolic letter terminates with ordering prayers to be offered up by the Church in favour of the Spanish nation.—Our accounts from Barcelona are to the 27th ult., at which date that city enjoyed complete tranquillity. Colonels Prim and Atmeller had been appointed to the command of the flying columns which had been organised for the surveillance of the frontiers of Catalonia. Several amnestied *cabecillas* connected with the Carlo-Christino conspiracy had been shot. Two chiefs, named Espaculella and Ramisa, taken prisoners in the neighbourhood of Vich, had likewise been put to death. Three inhabitants of San Pedro de Torello, acting as agents to Felip, had been imprisoned at Vich, and the latter was closely pursued by the Queen's troops. A French agent is said to have been lodged in prison at Barcelona, for having been detected enlisting men to join the Carlo-Christino conspiracy. A small guerilla of 25 men had also made its appearance near Santa Colosna, in Catalonia, but the National Guards were in close pursuit of them. All was quiet at Valencia on the 25th ult. Private accounts from San Sebastian, dated the 2d inst., state, that Alcala, Commander-in-Chief of the Basque provinces, was then inspecting the line of outposts along the Bidassoa and the Navarrese frontier. Suspicious persons were continually arriving at Bayonne, for the supposed purpose of preparing the way for the contemplated Carlo-Christino movement; and Gen. Harispe had been instructed to hold the artillery in readiness for active service, and the soldiers of that department and of the cavalry were daily exercised—a practice unusual at this season of the year. Letters from Algesiras of the 23d ult. state that the British authorities of Gibraltar, in conjunction with those of the adjoining Spanish districts, continued to exercise the strictest surveillance along the coast. The apprehensions of an invasion on that side appear to have been so general at Tarifa, that the principal inhabitants were quitting the town, carrying with them their most valuable articles.

Portugal.—We have received intelligence from Lisbon to the 28th ult., brought by the Tagus steamer. A new Ministry had been formed by the Duke of Terceira, which was composed as follows:—President of the Council, War, and Foreign Affairs—Duke of Terceira; Home Department, Antonio Bernardo da Costa Cabral; Ecclesiastical Affairs and Justice, Antonio Azovedo Mello e Carvello; Marine, Antonio Joze Maria Campelhos; Finance, Joao de Oliveira (Baron Tojal.) The bank, it is said, supported this arrangement, as also the tobacco contractors; and the former had supplied 130 contos for the payment of the troops. Baron Tojal had decided upon adhering to the contract made by his predecessors; and orders had already been given that the 2000 contos of Regency bonds, which the company was to purchase, should be then cancelled and destroyed. On the 22d ult. Mons. Capaccini, Envoy Extraordinary from Rome, was admitted to an audience at the Palace of the Necessidades. He delivered his credentials with the usual ceremonies, and was received by their Majesties in a cordial and flattering manner. It is stated that the Pope himself was to be godfather to the expected Prince or Princess. The Queen being near her confinement, a decree of the 28th ult. ordains that all public business be transacted by the King, Don Fernando, with the power of her signature.—Senhor Aguilar, the Spanish Minister, had returned to Lisbon, having come passenger from Cadiz by the Tagus steamer. Affairs at Lisbon appeared to be assuming again a more settled aspect. The Queen had given a dinner party to the chief members of the diplomatic body, the Duke of Terceira, and the Ministers. Some of the Oporto troops had already returned; it appears that they mustered at Coimbra stronger than was calculated, amounting to nearly 6000 men. The Nationals of Cadiz had serenaded and feasted the Conde das Antas, and a toast was given to the restoration of the liberties of the Portuguese, to which the Count duly responded. Col. Pezuela had left Lisbon for France on a mission. Pezuela, it will be remembered, was one of those who attacked the Madrid palace in October.

Germany.—It is asserted in the diplomatic circles that Baron Neumann will succeed Prince Esterhazy as Ambassador to the Court of London. The journals of the 1st inst. announce the death of the Count D'Alcudia, the former agent of Don Carlos at Vienna. The Count, it is said, had sacrificed his entire fortune to the cause of that Prince, and had reduced himself to a state of embarrassment. A Vienna letter mentions that two members of the central railroad commission, M. Ghigo, head engineer of the Emperor Ferdinand's railroad, and the Baron de Lehr, chief architect of the Vienna and Raab line, have been ordered by the Emperor to proceed without delay to the United States to inspect the principal lines of railroads, and to report on their merits. They are to be accompanied by four pupils of the imperial Polytechnic School, and are to go by way of Liverpool. A Gallician Israelite, named Danemarc, is at present the subject of general conversation at Vienna, in consequence of his extraordinary memory. At twelve years of age he could repeat the Talmud by heart. He was lately presented in his Polish costume to Prince Metternich, at a *soirée* composed of philosophers and distinguished naturalists. The *Cologne Gazette* says that Prince Albert, consort of the Queen of England, contemplates paying a visit to Coburg, the Prussian Court, and the camp near the castle of Bruhl, in the neighbourhood of Cologne; and that the journey appears to be decided upon, as the proper authorities have already received instructions to prepare for his reception. The King has conferred the Order of the Black Eagle on H. R. Highness. Baron Schleinitz, the Prussian Secretary of Legation, who, on the departure of his Excellency Baron Bulow for Frankfort, acted for some months as Chargé d'Affaires at London, has left for Berlin, having been appointed by his Sovereign to a high situation in the state. Baron Canitz has succeeded as Secretary of Legation.

Russia.—According to letters from St. Petersburgh, it is expected in that capital, that on the celebration of the 25th anniversary of the marriage of their Imperial Majesties, in the course of the summer, a comprehensive amnesty will be published; allowing all the exiles, without exception, to return home, and to have their estates restored without any restriction. It is thought that this idea must have been long since contemplated by Government, as all the confiscated estates are under the management of a special commission, and no portion of them has yet been disposed of for dotations. It is announced that Government was about to raise a loan to the amount of 50,000 silver rubles through the houses of Rothschild and Hope. The late report of the failure of a banking house at St. Petersburgh is stated to be unfounded, but considerable distress is said to exist amongst the manufacturing classes. The late reduction in the army appears to have furnished an opportunity to some officers who were implicated in the conspiracy which broke out at the death of the late Emperor Alexander, to renew their attempts to excite disaffection amongst the troops by distributing pamphlets calculated to cause dissatisfaction at the late measures. The Emperor, whose personal courage is proverbial, is said to have been quite astounded when informed of these facts; but when he recovered from the shock, he ordered the suspected officers to be banished, some to Siberia, and others transferred to the army of the Caucasus.

Turkey.—The accounts received this week are not of great interest. It is stated that Baron de Bourqueney had received fresh instructions from his Government relative to the Turco-Greek question; and that the French Cabinet does not approve of the proceedings of the Greek Government, and wishes that the just demands of the Porte be complied with. It was feared that this event, which appears to have been unexpected, would strengthen the determination of the Turkish Government, not to yield on this point. The same accounts state that, in answer to the explanations demanded by Baron Bourqueney, the Ottoman Cabinet has declared that it never contemplated any change in the actual form of government at Tunis. It is said that Sir S. Canning has made an application to the Porte to pay the pensions to the widows of the English sailors and marines killed in Syria; the result of which, however, is not stated. On the 10th ult. a deputation of dragomans from the representatives of the Five Great European Powers proceeded in a body to the Sublime Porte, for the purpose of offering a unanimous protest against the late changes in the Government of the mountain districts of Syria. The deposition of the native chief Emir Cassim, and the appointment in his place of a Turkish Pacha, are the measures which, it is said, have called for this intervention. Care, however, was taken to divest it of everything like a compulsory character, and the dragomans are said to have been instructed merely to intimate a hope on the part of their respective Governments, that these steps were not definitive. The reply of the Porte had not been made known. — Private correspondence, received by way of Vienna, of the 25th ult., states, that the reported intrigues which the Russian Government is said to have been for some time past carrying on in Wallachia had at length succeeded in their object; and the Hospodar Ghika had been obliged to leave Bucharest in consequence of the excitement which prevailed among the Boyars.

Egypt.—Our Alexandria news presents nothing of political interest. The Pacha was still up the country, supposed to be at Esneh, and Col. Barnett had returned to Alexandria.

India.—The anxiously-expected India and China mail, which left Bombay on the 1st Feb., reached Marseilles on Saturday morning: a telegraphic despatch, communicating the heads of the intelligence thus brought, was received in Paris on Sunday evening, and in London by extraordinary express on Tuesday morning. The details were received on Wednesday, and contain the following important, though disastrous, intelligence. The news of the most exciting interest is still connected with the struggle carried on in the town and neighbourhood of Cabul. Rumours and alarming reports are rife; but being contradictory, it is difficult to determine what degree of credit is to be attached to them. The winter season and the stopping of the mountain passes by snow, as well as the disturbed state of the country around the scenes of conflict, had prevented the arrival of accurate intelligence. The chief facts on which reliance can be placed are, that after the outbreak of the insurrection of the 2d Nov., and the murder of Sir A. Burnes and several other officers, the insurgents, who are said to consist chiefly of the Ghilzee tribes, made attempts to destroy the six thousand British soldiers in the Bala Hissar and the intrenched camp, but up to the end of December they, although stated to be ten times their number, had not succeeded. There were several engagements, and some severe fighting, in which British officers were killed and wounded, on the 19th Nov., when an attempt was made to send ammunition from the camp to the Bala Hissar, and on the 22d, when the enemy showed himself on the heights, on the 29th, and the 1st and 4th Dec., and also on the 13th and 23d of the latter month. The enemy did not, however, succeed in their attempts to overcome the British. The great want in both the stations of the British troops is stated to be food and clothing; for it appears that, unfortunately, the commissariat stores were so placed as to be seized by the enemy on the first attack, the consequence of which was that many lives were lost in endeavouring to send the necessaries from one place to another. Mahommed Akhbar Khan, the son of Dost Mahommed, joined the insurgents on the 25th Nov., and his presence is stated to have contributed to extinguish some dissensions amongst the chiefs, as well as to inspirit their troops. He pretended also to endeavour to enter into terms with the British Envoy and Commander-in-Chief, and on pretence of making arrangements with Sir W. H. M'Naghten, invited him to a conference near a bridge. Sir W. H. M'Naghten went there, accompanied by four officers and a small escort. He and Mohammed Akhbar had some conversation, when the latter abused the British Ambassador, drew a pistol, and when the shot missed, drew another, and firing into his breast, killed him on the spot. Capt. Trevor, 3d Bengal Cavalry, one of the escort, who, on seeing the first pistol fired, rushed to the rescue of Sir W. H. M'Naghten, was cut down, and the three other officers were made prisoners. It appears that Mohammed Akhbar had arranged an ambuscade near the spot. The head of Sir W. H. M'Naghten was subsequently cut off, decorated with the green spectacles which Sir William used to wear, and in that state paraded through the town by order of the son of Dost Mohammed. The care of the Cabul mission has been taken by Major Eldred Pottinger, whose reputation has been established since the gallant defence of Herat. Hopes appear to be entertained of his being enabled, either to defend his position until succour arrives, or else to make terms for the withdrawal of his brave companions. Among the deaths reported are those of Gen. Elphinstone, said to have resulted from an attack of gout, caused by fatigue; Col. Mackerell, H.M. 44th Reg.; Col. Oliver, 5th Bengal Native Infantry; Capts. Mackintosh, Laing, and Walker, of the same regiment; and Capt. Westmacott, 37th Bengal Native Infantry. In the mean time, the utmost exertions are making by the Government of Bengal and Bombay, to send troops towards the scenes of conflict. Sir R. Sale, the departure of whose brigade from Cabul in Oct. was the signal for the insurrection, has established a strong position at Jellalabad, whither two convoys and two brigades are marching from Peshawur. The spirited conduct of this officer and of his brigade has obtained the highest praise. If the forces in Cabul, which is 90 miles distant from Jellalabad, could hold out for some time longer, it was supposed in Bombay that the speedy defeat of the Affghans, who were still disunited as much as ever, would be easily effected. There is a large corps of British troops at Candahar and its neighbourhood. Ghuznee is also well garrisoned, so that it was thought, however desirous the Affghans there might be of revolting, they would not attempt it until the fate of Cabul is known. Scinde is also tranquil. In the interior of India tranquillity prevails generally. There have been some slight disturbances in the Nizam's country, caused by some small disaffected chieftains, and at different stations of the military, by some of the regiments discussing their rights to batta, or additional pay; but they are not of any moment. Tharawaddie is tranquil, and engaged in destroying the city of Rangoon and building another, which he calls Voh-a-lah-ban. The Nepaulese are also inactive. The news of the Sikhs in Thibet under Zorawar Singh is still unfavourable to them, but nothing is said of their total defeat. In Bombay there is a general mourning ordered by Government for three weeks, in consequence of the death of Sir W. H. M'Naghten, the late Governor elect. Just before the departure of the mail the most alarming rumours were circulated at Bombay respecting Cabul, but nothing official was published, and these reports met with little credit. The rumours in question were that Cabul had fallen; that the whole British force there, amounting to about six thousand men, had been annihilated; and that Lady M'Naghten and the ladies of the officers, sixteen in number, had been carried into captivity by the Affghans. As stated above, however, these are no more than rumours, that were considered to require confirmation. The "Times" of yesterday states that the worst can no longer be doubted of the unhappy troops at Cabul. Accounts have been received in town which can be implicitly relied upon, and from which the following is an extract: "On the 18th Jan. Dr. Brydon staggered into Jellalabad, wounded and confused from suffering and fatigue. He relates that our people quitted Cabul under the Convention agreed upon by Major Pottinger on the 5th inst. The cantonment was immediately occupied by the Affghans, and the English were almost instantly attacked. The march became and continued a constant fight. At the Khoord Cabul Pass, about 10 miles from Cabul, the ladies were sent back, under an escort of Ukbar Khan's people, who promised to protect them. At Tezeen General Elphinstone and Col. Shelton were made prisoners. The native troops became disorganised and scattered. At Jagdaluk, 400 of her Majesty's 44th, who had before kept well together, became disorganised also, broke and scattered. Beyond this the Doctor knows nothing, having with the greatest difficulty preserved his own life. He gives the names of seven officers whom he knows to have fallen. Brigadier Anguetil, Major Ewart, and Lieutenant Sturt are among them. Some stragglers may have escaped, but there is little hope that the main body have been anything but annihilated. We gave up six hostages before leaving the cantonment, Webb, Walsh, Connolly, and three others, chosen, I suppose, by lot. There is more hope, perhaps, for the women than for any one else. General Elphinstone (the report of whose death must have been erroneous) and Col. Shelton were taken prisoners. Something like a treaty, not very reputable to us, preceded the march of the troops."

China.—Our news from China by the Overland Mail extends to the 13th Dec. The latest accounts from the expedition, which had reached Macao, state that no event of importance had occurred subsequent to the occupation of Ningpo. It was, however, reported that a portion of the expedition had proceeded against Hong-choo-foo. Sir W. Parker and Sir H. Pottinger, when last heard of, were at Chusan. The latter had expressed an intention of returning to Hong Kong, and his arrival at that place was daily looked for. When the mail left Macao on the 13th Dec., a vessel was in sight supposed to be H.M.S. Cruizer, with the Plenipotentiary. It was generally understood that immediately on Sir Henry's arrival, instructions would be issued for an advance against Canton; the Chinese having committed repeated infringements of the truce, by repairing the old and erecting new fortifications, as also by obstructing the navigation of the river above Whampoa. Great activity has been displayed by the commanders of Her Majesty's ships of war, in carrying out the orders of the Admiral, for putting a stop to the Chinese coasting trade, as also to that with Japan, Java, and Manilla, by seizing their junks, and bringing them into Hong Kong and Chusan,—many hundreds of all sizes, from 20 tons and upwards, having already been captured. No molestation, however, is offered to junks *bona fide* proceeding to the British settlements in the Straits.

Cape of Good Hope. — We have received Cape of Good Hope papers to the 26th December. Trade generally was under much depression in the settlement, which appears to be attributed as well to a want of efficient labourers as to monetary and other causes. The colonists were doing all in their power to overcome the former evil, having subscribed liberally towards a guarantee of the expenses incurred in securing the requisite supply of free Africans, who have been captured by Her Majesty's cruisers and taken into St. Helena. A memorial had been forwarded from the inhabitants of the Cape to the Home Government, praying that a representative legislature may be granted them, and it appears that the document comes supported by the sanction of the Governor.

United States. — We have three arrivals this week from the United States, the packet ships Solon, Rochester, and England; the former of which arrived at Liverpool on Sunday, and the latter on Wednesday evening. By these conveyances we have papers four days later than those received by previous arrivals. Their contents, however, are not important. In the Senate, Mr. Clay brought forward on the 15th ult. his project for raising an increased and adequate revenue from duties on imports. He proposes to raise 26,000,000 dollars by such duties; but as this amount of revenue cannot be obtained by foreign imports, without adopting a higher rate than 20 per cent., as provided for in the Compromise Act, he will, it was thought, propose a rate of 30 per cent. Mr. Clay intimated that he had consulted his friends in the Senate on the subject of these propositions, and there was a general concurrence as to the propriety of some of the resolutions, but a dissent from others. It would be necessary to deliberate upon them, and those which were adopted might be made the basis of bills. Mr. Calhoun remarked upon the importance of the resolutions, and said they proposed to abandon the Compromise Act, and impose new and permanent burdens on the people. Mr. Clay did not wish, he said, to anticipate the discussion of the resolutions at this time, but he would, at a proper time, undertake to prove that the proposition to raise 26,000,000 dollars from duties did not involve any violation of the spirit of the Compromise Act, but, on the contrary, carried out the principles of that act. The resolutions were ordered to be printed. The only remarkable proceeding in the House of Representatives had been the refusal of members appointed to the committee on foreign relations to act, in consequence of Mr. J. Q. Adams being its chairman. The committee, owing to the resignation of its members, has been temporarily broken up. Mr. Cushing asked leave, on the 17th ult., to report, in part, from the select committee on the currency, and present a bill, which was granted, and the same was read twice by its title, referred to the committee of the whole house on the state of the union, and ordered to be printed. The plan of finance reported by Mr. Cushing is, in substance, the same which was proposed by the Secretary of the Treasury, but notified so as to remove some of the objections.

West Indies.—The Royal Mail steamer Thames, Capt. Hast, R.N., arrived at Falmouth on Thursday, being the first return voyage of the great national line of steamers between this country and the immense southern states on the other side of the Atlantic. She sailed from Havannah on the 11th Feb.; from Nassau on the 19th; from Bermuda on the 23d; and from Fayal on the 5th inst. The Solway and Forth were at Havannah, and the Tay was on the point of leaving for Turk's Island, so that the effective service of the Company is now in full operation. The only news of political interest is connected with some disturbances on the eastern side of Havannah. Troops have been ordered to march to that district, and the ships of war on the station are under orders to sail at a moment's notice. Government, it is said, are also determined to take serious steps with regard to the runaway negroes on the southern coast. The Thames was delayed for upwards of a week in waiting for the Jamaica mail, and was at last obliged to sail without it. The establishment of this line of steamers had produced a great sensation in all the states of South America, and their arrival had been received with cordial demonstrations of satisfaction at the increased facilities of communication with England.

South America.—The accounts from Texas are to the 24th Jan. The Texans were still under apprehensions of an attack from Mexico; and extensive preparations were making to repel it. A bill had been introduced into the Senate, directing the President to open negotiations for annexing the Republic to the United States. An act to fund the debt had passed that body; and the Government had been authorised to issue 150,000 dollars in exchange bills. Congress had passed a bill repudiating Texas liabilities after the 1st Feb.; and the old bonds or notes of the Republic were not after that date to be taken in payment of Government dues. An action is said to have been fought on the 12th Dec., between the Buenos Ayrean and Monte-Videan fleets. The result, however, does not appear to be exactly known, but it was supposed to have been in favour of the Monte-Videan squadron. The firing, which lasted two hours, was heard at Monte-Video.—Lima papers to the 16th Dec. state that Gamarra, who was in the south of Peru, had sent an order to Lopera for the troops that were in the city; but Lafuente and Menezden refused to obey the order, because they apprehended a revolution if the troops left the city. There had been three or four attempts to assassinate Sir James Wilson, the British Envoy, which had caused a great sensation throughout the Peruvian republic. It was generally believed that these attempts were at the instigation of Gen. Lafuente.

Parliament.

HOUSE OF LORDS.

Monday.—In answer to an inquiry by Lord Campbell, the Lord Chancellor said he would introduce a measure on the subject of the Bankrupt Laws on Monday next, and that a bill in reference to the Ecclesiastical Courts was in preparation, and would be introduced in the other House of Parliament, under the care of the Secretary of State. With respect to the Marriage Bill, he would move the second reading of the bill on Thursday, when it would be the proper time to discuss the principle. Subsequently the noble and learned Lord stated, in consequence of a remark made by Lord Brougham, that he would be willing to postpone the Marriage Bill by one stage, in order to give time for the meeting of the General Assembly of the Church of Scotland.

In consequence of a question from the Marquis of Clanricarde, Lord Aberdeen entered into an explanation of the misunderstanding which had arisen from an incorrect report of a conversation between himself and the French Ambassador at this Court, in reference to the occupation of Algeria by France The conversation, he said, had been of a confidential and familiar character. He had never said, however, that he had no objection to make to the establishment of the French in Algiers, but that he had now no observation to make on the subject, and that it was his intention to remain silent. He felt that, after ten years of silence, any objection now would have been misplaced; and the course which it would have been impossible for him to have adopted formerly was now entirely consistent with propriety; but it did not follow that because an objection was not expressed it was not entertained. His Excellency the French Ambassador, in communicating what he conceived to be the substance of this conversation to M. Guizot, had erroneously represented him as expressing acquiescence in the continued possession by France of her conquests in Africa. This supposed declaration on his part had been communicated to the French Chambers, and fearing that inferences might be drawn from it which his expressions were never intended to convey, he had forwarded a despatch, containing a detail of what had actually occurred, to our Ambassador at Paris, to remedy the mistake.

Lord Minto called the attention of their Lordships to a speech delivered by Sir C. Napier in the other House, which, he said, contained some unfounded charges against him for his conduct while holding office as First Lord of the Admiralty, in unduly reducing the complement of men employed in each ship. To refute these charges he quoted two letters from Sir R. Stopford, and explained the principle on which he had acted in apportioning the number of men to the force of the vessels in which they served.

Lord Colchester defended Sir C. Napier, and remarked upon the obvious inconvenience of noticing observations which had been made in the other House. In this he was supported by the Duke of Richmond and Lord Fitzgerald; and a somewhat desultory conversation ensued, which led to no result.

Tuesday.—The Lord Chancellor moved the appointment of a committee to take into consideration the law in Ireland with respect to Dissenters' marriages, with a view to remedy any defects in it.

The Marriages (Ireland) Bill was read a second time.

The Lord Chancellor brought forward a bill to amend the proceedings in cases of lunacy. As the law at present stood the jurisdiction of the permanent Commissioners was confined to a circuit of twenty miles from London, and beyond that distance persons were employed who, from want of experience in a duty of considerable delicacy, frequently committed mistakes which entailed great expense upon the estate of the lunatic. He proposed that two Commissioners, to preside both in town and in the country, should be appointed, who should be paid, not—as at present—by fees charged upon the estate, but by fixed salaries. A uniformity of system would thus be obtained; while by vesting in the Chancellor a discretionary power of dispensing in certain cases with twelve out of the 24 jurors, an item of expenditure which pressed most heavily upon the parties concerned would be materially reduced. He would give also to the Commissioners power to obtain information which was now procured at a great sacrifice of time through the Masters' offices, and they should also be constituted *ex officio* visitors of lunatics, with the right to examine into their treatment, either alone or with the ordinary visitors. These were the general outlines of the bill, but the details he reserved until it should be in committee.

Lord Brougham and Lord Cottenham both expressed their approbation of the measure.

On the motion of Lord Denman, the Law of Evidence Improvement Bill was read a second time, and the Committee fixed for the first Thursday after the recess. The principal objects of the measure are, that persons interested in a suit may be examined as witnesses, if not substantially parties to it; that persons convicted of felony, at present incapacitated from giving evidence, shall be competent to do so: that a particular class of Baptists be allowed to give evidence on affirmation, without being sworn; and that the doubts now existing as to the necessity of certain presentments of juries being made on oath, be removed by an express enactment.

The Lord Chancellor, Lord Brougham, Lord Wynford and Lord Campbell, briefly expressed themselves in favour of the general principles of the bill.

Thursday.—After the presentation of various petitions on the Corn laws, Presbyterian Marriages, and other subjects, the Marquis of Clanricarde said that the despatch which the Secretary for Foreign Affairs had laid on the table of the House, on Monday, respecting the conversation between himself and Count St. Aulaire, the French Ambassador, was dated the 8th Jan.; but he had observed in the public papers that reference had, more than once since, been made to the subject in the French Chamber. He wished to ask the noble Earl whether any official answer to the despatch had been made by the French Government?

The Earl of Aberdeen replied, none whatever.

In reply to a question from the Marquis of Lansdowne, the Duke of Wellington replied that Government did not intend to propose the withdrawal of the grant for national education in Ireland, and that if any alteration at all were made, it would only be with a view of improving the working of the system, and not of depriving the people of Ireland of the benefit of it. He had always supported the grant, and should continue to do so; and certainly he should be one of the last persons to encourage any alteration at present, or any at all, except such as, after mature deliberation, should seem calculated to improve the working of the system.

Earl Stanhope moved that there be laid on the table of the House certain returns of the number of union workhouses in England and Wales, showing the number of paupers admitted into them in each year, from 1836 to 1841, inclusive, &c. Also, a return of the expenditure of such union, and the sums respectively borrowed by them for the purpose of carrying out the regulations of the commission. Agreed to.—Earl Stanhope also gave notice that when the Corn Importation Bill came before their lordships for a second reading, he should move that it be read a second time that day six months, and take the sense of their lordships on the subject.

Lord Denman laid on the table a bill to enable Baptists, in certain cases, to give evidence by affirmation.

HOUSE OF COMMONS.

Monday.—After some unimportant preliminary business, Sir R. Peel, in reply to a question by Mr. Masterman, said that it was the intention of Government that the modified duties on corn should come into operation at the earliest possible period after the passing of the bill.

To an inquiry by Sir C. Napier, Mr. S. Herbert replied that the question of an increased allowance to retired captains in the navy was one for further consideration. At present he declined to say anything on the subject.

Sir R. Peel, in reference to a notice of motion lately given by Mr. Sheil, said he thought it best at once to say that it was his intention to lay on the table the despatch addressed by the Earl of Aberdeen to Lord Cowley on the subject of a conversation between the former noble Earl and the French Ambassador, respecting the occupation of Algiers by France. He was induced to take this step in the hope of preventing the inconvenience of discussing in the House of Commons what had taken place in the French Chamber of Deputies; but if a debate were persisted in, he should be quite prepared to take part in it. The Right hon. Bart. said he entirely acquitted the Count de St. Aulaire, the French Ambassador, of any intentional misrepresentation in his report to his Government, however much he regretted that any misunderstanding, such as had occurred, should have taken place.

In answer to a question from Mr. C. Wood, Sir R. Peel said that he did not propose to renew the committee on the currency. The subject was one which, he said, could be fitly considered only by the executive government; but, pressed as he was with other business, he could give no assurance that Government would produce any measure relating to it in the course of the present session.

Mr. Ferrand called upon Mr. Cobden and Mr. Villiers to prove their contradictions of his charges made on a previous evening against the members of the Anti-corn League, especially respecting the truck-system—a system which he said, was not, indeed, carried on in large towns, for there the shopkeepers would rise against it, but in small places, where there was nobody to stand between the manufacturers and their poor workmen. He repeated his undertaking, made on the former occasion, to prove all his accusations, and stated that most of the spinning-masters compelled their people to take cottages of them. He quoted various letters from workmen to show that the loss of trade complained of by the manufacturers was occasioned by their own frauds in the fabrication of their goods, and not by the Corn-laws; and concluded by challenging members opposite to bring the whole subject under the cognizance of a select committee. After a few words from Mr. Villiers, who said that the duty of proposing a committee lay, not on the manufacturers, but on the member who had accused them, Mr. Ferrand stated that if no member on the opposition side of the House should move for a committee, he would himself before Easter give notice of such a motion. The subject then dropped.

Mr. O'Connell, in moving for a return of the persons who had registered arms in the county of Down, imputed a recent murder in that county to the spirit of Orangeism.

Lord Eliot gave some explanations, and expressed the regret of Government. He believed, however, that the offence had begun upon the Roman Catholic side. The production of the return was agreed to.

The House then went into Committee of Supply, and Sir H. Hardinge brought forward the Army Estimates, proposing an addition of 1,447 men to the force voted in the last estimate, making a total of 95,628 men, exclusively of the troops employed in India. He explained the necessity of reliefs for some regiments which had for many consecutive years been kept abroad; and observed that efficiency was the truest economy. Lord A. Lennox thought that in the present state of our relations with America and France, a larger force should have been proposed. He wished, too, that more of encouragement should be bestowed upon the service, in order to induce good men to join it.

Mr. Macaulay said a few words; and Sir H. Hardinge, in making some additional observations, declared that Her Majesty had now six battalions in the completest order, ready at any moment to be sent to any quarter of the globe. Some conversation about the dépôt system took place between Sir H. Hardinge and Lord J. Russell, in the course of which Lord John expressed his general concurrence in the vote.—Mr. Williams thought that the statement of the Ways and Means ought to have preceded the discussion of the Estimates. The revenue fell short of the expenditure in the last year; and the expenditure in this year was greater than in the last. The deficiency was two-and-a-half millions last year, and this year it would be more. He saw no occasion for so large a force, and would move a reduction.—After some observations from Sir H. Douglas, a conversation ensued between Sir C. Napier and Sir T. Troubridge, respecting the effective state of the British fleet during the late operations on the coast of Syria, in the course of which the latter strongly controverted the opinion of the former that our ships, even with the small complements they then possessed, would have been defeated by an enemy,

Sir H. Hardinge said that with respect to Mr. Williams's observations, seven battalions of the proposed force were required for the war in China, and that the service abroad was so severe, that the reliefs must absolutely be increased: and this required an increase in the total force.—Mr. Williams said, after the explanation given as to the exigencies of the Chinese war, he would forbear from dividing the House. The vote was then affirmed.

On the second vote for the sum required to maintain these forces, Mr. Williams proposed to cut off the excess of pay received by the Household troops beyond what was received by other regiments.

Sir H. Hardinge defended this extra pay on the ground of the peculiar character of these troops, and the greater expense of living in the metropolis.—Mr. Williams persevered in dividing the House, and was defeated by a majority of 144 against 12. The hon. gentleman then took another division upon the vote for the volunteers, and was again defeated by a similar majority. The Committee then passed the remainder of the army estimates, and proceeded to those of the navy. The first item having been moved,

Mr. Curteis raised a discussion on the case of Mr. Elton, a gentleman lately in her Majesty's service, and an officer of the Thunderer, who was lately tried by a court-martial for breach of discipline, the result of which was that he was dismissed the service, and sentenced to six months' imprisonment. The Admiralty, however, subsequently remitted five months of the sentence. Mr. Curteis now spoke in favour of Mr. Elton, and defended some parts of that gentleman's conduct.—Capt. Berkeley gave a sketch of Mr. Elton's naval life, impeaching him of habitual insubordination.—Capt. Rous vindicated the court-martial, and disapproved the clemency of the Admiralty in remitting part of the sentence. The discussion then dropped.—Several of the Navy Estimates having been agreed to, the Chairman reported progress, and obtained leave to sit again.

The Rivers (Ireland) Bill was read a second time, and ordered to be committed on Monday.—The Forged Exchequer Bills Bill was read a second time, and ordered to be committed on Thursday.—The Newgate Gaol (Dublin) Bill was read a second time, and ordered to be committed on Friday.

Tuesday.—The attention of the House was called by Mr. Disraeli to the Consular establishment of the country, which he suggested the expediency of blending with the Diplomatic body. He took an extensive survey of our commercial and of our political legations, both in the old and in the new world, and criticised some of the arrangements of the Foreign-office under the late Ministry. He pointed out the practical advantages which would follow a better organization of our foreign agency in both its branches; and moved a resolution purporting that it would be expedient to effect a combination of the two services.—Lord C. Hamilton seconded the motion. He complained particularly that there was no written code of instructions by which British consuls abroad could regulate their conduct in cases of emergency.—Dr. Bowring concurred as to the necessity of a reform, but thought the root of the evil to be, that men were sent out as consuls who had not been properly educated for the service.

Sir R. Peel could not agree to the resolution, because, though there were cases in which it was very desirable that the diplomatic and consular character should be united, there were many others in which such an union would be manifestly absurd. A functionary might be highly qualified for diplomatic duties who had not the commercial knowledge requisite for the transaction of consular business. Wherever the two characters could be properly united, the saving of one of the two appointments undoubtedly ought to be effected; but the arrangement ought to be left in each individual case to the discretion of the executive Government. The subject had occupied the attention of Mr. Canning and Mr. Huskisson, and had been carefully investigated by a committee of the House of Commons, but neither of them had recommended the measure now proposed.

Lord Palmerston apprehended Mr. Disraeli's speech to have been intended, not so much for its ostensible object as to serve by way of vehicle for censure upon some of the appointments of the late Ministry. That the Consuls, of whom there might be one at every considerable port, should all have diplomatic functions, would be a state of things which could never be permitted by the Government of any country where those officers might reside. Still where the consular agent could be safely invested with the diplomatic duty of the place where he was stationed, the principle of combining the two functions in him was, from motives of economy, adopted; particularly in South America, where our commercial relations were of more immediate importance than our political. Lord Palmerston then vindicated those of his own appointments which had been blamed by Mr. Disraeli, and bore testimony to the general efficiency of the consular body. He deprecated the practice of attacking an Administration, present or past, through the sides of public officers who were not party men, and whose efficiency in the service of their country abroad was mainly dependent on the reputation they might be able to maintain at home.—Several other members having spoken, Mr. Labouchere stated that in those capitals where a British Minister resided, the late Government had in general proceeded on the principle of dispensing with the office of Consul.

Mr. Disraeli felt assured, that though his motion might not now be successful, the discussion would advance his general object. The motion was then negatived without a division.

On the motion of Mr. Mackinnon, a committee was appointed "to consider the expediency of framing some legislative enactment, due respect being paid to the rights of the clergy, to remedy the evils arising from the interment of bodies within the precincts of large towns, or of places densely peopled."

Sir J. Graham thought it fit that some provision should be made upon the subject of burials in large towns, and consented to the motion.

Lord F. Egerton then moved for leave to bring in a Bill "to render certain marriages valid, and to alter the law with respect to certain voidable marriages, and to define the prohibited degrees of affinity." The object of the noble Lord, in the prospective part of his measure, was to legalise the marriage of individuals with a sister of their deceased wife; and he quoted many authorities, ecclesiastical and civil, to show that such a provision was not really in contravention of either branch of the law.

Sir R. Inglis strenuously opposed the Bill. He believed there were reasons in the circumstances of the time fully sufficient to render such a measure as this a very improper one to be entertained, and it was, for practical, political, and general reasons, that he felt bound especially to offer the bill every opposition in his power.—Mr. Milnes expressed himself somewhat favourably to the measure; and Mr. A. Hope avowed his decided objection to it. After some observations from several members,

Sir R. Peel thought that it was a question which should not be considered a political one; it was one which must in a great degree be decided by religious feelings and impressions with which politics should not be mixed up. He thought the best course would be that the debate should be adjourned. This suggestion was ultimately adopted, and the debate was adjourned till Tuesday next.—The other orders of the day were then disposed of.

Wednesday.—After the presentation of numerous petitions and notices of motion, Mr. Shaw moved for a return of all persons who had registered arms in Ireland during the past year. He made this motion, he said, as a necessary addition to the one submitted by Mr. O'Connell on the previous evening for a similar return for the county of Down.—Mr. Hutt inquired if there were any objections on the part of Government to his bringing in the bill, of which he had given notice early in the session, on the subject of foreign corn and flour? His object, he said, was to have the bill printed and placed in the hands of Members, with a view to its being discussed after the Easter recess.

Sir R. Peel had no objection to the introduction of the bill, but declined to pledge himself in any way to the course he might feel it his duty to pursue when it should be before the House.

Lord Eliot, in answer to a question by Mr. J. O'Connell, said he saw no means at present of departing from the system existing in Ireland for securing evidence in criminal prosecutions, although by no means unaware of the evils occasionally arising out of it.

Lord J. Russell asked why the names of the Commissioners of Inquiry into the Exchequer-bill fraud had not been named in the bill before the House, and suggested that there should be three instead of two Commissioners.—The Chancellor of the Exchequer said the names of the Commissioners should be inserted before the next stage of the bill, and that he would give his best consideration to the suggestion of the noble Lord.

Sir R. Peel stated, in answer to a question by Mr. Ellice, that he intended immediately to refer the report of the Commissioners of the Caledonian Canal to a committee of the House. Sir R. Peel having moved the order of the day for the second reading of the Corn Importation Bill, Lord Ebrington spoke at some length against the principle of the measure, and concluded by moving, as an amendment, that the bill be read a second time that day six months. Another protracted debate ensued. After some observations from Mr. Vivian and Mr. Blackstone, both of whom, though the latter generally supports the present Government, spoke in favour of the amendment, Lord Howick felt assured that this measure must be the forerunner of a more extensive reform. He objected to any attempt at fixing by legislation the price of any article whatever. The whole influence of our Corn-law legislation, he said, had been pernicious; and now he wanted to know why the Government measure stopped half-way on the road to sound principles. He was not, however, an advocate for a total and immediate repeal of the Corn-laws; looking to the various interests involved, he would prefer a moderate fixed duty. The existing distress was undoubtedly produced by different causes, such as over-speculation and over-production; but the chief cause arose from the operation of the Corn-laws, in misdirecting the application of capital, and fettering the industrious energies of the country. The present measure would not be a "final" settlement of the question; another alteration would yet be demanded, and another change be submitted to; but the longer it was deferred, the worse would be the terms which the agricultural interest would be compelled to accept; and while the question remained unsettled, no improvement in agriculture was to be expected, for farmers would not venture on long leases. The noble Lord concluded by stating that he should vote for the amendment.—After some remarks from Mr. Pakington and Mr. C. Buller, the latter of whom spoke at great length against the Government measure, Sir E. Knatchbull felt persuaded that, with the exception of the Anti Corn-law League, and the persons whom they had succeeded in exciting, the country in general was decidedly favourable to this measure.—Mr. Sheil expressed his surprise that no notice had been taken of Lord Howick's affirmation, that this measure was but the herald of future changes. Would they apply the principle of a sliding-scale to coffee or sugar? Our Corn-laws were protective, but who reaped the chief advantage from them? Our foreign competitors, our rivals in manufacturing industry and skill!

Mr. Gladstone taunted Mr. Sheil with inconsistency in not having, on former occasions, supported a change of the Corn-laws, and concluded by remarking on the divisions of opinion amongst the opposition side of the House, with respect to the amount of protection, a fixed duty, and free trade.—Lord J. Russell retorted, in reply, the fact of the variations of opinion on the Government side of the House, including Lord Sandon, who had confessed that a fixed duty was commercially the best measure. The late Government, he said, had felt that they could not touch the sugar or timber monopolies, without also dealing with the Corn-laws. He would protect the British farmer in proportion to his actual special burdens; but that being done, the cheaper corn could be sold the better, he considered, for the consumer, the revenue, and the country.

Sir R. Peel did not adopt the scheme of a fixed duty of 8s., because he totally disapproved of it. The measure which he proposed would reduce the price of corn, and would, therefore, be a relief to the country. If Lord John had been disposed to try his own theory fairly, he ought to have had the amendment shaped with that view; but he had shaped it, not in such a form as to bring his principle to a test, but in such a form as to catch a few votes of gentlemen not concurring in that principle. He himself had brought forward his plan, sincerely expecting that he should obtain the approbation of all moderate and thinking men; and he had obtained it. Therefore it was that these debates were so flat and dull on the part of the Opposition. Really, Lord John ought to have some little feeling for agricultural prejudices, after having written more than any other public man to excite them. But that was when he was a county member; now that he represented a populous city, his opinion had undergone a total change.—After a few words from Lord Worsley and Sir C. Napier, the House divided, when there were—For the second reading, 284; against it, 176. Majority for Ministers, 108.

Thursday.—Only 32 members were present at four o'clock, and the Speaker therefore adjourned the House.

Friday.—Sir R. Peel according to notice rose to develope the views of Government in reference to the financial and commercial policy of the country. The right hon. Baronet commenced by stating the deficiency in the revenue, which he said independently of the decrease in our Indian empire was no less a sum than 4,700,000*l.*, and this deficiency must be made up. He discarded the notion of supplying the deficiency by incurring fresh taxes on articles of consumption. He also abandoned the idea of realizing any revenue from the Post-office; or adding to any of the ordinary sources of revenue, and concluded by saying that he felt it his duty to make an earnest appeal to the possessors of property, for the purpose of repairing the deficit in the revenue, which they had now to remedy. He proposed for a time to be limited, that the incomes of this country should be called upon to contribute a certain sum for the purpose of remedying this mighty and crying evil. He proposed that the "Incomes of this country shall bear a charge not exceeding sevenpence in the pound—not amounting to Three per Cent.—being a charge of two pounds eighteen shillings and fourpence," for the purpose not only of supplying the deficiency of the revenue, but also for the purpose of enabling him, with confidence and satisfaction, to propose those great commercial reforms which Government was desirous of bringing forward. On former occasions incomes of 60*l.* a year were exempt from any tax; and incomes of from 60*l.* to 150*l.* were subject to a reduced rate: he should propose that any income under 150*l.* a year should be exempt from the tax. The right hon. Bart. then entered into details explaining the grounds on which his proposal was founded. He assumed that the rental of land at present was equal in amount to the rental in 1814, viz., 39,400,000*l.* In order to calculate the revenue which he could derive from 3 per cent. on the rent of houses, he found that in 1814 the number of houses was 2,231,000. In the present year he found the number of houses had increased from the number in 1814, 3,460,000, and the value of the increase of rental had been in proportion to the increase in number. He should be justified in estimating the amount of the income from the rental of houses at 25,000,000*l.* The rental of land then was 39,400,000*l.*, the rental of houses 25,000,000*l.*; tithes, shares in railways, mines, and other sources, 8,400,000*l.*; and this would give a grand total of income, in respect of which the tax was to be assessed, subject to the reduction he had referred to, of 72,800,000*l.* But then he proposed to exempt all incomes under 150*l.* a year, and that would make an immense difference. And he must deduct on that account not less than one-fourth of the total of the assessment—deducting that one-fourth from the produce of the tax which he had calculated on, from the gross income, he found it would amount to 1,600,000*l.* He proposed that in respect to the occupying tenant the occupation of land should be estimated at one-half, instead of three-fourths, of the rent. He proposed, and he saw no grounds for taking a contrary course, that all funded property, whether held by merchants of this country or by foreigners, should be similarly charged to the extent he proposed in respect to other property. The right hon. Baronet then recapitulated the total amounts of his estimates, to explain to the House what he expected to derive from his proposed duty on incomes, and which he showed would make a total aggregate estimated receipt of 3,771,000*l.* He then stated what were the views of Government with respect to the duration of this impost, if it should meet with the sanction of the House. He trusted that Parliament would confirm this measure. In order to give the opportunity of a full experiment, he hoped that Parliament would not be unwilling, in case of necessity, to continue the duration for a period of five years at most. He thought it just, however, in the first instance, to limit it to three years; that is, to give Parliament the opportunity of sanctioning it at the expiration of three years. The 5th Oct. would be the first half year. The right hon. Bart. then summed up his statements, stating that the total loss to the revenue by the remission of taxes he proposed, would be 3,780,000*l.* He should still have in his hands a small surplus to meet contingencies. He believed he had now completed his task, and developed the views of her Majesty's Government. He was indebted to the House for its attention, and he had given it a full but unexaggerated description of the finances of the country. He had done so, because this was an occasion on which the Government would make no compromise, and on which it was the duty of the Government to give the Legislature good advice, leaving the responsibility of adopting it or not to the Legislature. The right hon. Baronet concluded by reference to the present period of the world as one of the most momentous that ever existed, referring with much eloquence to the countless millions that would view with great admiration the glorious achievements of this generation in rescuing the world from despotism; and he hoped that they would now in peace display the same energies to meet the present evil which they had displayed in war. He had no doubt that they would; and that they should exert themselves as their forefathers had done, to meet the difficulties of their present situation. The right hon. Bart. then moved his first resolution, which went to grant a duty on Irish spirits.

Lord J. Russell hailed the adoption of such liberal principles of commerce as those developed in the Ministerial statement; the measure proposed was certainly a great one, and the Government had acted in a manner becoming a great country, and he and his friends would meet them in a spirit free from party bias.—Mr. O'Connell protested against the measure of duty on Irish spirits, and said it was contrary to the spirit of the Union to make Ireland responsible for the public debt of England. A conversation took place respecting the days for the discussion of the different topics of finance, &c., in which several members took part. The House then went into committee on the West India Clergy Bill, and Sir C. Napier proposed to reduce the number of Bishops in the West Indies from three to two, which was negatived on a division by a majority of 109.

CITY.

Money Market, Friday.—Consols for money closed 89; and for the account, $89\frac{3}{8}$; Exchequer-bills, 29s. to 31s.; and New Three-and-a-half per Cents., $98\frac{7}{8}$.

Metropolis and its Vicinity.

The Weather.—During the whole of Wednesday night, and until seven the following morning, the wind blew a violent hurricane from the south-west, and did considerable damage in London and the suburbs, by the partial destruction of the roofs of houses, chimney-pots, &c., which were blown down in various places; the injury appearing to be nearly equally felt in all directions. At Holloway an accident occurred occasioned by the violence of the wind, which was attended with loss of life. It seems that a high stack of chimneys was blown down from a newly-built house in St. James's-road, Holloway, belonging to a Mr. Atkinson, and forcing its way through the roof of a chamber, in which a young lady on a visit together with one of the female servants were sleeping, killed the servant, and so seriously injured the young lady, Miss Feast, that she still continues in a dangerous state. Great damage has also been sustained by the barges and lighters on the river; but the shipping in the Pool escaped without any injury. It was, however, found necessary to keep extra watches on deck all night, and the masts threatened to snap every instant with the violence of the storm. Above bridge a number of coal barges were sunk with their cargoes.

Metropolitan Post.—On Monday a new order extending the time of posting letters at the branch offices at Charing-cross, Old Cavendish-street and the Borough came into operation. Letters can now be posted at each of the above offices without any fee until half-past six, by affixing an additional penny stamp on inland letters. On foreign letters a similar fee is required, but this may be paid in cash; although for facilitating the general business, a stamp, it is said, will be preferred.

Metropolitan Improvements.—The projected new street at the back of Astley's late Theatre, which is to form a continuous line from the York-road by Stangate-street to the walls of the Archbishop of Canterbury's Palace, is now nearly completed, and will shortly be opened to the public, who will then have a direct line of road from Palace-road by the new street, York-road, and Stamford-street, to Blackfriars, avoiding the inconvenient corner by the stage-door of Astley's Theatre and Stangate-street. It is also said to have been in contemplation to extend this improvement as far as Vauxhall-bridge, and thus make an open road from Blackfriars to the Wandsworth-road, which would effect a considerable saving of time to persons who have to travel by vehicles from the east side of Westminster-bridge to Vauxhall, or the lower parts of Lambeth. But a great obstacle appears to exist to the completion of this new line of road, as in passing by the Bishop's walk it would encroach upon the gardens of the Archbishop's Palace, and perhaps touch a part of the Palace itself. To get rid of this objection, however, it has been suggested that a small embankment of the river might be made, at little expense, where that part of the Palace abuts upon the present walk; and it is thought that it would also be the interest of the proprietors of steam-boats to assist in the undertaking.

Wood Pavement.—At the Marylebone Vestry on Saturday, the question, which has been so long agitated, of paving Oxford-street with wood, was finally settled. The meeting was unusually numerous, and a great degree of interest was manifested in the proceedings, the gallery being crowded with ratepayers. The object of the meeting was the confirmation or non-confirmation of a minute, which had been carried by a large majority on the preceding Saturday, noticed in our last, for paving that part of Oxford-street running from Wells-street to Vere-street with wood. Mr. Tabrum was in the chair; and amongst the vestrymen present were, Lord Kenyon, Earl Strafford, Lord Barrington, Earl Manvers, Lord Nugent, Sir B. Hall, M.P., Mr. Tufnell, M.P., Mr. Hume, the Dean of Chichester, and many others. After a lengthened and animated discussion, a division took place; when there appeared for the non-confirmation 24, for the confirmation 41; majority in favour of the wood-paving seventeen. The minute was consequently confirmed, and a resolution passed to advertise for tenders to carry out the wood-pavement in the part pointed out in the original resolution of the vestry. The announcement of the result of the division was hailed with loud cheering.

Public Meetings.—On Monday, a public meeting of the ratepayers of Marylebone was held for the purpose of opposing a bill now before Parliament, to alter the present local acts of that parish, and to repeal some of the clauses contained in Sir J. Hobhouse's Vestries Act. Lord Nugent was in the chair, and explained the object of the meeting, which he said was to oppose a bill which had been introduced into Parliament, and which would repeal all the best clauses of Sir J. Hobhouse's Vestries Act, destroy the vote by ballot in parochial elections, and disfranchise a large number of rate-payers, by compelling them to pay rates in advance, and divide the parish into wards, and thus afford facilities for bribery and intimidation. Mr. Hume, Sir B. Hall, M.P., and others addressed the meeting, and it was contended that if the bill passed, it would disfranchise three-fourths of the rate-payers. Out of 13,900 rate-payers, upwards of 9,000 would be ineligible to become vestrymen, in consequence of the raising the qualification, as proposed, from 40*l.* to 60*l.* The bill proposed to give to the district of Christ-church, with 6,000 rate-payers, but eight vestrymen; whilst the rectory district, with only 2,000 rate-payers, was to elect nine. The bill also proposed to elect a parish treasurer, at a salary not exceeding 1,000*l.* per annum, and that the expenses of the bill should be paid out of the parish rates. It was denounced as an invasion of the people's rights; and Sir B. Hall declared he would give it his strenuous opposition in the House of Commons. Mr. Barnes came forward to move an amendment, but the meeting refused to hear him. Resolutions strongly condemnatory of the bill were adopted, as also a petition founded on them against it.—On Thursday the annual general meeting of the stockholders of the New Brunswick and Nova Scotia Land Company was held. From the report it appeared that the property originally purchased of the Crown consisted of 558,000 acres of land. Besides that territory the company possessed two properties, the one in St. Mary's and the other in Campbell Town, on the banks of the Miramichi. The 558,000 acres were twenty-five miles from Frederickton. The sums already paid and about to be paid to Government for the first tract amounted to 60,229*l.*; the purchase money paid for the land at Campbell Town was 3,327*l.*; and the purchase money for the property at St. Mary's was 867*l.*, making a total of 64,493*l.* 10*s.* 6*d.* The sums expended by the company in making roads, erecting buildings, &c., amounted to 78,444*l.*, and the gross expenditure, including that of 1841, figured 145,326*l.* Against that expenditure the receipts for timber, land, &c., were 4,518*l.* The average price of the land was 4*s.* 6*d.* per acre, which made the three properties appear worth 125,954*l.* exclusively of the houses erected at Stanley, and those occupied by the officers of the company. The proceeds from the timber during the last four years amounted to 3,560*l.* During the last year 4,000 acres were divided amongst fifty emigrants. The balance-sheet for the past year was as follows:—Liabilities, 9,400*l.*; assets, including 4,000*l.* cash, 2,400*l.*; calls upon shares arranged, 5,300*l.*; calls upon shares not validly arranged, 11,700*l.* There was a sum of 8,200*l.* to be paid Government on next Nov., towards which 6,000*l.* worth of assets would be applied. The report was adopted. Earl Mountcashel and others having addressed the meeting, it was suggested that the directors should not expend more money in the colony without the consent of the stockholders.

Spitalfields.—On Wednesday, at the Mansion House, the Lord Mayor stated that he had received a communication from some gentlemen at the West-end of the town, who had interested themselves for the benefit of the distressed weavers of Spitalfields. The letter enclosed the sum of 163*l.* 0*s.* 6*d.*, which had been raised at a ball given for the purpose of aiding the funds already collected for the relief of this distressed class of operatives. The money was immediately transmitted to the committee appointed to distribute it.

Forged Checks.—A few days since, a young man called at the private residence of Sir R. Peel, in Whitehall-gardens, and gave to the porter a sealed paper parcel, requesting that it might be immediately delivered to the Right Hon. Baronet, the contents being of considerable value; and at the same time adding that he should expect to receive some acknowledgment from Sir R. Peel or his secretary that the parcel had been duly delivered. It appeared subsequently that he was the son of a respectable butcher in the Strand of the name of Warren, and that on the morning in question, whilst on his way to Newgate-market, he picked up in Ave Maria-lane a piece of paper, which purported to be a check for 401*l.* 17*s.* 6*d.*, drawn by Sir R. Peel on Barclay and Co.'s bank, in favour of Mr. H. Barker, of Hull, the instrument appearing to be genuine. Supposing it to have been dropped accidentally, he took the opportunity of restoring it as above mentioned. In the course of the day he received a note from Sir R. Peel's secretary, acknowledging the receipt of the parcel, with the Right Hon. Baronet's thanks for the attention shown, as well as for the proper sense of probity that had suggested that course, at the same time assuring Mr. Warren that the check was of such a spurious description that there was no possible chance of its having been paid if presented at the banking-house where it was made payable. It seems that three or four checks of a similar description had even been presented for payment, but had been dishonoured. The author of the forgery, however, has not been detected.

Mortality of the Metropolis.—The following is the number of deaths from all causes registered in the Metropolis in the week ending Saturday, Feb. 26th: males, 457; females, 485; total 942. Weekly average, 1838-9-40-1, males, 467; females, 445; total, 912.—A statement has just been published, by authority of the Registrar-General, of the number of deaths in London and its suburbs in the year 1841, from which we gather the following information:—The population comprised in the districts for which the returns are made, forming an area of 70 square miles, amounted, according to the last census, to 1,870,727, of which number 874,139 were males, and 996,588 females. The deaths in the year were 45,284, being at the rate of 2·429 per cent.; of the total number 22,995 were males, and 22,288 females; the deaths in the first quarter of the year amounted to 13,713, in the second to 10,104, in the third to 10,406, and in the fourth to 10,761. 20,780 are stated to have died under 15 years of age, 15,167 between 15 and 60, 9,266 60 years and upwards.

Fires.—On Monday, a serious fire broke out at Minerva House, Deptford, in the occupation of the Duke of Normandy, who, it is stated, is at present engaged by Government in improving the various missiles used in war. It appears that the duke and his assistants were trying some chemical preparations in the course of their experiments, when an ignition took place, which was instantly followed by an explosion; the result of which was, that the roof of the building was blown off. Several engines were soon on the spot, and the fire was got under; but not before the building where it had originated had been entirely destroyed.

Losses at Sea.—Intelligence has been received by the Directors of the General Steam Navigation Company of the entire wreck of the steamer the City of Edinburgh. It appears she left the river a few days since for Ostend, having on board between 30 and 40 passengers and a general cargo; that she shortly after encountered a heavy gale from the westward, which lasted the whole day and night; notwithstanding which, however, her passage was not impeded, and she reached her destination in safety the following day, and brought up alongside of Ostend pier to land her passengers, which was safely effected. At an early hour the following morning, while the crew were employed landing the cargo, it came on to blow a hurricane, and all of a sudden the warps that secured her to to the pier snapped asunder, and she drifted out into the centre of the stream, and ultimately ran ashore about a mile eastward of the harbour. Every exertion was made, but unsuccessfully, to get her off; and she at last became a perfect wreck, though the crew succeeded in safely removing the greater part of what was of any value in her. No lives fortunately were lost.—On Tuesday afternoon considerable interest was manifested on the river by the arrival of a brig, the Astley, in Limehouse Reach, almost a wreck, having been run into by a vessel called the Penelope, while out at sea, near Aldborough. So serious was the collision, that the latter vessel went down headforemost almost immediately afterward, carrying with her one of the crew, who was drowned, though all the rest fortunately escaped with their lives. The damage done to the Astley was also very serious; and it is considered surprising that she also did not go down.—On Wednesday evening, as the Royal Adelaide, a London and Leith steam ship, having 40 passengers on board, was proceeding down the river, the weather being at the time very boisterous, and the tide running down strongly, when off Gravesend she ran into the Wilmot, a large emigrant ship of 800 tons burthen, having a number of passengers on board. The concussion was very violent, by which both ships sustained serious damage, and the greatest alarm and confusion prevailed for some time among the numerous passengers. Fortunately, however, no lives were lost; and the steamer has since been able to pursue her voyage. The Wilmot has sustained so much injury that it is feared her departure will be delayed in consequence of the accident, and that it will be necessary to take her into dry dock to be overhauled and repaired. It is thought that if she had not been a large and strong ship, she would have met the fate of the Tyrian, which, it will be remembered, was sunk by a steamer in the same place while riding at anchor two years ago.—On Thursday accounts were received in the City from Portsmouth of the total loss of the brig Jane Clark, of London, on the morning of Monday, in the British Channel, in consequence of a violent collision with H.M.S. Athol, on her homeward voyage from Barbadoes. The collision took place at about 10 miles S.W. of the Lizard Lighthouse, whereby the brig's bows were completely stove in, and she immediately filled and went down in 14 fathoms water. Fortunately the master and all on board were saved by the cutter of the Athol. The loss of the brig and cargo is reported to be 2,000l.

Provincial News.

Bath.—This city has been visited by an extensive flood, making the fourth, it appears, within the last twelvemonths. As, however, in this instance the calamity seems in some measure to have been foreseen, time was given to secure property, and the damage done has not been extensive. The waters were at their height about noon on the 3d inst., from which time they gradually began to subside. Mr. Terrett, butcher, of Northgate-street, is said to have been a heavy sufferer, having lost 21 sheep, which were swept away. With this exception, there does not appear to have been any serious loss, although the flood occasioned considerable inconvenience to the inhabitants of the Dolmeads and the Bristol-road, the water quite surrounding many of the houses to the height of several feet, and all communication being cut off, except by boats.

Bedford.—A local paper states that a gentleman residing in this county, not far from St. Neot's, a few days since, met with the following adventure:—He was riding home on horseback, with a quantity of gold and silver in his pocket, in which there happened to be a hole, which let out the cash; and on reaching the end of his journey, he found that 70l. in sovereigns and silver had disappeared. On discovering his loss, the gentleman retraced his steps, though it was nine o'clock in the evening, and on half a mile of road picked up most of his lost treasure. On the following morning at day-break the search was renewed, and so successfully, that out of about five hundred pieces of coin only two shillings were finally lost.

Brighton.—One of the inspectors of the General Post Office has been engaged for several days at the Post-office in this town, investigating the circumstances connected with the loss of a number of letters. It appears that within the last two months no less than forty-eight letters, containing money, and addressed to various individuals in this place, have never reached their destination. In addition to these, it also appears that a letter containing 25l. in notes, and a money order for a few pounds, was lately registered at the post-office here, directed to a fisherman at Portsmouth, which never reached its destination; and although every inquiry has been made, no clue can be obtained to it. The sender, it is stated, holds the receipt given by the postmaster. On Saturday, the chief officer of the police, assisted by a number of other officers, searched the whole of the clerks, sorters, and letter-carriers, and afterwards proceeded to their various residences, to endeavour to find out the guilty party; but although the search has been as strict as could possibly be made, nothing appears to have been discovered that throws any light on the subject.—The firm of Messrs. Wigney and Co., a respectable private banking-house in this town, has suspended payments. The event has produced considerable excitement in the town, and great numbers, it is said, will be serious sufferers by the failure. On Tuesday the Sheriff took possession of the bank, under a writ of extent, for moneys deposited in the concern on behalf of her Majesty, by the postmaster. Nothing has yet transpired as to the amount of liabilities. It is stated that three tradesmen in this town drew out nearly 50,000l. in two days previously to the stoppage of the bank.—It being generally known that the Court would leave for London on Tuesday, the whole line of road, from the North gate of the Pavilion to the end of the town, was thronged at an early hour with crowds of persons, and every balcony and window was filled with people, anxious to obtain a parting glance of her Majesty and Prince Albert. A guard of honour of the Coldstream Guards lined the road from the Palace. The Royal carriages, which left the Pavilion a little before nine, proceeded at a walking pace through the town, her Majesty and Prince Albert continually bowing to the multitude. The Princess Royal and the Prince of Wales were held up to the window of the carriage, which caused much cheering, the little Prince being fast asleep. A royal salute was fired from the battery; the various flags on the churches and public buildings were lowered, and her Majesty left the town, amidst the most cordial demonstrations of attachment and respect from all classes of the inhabitants. The Queen's stay at the Pavilion has been a little more than one month, and it is stated that the health of her Majesty and the Royal Infants has so much improved, that her Majesty will return in the course of the summer.—On Wednesday this town and neighbourhood were visited by a severe hurricane, which did considerable damage; and during the storm a brig named the Economy, of Little Hampton, of about 150 tons burthen, laden with coals, from Sunderland, went down, and all on board perished.

Chichester.—The first meeting under the fiat issued against W. T. Goodeve, the late cashier of the old Bank, has been held in this city. The solicitor to the assignees of the bank offered to prove to the amount of 24,593l. under the estate of Ridge and Co. After a long examination, in which the bankrupt acknowledged that he had made over all his property to his family to prevent its reverting to the Crown in the event of his being convicted of embezzlement, the proof was admitted for 12,918l., the solicitor for the assignees waving his right to prove for the larger sum. The bankrupt's debts, independent of Messrs. Ridge's, did not amount to 400l. It appeared that no entry had been made of the various checks drawn by Goodeve upon the bank in any of the bank books.

Newark.—A fire of a serious description has occurred in the vicinity of this town. It took place at the steam corn-mills belonging to Mr. Hole, corn-factor and miller, at Carlton-upon-Trent, a small village, situated about seven miles from this town. The mills, which are said to have been the most capacious in the county, consisted of several buildings, covering a large space of ground. The fire originated on the third floor of the principal part of the establishment, and was discovered by a private watchman, who gave the alarm, but there being no fire-engines in the village, an express was despatched to this town. It was, however, upwards of an hour before any reached the spot, and at that period the conflagration had extended throughout the building, and its destruction was complete. The engines continued working for several hours before the flames were got under. The loss of corn is stated to be very considerable; there were upwards of 2,000 quarters in the mills, and the whole of it is supposed to be consumed. The fire is thought to have originated from the friction of the machinery, it having been in active operation both day and night for some time past. This, it appears, is the second time within ten years that these mills have been destroyed by fire. The loss sustained is supposed to be upwards of 7,000l.

Portsmouth.—A few days since, as H. M. Frigate the Vindictive, Capt. J. T. Nicholas, with the flag of Rear-Admiral Sir T. Cochrane, was towing out of the harbour, having completed the repairs rendered necessary by her lately getting on shore on the Spit, she was placed in a situation that again nearly occasioned a similar misfortune. It appears that for the purpose of towing her out two steamers were lashed alongside, which took her along very well until they got to the Spit, where, as it was blowing fresh, there was a heavy swell, so that the weathermost steamer was compelled to cast off, as she was injuring both her own and the Vindictive's side. No sooner, however, had she cast off than the wind and tide took the Vindictive on the bow, and turned her round, so that she was nearly on shore on the Spit, and this was only prevented by letting go her anchor, the remaining steam-ship being unable to control her. Many persons, it is said, who witnessed the occurrence, believed she was really on shore, and a report to that effect was circulated and believed throughout the town, and caused a great sensation. Fortunately, however, this was not the case, and, sail being made upon her, she slipped her cable and ran for the most eastern part of Spithead, where she dropped her anchor. She was expected to sail in the course of the week for China.

Southampton.—The half-yearly meeting of the proprietors of the Southampton Dock Company has been held. The report gave a detailed account of the operations of the Company, from which it appeared that the tidal dock would be opened for trade by Midsummer. The total receipts of the company to the 31st Dec. were, 237,789l. 3s. 2d., and the payments 229,264l. 1s. 10d., leaving a balance of 14,773l. 4s. 5d. A long discussion took place between the chairman and one of the proprietors on the method of contracting the forfeiture of shares, and the excess in the estimates, the objections to which the chairman met, and justified the conduct of the directors, when the report was adopted. In answer to a proprietor, the chairman said that about 23,000l. had been spent on the close dock, and about 50,000l. on the tidal dock, to the 1st Jan. The secretary, on a resolution being passed to forfeit 139 shares, said the total number forfeited was 1311 at that time.—A local paper states that the total contracts for mail-packet services, at the present time, amounts to 421,929l. out of which the packets from this port alone earn no less a sum than 304,000l.; leaving to London 17,000l., to Liverpool 89,000l., and to Dover, Weymouth, &c., about 20,000l.

Railways.—The following are the receipts of the principal railways for the past week, viz.; Birmingham, 13,070l.; Great Western, 9,948l.; South Western, 4,316l.; Manchester and Leeds, 4,002l.; North Midland, 3,616l.; Midland Counties, 2,211l.; Great North of England; 1,063l.; Brighton, 1,969l.; York and North Midland, 1,369l.; Birmingham and Gloucester; 1,450l.; Birmingham and Derby, 948l.; Northern and Eastern, 766l.; Hull and Selby, 870l.; Greenwich, 704l.; Eastern Counties, 673l.; Manchester and Birmingham, 329l. A fatal accident has occurred on the Manchester and Leeds Railway to a man named Forrester, of Manchester, one of the guards of a luggage train, who was found dead a few mornings since on the line, at Thornhill Lees, the Dewsbury station, near the gates of the Dewsbury and Thornhill road, which crosses the line. It is supposed he was asleep and fell off, as he was safe in his place when at Bridgehouse, on one of the waggons used to convey some materials used on the railway. The train off which he fell consisting of empty waggons, did not stay at the Dewsbury station, but soon after it had passed, the body of deceased, who was not missed until the train arrived at Wakefield, was discovered by the watch. An accident has occurred on the North Midland Railway, whereby a gentleman of Wakefield, named Whetnall, has been seriously injured. It appears that he was a third-class passenger in the train for Leeds, and shortly after leaving Normanton, he was leaning against the door of the carriage, which was insecurely fastened, when it suddenly burst open, and he fell out of the carriage on the line, and the train passed over one of his legs. The persons in the carriages called out to the engine-drivers to stop, as well as to the guards, but without success. On the arrival of the train at Leeds a special engine was sent back for Mr. Whetnall, who was found on the embankment near the scene of the accident, having been removed from the rails by some labouring men. From the injuries he had received immediate amputation of the leg was found necessary, and he continues in a dangerous state.

IRELAND.

Dublin.—His Excellency the Lord Lieutenant and the Countess de Grey and suite left the Castle on Wednesday for Bray, county Wicklow, where the Viceroy and his Countess intend to sojourn for a few days. His Excellency has been threatened with an attack of gout, and change of air has been recommended by his medical attendants, Sir H. Marsh and Sir P. Crampton.—A party of the 10th Hussars left town for Bray on the same morning, to be quartered at the Royal Hotel during his Excellency's stay, which it is expected will not be prolonged beyond the 16th inst.—A collar of the Order of St. Patrick has just been completed by the jewellers and goldsmiths to the Irish Court. It has been finished by order of the Lord Lieutenant, to be presented to Prince Albert, who was lately made a Knight of St. Patrick. It is made of gold, the produce of the county of Wicklow, and is said to be of beautiful workmanship.—The Lord Lieutenant and the Countess de Grey gave a dress ball at the Castle, on

Thursday evening, the 3d instant, to all the nobility and gentry at present in the city and its vicinity. Upwards of 600 were present on the occasion. Cards have also been issued for a full-dress ball on St. Patrick's night, the 17th instant, and St. Patrick's Hall is undergoing the necessary preparations for this annual festivity. New arrangements, it is stated, have been necessary to secure ingress and egress for the company frequenting the Irish Court, the numbers greatly exceeding those for many years past.—George Mills, the person charged, as noticed in our last, with fraudulently altering bank-notes, has at length been admitted to bail, the bank authorities consenting to receive the securities tendered in his behalf.—The Bishop of Cashel was seized with a severe fit in Westland-row, on Saturday evening, after leaving the Dublin and Kingstown Railway for his residence. He had to be supported home on a bier, but it has since been announced that he has nearly recovered from the attack, which is said to have been caused by fatigue and over-exertion.

Cork.—The following serious outrage was committed a few days since in this city. It appears that Mr. Wilson, who has lately erected saw-mills in the city, incurred, for some reason, the ill-feeling of the sawyers, in consequence of which he found it necessary to be constantly guarded by the police, and to go armed. A few nights since, however, being on his way home, having forgot his pistols, he was followed by three men, who threw a bottle of vitriol into his eyes, destroying the sight of one, and leaving the other in a dangerous state. He seized two of the men, but the pain obliged him to let them go, and they escaped. Eleven persons have been taken into custody until Mr. Wilson's sight is so far recovered that he can identify the authors of the outrage.

Sligo.—At the recent assizes held in this town, Mr. Henry Irwin, the coroner, was found guilty of giving an order on the county treasurer, to a surgeon for attending an inquest that never took place, and sentenced to transportation for seven years.

Waterford.—Mr. George Wyse, brother of the ex-member for this city, has obtained a verdict, with 750*l.* damages, against the proprietor of the "Waterford Mail," for having inserted in his journal two libels; the first charging Mr. Wyse with perjury, by alleging that that gentleman had falsely sworn, during the late election, that he was six months residing in this city, having been all that time, according to the libel complained of, a visitor on the Continent. The second libel insinuated that the plaintiff instigated his brother to cause the death of his elder son, Napoleon Alfred Wyse, in order that he (the plaintiff) might be the nearer to an inheritance of the family property. Mr. Thomas Wyse, who was examined at length to prove the falsity of the allegations, said that his brother George and Mrs. G. Wyse, in their treatment of his son, had his full consent, gratitude, and approbation. Mr. Dickson, Q. C., for the defendant, confessed that Mr. Wyse had vindicated his character and parental conduct in the fullest manner, and that there was not a shadow of truth in the calumny; the case would, therefore, be no further defended. The jury consequently at once found for the plaintiff damages as stated above. Another action has been brought against the same paper, by Captain Newport, for a libel contained in a letter, in which the writer sought to show that Capt. Newport was "mentally, morally, and physically a coward." The most ample apology was offered; but plaintiff's counsel required besides 100*l.* to be given in charity, which was acceded to.

Limerick.—A local paper gives the following account of a singular outrage committed in the town of Kilmallock: "On Wednesday the 23d ult., a large body of country people entered the town in a body, with horses and cars, and in the open day surrounded the union workhouse, demanding with threats the immediate release of the paupers from Kilfinan and Glenroe districts, which the master was obliged to comply with, and 60 persons were discharged, whom the country people carried away with them, declaring they would sooner support them in their own cabins than be over-taxed for having them confined as prisoners. Informations were taken next day against the leaders in this extraordinary outrage, but it does not appear that they have yet been taken into custody." —A few nights since the mail from this city to Dublin was again fired at near Moreygall, the place where the attack was recently made upon the guard, who was severely wounded, as we noticed at the time. In the present instance, however, no injury was done. The parties by whom the attack was made succeeded in escaping and have not since been traced.

SCOTLAND.

Edinburgh.—A bill has just been introduced into Parliament to alter the close time of the salmon fisheries in Scotland. It is prepared and brought in by Mr. H. H. Drummond, Mr. C. Hope, and Mr. Cumming Bruce, and contains three clauses. The first clause enacts, that from and after this present year (1842) no salmon, grilse, sea-trout, nor other fish of the salmon kind, shall be taken in or from any river, stream, lake, water, or estuary whatsoever, or on any part of the sea-coast between the last day of August in any year and the 1st day of February thereafter, by any person or persons, any law, practice, or statute to the contrary notwithstanding, &c. The second clause enacts that it shall be lawful for the proprietor of any salmon fishery, or any person authorised in writing by such proprietor, within the boundary of such proprietor's fishery, to angle for and take with the single rod only, any salmon, grilse, sea-trout, &c., during the first fifteen days of Sept. yearly, anything in this act to the contrary notwithstanding: provided always, that any person who shall at any time sell, or attempt to sell, any such fish taken within the said fifteen days, shall forfeit and pay a sum not exceeding 5*l.*, &c. The third clause enacts that nothing in the act contained shall extend to England, Ireland, Wales, or Berwick-on-Tweed, &c.

Glasgow.—An explosion took place at Spittle Coal-pit, near Rutherglen, on Saturday, the 26th ult., when 8 men were seriously burned, but no lives lost. There were 10 men in the pit at the time the explosion took place, but two of them were saved by throwing themselves flat upon the ground. The accident was occasioned, it seems, by the flame of one of the lamps being allowed to come in contact with the gas which had generated in that part of the pit. The tube used for drawing up water, along with a quantity of stones, was thrown into the air to a considerable height in consequence of the force of the explosion. —An extensive seizure of smuggled tobacco was made in this city a few days since. It appears that, from information received, one of the Excise officers proceeded to a house in Melville Court, Trongate, which was apparently uninhabited, and had been a long time shut up; but effecting an entrance through the window-shutters, he found no less than ten hogsheads of tobacco-leaf, although there was no person on the premises. The goods were removed to the Custom-house. It appears to remain a mystery to whom the tobacco—which is valued at 2,600*l.*—belongs. A rigid inquiry, however, it is stated, will be instituted by the proper authorities. It is supposed that the hogsheads must have been brought from Ireland in lime vessels and landed on the banks of the canal, and then carted with all expedition to this store in Melville Court.

Miscellaneous.

Population of Great Britain.—The amount of the population of Great Britain for the several years between 1831 and 1841 will be seen by an examination of the annexed table, derived from a return recently moved for in the House of Commons by Mr. Hawes:—

	Population of			
Years.	England and Wales.	Scotland.	Islands in the British Seas.	Total—Great Britain.
1831	13,897,187	2,365,114	103,710	16,366,011
1832	14,098,601	2,390,663	105,747	16,595,051
1833	14,300,095	2,416,213	107,783	16,824,091
1834	14,501,548	2,441,763	109,820	17,053,131
1835	14,703,003	2,467,312	111,857	17,282,172
1836	14,904,456	2,492,862	113,894	17,511,212
1837	15,105,910	2,518,411	115,931	17,740,252
1838	15,307,364	2,543,961	117,968	17,969,293
1839	15,508,817	2,569,511	120,005	18,198,333
1840	15,710,271	2,595,060	122,042	18,427,373
1841	15,911,725	2,620,610	124,079	18,656,414

The Winter Abroad.—Letters from Vienna, dated the 9th ult., state that the winter was then becoming more and more severe every day, so that the mercury in Réaumur's thermometer was at twelve or thirteen degrees below zero, morning and evening. The accounts from Hungary, Transylvania, Wallachia, and Servia, complain of the intense cold and the vast masses of snow by which the roads are rendered nearly impassable. In Wallachia, Transylvania, and some parts of Hungary, droves of wolves add to the horror of the season. The last mail but one from Bucharest was attacked on the road by these beasts, compelled by famine to leave their retreats. We learn by the last mail that the post-carriage was found on the road, by two men, without driver or horses, but with the letters and goods untouched; and of the horses, little more was found than the bones scattered about the carriage.

Law.

Court of Chancery.—*In re the Northern and Eastern Railway.*—This was a motion to dissolve an injunction, granted by the Vice-Chancellor, to restrain the defendants from proceeding to cover by arches a portion of certain streets within the boundaries of their terminus at Shoreditch. The act of Parliament, by the admission of the complainants, gave the company power to cover roads and streets in the progress of the railway; but it was contended that no such powers were extended to the station, which ought to have been chosen in a place where no such arches would have been required. The matter was carried to the Court of Exchequer, and that court was of opinion that the company had full power to select any place for their station within the limits recited in the act of Parliament, and that having so chosen the station, they were at liberty to cover an arch over any streets or ways, if they considered it necessary or reasonably convenient. Under these circumstances, it was now hoped the injunction would be dissolved. Against the motion it was contended, that the company were straining the powers of the act of Parliament to the detriment of the neighbourhood. The Lord Chancellor was of opinion that the question was concluded by the decision of the Court of Exchequer. The company had the power to make their station within certain limits, and to cover roads if they thought it necessary and reasonably convenient. It was not pretended that they were exceeding these limits, and the injunction must therefore be dissolved.

Court of Common Pleas.—*Woolley and another* v. *Newton.* —An action brought by plaintiffs, as assignees of Messrs. Rabbitt and Fuller, who formerly carried on the business of silk-mercers, in Gutter-lane, Cheapside, to recover back certain bills, goods, and pawnbrokers' duplicates, which it was alleged the bankrupts had paid over to defendant by way of fraudulent preference. On the part of the plaintiffs the evidence went to show the manner in which the articles in question had got into possession of defendant; and it was contended that there had been an undue preference, and defendant was not entitled to retain them as a creditor of the bankrupts. The claim was resisted on the ground that defendant held the goods, &c., as security for a debt due to him by Rabbitt and Fuller. The jury found a verdict for plaintiff. Damages, 446*l.* 15*s.* 11*d.* Costs, 40*s.*

Central Criminal Court.—On Monday Samuel Haslem, James Fernley, William Henry Fernley, George Fernley, Elizabeth Fernley, and Abigail de Soiza, the persons charged with being concerned in numerous recent burglaries in Mile-end and other places in the eastern part of the Metropolis, noticed in a previous Number, were tried at this court on a variety of indictments involving a great number of burglaries and larcenies. After a long trial, and the examination of several witnesses, the Recorder summed up the evidence, and the jury returned a verdict of guilty against the prisoners Haslem, Elizabeth Fernley, and W. H. Fernley, and acquitted the other prisoners, on the ground that there was not sufficient evidence against them. Haslem was then sentenced to be transported for life, and Elizabeth Fernley for the term of fourteen years. The sentence on he other prisoner was deferred.

TATTERSALL'S, Thursday.—The Derby betting, as far as it related to the two principal favourites, was more encouraging to their respective parties than had been observable for some days previous:—7 to 1 was taken to a trifle about Attila, and 20 to 1 to 100*l.* about Chatham, the subsequent offers being in unison with those prices. Repeated attempts were made to get on about Wiseacre, Ballinkeele, and Auckland, and in each case without success, until six o'clock, when a noble Lord laid 33 to 1 to 200*l.* against the last of the three, who finished at 30 to 1, taken. Nothing was done about the other two: but they are quoted at the previous prices. The Dirce colt and Defier opened and finished as before. A few outsiders were backed, but only Canadian and Palinurus with any spirit. The Oaks betting was remarkable only for the advance of Syren to the top of the tree:—9 to 1 was taken in fifties, and an offer made to back her against anything. Closing prices:—

2,000 GUINEAS STAKES.

4 to 1 agst Wiseacre	7 to 1 agst Meteor

DERBY.

30 to	1	agst all the Males	50 to	1	agst Canadian (taken)

MARK LANE, Friday, March 11.—The condition of the English Wheat has been so bad this week, that the greater part has been refused by the buyers, and resold at very reduced prices; and fine selected White should make as much money. There has been scarcely any business doing in Foreign, and Bonded is without buyers.—Barley has again declined 1*s.* p. qr. with a large supply. Beans and Peas remain as on Monday.—To sell Oats a further decline must be submitted to.—The trade for Clover Seed is very much depressed, and where sales are forced lower prices are taken.

GAZETTE OF THE WEEK.

INSOLVENTS.—D. Bidmead, 62, Bread-street, City, warehouseman.—J. Seabrook, Stanmore, Middlesex, licensed victualler—W. Darlington, Liverpool, wine-merchant.

BANKRUPTS.—E. Hayes, Pickett-street, Strand, picture dealer—S. L. Lazarus, otherwise S. L. Laurence, of the Kent and Sussex Tavern, Jermyn-street, St. James's, coach proprietor—W. Holmes, Friday-street, Cheapside, silk-gauze-manufacturer—W. Charnock, 20, Albion terrace, Wandsworth-road, Surrey, plumber and glazier—Ann Leach, John Leach, and James Leach, 40, Brick-lane, Spitalfields, builders—J. Thomas, Ramsgate, Kent, butcher—W. Walker and J. Gray, Leeds, woolstaplers—J. Alexander, Newcastle-upon-Tyne, dealer—R. Loxham, Wigan, Lancashire, newspaper-proprietor and printer—E. Mullinger, now or lately of Southampton, ironmonger—T. Gales, W. J. Guest, J. F. Naisby, and M. Kirtley, Hylton, Durham, ship builders—G. Robertson, J. Garrow, and J. Alexander, Liverpool, ship-chandlers and rope manufacturers—T. Stephenson, Manchester, coachmaker—J. Carlisle, Bury, Lancashire, draper—G. A. Thompson and B. J. Thompson, Wylam, Northumberland, iron masters—F. Pratt, Stoke-upon-Trent, miller—E. S. Webster, Bull-street, Birmingham, draper—W. Bury, Blackburn, corn-dealer—J. Horncastle, Glamford Briggs, Lincolnshire, seed-merchant—J. Emery, Wells, Somersetshire, surgeon—S. Jackson and T. F. Jackson, Bermondsey-street, Surrey, woolstaplers—J. County, Winchcomb-street, Cheltenham, oil and colourman—I. N. Wigney and C. Wigney, Brighton, bankers—P. W. Hart, Norwich, coach manufacturer—G. Stanway, Stoke-upon-Trent, Staffordshire, grocer—J. P. Clarke and O. Lewis, Crown-court, Threadneedle street, newspaper-agents—W. Robinson, Hulme, Lancashire, glass-manufacturer—E. A. Birch, Bedford-place, Russell-square, lodging-house keeper.

SCOTCH SEQUESTRATIONS.—J. Haldane, Selkirk, sometime brewer, but now innkeeper—T. Gemmill, Greenock, merchant—J. Rodger, Dalry, Ayrshire, merchant—J. Muir, Glasgow, merchant—J. Riddell, late of Glasgow, but now of Paisley, innkeeper—J. Annand, Burghead, grain-dealer—J. Macphail, Dingwall, merchant.

BIRTHS.—On the 4th inst., at the Cedars, Putney, the lady of Lieut.-Col. G. Hutchinson, Bengal Engineers, of a son—On the 5th inst., at Biggleswade, Mrs. Weston, of a daughter—On the 6th inst., at Cheltenham, the lady of the Rev. W. F. Rawes, of a daughter—On the 6th inst., at the vicarage, Milton Ernest, Beds, the lady of the Rev. C. C. Beaty Pownall, of a son—On the 7th inst., the lady of Mr. Phillipson, Ludgate hill, of a daughter—At No. 18, Grosvenor-place, Camberwell, on the 8th inst., Mrs. A. M. Burghes, of a son—On the 8th inst., Mrs. J. Bailey, Woburn-square, of a daughter—On the 8th inst., at No. 58, Myddelton-square, the lady of Dr. R. Brien, surgeon, R.N., of a son, still-born.

MARRIED.—At Bethnal-green, on the 8th inst., J. Budge, Esq., Camborne, Cornwall, to Eliza, relict of Count Mahe de la Bourdonnais, and daughter of the late L. Gordon, Esq., Purser in the Royal Navy—On the 8th inst., at St. George's Church in the East, Mr. G. La Mark, youngest son of W. La Mark, Esq., of the Commercial-road, to Isabel Susanna, youngest daughter of the late Capt. A. Carr—On the 8th inst., at the Church of the Holy Trinity, Brompton, Walter W. Rees, Esq., to Laura Ann, eldest daughter of the late J. Tatham, Esq., Dorset-place, Regent's-park.

DIED.—On the 6th inst., of apoplexy, in Curzon-street, Henry Francis Roper Curzon, 14th Lord Teynham, in the 74th year of his age—On the 6th inst., suddenly, Bertram Osbaldeston Mitford (formerly Bertram Mitford), of Mitford Castle, in the county of Northumberland, and of Hunmanby, in the county of York, Esq.—On the 27th ult., the Rev. R. Prowde, M.A., of Hovingham, in the North Riding of Yorkshire—On her journey from attending the funeral of her husband, at Edinburgh, Lady Leith, widow of the late Major-General Sir G. Leith, Bart.—On the 4th inst., at Castle Toward, Argyleshire, K. Finlay, Esq.—On the 5th inst., Mr. L. Cohen, of No. 6, Upper East Smithfield, aged 74.

INDEX OF THE PRINCIPAL HORTICULTURAL SUBJECTS IN No. 10.

Amateur's Garden . . . 158 *b*
Ammoniacal liquor, quantity per acre . . . 155 *a*
Apricot, kind for a standard . 161 *b*
Apples, treatment before grafting 161 *b*
Assam Tea, its discovery . . 158 *c*
Bone-dust, its effects . . . 159 *b*
Books for studying botany . 161 *c*
Bread, pharmaceutical, described 159 *c*
Brugmansia floribunda . . 159 *c*
Calceolaria, treatment of seeds 161 *a*
Carrot, seed for an acre . . 161 *b*
Caterpillars, to drive away . 161 *a*
Chermes, Pear, described . . 157 *b*
Cherries for a north aspect . 161 *c*
Climbers for a south aspect . 161 *a*
Crops, rotation of . . . 160 *b*
Cucumbers, their management 158 *c*
Dahlias of 1841, remarks on . 156 *c*
Deodar, raised from cuttings . 159 *a*
Firs, to transplant . . . 159 *a*
Fruit trees, a selection of . 161 *b*
Fuchsia fulgens, time to disroot 161 *b*
Galvanism, its effect on plants . 160 *a*
Greenhouse for house-roofs . 161 *a*
Guano described . . . 161 *a*
— its effects . . . 159 *b*
Hawthorn fences, their formation 158 *b*
Heat, instances of, in March and April . . . . 160 *a*
Ipomœa Learii, its treatment . 161 *c*
Knight's Nursery, notes on . 160 *a*
Land, to inoculate . . . 161 *a*
Laurels, their treatment . . 161 *b*
Lily of the Valley, situation for 158 *c*
Manures, remarks on . . 161 *b*
Mowing machine, its price . 161 *b*
Mule plants, sometimes seed . 161 *c*
Nitrate of soda, its effect on Wheat . . . . . 160 *a*
Onion seed for an acre . . 161 *b*
Pæony, tree, its treatment . 157 *c*
Pasture, grasses for . . . 161 *a*
Pears for a north aspect . . 161 *b*
Pear-tree, Chermes, described . 157 *b*
Pelargoniums, their treatment . 161 *b*
Plants, to dry . . . . 161 *c*
Plums for a north aspect . . 161 *c*
Potato, remarks on planting . 156 *a*
Potatoes, Chapman's, remarks on 159 *a*
Rhodochiton volubile, its treatment . . . . . 161 *a*
Ricauti's Rustic Architecture rev. . . . . . 160 *b*
Roses, China, to prune . . 161 *c*
— manure for . . . 161 *b*
Seeds, to germinate . . . 161 *b*
— treatment of . . . 161 *c*
Shrubs, a selection of, for Scotland . . . . . 161 *b*
Tea, Assam, its discovery . 158 *c*
Trees, a selection of, for Scotland . . . . . 161 *b*
Walls, remarks on coloured . 161 *b*

THE FARMERS' & GARDENERS' HAIL-STORM INSURANCE COMPANY,

(to be empowered by Act of Parliament,) Offices, 346, Strand, London.

CAPITAL, £200,000.

In Shares of £10 each.—Deposit, One Pound per Share.

[It is not probable that any further call will be made.]

HONORARY DIRECTORS.

(Those marked thus * are Members of the Royal Agricultural Society of England.)

The DUKE of RUTLAND, a Trustee of the Royal Agricultural Society, Leicestershire

The EARL of STRADBROKE, a Governor of the Royal Agricultural Society, Suffolk

The EARL of COVENTRY, Worcestershire

EARL of DUCIE, Vice-President of the Royal Agricultural Society, Gloucestershire

The EARL of STAMFORD and WARRINGTON, Cheshire and Staffordshire

JOINT SOLICITORS.—*JOHN ROGERSON; C. BOYDELL.

BANKERS.—The LONDON and WESTMINSTER BANK, Throgmorton Street.

The plan of Insuring against damage done to standing crops of grain, pulse, and seeds by hail storms, proposed by the parties who have established "The Farmers' Fire and Life Insurance Institution," having been adopted on a temporary arrangement during the last two years, will now be established upon a secure and satisfactory basis. A Bill is in progress through Parliament to establish the Company with a capital of 200,000*l.*, in 20,000 Shares, of 10*l.* each, deposit one pound per share, and beyond which it is not expected that any further call will be made. The fact of property to the extent of upwards of HALF A MILLION having been insured during the last year, the fund arising from premiums alone being available for any losses which might have happened, is a satisfactory guarantee for the acquisition of a large amount of Insurance.

One-tenth of the profits will be appropriated to such *agricultural objects* as the Directors may deem most deserving, or most expedient; another tenth to be reserved as a Rest to add to the Capital Stock, and the remaining four-fifths divided among the Shareholders.

It is not generally known, that numerous offices have, for upwards of 30 years past, been established in France for Insuring against damage by Hail Storms, that country being much more subject to damage from this cause than England.

This is a subject which deeply affects the interest of both landlord and tenant, the destruction by Hail Storms being equally fearful and frequently more extensive than damage by Fire.

Against the latter, security is afforded in the "Farmers' Insurance Institution." Agricultural produce to the value of 1000*l.* may be protected for the trifling charge of 17*s.* 6*d.* Whilst protection can be had for so small a sum, it is a duty a landlord owes to himself, to require his tenant to insure; and the tenant who suffers from not availing himself of such protection, deserves no commiseration.

Full protection will now be provided against damage done to standing crops by Hail Storms, and the observations last made in reference to fire apply, if possible, with greater force to Hail Storms.

The rate of premium on crops of Wheat, Barley, Oats, Beans, Peas, and Tares, will be 3*s.* 6*d.* per cent.

In effecting an insurance, the *maximum* price per acre, and the number of acres of each sort of grain, seed, &c., must be specified before the insurance is effected, and the premium paid on the amount agreed upon.

When part only of the crop is insured, the insurance will extend over the land specified only.

In case of total loss, the *maximum* price per acre fixed will be paid, and no more, although the crop should be of more value.

In case of partial loss, the estimated amount of loss will be paid.

All claims will be settled in the month of November in each year, and should any disputes arise, they will be settled by arbitration.

Applications for Shares may be made, and Prospectuses or other information obtained, of the Agents of the "Farmers' Fire and Life Insurance Institution," in their respective districts, or by letter, pre-paid, forwarded to W. SHAW, Esq., 346, Strand, London.

PRODUCTIVE LIFE ASSURANCE SOCIETY and MARITIME FUND

empowered by Acts of Parliament. Offices, 29, Moorgate-street, Bank, London.

Board of Directors.

John Blogg, Esq., Guildford-st., Russell-square.

Donald Grassick, Esq., Bedford-place, Kent-road.

Hyam Hyams, Esq., Cornhill.

George Rose Innes, Esq., Billiter-street, City.

J. Linnit, Esq., Argyll-street, Regent-street.

W. T. Smith, Esq., Public Office, Southampton-buildings.

(With power to add to their number.)

Treasurer.—Hyam Hyams, Esq.

Auditors.

Robert Dover, Esq., Cornhill.

Amos Hodgson, Esq., Ordnance Office, Tower.

James Walton, Esq., Grocers' Hall.

Arbitrators.

Charles Compton, Esq. | Peter Ellis, Esq.

John Tidd Pratt, Esq.

Bankers.—The Bank of England.

Physician.—William Brewer, M.D., F.R.S., &c., 21, George-street, Hanover-square.

Surgeon.—David Lewis, Esq., 28, Artillery-place West, Finsbury.

Solicitors.—Messrs. Chatfield, Wingate and Hart, Cornhill.

Actuary.—Francis G. P. Neison, Esq.

Chief Agent for the Maritime Fund.—Thomas Bull, Esq., 91, Minories, London.

This Society is established on the principles of Mutual Life Assurance, with a division of the whole amount of profits among all the assurers, to whom the books of the Society always lie open for inspection. A General Meeting takes place annually, at which is given a detailed account of the business of the Society. No policy stamp duty charged on assurances above the term of ten years.

The Maritime Fund is a department of the Society which affords to captains and mariners the same facilities and advantages of life assurance which residents in England have hitherto enjoyed. Upon this fund, at a comparatively small cost, a member (should he be lost at sea on a particular voyage) will provide an annuity for his wife as long as she lives, in proportion to what he has paid.

Every particular may be known by applying to Mr. Bull, agent; or to the Secretary, at the offices, 29, Moorgate-street.

GEORGE B. SCOTT, Secretary.

EDWARD BECK, MANUFACTURER IN SLATE, Isleworth, Middlesex, respecfully informs Horticulturists, that his IMPROVED SLATE TUBS for Orange Trees and Conservatory Plants, mounted upon rollers, Slate Cisterns, Shelves, and Edgings for garden paths may be seen in use at his house upon application to the gardener.

ORNAMENTAL WIRE-WORK, &c., FOR THE GARDEN.
390, OXFORD STREET, LONDON.

G. B. THOMPSON having added to his General Stock of FURNISHING IRONMONGERY a large assortment of WIRE-WORK,

Suited to the Flower-Garden and Greenhouse, begs to submit for the inspection of the Nobility and Gentry who patronise Horticultural pursuits his numerous patterns of FLOWER BASKETS, TRAINERS, BORDERS and STANDS, with GARDEN ARCHES, SEATS, and VASES, which for variety, elegance, and utility stand unrivalled.

Also his Improved GARDEN and HOTHOUSE ENGINES, FUMIGATORS, SYRINGES, and PATENT WATER-POT, with every other Implement.

GAME and CATTLE FENCING in variety.

HEATING BY HOT WATER.

HOTHOUSES, and every description of Horticultural Buildings, Churches, Chapels, Public Buildings, Mansions, and large Rooms, fitted up with the above apparatus on the most improved and scientific methods.

W. WALKER and Co. (late of Mosley-street, Manchester), beg to announce that they continue to execute works of the above description, in which they have introduced a variety of important improvements of a satisfactory nature, especially to Horticulturists. They have applied this principle on a more extensive scale than has ever been hitherto adopted at the stupendous Conservatory and Hothouses of his Grace the Duke of Devonshire, and in numerous other extensive establishments, with the most complete success.

They have also successfully applied C. W. Williams' Patent Argand Furnace to their boilers, and have made arrangements with the Patentee for its general adoption. It economises fuel, and removes the nuisance and disfigurement of smoke, so much complained of by Gardeners, and is a new and valuable feature in these Apparatus.

Works executed in every part of the United Kingdom with punctuality and dispatch.—33, Brown-street, Manchester.

CUCUMBER and MELON BOXES and LIGHTS—For SALE, one, two, and three Light BOXES and LIGHTS, of all sizes, ready for immediate use, warranted of the best materials, packed and sent to all parts of the Kingdom; two Light Boxes and Lights complete, from 1*l.* 8*s.* Garden Lights made, glazed and painted, from 1s. per foot. Sashes and Frames made, glazed, and hung complete, 1s. 8d. per foot.—At JAMES WATTS' Sash Manufactory, 8, Claremont-place, Old Kent-road.

TO NOBLEMEN, GENTLEMEN, FLORISTS, and OTHERS.—Messrs. PROTHEROE and MORRIS have received instructions to offer to public competition by Auction on the premises, on TUESDAY, the 5th of April, 1842, at 11 o'clock, the celebrated Stock of GREENHOUSE PLANTS, late the property of — Daubauz, Esq., deceased, near the church at Leyton, comprising fine specimens of Camellias, Oranges, Hybrid Rhododendrons, Ericas, Choice Geraniums, Acacia, Azalea Indica, Cactus, Neriums, Myrtles, Eutaxia, &c.

May be viewed by cards; Catalogues may be had of the principal Nurserymen and Seedsmen, and of the Auctioneers, American Nursery, Leytonstone.

Price 7*s.*, illustrated with Wood-cuts of Birds, Cages, &c.,
A NEW EDITION OF THE

NATURAL HISTORY OF CAGE BIRDS; their Management, Habits, Food, Diseases, Treatment, Breeding, and the Methods of Catching them. By J. M. BECHSTEIN, M.D.

"A very delightful book of its kind. . . . . . . It seems to us an indispensable book for the bird-fancier."—*Spectator.*

"It will be welcome to every gentleman's library or drawing-room table. It is superbly got up, with an immense number of vignettes; and in fact, rivals the beauty of the Annuals."—*Weekly Dispatch.*

London: W. S. Orr & Co.; and W. & R. Chambers, Edinburgh.

Just published, in royal 4to, price 1*l.* 15*s.* bound,

RUSTIC ARCHITECTURE—Picturesque Decorations of Rural Buildings in the use of Rough Wood, Thatch, &c. Illustrated by Forty-two Drawings; consisting of Plans, Elevations, Sections, and Perspective Views; the Doors, Windows, Chimneys, Shafts, &c., drawn Geometrically to a large scale: with descriptions and estimated costs. Sold also by Tilt and Bogue, Fleet-street.

Publishing Monthly, with Four coloured Engravings,
Price 2*s.* 6*d.*

PAXTON'S MAGAZINE OF BOTANY.

The Number for FEBRUARY contains beautifully-coloured figures of *Cattleya Aclandiæ, Brugmansia floribunda, Mahonia aquifolium,* and *Loasa Pentlandica,* with the history and directions for the culture of each: also comprehensive Papers on the science of Gardening, including the phenomena of impregnation and germination in the seed of plants; the Culture of Gesnera rupestris; on Arranging and Planting Specimens in Conservatories; the Propagation of Tropæolum tricolorum; Notices of Plants figured in the floral periodicals for December and January, and of those flowering in the suburban nurseries; with a copious Calendar of Operations for the month.

This work comprises, monthly, four admirably-coloured plates, and twenty-four pages of interesting and useful letter-press. The admirers of flowers are requested to observe—

1. That all the drawings are taken from nature, and are consequently made from plants which have flowered in Britain.

2. That, with few exceptions, they are all done by one artist, whose abilities are of the highest order, and who travels himself to the places where the plants are in flower.

3. That they are lithographed on zinc by the same individual, and, being coloured in a superior manner, have all the spirit and elegance, and much of the finish, of the original drawing.

4. That about one-half of the drawings are from plants which have never before been figured in this country, the rest representing the most popular novelties, as well as the more neglected, though sometimes far handsomer, old species; the majority being such as can be cultivated by every one possessing a flower-border and a greenhouse or frame.

It may, in conclusion, be safely asserted that, both for the beauty of its embellishments, and the utility of its contents, this work is well adapted to the wants of all who delight in gardening; and as the improved system of having the plates lithographed commences with this Number, and as it is intended that each volume shall now be perfect in itself, the present is a desirable opportunity for those who wish to become subscribers.

London: W. S. Orr and Co., Paternoster-row.

In one small volume, price 15*s.*

PAXTON'S POCKET BOTANICAL DICTIONARY.

In what may be called an age of Cyclopædias, when the compression of a great variety of information into one volume, in order to bring it within the means of persons of all ranks, is so universally sought, it is evidently desirable that the Gardener, and those connected with his profession, should be as well accommodated as other classes in this particular. No such work existing, however, prior to the issue of the present publication, its value will be at once apparent; since it combines the more essential features of a Botanical Catalogue, an Horticultural Guide, and a Technical Glossary.

Besides being of this comprehensive description, it is especially adapted for the Amateur or Floriculturist; who may, by carrying it in his pocket, examine all the plants that are at any time submitted to his inspection, and immediately derive every intelligence respecting the peculiarities or affinities of particular species which could reasonably be wished for. This is an advantage that can only be sufficiently estimated by those who have felt the want of such an assistant; and to all such individuals, as well as to every agent or friend of horticulture, the Pocket Botanical Dictionary is decidedly indispensable.

London: J. Andrews, Bond-street; Orr & Co., Paternoster-row

In cr. 8vo. 4*s.* 6*d.* bd. with 220 Diagrams engraved for the work,

EUCLID'S ELEMENTS OF PLANE GEOMETRY; with Explanatory Appendix, and Supplementary Propositions for Exercise. Adapted for the Use of Schools, or for Self-instruction. By W. D. COOLEY, A.B., author of the "History of Maritime and Inland Discovery."

"This is the best edition of the Elements which has yet appeared."—*Athenæum.* "For brevity, clearness, and discerning attention to the wants of learners, cannot be easily surpassed."—*Dublin University Mag.*

FUN FOR THE FIRESIDE!!
Bound in cloth, price 5*s.* 6*d.*,

JOE MILLER'S JEST-BOOK.

A Reprint from the first and genuine edition, such omissions and alterations only having been made as were required by the greater delicacy observed in modern conversation. But that the volume might have some substance, and be a good table or travelling book, copious additions have been made from other old volumes of Facetiæ.

Extract from the Preface.

"Another strange circumstance connected with this work is, that everybody presumes that he himself, and everybody else, is perfectly familiar with its contents . . . . and yet if the reader will ask his acquaintance, it will appear that not one in five hundred ever set eyes on a copy. It is in consequence of like questions that this edition is published."

One Volume, price 7*s.* 6*d.*,

THE LIFE AND TIMES OF RIENZI.

"Not less interesting than Sir E. Lytton Bulwer's eloquent Romance, and scarcely less romantic, is this historical record of the Conspiracy of Gabrini."—*Monthly Repository.*

"To all who have read Sir E. Lytton Bulwer's 'Rienzi,' its perusal is, in a measure, a duty."—*Spectator.*

"A curious and pleasing volume, and full of matter of historical character and illustration."—*Literary Gazette.*

"The publication of this work is well timed . . . . The Life of Rienzi is to us full of interest."—*Athenæum.*

"Those that wish to become acquainted with the true history of a man who was, in some sort, the *Napoleon* of his own age and country, would do well to consult the extraordinary narrative of the 'Life and Times of Rienzi.'"—*Tait's Magazine.*

Whittaker and Co., Ave-Maria-lane, London.

Printed by Messrs. BRADBURY and EVANS, Lombard-street, Fleet-street, in the Precinct of Whitefriars, in the City of London, and Published by them at the OFFICE, 3, CHARLES-STREET, COVENT GARDEN, in the County of Middlesex, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, March 12, 1842.

THE GARDENERS' CHRONICLE.

A STAMPED NEWSPAPER OF RURAL ECONOMY AND GENERAL NEWS.

THE HORTICULTURAL PART EDITED BY PROFESSOR LINDLEY.

No. 12.—1842. SATURDAY, MARCH 19. Price 6*d.*

UNDER THE PATRONAGE OF HER MAJESTY.

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY. Flower-shows will be held on the following days:—At the Horns Tavern, Kennington—On Wednesday, April 20th, for Auriculas, Polyanthuses, &c.; Wednesday, May 18th, for Tulips, Pelargoniums, &c. At the Royal Surrey Zoological Gardens—On Tuesday, June 14th, for Roses, Pelargoniums, &c.; Tuesday, July 26th, for Carnations, Picotees, Greenhouse Plants, &c.; Tuesday, Sept. 13th, for Dahlias, Greenhouse Plants, &c.

R. H. CUMING, Hon. Sec.

SWEEPSTAKES—OPEN TO ALL ENGLAND.

WARWICK AND WARWICKSHIRE HORTICULTURAL SOCIETY'S FIRST EXHIBITION for 1842, April 28th, for Cut Specimens of Auriculas, Polyanthuses, Heartsease, Calceolarias, Greenhouse and Herbaceous Flowers. Second Exhibition, 23d June, for Cut Specimens of Geraniums, Tulips, Pinks, Roses, Fuchsias, Heartsease, &c.

Particulars, with conditions of Exhibition, may be had on application. Ten clear days' notice, or double entrance, required of Exhibitors. The specimens may be consigned, carriage paid, addressed—T. Hodgkinson, Secretary, Warwick.

HACON'S INCOMPARABLE PEAR.

GOOD STRONG PLANTS of this superb Variety, price 7*s.* 6*d.* each, may be obtained of Mr. Harrison, Nurseryman, Downham, Norfolk. For description see last number of the *Chronicle*, p. 172.

T. JACKSON, Nurseryman, &c., Kingston, Surrey, respectfully informs his Patrons and the Admirers of Horticulture, that his Supplement CATALOGUE OF PLANTS, with their prices, for 1842; and his List of Choice Show DAHLIAS may be obtained on application.

Kingston Nursery, March 17th, 1842.

JAMES PAMPLIN, NURSERYMAN, WALTHAMSTOW, ESSEX, begs to inform the Public he has a few plants of his following splendid PELARGONIUMS to dispose of, viz., Enchantress 21*s.*, Camilla 42*s.*, Anna 21*s.*, Van Amburgh 42*s.*, Louisa 10*s.* 6*d.*, Alice 7*s.* 6*d.*, Superb 10*s.* 6*d.*, Prince Ernest 10*s.* 6*d.* Fulgens 5*s.*, Duchess of Sutherland 21*s.*, Muckle Wonder 10*s.* 6*d.*, &c. &c. of which Catalogues may be had on pre-paid application.

N.B. Strong plants of Hardenbergia Macrophylla, at 5*s.* each.

Walthamstow, March 2.

NEW AND SUPERB FUCHSIAS.

THE Nobility, Gentry, and Florists, are respectfully informed that Messrs. W. and F. YOUELL having bestowed great care and attention in forming a collection of all the new Fuchsias sent out by various parties, which have proved to be of great beauty and distinctness, and having selected about thirty varieties which they can confidently recommend, they offer to send them out the first week in April, at the rate of 21*s.* per 12 varieties, fit for competition at any of the Horticultural exhibitions of the ensuing season. By enclosing a Post-office order for one guinea, they will be sent post-free to any part of the United Kingdom. Their list of Fuchsias, with respective prices, can be obtained by enclosing a Postage Stamp.—Great Yarmouth Nursery, March 15.

THOMAS CRIPPS, FLORIST, Tunbridge Wells, respectfully informs his friends that Plants of the New White Fuchsia, "Venus Victrix," will be ready in May, at 21*s.* each, with the usual discount to the trade if three or more plants are taken at once. For particulars, see "Floricultural Cabinet" for March, or "Gardeners' Gazette" or "*Chronicle*" of 5th inst.

Orders for this will be received by Mr. George Charlwood, 14, Tavistock Row, Covent Garden; Messrs. Cormack and Co., New Cross Nursery; Mr. Harrison, Downham, Norfolk; Mr. J. Ashdowne, Seedsman, High-street, Hastings; Messrs. Wood and Son, Maresfield Nursery; or addressed as above.

TO AGRICULTURISTS AND FARMERS.

THE SUBSCRIBERS have been appointed SOLE AGENTS by Importers of GUANO, for the disposal of same in this quarter; and they will be happy to receive orders. The wonderful influence of Guano in Fertilising the Soil has been so clearly pointed out by Liebig and the other leading Chemists who have turned their attention to Agriculture, as to warrant the belief that the intelligent Agriculturists of this country will embrace the present favourable opportunity of securing a quantity of this unsurpassed Manure. In England, where it has been extensively used, its virtues have far exceeded expectations.

Jas. Dickson and Sons, Nursery Seedsmen, and Florists, 32, South Hanover-street, Edinburgh.

⁂ J. D. and Sons have reason to believe, from recent experiments, that it is highly valuable for kitchen cropping.

DAHLIAS.—Your statement some time ago, that a system of class-showing might be adopted with effect, in addition to other modes of exhibition, appears to have considerable weight; but the opportunities do not always present themselves. You also state that Mr. Wildman will always be happy to receive such proposals, and that a White Class would be desirable this season. If Mr. Wildman will make the attempt, by offering to exhibit his seedling Bianca in the white class, he may rely upon two, if not three more, entering for a Sweepstakes of five guineas each (2½ guineas whereof to go to the fund at Salthill) upon condition, 6 or 12 blooms each; cut and cut, if required, or otherwise by declaration; and from one person's growth, and one place. To be adjudged by three or more, if willing, of the following respectable judges, at the ensuing Salthill exhibition, viz., Messrs. Catleugh, Mountjoy, Spary, Whale, Keynes, Mitchell, Lidgard, Davis (Bath), Widnall, Dod (Cliefden), Dodds (Salisbury), J. Brown or his foreman, Turner, Jeffries, Taylor (Southampton), or other respectable person named.

J. HENCHMAN begs to inform Cultivators of the PANSY, that he still has for Sale good healthy well-rooted Plants of many of the leading varieties in his collection; and begs to call the attention of Amateurs to the very moderate rate at which they may improve their collections of this favourite flower.

12 fine Seedling varieties by Name	42*s.*
12 first-rate Show Flowers, selected from the best of last year's varieties by various growers . . .	21*s.*
12 superior varieties ditto ditto . .	15*s.*
25 good Show Flowers, including many of last year's var.	20*s.*

A few Packets of Seed at 2*s.* 6*d.* and 5*s.*

N.B. A remittance is requested from unknown Correspondents.

Edmonton, near London, March 19, 1842.

MYATT'S VICTORIA RHUBARB.

J. AND W. MYATT having a good Stock of Strong Roots raised by offsets from the original Seedling, can supply them at 10*l.* per hundred.—N. B. As various spurious sorts have been sold and are now selling under the name of "Myatt's Victoria," purchasers would do well to require them warranted.—Manor Farm, Deptford, Oct. 23, 1841.

J. KEYNES' CATALOGUE OF FIRST-RATE DAHLIAS is now ready, and may be had on application. Extra fine Plants may be depended on early in May.

J. Keynes having received Catalogues quoted at much lower prices for some varieties than his own, begs to state that, although he does not wish to underrate good SHOW FLOWERS, he will not be *undersold* by any Nurserymen in the trade.

Salisbury, March 10, 1842.

CHOICE FLOWER SEEDS.

LUCOMBE, PINCE, & CO., having an extensive and well-selected Stock of all the newest and choicest Flower Seeds, to the cultivation of which they have paid considerable attention, and the quality of which they can confidently recommend, beg leave to offer them for sale, delivered carriage free to any part of the Kingdom, on the following terms:—

25	packets of distinct-named sorts		. . .	21*s.*
50	do.	do.	do. . . .	30*s.*
100	do.	do.	do. . . .	42*s.*

Amongst them are—Asters, Brachycome iberidifolia, Clintonia pulchella, Erysimum Perowskianum, Godetia Willdenowii and Schamanii, Lupinus Hartwegii, Martynia fragrans, Mesembryanthemum tricolor, Phlox Drummondii, Stocks, Zinnias, &c. &c. Catalogues of which may be had on application to them.

Exeter Nursery.

CARNATIONS AND PICOTEES.

MESSRS. W. and F. YOUELL have a few pairs to spare of that most beautiful Rose Flake, Wilson's Harriet, which is considered by the first judges in the kingdom to be decidedly the most perfect flower of its class ever raised. Also that splendid Picotee, Anacreon. The above will be forwarded by post, free, to any part of the kingdom by inclosing a post-office order for 18*s.*—They also offer from their superb collection,

				£	*s.*	*d.*
12	pairs fine Show Carnations and Picotees			1	10	0
25	do.	do.	do.	3	0	0
12	do. first-rate extra fine		do.	2	10	0

Great Yarmouth Nursery.

VERBENA, "THE QUEEN;"

Flowers of a pure white, and sweet-scented.

WM. IVERY, Florist, Peckham, near London, begs most respectfully to offer this beautiful variety of Verbena, which has the habit of V. Tweediana, blooming equally vigorous and profuse: being, too, of a pure white, it produces a striking contrast with the other kinds. It was exhibited, and obtained a prize, at the Surrey Zoological Gardens last September, and at the Crown and Anchor, Strand, London; also at Salt Hill, where it was greatly admired. Highly favourable notices of it have been made too in the "Floricultural Cabinet," "Gardeners' Chronicle," and "Gardeners' Gazette."

Plants can be had after March 10 at 7*s.* 6*d.* each. Agents in London, Messrs. Warner and Warner, 28, Cornhill. A remittance or reference expected.

BROWN'S MARQUIS of LANSDOWNE DAHLIA.—This most essential Show Flower will be sent out in May next. Colour, shaded salmon; fine cupped petals, which are beautifully arranged; and one of the most constant and successful Dahlias of the season, having obtained Seven Seedling Prizes, three of which were first, and twice defeating "Conqueror of the Plain." Also shown in three successful Stands of two 24's, and 12 blooms for three 20*l.* prizes. A drawing was made by Wakeling, which will appear in the *Florist's Guide*, March 1842.

T. B. has a few strong Plants on hand of his much-admired Seedling PANSIES the "Countess of Orkney" and "Jewess," at 7*s.* 6*d.* each.

A CATALOGUE, containing a choice selection of DAHLIAS and HEARTSEASE, is now ready, and may be had on pre-paid application.—Slough, March 2d, 1842.

RANUNCULUSES, ANEMONES, AURICULAS, CARNATIONS, PICOTEES, AND GERANIUMS.

H. GROOM, Clapham Rise, near London, (removed from Walworth), by Appointment Florist to Her Majesty, respectfully informs the Nobility, Gentry, and the Public, that he has a fine Selection of the above Flowers, which he can offer at the following very moderate Prices:—

	£	*s.*	*d.*
RANUNCULUSES.			
100 Roots in 100 superb sorts, with their names .	5	0	0
100 ditto very fine sorts, ditto . .	2	10	0
Superfine Mixtures, from 7*s.* to 21*s.* per hundred.			
ANEMONES.			
100 Roots in 100 superfine sorts, with their names .	3	10	0
100 ditto in 50 ditto ditto .	2	10	0
Superfine Mixtures, from 10*s.* 6*d.* to 21*s.* per hundred.

SEEDLING DAHLIAS to be sent out in May next, by N. GAINES, FLORIST, SURRY-LANE, BATTERSEA.

Gaines' ORANGE PERFECTION; beautiful orange, at times shaded. This flower was sent for the opinion of the Horticultural and Floricultural Societies of London; at both places considered first-rate. It is a fine grower, throwing its flowers well above its foliage. A good show flower. Awarded first Prize at Kingston, and 2nd Prize at Teddington. 4 ft. 10*s.* 6*d.*

Gaines' EMPEROR; beautiful rosy crimson, very superior petal, with great depth of flower, and well up in the centre. A constant good show flower. Awarded 2nd Prize at Kingston. 3 ft. 10*s.* 6*d.*

Gaines' COMPACTA; fine purple, very superior form, of excellent habit, throwing its blooms well above its foliage; its centre well up. A good show flower. Awarded 2nd Prize at Hammersmith. 5 ft. 10*s.* 6*d.*

N.B. The above were considered first-rate flowers by those that saw them growing. Plates of them will appear in "Wakeling's Amateur Guide," in April and May next.

N. Gaines' extensive List of first rate Dahlias, Geraniums, Pansies, Calceolarias, &c. may be obtained by post-paid application as above. His new Cineraria, Prince of Wales, is now ready for delivery.

WANTED as an AMANUENSIS, a fairly-educated man, who is very industrious, very steady, can write very good English, and is acquainted with Natural History; if with Chemistry, Horticulture, or Farming, so much the better. Salary 100*l.* a year to begin with. Apply by letter, post-paid, to R , Messrs. Norman and Skeen, Printers, Maiden Lane, Covent Garden, London.

WANTS a SITUATION as GARDENER, a Married Man, 33 years of age, who has lived in the most extensive places of forcing, fully understands gardening in all its various branches, and who has had great success in the forcing of Pines, Grapes, Peaches, &c. &c.; has also a competent knowledge of Landscape Gardening. He can be highly recommended by the gentleman he has just left, as also by some of the first Horticulturists of the day. Address W. H., 54, Milton-street, Dorset-sq.

WANTS a SITUATION as GARDENER, a Single Man, Aged 30, who is well acquainted with the different departments of Gardening, Forcing, and the Propagation and Culture of Plants. Can have a good character from his last situation. Direct to A. B., Mr. Pamplin's, Nurseryman, Hornsey-road, Islington. Can be also recommended from the above Nursery.

WANTS a Situation as GARDENER, a Single Man aged 26, who thoroughly understands the management of Pines and forcing in general, &c., Kitchen and Flower Garden. Would have no objection to take the management of the farm (if not too extensive). Upwards of three years' character will be given from the last place, and most respectable reference for character and ability can be had from different families with whom he served. Has no objection to what country he goes. Apply personally, or by letter, to — Grant, care of Messrs. Loddiges, Nurserymen, Hackney, near London.

TO SEEDSMEN, &c.—WANTED to ARTICLE a respectable YOUTH, for 5 or 7 years, at a fair premium. Address to H. and H., Mr. Hastings's, bookseller, Carey-street, Lincoln's Inn.

R. FORREST & Co., late Wm. Malcolm & Co., KENSINGTON NURSERY, beg respectfully to direct the attention of their friends to the undermentioned, which they can recommend with confidence to their notice; and for a more extensive collection, they refer to their General Catalogue, which on application will be forwarded post free.

Aconitum chinense, new
Ageratum grandiflorum
Alstrœmeria acutifolia
Brachycome iberidifolia
Clintonia pulchella
Clintonia elegans
Cosmanthos fimbriatus
Cantua coronopifolia
Centaurea americana
Calceolarias, finest sorts
Cineraria, from new sorts
Euphorbia variegata
Eucharidium concinnum
Heartsease, finest kinds
Humea elegans
Helianthemum, mixed sorts
Ipomopsis picta
Ipomœa rubro-cærulea
Ipomœa Michauxii
Ipomœa Quamoclit
Lychnis fulgens
Lupinus Hartwegii
Lisianthus Russellianus
Martynia proboscidea
Martynia formosa
Peas, Auvergne
Peas, New Green Marrow
Nemesia floribunda
Pentstemon, of sorts
Phlox Drummondii, and others
Portulaca, fine species
Papaver floribunda, and others
Platystemon californicum
Primula sinensis
Primula cortusoides
Rhodanthe Manglesii
Rhodochiton volubile
Stachys coccinea
Schizopetalon Walkerii
Streptocarpus Rhexii
Thunbergia, of sorts
Tobacco, of sorts
Tropæolum, of sorts
Cucumber, Walker's
Cucumber, Weedon's
Cucumber, Manchester prize, and all the finest sorts
Celery, Seymour's fine white
Endive, long Imperial, for stewing
Melons, all the best kinds for early and late crops

WARNER and WARNER, Seedsmen, 28, Cornhill London, beg to acquaint their friends and the public of the arrival of their imported GERMAN ASTERS, STOCKS, and ZINNIAS (in collections) from the Continent, and to invite their attention to their list of new and choice Flower Seeds, in Harrison's Floricultural Cabinet for the present month, among which are the following:—

IPOMŒA RUBRO-CÆRULEA, at 1*s.* per packet.
AGROSTIS PULCHELLA, 1*s.* per ditto.
BRACHYCOME IBERIDIFOLIA, 3*s.* 6*d.* per ditto.
GERANIUM, from fine varieties, 1*s.* to 2*s.* 6*d.* per ditto.
HEARTSEASE, from the best kinds, 1*s.* to 2*s.* 6*d.* per ditto.

And the following at 1*s.* per packet:—

Alstrœmerias, of sorts
Anagallis, ditto
Asters, imported German, mixed colours
Auricula
Calceolaria, shrubby and herbaceous
Carnation, from stage flowers
Cinerarias
Clintonia pulchella
Centaurea americana
Dahlia, from choice varieties
Elichrysums, new varieties
Ipomœa Quamoclit
Ipomopsis
Lobelias
Lupinus Hartwegii
Mimulus
Pentstemons
Petunia
Phlox Drummondii
Picotee, imported
Pink, from a choice collection
Primulas
Ranunculus, saved from superb varieties
Schizanthus
Stocks, imported German, mixed colours
Verbenas
Zinnia elegans—&c. &c.

Also a few choice Vegetable Seeds, including the following kinds of Frame Cucumber, at 1*s.* per packet:—Barnes' Man of Kent, Farmer Allen's Victory of Suffolk, Walker's Improved Manchester, Weedon's Superb, Windsor Prize, Prize Fighter, and Perkin's Victoria. Greave's Prince Albert Melon, 1*s.* per packet. Lake's New Superb White Roman Broccoli, and Metcalf's New Pink Cape ditto, at 1*s.* per packet. Imported Brussels Sprouts, &c. &c.

Martin's superior Frame Potatoes, 3*s.* per peck. New Bokhara Clover, 1*s.* per packet. Myatt's British Queen Strawberries, 5*l.* per hundred; Myatt's Eliza, ditto, 1*l.* per hundred; Myatt's Victoria Rhubarbs, 2*s.* each. Seymour's Superb White Solid Celery, 2*s.* 6*d.* per packet.

A large assortment of Herbaceous Plants from 6*d.* to 1*s.* each; Carnations and Picotees 1*s.* 6*d.* per pair. Pinks 9*d.* to 1*s.* per pair, all carefully named from the best collections.—Cornhill, March 17, 1842.

General Catalogues can be had on application.

EDWARD BECK, MANUFACTURER IN SLATE, Isleworth, Middlesex, respectfully informs Horticulturists, that his IMPROVED SLATE TUBS for Orange Trees and Conservatory Plants, mounted upon rollers, Slate Cisterns, Shelves, and Edgings for garden paths may be seen in use at his house upon application to the gardener.

THEOBALDS GROVE ACADEMY, WALTHAM CROSS, within 20 minutes' walk of the N. E. Counties' Station, Waltham. Young Gentlemen are liberally Boarded and carefully Instructed in a course of Mathematical, Classical, and Commercial Education, by Mr. E. THORNTON and able Assistant Masters.

Pliny says, "No man's abilities are so remarkably shining as not to stand in need of a proper opportunity, a patron, and even the praises of a friend, to recommend them to the notice of the world."

A plot of Garden Ground is given to each Pupil, to form habits of industry, and a knowledge of Horticultural science.

SEA-SIDE.—Mr. FURNER, of the Royal Hotel and Family Boarding House, Hayling Island, Hampshire, begs leave to inform the Nobility and Gentry that he has a choice of Sitting Rooms commanding fine views of the Isle of Wight, Spithead, &c., with other necessary accommodations, that can be taken for any period, and, if wished, upon terms including every accommodation. Hot, Cold, or Shower Baths can be had in the Hotel. Four hours' journey by railroad to Fareham. Mr. F. can supply particulars of any houses to let, furnished or unfurnished, having one or two detached residences with Gardens, at this time.

BRITISH SHEET GLASS FOR HORTICULTURAL PURPOSES.—Noblemen, Gentlemen, and Horticulturists generally are respectfully informed that they may be furnished with lists of prices, and particulars regarding the above article, which has in every case in which it has been adopted proved itself to be by far the most economical material for Horticultural Glazing: upon application to Drake and Bromley, 315, Oxford-street, London.

J. DRAKE, late of 100, Edgware-road, and 8, Jermyn-street, begs to notify that he has removed his business to the above address, for the convenience of more extensive premises, and solicits for himself and partner, a continuance of the support he now gratefully acknowledges. French and every description of Glass Shades, Stained and Ornamental Glass, Patent Plate and British Plate Glass supplied in any number or quantity, at wholesale prices.

TO THE NOBILITY, GENTRY, NURSERYMEN, and others, who are inclined to purchase by Private Contract a Cheap Bargain: about two acres of Freehold Nursery Ground, in a beautiful situation, about one mile from the sea; half a mile from Portsmouth or Portsea; 1½ miles from Gosport, South Western Railway Terminus. On the Ground—a Dwelling house, a Greenhouse, 2 Bricking-pits, all well stocked with Pot-plants, Shrubs, Fruit trees, &c.

For particulars, apply to Mr. John Nobes, on the premises, or to Mr. Purchess, builder, near the Bush hotel, Southsea.

PINES.

TO BE DISPOSED OF, 60 or 70 SUCCESSION PINE PLANTS, perfectly clean and healthy, which may be chosen from about 300. For particulars apply to Mr. Jacobs, Fruit Salesman, Covent Garden Market.

TO PINE-GROWERS.

TO BE SOLD by Private Contract, by order of the Assignees of James Bishopp, of Westburton, a Bankrupt, ONE THOUSAND SUCCESSION PINE PLANTS of all sizes, and One Thousand very fine Fruiting Pine Plants. N. B.—There will be about Four Thousand Pine Plants of all kinds, with the Pits, to be sold by auction in August next. Application to be made to Mr. Henry Satter, Auctioneer and Surveyor, Arundel; or to John Mann, the Gardener at Westburton, near Petworth, Sussex.

TO BE DISPOSED OF, (in consequence of the death of the late Proprietor,) an extensive and highly-respectable NURSERY and SEED BUSINESS, in one of the most fertile of the Midland Counties, which has been established and has possessed a first-rate connexion for nearly 50 years. The arrangements for conducting the business are unusually advantageous and complete.—For particulars apply to Messrs. Warner and Warner, Seedsmen, 28, Cornhill, London.

MESSRS. PROTHEROE & MORRIS are instructed to sell by Public Auction, at the Mart, Bartholomew Lane, on TUESDAY, March 22d, and THURSDAY, 24th, 1842, at twelve o'clock, about 500 Standard and Dwarf ROSES of the most approved varieties; also a choice collection of Carnations, Picotees, and Pinks (the surplus stock of an Amateur), Dahlias in dry roots, &c. May be viewed the morning of sale. Catalogues may be had at the Mart, and of the Auctioneers, Leytonstone.

TO GENTLEMEN, FLORISTS, AND OTHERS.

MESSRS. PROTHEROE and MORRIS have received instructions to offer to Public Auction, on the Premises, Lamb Farm, Dalston, near the Swan, Kingsland Road, on Wednesday, March 23rd, 1842, at 11 o'clock, by order of Mr. F. Bryant, in consequence of the land being let for building, the entire Stock consisting of about 14,000 Greenhouse and other Plants in a very healthy condition, viz.: Geraniums, Myrtles, Fuchsias, Verbenas of sorts, Cactus, Mesembryanthemums, Hyacinths, Tulips, &c. Also four newly-erected Greenhouses, several Pits, 1, 2, and 3 light Boxes, about one hundred Hand-glasses, and sundry utensils in trade. Also about 400 strong Roots of Myatt's Victoria Rhubarb, remarkable for its size and quality, and lotted suitable for private buyers and the trade. May be viewed prior to sale. Catalogues may be had of the principal Nurserymen and Seedsmen, on the premises, and of the Auctioneers, American Nursery, Leytonstone.

WARD'S PORTABLE GREENHOUSES.

TREGGON AND Co., ZINC MERCHANTS AND MANUFACTURERS, 22, JEWIN STREET, and 57, GRACECHURCH-STREET, City, beg to inform the Nobility and Gentry, that they are now manufacturing Portable Greenhouses on Ward's principle (see No. 49 of the *Gardeners' Chronicle*, with plain and ornamental stands. Also GALVANIC PLANT PROTECTORS AND BANDS, Zinc Fanlights, Skylights, and Gothic Frames for Conservatories, Hothouses, Forcing Frames, &c. Garden-stand Frames, Engines, Watering pots, Flower Labels, Perforated Safes, and Dish Covers, Baths, &c. &c. Experienced workmen sent to all parts of the kingdom, for covering with Zinc, Churches, Spires, Houses, Terraces, Verandas, &c. &c.

THE CONICAL HOT-WATER BOILERS invented by J. ROGERS, Esq., may be obtained to any size of JOHN SHEWEN, Ironmonger, &c., Sevenoaks, Kent.

J. SHEWEN having had every opportunity afforded him by an extensive practice to bring this apparatus to perfection, begs to offer it as most efficient and economical: it may be seen at Messrs. Chandler & Son's Nursery, Vauxhall; Messrs. Loddiges', Hackney; Messrs. Henderson's, Pineapple-place; Mr. Knight's, King's-road, Chelsea; Messrs. Veitch and Son's, Exeter; and at the Garden of the Horticultural Society of London.

W. DAVIS, 34, Wych Street, Strand, London, begs to inform the Nobility, Gentry, and Horticulturists, that he [illegible] a system for HEATING FORCING-HOUSES and other [illegible] HOT WATER, upon the most simple, efficient, and economical principle. As a proof, he will refer them to his work completed for the Most Noble the Marquis of Salisbury; Sir Simon Clarke, Bart., Oak Hill, Barnet; Abel Smith, Esq. M. P., Woodhall, Herts, &c.

All orders conferred upon him will be punctually attended to.

HOT-WATER APPARATUS, upon improved and economical principles, for Horticultural and other Buildings.—STEPHENSON and CO., Agents for the Old Park Ironworks, and Manufacturers, 61, Gracechurch-street, London, beg to return their most sincere thanks to the Nobility and Gentry who have so liberally patronized their improved Conical Boiler, (for a description see *Gardeners' Chronicle*, March 12, p. 175.) To Amateurs these Boilers will be found invaluable. They require no furnaces or setting in brickwork, are moveable at pleasure, and may be applied with equal facility to the smallest houses or most extensive range of pipes, price 5*l.* 5*s.* and upwards. Further particulars, plans, estimates, &c. for warming every description of building may be obtained as above; where also may be seen a variety of patterns of Iron Fencing, Hurdles, Brass and Iron Bedsteads, Ornamental Wire-work, Garden Implements, &c. &c. The trade supplied with Hot-water Socket-pipes, two, three, and four inches, at 2*s.* 3*d.*, 3*s.* 3*d.*, and 4*s.* 3*d.* per yard.

HEATING BY HOT WATER.

HOTHOUSES, and every description of Horticultural Buildings, Churches, Chapels, Public Buildings, Mansions, and large Rooms, fitted up with the above apparatus on the most improved and scientific methods.

W. WALKER and Co. (late of Mosley-street, Manchester), beg to announce that they continue to execute works of the above description, in which they have introduced a variety of important improvements of a satisfactory nature, especially to Horticulturists. They have applied this principle on a more extensive scale than has ever been hitherto adopted at the stupendous Conservatory and Hothouses of his Grace the Duke of Devonshire, and in numerous other extensive establishments, with the most complete success.

They have also successfully applied C. W. Williams' Patent Argand Furnace to their boilers, and have made arrangements with the Patentee for its general adoption. It economises fuel, and removes the nuisance and disfigurement of smoke, so much complained of by Gardeners, and is a new and valuable feature in these Apparatus.

Works executed in every part of the United Kingdom with punctuality and dispatch.—33, Brown-street, Manchester.

HEATING BY HOT WATER, WITH THE CIRCULATION OF ATMOSPHERIC AIR.

J. WEEKS & CO., Architects, &c., Gloucester-place, King's-road, Chelsea, Hothouse Builders, and Hot-water Apparatus Manufacturers, beg leave to inform the Nobility and Gentry that their business, which has been extensive throughout the country for many years, is entirely confined to the BUILDING OF HORTICULTURAL ERECTIONS of every description, and the HEATING of them by HOT WATER; see the 3rd and 37th Numbers of the *Gardeners' Chronicle*.

References may be had, and their works seen, at Mr. Perry's Nursery, Banbury; Mr. Green's, Lower Cheam; Messrs. Henderson's, Pine-apple Nursery; Messrs. Rollisson's Nursery, Tooting; Mr. Knight's Exotic Nursery, Chelsea; Messrs. Low's, Clapton Nursery; Mr. Catleugh's Nursery, Chelsea; Mr. Gaines's Nursery, Battersea; Mr. Buck's, Portland Nursery; Mr. Young's, Milford Nursery; Mr. Smith's Nursery, Dalston; Mr. Woodroff's Nursery, Kensall Green; Mr. Hopgood's Nursery, Bayswater; Mr. Willmer's Nursery, Chelsea; and at most of the Nobility and Gentlemen's Seats in the country.

Every particular to be had at their Horticultural Manufactory, Gloucester place, Chelsea, near Sloane-square.

HOT-WATER APPARATUS FOR HEATING HORTICULTURAL BUILDINGS, DWELLING-HOUSES, CHURCHES, and MANUFACTORIES, upon improved principles, and at very moderate charges, erected by DANIEL and EDWARD BAILEY, 272, HOLBORN.

D. and E. BAILEY having devoted much time to the consideration of this subject, and had much experience in the erection of apparatus for the above-mentioned purposes, have, by improvements suggested in their practice, rendered their mode of heating not only very efficient, but very simple, and have combined durability in the apparatus with economy in the charge. They have erected apparatus in England, Scotland, and Ireland, for many noblemen and gentlemen, and have had the honour to be employed by the Horticultural Society of London, in executing the works of their splendid Conservatory, lately erected at Chiswick.

D. and E. BAILEY also construct in metal all descriptions of Horticultural Buildings and Sashes, and invite noblemen, gentlemen, and the public to an inspection of their various drawings and models, at 272, Holborn, where they have the opportunity of exhibiting, amongst other metal works, an extremely complete and convenient kitchen apparatus, or range, adapted for the continued supply of hot water, and an arrangement of the oven more complete than has hitherto been brought before the public.

D. and E. BAILEY were the first to introduce metallic curvilinear houses to horticulturists, and can refer to the Conservatory attached to the Pantheon as one of their works, besides many others in this country and on the Continent.

D. and E. BAILEY have prepared a quantity of the Galvanic Plant Protectors, which are now ready for immediate delivery; they beg to introduce to public notice a new Trough Pipe, for Orchidaceous or other Houses where vapour is constantly, or at intervals, required, and which may be seen at their manufactory.

ORNAMENTAL WIRE-WORK, &c., FOR THE GARDEN.
390, OXFORD STREET, LONDON.

G. B. THOMPSON having added to his General Stock of FURNISHING IRONMONGERY a large assortment of WIRE-WORK,

Suited to the Flower-Garden and Greenhouse, begs to submit for the inspection of the Nobility and Gentry who patronise Horticultural pursuits his numerous patterns of FLOWER BASKETS, TRAINERS, BORDERS and STANDS, with GARDEN ARCHES, SEATS, and VASES, which for variety, elegance, and utility stand unrivalled.

Also his Improved GARDEN and HOTHOUSE ENGINES, FUMIGATORS, SYRINGES, and PATENT WATER-POT, with every other Implement.

GAME and CATTLE FENCING in variety.

FOR THE FACE AND SKIN.

ROWLAND'S KALYDOR, a preparation from Oriental Exotics, is now universally known as the only safe and efficient protector and beautifier of the Skin and Complexion. Its virtues are commonly displayed in thoroughly eradicating all Pimples, Spots, Redness, Tan, Freckles, and other unsightly Cutaneous defects, and in rendering the most rough and uneven skin pleasantly soft and smooth. To the Complexion it imparts a juvenile roseate hue, and to the Neck, Hand, and Arm, a delicacy and fairness unrivalled.

It is invaluable as a renovating and refreshing Wash, during travelling, or exposure to the sun, dust, or harsh winds, and the heated atmosphere of crowded assemblies. Gentlemen will find it peculiarly grateful after shaving.

Price 4*s.* 6*d.* and 8*s.* 6*d.* per bottle, duty included.

CAUTION.—Ask for "Rowland's Kalydor," and see that these words are on the envelope, with their signature and address in *red*, "A. ROWLAND & SON, 20, Hatton-garden, London;" the same are engraven on the Government Stamp affixed over the cork. Sold by them, and by respectable Perfumers and Medicine Venders.

NEW AND CHEAPER EDITION.
With Portrait, Two Vols., Fcap 8vo, 12*s.*,

THE LIFE of SIR SAMUEL ROMILLY, written by himself; with his Letters and Political Diary. Edited by his SONS.

John Murray, Albemarle-street.

DR. DEAKIN'S BRITISH BOTANY.

Now ready, price £1 10*s.* plain, and £2 17*s.* 6*d.* coloured, in cloth boards, lettered, Vol. I., 8vo, 470 pages, comprising Classes I. to V. of

FLORIGRAPHIA BRITANNICA; or, Engravings and Descriptions of the Flowering Plants and Ferns of Britain. By RICHARD DEAKIN, M.D. This Volume contains Figures of Five Hundred and Twenty-four species of British Flowering Plants, with original Descriptions of each. The Illustrations, mostly Six on a Page, are accurate fac-similes engraved from original drawings made by the Author from the plants themselves, and carefully coloured after nature. The figure of each species is accompanied with representations of the characteristic parts of fructification delineated from actual dissections of the various organs as they appear under the microscope, or to the naked eye of the practical botanist. The volume is furnished with a Synopsis of the Genera, and an Index of the Generic and Specific Names, Synonyms, &c. The work, which is also in course of publication in Monthly Numbers, price Sixpence Plain, and One Shilling Coloured, will be brought to a close as promptly as is compatible with the anxiety of the author to secure fidelity in the figures and accuracy in the descriptions.

London: Published by R. Groombridge, Panyer-alley, Paternoster-row; and G. Ridge, Sheffield; and may be had of all Booksellers.

Publishing Monthly, with Four coloured Engravings,
Price 2*s.* 6*d.*

PAXTON'S MAGAZINE OF BOTANY. The Number for March, 1842, contains beautifully-coloured figures of *Ipomœa ficifolia*, *Fuchsia radicans*, *Iris bicolor*, and *Columnea Schiediana*, with Woodcuts illustrative of the habit of of the first and last, and copious descriptions, history and directions for the culture of each: also Papers on the science of Gardening, No. 2, in which Vegetable Developments are treated of, and an Engraving is given to show an Oak germinating in water; the Importance of Shortening the Shoots of Exotic Plants, while in a Growing State; the treatment of Hydrangea hortensis as a border-flower; on Exposing Greenhouse Plants in Summer; Notices of new and beautiful Plants figured in the leading Botanical Periodicals for February, as well as of those in flower in the suburban nurseries; with an ample Calendar of Operations for March.

This work comprises, monthly, four admirably-coloured plates, and twenty-four pages of interesting and useful letter-press. The admirers of flowers are requested to observe—

1. That all the drawings are taken from nature, and are consequently made from plants which have flowered in Britain.
2. That, with few exceptions, they are all done by one artist, whose abilities are of the highest order, and who travels himself to the places where the plants are in flower.
3. That they are lithographed by the same individual, and, being coloured in a superior manner, have all the spirit and elegance, and much of the finish, of the original drawing.
4. That about one-half of the drawings are from plants which have never before been figured in this country, the rest representing the most popular novelties, as well as the more neglected, though sometimes far handsomer, old species; the majority being such as can be cultivated by every one possessing a flower-border and a greenhouse or frame.

It may, in conclusion, be safely asserted that, both for the beauty of its embellishments, and the utility of its contents, this work is well adapted to the wants of all who delight in gardening; and as the improved system of having the plates lithographed commenced with the present year, and as it is intended that each volume shall now be perfect in itself, the present is a desirable opportunity for those who wish to become subscribers.

London: W. S. Orr and Co., Paternoster-row.

GARDEN NETS, Fishing Nets, Sheep-Nets.—Woollen and Worsted Netting, various widths; New Hemp Net, very small mesh, Bunting, &c., for protecting blossom of Fruit-trees; New Herring Fishing Net, 1½d. per yard; Old Herring Fishing Net, ¾d. Fishing Nets of all kinds, from 4 to 400 yards long; Tarred Rabbit Fence Net, 2d. per yard; Sheep-folding Net (strong tarred cord), 4½d. per yard, 3 ft. 6 in. high; New Expanding Tents for Lawns, erected and taken down in one minute, 12 ft. by 12 ft., circular shape, 6 ft. high in the lowest part, price 5*l.*

Robert Richardson, 21, Tonbridge Place, New Road, near Euston-square.

ECONOMIC LIFE ASSURANCE SOCIETY, No. 34, BRIDGE-STREET, BLACKFRIARS, LONDON. Established 1823. Empowered by Act of Parliament, 3 William IV.

LOWER RATES OF PREMIUM THAN THOSE OF ANY OTHER OFFICE, that entitle the assured *to participate in the profits*, as follows:—

Age.	15	20	25	30	35	40	45	50
Annual Premium per cent.	1 10 8	1 14 7	1 19 0	2 4 3	2 10 11	2 19 9	3 11 9	4 8 0

The BONUS declared in 1834 amounted upon an average to 16*l.* per cent. on the premiums then paid; and in 1839 a second BONUS was awarded, amounting on the average to 31*l.* per cent. on the premiums paid during the preceding five years.

No extra charge for residence in any part of Europe, nor for proceeding (in a decked, sailing, or steam-vessel) from any one Port thereof to another during peace, to Assurers not being seafaring men by profession. Licenses are granted to go to any part of the world upon terms proportionate to the risks.

Policies on the lives of persons dying by suicide, duelling, or by the hands of justice are not void as respects the interests of parties to whom they may have been legally assigned.

Assurances may be effected on any and every day.

By order of the Board of Directors,
CAMPBELL JAMES DOWNER, Secretary.

ANNUITIES.—In the AUSTRALASIAN, COLONIAL and GENERAL LIFE ASSURANCE and ANNUITY COMPANY, Annuitants participate in the Profits of the Company, and receive a rate of ANNUITY much more favourable than can be granted by any Company making its investments wholly in England. The Company is enabled securely to grant these favourable terms from the advantage it possesses of investing a portion of its Funds at a high rate of Interest.

DIRECTORS.

Edward Barnard, Esq., F.R.S.	C. E. Mangles, Esq.
Henry Buckle, Esq.	J. B. Montefiore, Esq.
John Henry Capper, Esq.	J. H. Ravenshaw, Esq.
Gideon Colquhoun, jun., Esq.	Capt. Sir Jas. Stirling, R.N.
John Edwardes Lyall, Esq.	William Walker, Esq.

SOLICITORS.—Messrs. Swain, Stevens, and Co.

Prospectuses, with Tables, Forms of Proposal for the purchase of an Annuity or for making an Assurance, and every information, may be obtained by application at the Office of the Company, No. 126, Bishopsgate-street, City.

By order of the Board, CHRISTOPHER COUSINS, Accountant.

HORTICULTURAL SOCIETY OF LONDON.

EXHIBITIONS AT THE GARDEN.

All Fellows who shall apply on or before Tuesday, the 5th of April, may obtain for these Exhibitions, at the rate of *Three Shillings and Sixpence* each, any number of Tickets not exceeding TWENTY-FOUR. After the 5th of April any further number of Tickets will be delivered to Fellows, on their personal application or written order, at the price of *Five Shillings* each Ticket. Each Ticket will be available for the admission of one Visitor, after One o'clock, to either of the Three Exhibitions, at the option of the Visitor. All applications for Tickets must be made at the Society's Office, 21, Regent-street.

The Gardeners' Chronicle.

SATURDAY, MARCH 19, 1842.

MEETINGS IN THE ENSUING WEEK.

Tuesday	Zoological	8½ P.M.
Wednesday	Geological	8½ P.M.
Saturday	Royal Botanic	4 P.M.

A FEW weeks since, we reported briefly the substance of a paper upon the cultivation of Asparagus in the North of Spain, which was communicated to the Horticultural Society by Captain Churchill, of the Royal Marines (see p. 159). This gallant officer was at St. Sebastian during its occupation by General Evans; and he profited by such leisure as his military duties afforded him, to make himself acquainted with the natural history and horticulture of Guipuscoa. We might content ourselves with merely referring the many inquirers who want to know how to grow Asparagus *well*, to the report just alluded to: but in our opinion it is much too important to be passed by with so little attention.

Asparagus is probably the vegetable most generally admired and most seldom well cultivated; it is only here and there that it is large, tender, and delicate. In country gardens it is small, green, and strong: in the London market it is long, white, hard, and tough—to the eye attractive enough, but to the taste more like bleached timber than an esculent. Indeed, we have never been able to comprehend the reason why, in this our age of improvement, some ingenious turner has not produced imitation sticks, which might be tipped with half an inch of eatable Asparagus, and thus spare the necessity of cooking four-fifths of the stuff that is brought to a London table. Covent Garden Asparagus is assuredly the worst in Europe. For this reason, when really fine Asparagus is met with, people think it must be some peculiar sort—obtain the roots from Vienna, Berlin, Hamburgh, Battersea, or Deptford, and then, when they find them producing heads identical with what they had before, lay the blame on the seedsman, or the soil, or the climate, or anything rather than their own want of skill. There is but one sort of Asparagus, be its name what it may; all the differences consist in its cultivation.

Captain Churchill says the Guipuscoan Asparagus measures from three to six and more inches in circumference. How this is obtained, his excellent account leaves no room to doubt.

Asparagus is a plant found naturally on the beach of various parts of the coast of Europe, where it is covered by the drifting sand, and watered by salt water at high tides. Sand and salt water occasionally may, therefore, be regarded as indispensable conditions for maintaining it in health. How seldom is this thought of! It, however, explains in part the excellence of St. Sebastian Asparagus.

It seems that at the mouth of the Urumea is a narrow slip of land, about three feet above high-water mark, consisting of alluvial soil, and the wearing away of sandstone hills, at whose foot it is placed. This is the Asparagus ground of St. Sebastian. Beds are formed five feet wide, without any previous preparation, except digging and raking. In March the seed is sown in two drills, about two inches deep,* and 18 inches from the alleys, thus leaving a space of two feet between the drills. The rows run invariably E. and W.—doubtless in order that the plants may shade the ground during the heats of summer. When the seedlings are about six inches high, they are thinned to something more than a foot apart. Water is conducted once a day among the alleys and over the beds, so as to give these seedlings an abundant and constant supply of fluid during the season of their growth. This is the cultivation during the first year.

The second year, in the month of March, the beds are covered with three or four inches of fresh night-soil from the reservoirs of the town; it remains on them during the summer, and is lightly dug in during the succeeding autumn; the operation of irrigation being continued as during the first season. This excessive stimulus, and the abundant room the plants have to grow in, must necessarily make them extremely vigorous, and prepare them for the production of gigantic sprouts.

In the third spring, the Asparagus is fit to cut. Doubtless all its energies are developed by the digging in of the manure in the autumn of the second year; and when it does begin to sprout, it finds its roots in contact with a soil of inexhaustible fertility. Previously, however, to the cutting, each bed is covered in the course of March very lightly with dead leaves, to the depth of about eight inches; and the cutting does not commence till the plants peep through this covering, when it is carefully removed from the stems, in order that the finest only may be cut, which are rendered white by their leafy covering, and succulent by the excessive richness of the soil.

In the autumn of the third year, after the first cutting, the leaves are removed, and the beds are again dressed with fresh night-soil as before; and these operations are repeated year after year. In addition to this, the beds are half under salt water annually at spring-tides.

Let any one compare this mode of culture with ours, and there will be no room for wondering at the difference in the result. The Spaniards use a light, sandy soil; we are content with anything short of clay. They irrigate; we trust to our rainy climate. They know the value of salt water to a sea-coast plant; we take no means to imitate nature in this respect. They dress their beds with the most powerful of all manures; we are contented with the black residuum of a cucumber frame, which is comparatively a *caput mortuum*. Finally, they throw leaves lightly over their beds, by which means they expose the young sprouts to the least amount of resistance, and force them onward by the warmth collected from the sun by such beds of leaves; we, on the other hand, compel the Asparagus to struggle through solid earth, capable in the smallest possible degree of absorbing warmth during the day—but, on the other hand, ready to part with its heat again at night to the greatest possible amount.

Can any one wonder, then, at the poor results obtained by our manner of cultivation?—or that some gardener should now and then astonish his neighbours by producing Asparagus which we call Giant, but which at St. Sebastian would be called second-rate?

IN another column will be found an account of the manner of preparing manure in Alsace, which we recommend to the consideration of our readers. The principle upon which the practice is founded is that of preventing the loss of the volatile part of the manure, which is the most valuable, by converting it into a substance possessing no volatility. It will probably be found that gypsum is the cheapest of the materials recommended for this purpose.

"SEASONS of abundance and scarcity usually recur in cycles of several successive years." Such is the substance of an observation lately made by Sir Robert Peel in the House of Commons. This, if true, is a remarkable circumstance. Is it true?

We have taken some pains to examine the statement, and the result is embodied in the following letter from a correspondent, to whose opinions, if we were at liberty to mention his name, all would defer.

"In Sir William Herschel's paper on the spots in the sun (Phil. Trans., 1801), there are some comparisons of these spots with seasons of abundance and scarcity. The data are from an extensive table by Adam Smith (which will be found at the end of the 1st Vol. of his Wealth of Nations), of *prices of Corn*, which I suppose is all we have to guide us as to seasons of abundance or scarcity of *produce*. On looking it over, I see no ground for any conclusion as to *cycles*, farther than such coincidences of successions and alternations as often occur at *Rouge et noir*. Sir J. Lubbock has published a table arranged in curves, in which are comprehended the fluctuations of Wheat prices from 1780 to 1839, in which certainly there occur great ups and downs, and in which, no doubt also both elevations and depressions are not confined to single years, but affect usually two or three together. This, however, I rather consider as an effect of the laws of human agency than of weather; and on the whole I see in it nothing at all indicating any *cycle* or *periodicity*, any more than in the waves of a storm taken consecutively with those of an adjacent calm. Sir J. L.'s table is headed—'A Retrospective Mercantile Chart. Diagrams, showing the Fluctuations of the Prices of various Articles between the Years 1782 and 1839 inclusive.' Published by J. C. Walter, 9, Castle-street, Holborn. Probably as both these authorities are good, and to the point, so far as *price* is an indication of *supply*, they may answer the purpose of those who wish to know on what evidence Sir R. Peel's statement is founded."

In the paper above alluded to, Sir W. Herschel sums up his observations in words to this effect: "I am much inclined to believe that openings (in the sun) with great shallows, &c., instead of small indentations, may lead us to expect a copious emission of heat, and therefore mild seasons; and that, on the contrary, small indentations, &c., will denote a spare emission of heat, and may induce us to expect severe seasons. A constant observation of the sun with this view, and a proper information respecting the general mildness or severity of seasons in all parts of the world, may bring this theory to perfection, or refute it if it be not well founded."

These, however, are mere speculations of an ingenious philosopher, and do not appear, so far as we can learn, to be confirmed by any subsequent observations. It certainly would seem, if the spots with which the sun is marked can be proved to be fixed appearances connected with the physical constitution of that luminary, and also to cause increase or diminution of heat, that then seasons of heat or cold may be foreseen, and will necessarily be periodical. But this remains to be proved.

CHATSWORTH.—(*Concluded.*)

THE Chatsworth pilgrim is apt to suppose that he has "seen everything worthy of notice" when he has made the tour of the house, paced round the grounds, stared at the fountains, and peeped into the grand conservatory; but the object of, perhaps, greatest interest remains yet to be explored; and this, *me judice*, is the village of Edensor in its new site. They who were familiar with Chatsworth a few years back, could scarcely have failed to notice a number of shabby cottages that were crowded together near the Edensor gates, and within the boundaries of the park itself, to which they were, in truth, a most unseemly appendage. Now, however, as if by magic, *tout cela est changé*; the village is gone, and a beautiful greensward covers the spot where it formerly stood. Two lodges (not a pair) have been erected on either side this entrance to the park—one of which is a peculiarly beautiful example of the rich effect of ornamental timber-gables when carefully adjusted; the lodge on the opposite side is a plain building in the Italian style, intended, perhaps, by way of contrast to its opposite and more ornate neighbour; but, to my fancy, it might be dispensed with. In this place, being near the Edensor Hotel, I must, as in duty bound, say a word in favour of the latter as at present conducted. Disappointments and disagreements therein encountered in days of yore, had left an unfavourable impression not easily removed: being compelled, however, to seek a harbour there after the lapse of some half-dozen years, I was delighted to find the establishment in entirely different hands, and vastly improved in all its arrangements; in fact, among country inns (a degenerate race), it might now be difficult to find a better.

But what, it may well be asked, has become of the village of Edensor?—a question this which, as I have already hinted, it might puzzle the majority of Chatsworth visitants to answer, and yet a walk of a few hundred yards would solve the mystery; for it has reappeared in a beautiful little dell not a hundred yards from its original site. This dell gradually opens as it descends gently towards the park, from which it is prettily separated by a wavy line of plantation, and is as profusely studded with architectural gems as was Sinbad's famous valley with gems of another kind. The buildings embrace houses of almost every calibre, from the spacious farmhouse to the humble cottage, and they are distributed with admirable skill; some on the level ground at the mouth of the dell, and others on gentle declivities, while not a few overhang the brow of a precipice or occupy a snug position that has been excavated out of the solid rock. The buildings are entirely of stone, except where enriched wooden gables or other ornamental carvings have been introduced; and they present a perfect compendium of all the prettiest styles of cottage architecture, from the sturdy Norman to the sprightly Italian. The variety thus produced is charming, and vastly preferable to the monotony which prevails where a particular style is selected and adhered to throughout, as is the case in one or two ornamented villages which I might, but will not, name. The fact is, that uniformity is quite incongruous where a number of different habitations are brought into juxta-position; and although we have a right to expect that an individual when he builds a house should confine himself to one style rather than indulge in an amalgam of all, yet in a country where there is no dominant style, other individuals are not bound to walk in his steps, nor is it desirable or likely they should. Hence a Gothic village, or a brick and timber village, or an Italian village, is scarcely true to nature, and, on this account, would fail to please even if it lost nothing on the score of contrast and variety, in which the painter would tell us the elements of beauty are to be sought.

The houses are all extremely comfortable, and fitted up in a neat and substantial manner, and are evidently the pride of their occupants. The wants, too, physical and moral, of this community are amply provided for; for there is a village school and a village play-ground, a village fountain, &c. The latter is, I think, unique in its design, and must be seen to be appreciated; it is quite the poetry of architecture.

One word about the church and I have done. This has lately been surrounded by a handsome wall, in which is a comely gateway, by which you enter the churchyard. So far, so good; but the church itself, which is beautifully placed and literally founded on a rock, though inoffensive in its character, is yet unworthy of Chatsworth. I was told that it is to be altered or rebuilt, which I trust may prove to be true: indeed, it is impossible but that the Duke must feel the propriety of sparing neither pains nor expense to render the house of God what, in such a domain, we would expect to find it; and happily the days of barn-like churches are gone by, never, I trust, to return; for with the growth of a more genuine piety there has sprung up likewise a deeper and more reverential feeling towards these sacred edifices—a feeling which, while it scorns to place religion in mere externals, scorns also to leave it untended and in rags.

---

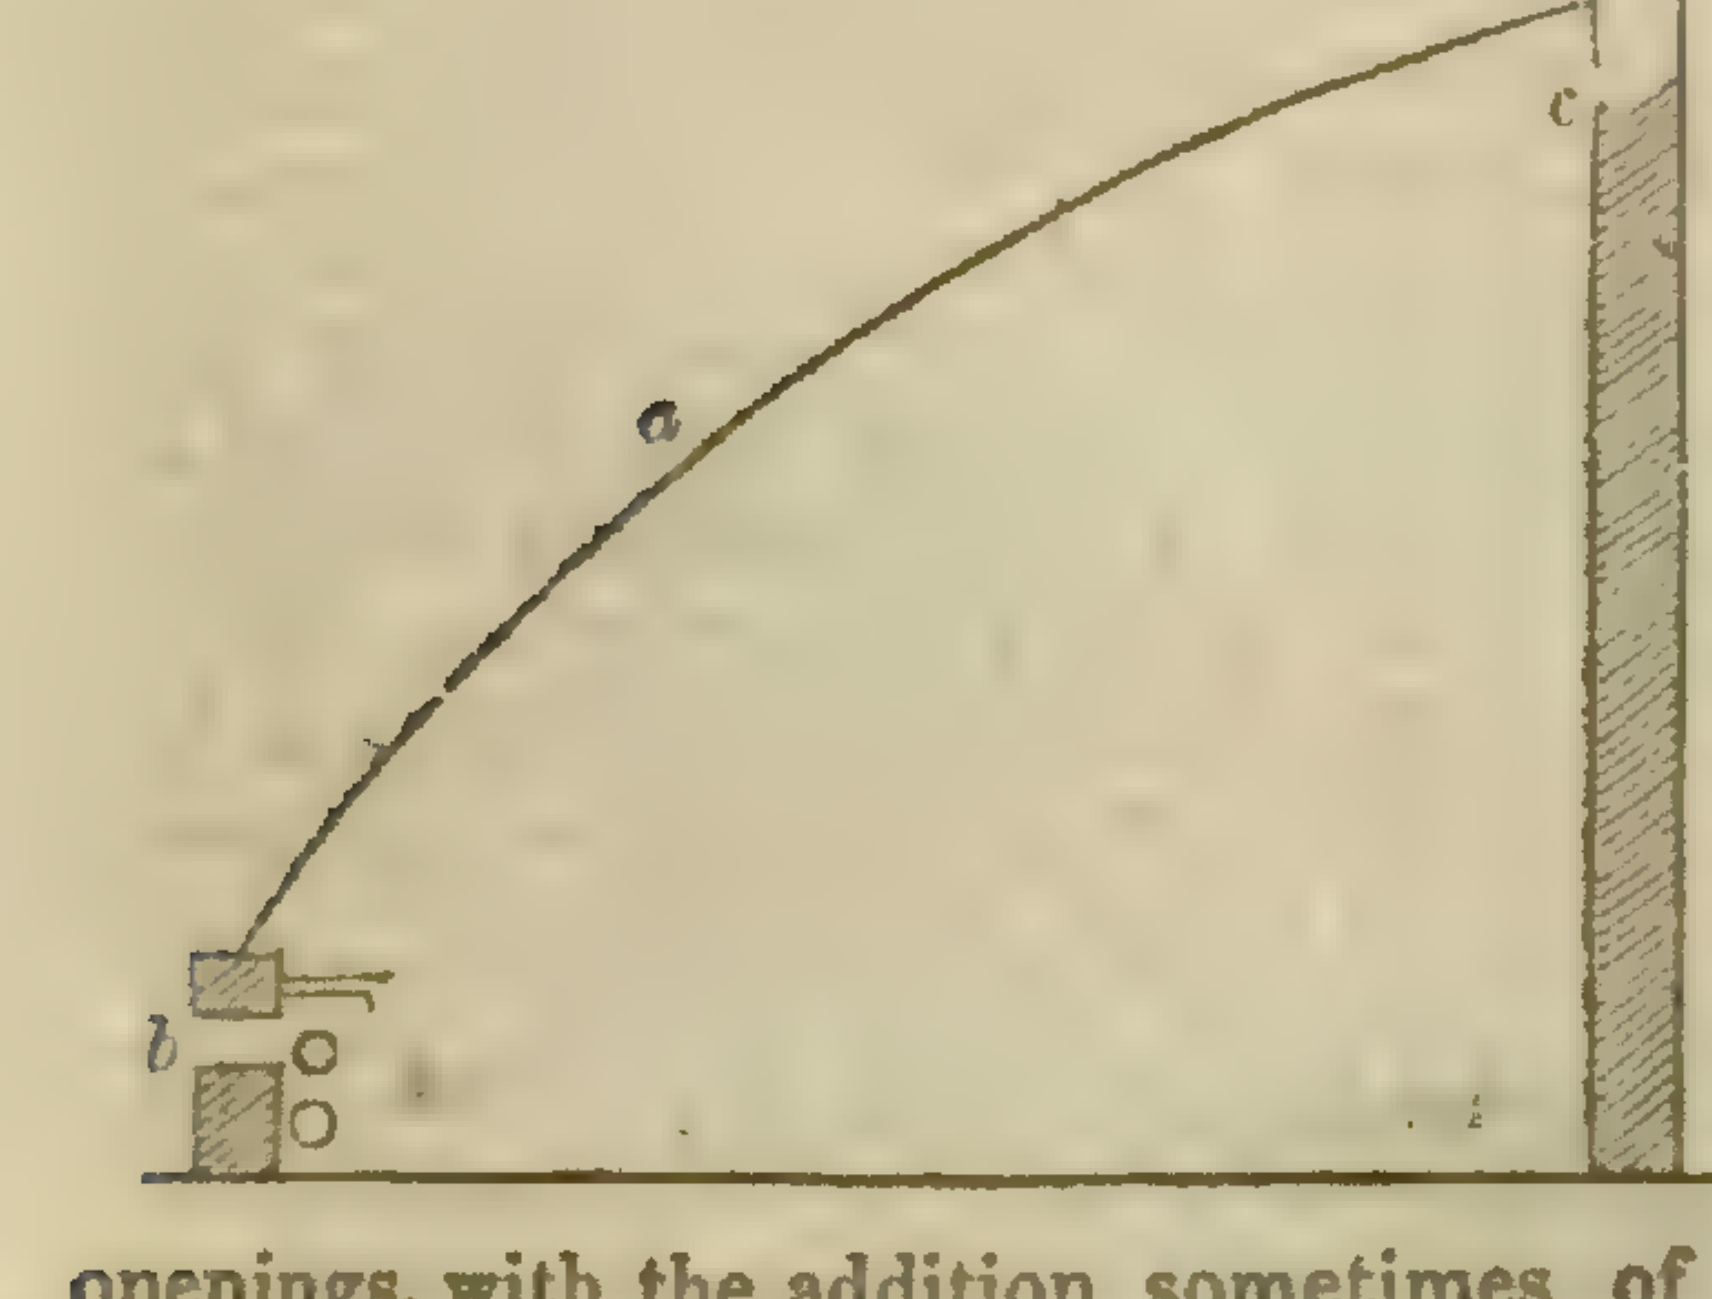
* By a blunder of our reporter, at p. 159, the seed was stated to be sown 18 inches deep.

TREATMENT OF CYRTOPODIUMS.

HAVING cultivated Cyrtopodiums for six or seven years without ever succeeding in getting them to flower, I last year tried the following treatment, the result of which has been, that this spring my strongest plant, though by no means so strong as it has been in former years, has thrown up a flower-stem:—About this time last spring I fresh potted my plants, removing all the peat and potsherds in which they had formerly been grown, and substituting in their place a very strong friable loam, which I have for some time employed for the cultivation of Hippeastra, its nature being such, that when once crumbled by frost, it does not set again, but remains an open and porous, though extremely tenacious soil, absorbing a great deal of water, but allowing the superfluous moisture to pass off freely. It was obtained from the bottom of the channels of an irrigated meadow, in a strong loamy soil. I replanted the plants in the same pots in which they had previously grown, draining them well with crocks. In all other respects except soil they received the same treatment as in former years—strong moist heat when growing, and perfect rest and drought afterwards. In former years the young shoots often damped off, and the greater part of the roots perished at the season of rest, neither of which results took place last year. I was induced to make this experiment partly by a statement which appeared in the *Chronicle* last year, p. 230, from the gardener to Mr. Brocklehurst, and partly by my own experience of the growth of Cyrtopera flava, a rare East Indian species with thick, fleshy roots like those of Cyrtopodium, which dwindles and perishes in peat, but becomes strong and luxuriant if grown in a stiff, tenacious, clay-like loam. I believe it will be found that Phajus maculatus, and some others of the strong-rooted terrestrial Orchidaceæ, prefer this description of soil. The present is a good time, when Cyrtopodiums are beginning to grow, for those who are disposed to repeat my experiment. I may observe that my plants are by no means strong, not having above two or three pseudo-bulbs, the rest having been cut away from time to time, to get rid of the white scale which infested them as long as they were in peat, but which has now disappeared.—*John Rogers*.

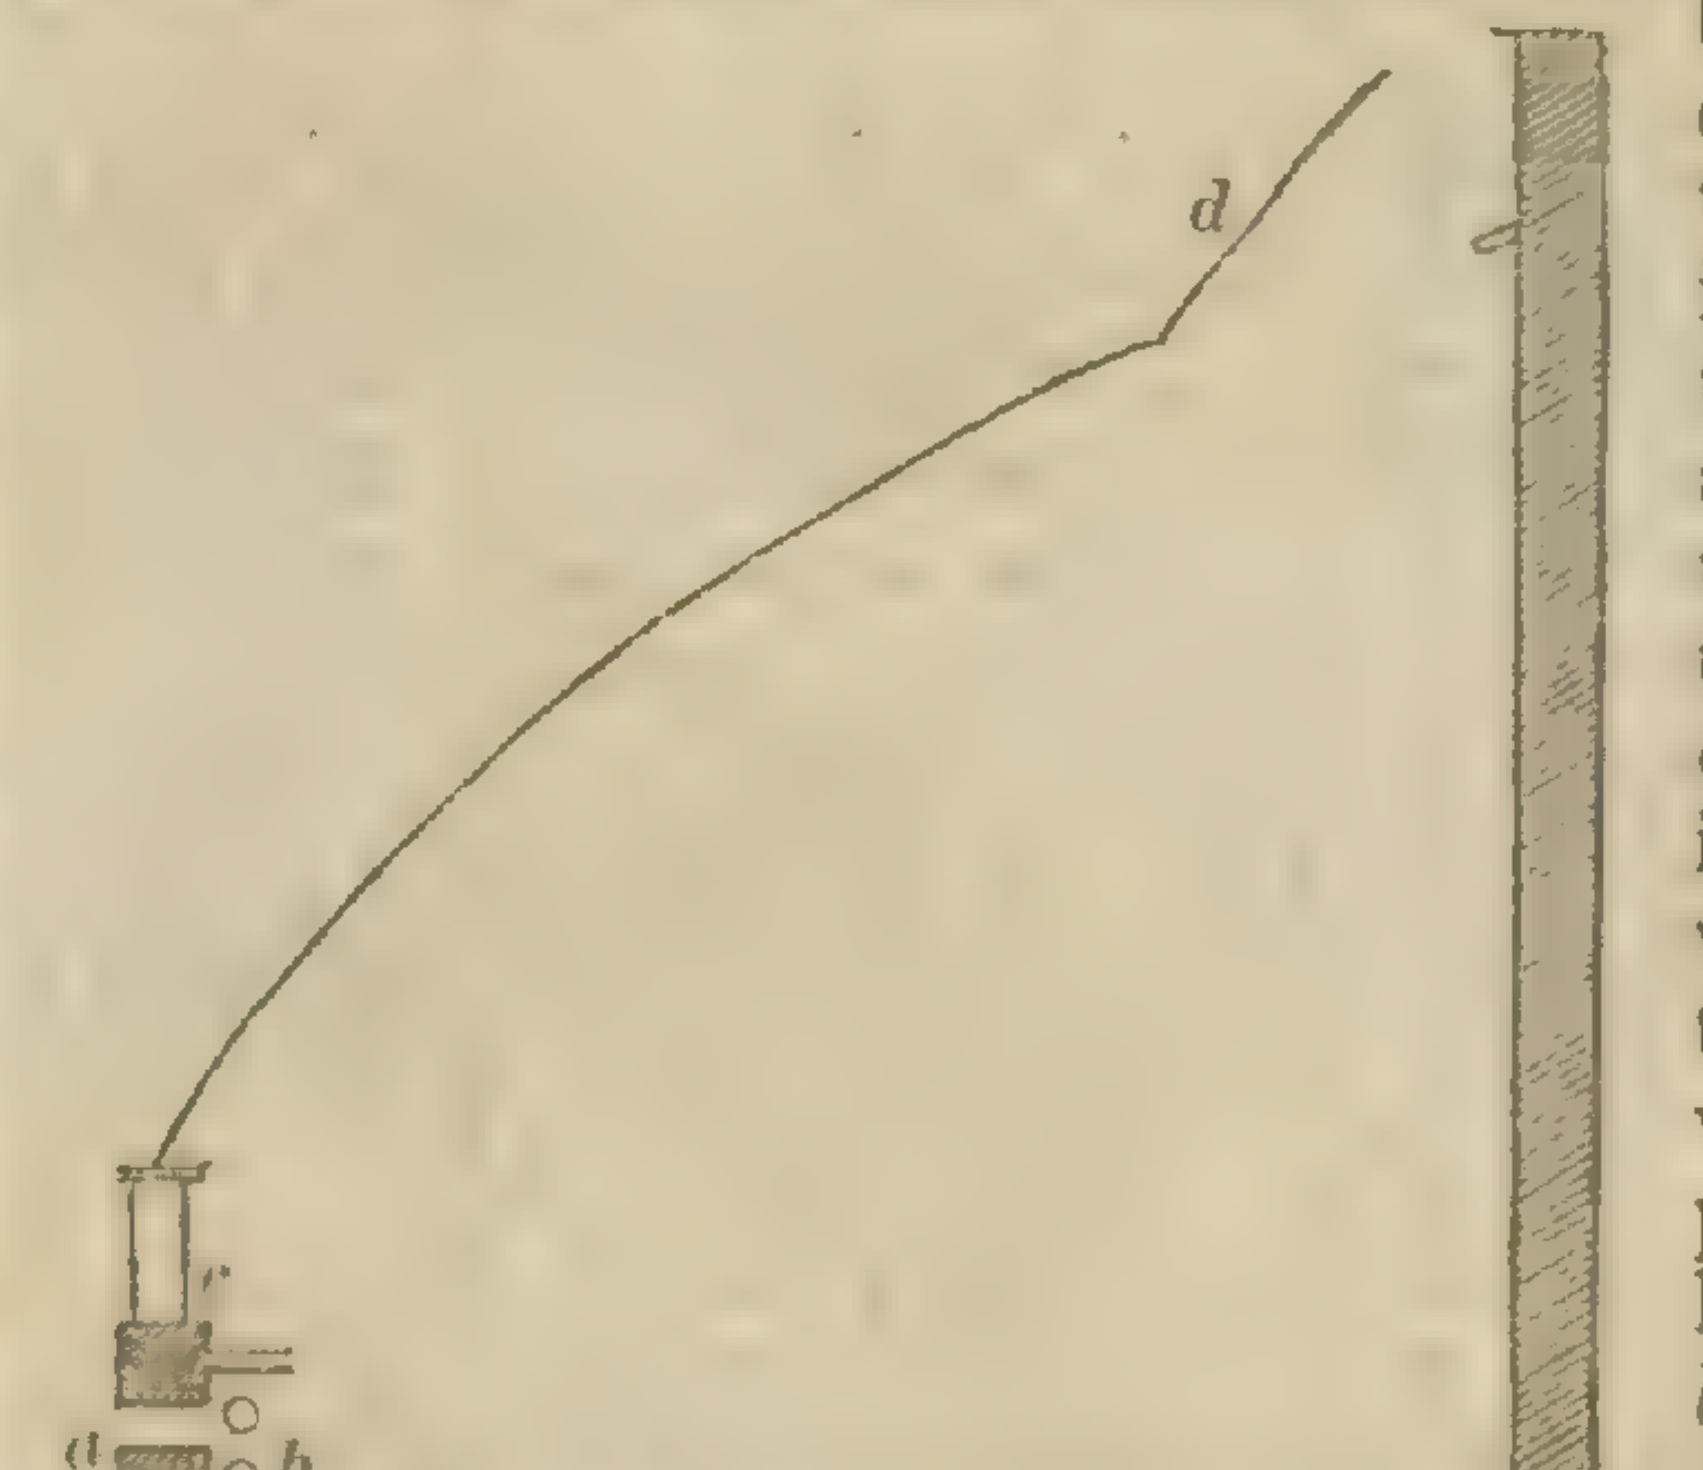
ON THE VENTILATION OF CURVILINEAR IRON HOTHOUSES.

CURVILINEAR iron-roofed hothouses have been erected in various parts of the country of late years, but they have not proved to be so generally useful as was at first expected. Those in common use are modifications of forms recommended by Sir George Mackenzie, and the late President of the Horticultural Society, with the view of having the sun's rays perpendicular to some part of them at all seasons of the year. The principle is certainly good, but in making an artificial climate there are other things to be attended to besides light, and one of these, if it has not been overlooked, has at least not been provided in many of these houses—I mean a sufficient ventilation. Everywhere we hear gardeners complain that they admit too much light, and consequently burn the leaves and otherwise injure the plants. There can be no question about such effects being produced, although the cause is not what it is generally supposed to be; for we are not likely to have too much light in England for greenhouse plants or Vines, even if the photometer would indicate a higher degree in the house than out of doors. The accompanying transverse section of one of these houses in common use, will enable me better to explain its defects.

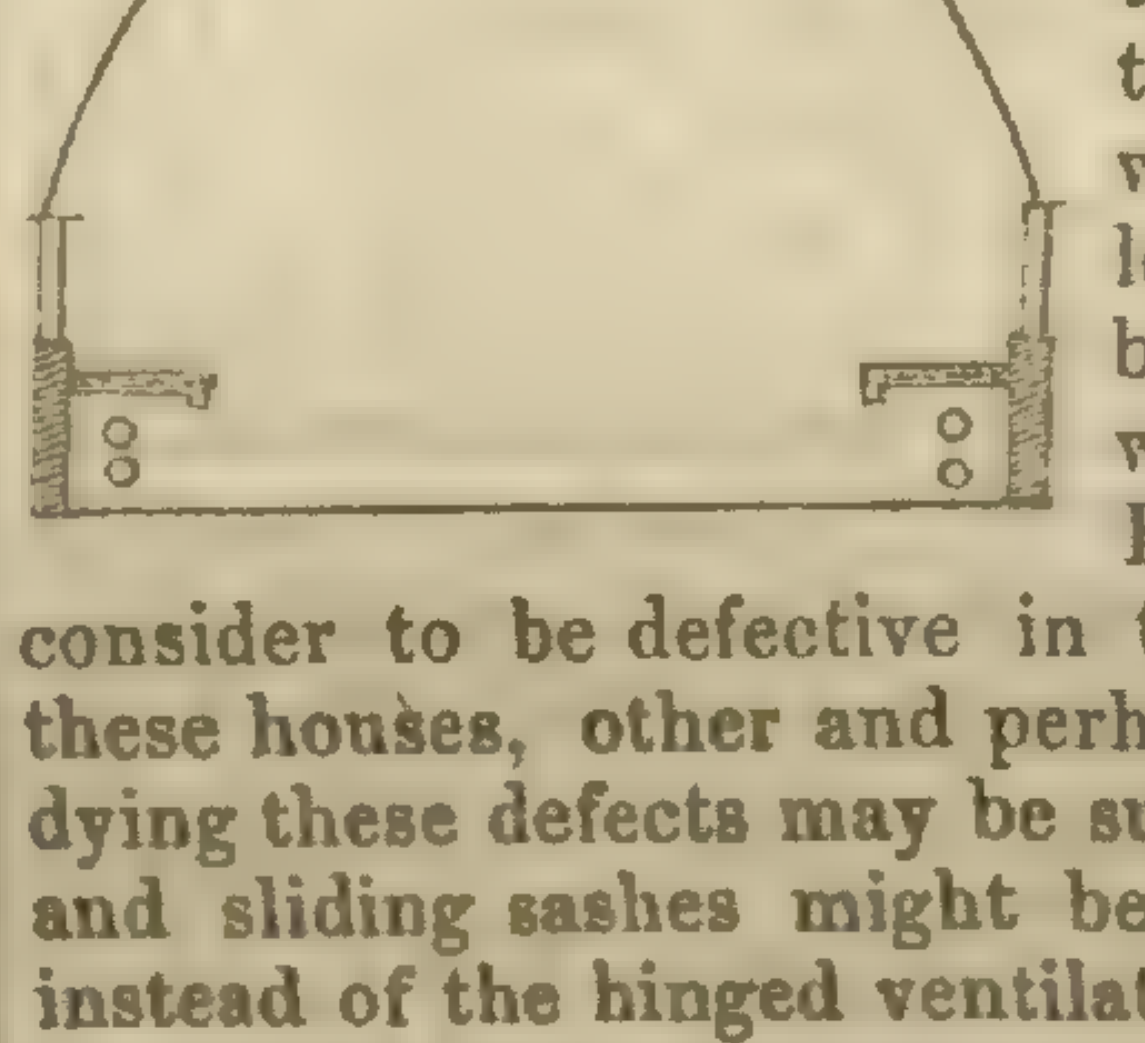


a is the fixed roof, reaching from the front wall to the back; *b* represents one of the small ventilators in the front wall; *c c*, one of the small ventilators at the top of the back wall, to allow the heated air to escape. These small openings, with the addition sometimes of one or two in the ends, are all the means available for reducing the temperature in a hot summer day. If such houses had been heavy wooden ones, affording ten times as much shade, they would doubtless have had ten times more space for ventilation. Supposing then that the house is built and filled with plants; if this happens to be late in autumn, they will look remarkably well in winter and early spring; but as soon as the sun's rays become more perpendicular, shining in a clear sky for a few days, the worst effects are produced. The change is easily explained. These structures are so light that they admit nearly all the sun's rays; and as they are reflected by the back wall, few of them can pass quickly out: the atmosphere is thus subjected to sudden variations of temperature, although every ventilating board is open; and the moisture is drawn from the leaves of the plants much faster than their roots can supply it, consequently the leaves flag, curl at their edges, become blotched and unhealthy. That this is a correct explanation is proved by the fact that succulent plants, such as Cacti, having leaves with few evaporating pores, will flourish in a house of this description. The front ventilators in such houses are placed in a very good situation for the admission of air, but those in the back wall are in a very bad one for allowing it to escape when it is over-heated. Several persons lately had rather an expensive example of the truth of this principle in the working of a new method of heating plant-houses, where it was supposed that if the pipes were placed in a chamber below the level of the floor of the house, and communicating with it by a few holes or trunks made along the front or back, the heat generated by the pipes in the chamber would all ascend through these places and keep up a sufficient temperature. Such, however, was not the case: a great quantity of the heat remained where it was, and the plants were in some instances frozen. So in like manner the heated air passes out very slowly at these back ventilators, and the plants are burned.

A house, of which the following is the section, would have all the advantages of the other with regard to light, and at the same time the means of sufficient ventilation would be provided.



a represents the ventilating boards in the front wall as shown in the other section; these could be used in mid-winter, when the air thus admitted would have to pass over the hotwaterpipes *b*, before it came in contact with the plants. *c* is a glazed ventilator, as seen in common wooden houses; and *d*, ventilators in the roof, which move on hinges. The span-roofed curvilinear house is not liable to such sudden variations of temperature, because having glass on both sides, many of the rays pass through, and therefore it is much cooler than those which have a back wall.



The annexed sketch shows a house of this description, which is ventilated at the base, in the same manner as the preceding, and at the top, by either having part of the roof of an inclined plane with moveable sashes, or by leaving a considerable space below the coping, and fixing wooden ventilators on it. Having pointed out what I consider to be defective in the construction of many of these houses, other and perhaps better methods of remedying these defects may be suggested. The inclined plane and sliding sashes might be used in the second section, instead of the hinged ventilators, if it is thought desirable. It would be rather advantageous than otherwise with regard to light, being of course more perpendicular to the sun's rays in winter and spring; and although it would be less so in the months of June and July, yet this would be rather beneficial.—*R. Fortune*.

AMATEUR'S GARDEN.—No. XII.

FLOWER borders containing bulbs and other herbaceous plants may now be put in order and dug. It is not a good plan to dig these early in the spring, because many of the plants are entirely under ground at that season, and are almost certain to get cut and perhaps destroyed by the spade; hence it is no uncommon thing, even in good gardens, to see confused masses of the same plant springing up in all directions. In digging these borders, it is frequently necessary to reduce the size of overgrown specimens; but this is often done in the very worst manner, in so far as their health and beauty afterwards is concerned. Many persons, when they wish to keep a plant within certain limits, cut away all the outside year after year, leaving continually the old part which was first planted. This may do very well for strong-growing plants, but it is certain death ultimately to the weaker kinds; and the latter are generally those which are most admired. Almost all plants grow outwards from a centre, and the parts which root nearest the edges, or the youngest, are, in all cases, the most vigorous and healthy; it must be evident, therefore, to every one, that if the healthy parts are constantly removed, those which remain will be apt to grow weak and produce few flowers. Nurserymen and propagators of rare plants know well the value of front shoots, and always prefer them when they can be had. Those, therefore, who have to cut in such pretty dwarf plants as Arabis alpina and Aubrietia deltoidea should always choose a patch from the most healthy part, which will generally be found on the outside, and plant it in its proper place in the border amongst fresh soil; they will in this manner have healthy plants, and fewer blanks in their borders.

There are many pretty spring-flowering plants which belong to this class, which make the herbaceous border extremely interesting, even at this early season; so that those who do not possess a greenhouse need not be without flowers. The following may be noticed as among the most worthy of a place in a small garden: Crocuses, of which there are many fine varieties of various shades of colour; one called Susianus, or "Cloth of Gold," is extremely beautiful. Dog's-tooth Violet, Adonis vernalis, Narcissus, the Winter Aconite, double-flowering Pilewort; Hepaticas, the single and double blue, and another which is commonly named the Peach-blossomed; Saxifraga oppositifolia, Draba aizoides, Sisyrinchium grandiflorum, Alyssum saxatile. Besides these, there are the common Primrose and Violets, the Snowdrops and Snowflakes, and the pretty light blue Omphalodes verna, commonly called "Forget me Not."

Among things which flower late in the season, there is a plant called Anemone vitifolia, which should be in every border of herbaceous plants. The leaves are shaped like those of the Vine, of a deep green; and the flowers which stand above the leaves are white; the habit of the plant is good, as it does not grow till it is well fitted for the middle or front of the border. There is another fine plant for a border, called Acanthus mollis, which is a native of the Levant, and not very common in small gardens. Its large spikes of flowers are very ornamental, and its shining pinnatifid leaves are interesting, as being the model from which the Grecian architects are said to have taken the leaves of the Corinthian capital. It is apt to get injured in winter in wet situations.—*R. F.*

HOME CORRESPONDENCE.

Rooks.—From many communications with which we have been favoured on this subject we select the following:—In compliance with your request (being a great friend to the rooks) I will endeavour to assist your correspondent in his attempt to establish a rookery. Never having had any personal experience in such an undertaking, I have looked into two works of great authority in all matters connected with natural history, viz., "Yarrell's History of British Birds," and "Stanley's Familiar History of Birds, their Nature, Habits, and Instincts." In the second vol. of the former work, page 96, it is mentioned that in two instances where rooks had been destroyed in great numbers, the failure of crops had been so great from the ravages of grubs, insects, &c. &c., that the farmers were obliged to "import" and "reinstate" the rooks: how it was done is not stated. In Stanley's work, however, it is suggested (i., 246) that in "looking out for a magpie's nest near the wished-for spot, and exchanging her eggs for those of a rook, the desirable point may be accomplished." This experiment has, we are told, been actually tried, and with success, in Warwickshire. A carrion crow's nest would probably succeed as well as a magpie's. Possibly procuring some young rooks this season, and keeping them domesticated near the desired spot till the next breeding season, would induce them to build in the neighbouring trees; if regularly fed, they would have no inclination probably to fly away, being much attached to localities: but that might be prevented by clipping their wings sufficiently to prevent a long flight, but still giving them the power of roosting on low branches. As the magpies, crows, and rooks are now busy preparing their nests, and will soon begin laying, your correspondent should lose no time in looking out for a magpie or carrion crow's nest to place the rooks' eggs in. Boys who are accustomed to climb trees to procure young rooks could easily get at the eggs. It is desirable that your correspondent should communicate the result of any experiment he may make.—*D. P.* In order to entice the rooks to build in trees, procure a quantity of nests, the more the better, and secure them against the effects of the wind; the best time to accomplish this is as soon as the rooks have reared their young. The nests will then better bear handling than if deferred to a later season. They cannot be enticed this season, as they have commenced building.—*Edward Morse, Gardener, Butleigh Court, Glastonbury.*

Chapman's Potato.—In the *Chronicle* for March the 5th, I find Mr. C. Chapman, of Brentford End, complaining that I have misconstrued his circular, and that, without understanding the subject of producing what he calls New Spring Potatoes, but what I beg to call immature old ones. As he seems to think that I wished to injure the sale of his Potatoes, I beg in the first place to state that I have not the pleasure of knowing him otherwise than as connected some time ago with the sale of a Pear, then called Chapman's, but long before well known as the Passe Colmar; and that my sole motive for writing to you, was to put the public on their guard against trusting implicitly to the wonderful things sometimes advertised. But to the point. Messrs. Chapman in their circular say, "the sets greened and prepared for planting will be ready to be delivered in May next" (why not before?) "with full directions for their culture." "A sample in their natural state and not greened will be sent on the remittance of one shilling, and sets in a greened state at the charge of one pound one shilling per bushel." Now, does Mr. C. mean to state that there is nothing in this extract respecting a peculiar treatment being required? Surely, if the merit he speaks of is owing to any particular variety (he has two varieties, by the way), such treatment is not requisite. Why, let me ask, is it so necessary that the sets should be "greened;" and why purchasers are to have such full directions, upon the observance of which the produce of their Potatoes is to be the same as the sample? unless it is the management which causes the peculiarity and not the sort. What need too can there be of holding back instructions till the month of May? There is something mysterious in this very circumstance which naturally excites suspicion. Why will not the same treatment act on any other variety in the same manner as on the two kinds which Messrs. C. call their New Spring Potatoes? Most assuredly greening sets, and particular directions, cannot have anything to do with particular varieties. Mr. C. says their New Potatoes are not obtained in the manner stated in the "Gardeners' Magazine;" now this may be true enough in some minor details, but I ask Mr. C. where is the difference in principle? are not his Potatoes produced by retarding the old Potatoes of a previous season, or by exposing some of the immature ones (which he calls new ones) to the action of light to mature them (green them); then, by planting them at a much later season than is ordinarily done, but n sufficient time to allow the produce to be half-grown before winter; and, finally, by taking them up and burying them, or otherwise protecting them from frost and air? Does Mr. C. really imagine that people will receive as a proof that his Potatoes are different from others, that he plants them in rows eighteen inches apart and six or eight inches in the row? There is nothing extraordinary in that, any more than there is in his after statement about the boy and the donkey, &c. Upon looking back over what I have written, I find that I have already proposed several questions; I will now put them into a distinct form. 1st. Are not Chapman's New Spring Potatoes immature old ones of the previous year's growth, procured by retarding the sets, and by planting at a much later season than ordinary? 2d. What is the difference (if any) between these New Spring Potatoes and those grown by others for the London market, especially in the neighbourhood of Brentford; and whether (if different) they are seedlings raised by Messrs. Chapman, of Brentford End? and if so, from what particular variety, and how many years since? 3rd. Did ever Messrs. Chapman try the Ash-leaved Kidney, or any other old variety of Potato, in their peculiar way by greening them, &c.? and if so, what was the result? 4th. What is the peculiar way of treating "New" Spring Potatoes? and is it requisite for water to lie on the surface of the ground all the year, particularly after the sets are planted? By answering these few questions candidly and to the satisfaction of the public, Mr. Chapman will do more for the sale of his New Spring Potatoes than ten times the quantity of such unsupported assertions as he has made in the *Chronicle* of March the 5th; and, if I am in error, I shall be ready to acknowledge my mistake.—*G. Gordon.* [Mr. Gordon has very wisely abstained from entering into any subject not immediately connected with the present inquiry. If Mr. Chapman answers this letter, he must confine himself strictly to the questions put. We shall not permit any digression to be printed.]

Daniell's Manure.—I have just seen your observations on this substance, a general knowledge of the composition of which has been made known by Mr. Webb Hall, and perhaps you will allow me to make a few remarks on the subject. On looking at this substance, it certainly is not what I should have expected from having heard so much of its effects; but our knowledge of feeding plants is not yet sufficiently advanced for any one to be able to say what ingredients that are to be easily obtained shall make an efficient manure. We must therefore take for granted that this composition is an effectual stimulant of vegetation. The vegetable matters and the alkalies are undoubtedly valuable ingredients, for the reasons you have pointed out. With regard to the bituminous substances, it does not appear to me that they can be of any benefit, unless combined with something that produces in them a chemical change, or that they act mechanically upon the soil, as they are generally of an insoluble character, and it is quite impossible that insoluble manures should act as food. If these bituminous matters are converted in any manner into soluble hydrocarbonates, then their action would undoubtedly be beneficial. Sir H. Davy found that thin solutions of sugar, gum, and starch nourished plants well; but that thick solutions of these substances destroyed them. He also found that charcoal in substance was not absorbed by plants. But the immediate object of my writing is to draw your attention to the sulphur in this composition. From some observations that I have made, I believe that sulphuretted hydrogen in small quantities has a very favourable influence on vegetation; and if the sulphur in this case is applied in such a manner as to form sulphuretted hydrogen, it may be a more important ingredient than at first might be suspected. In the summer of 1839, I investigated the subject of the formation of sulphuretted hydrogen from the decomposition of the sulphates in contact with vegetable matter. I found in most places where water with sulphates was standing in contact with decaying vegetable matter, that this gas was developed in great abundance. The effect of this was to destroy vegetation where the sulphuretted hydrogen was in great quantity; but all around, where only slight quantities of this gas could be detected, the vegetation was uncommonly vigorous. In two large pieces of water, the mud of which I found to contain considerable quantities of sulphuretted hydrogen, the vegetation was very prolific, and I never saw the various species of water-plants, as the Charas, Water Lilies, Myriophyllum, Potamogetons, &c., grow in greater profusion. My friends Dr. Percy of Birmingham, and Mr. E. Solly, jun., have both assured me that they have witnessed the beneficial effects of small quantities of sulphuretted hydrogen in the growth of plants. It is also very well known that human manure is most efficient; and this also contains considerable quantities of sulphuretted hydrogen. Nor is this gas so injurious to animal life as has been supposed. The fish in the above waters were uncommonly abundant; and I have described several species of Infusoria and Cryptogamia that live in water highly impregnated with it. From Turner and Christison's experiments, also, this gas does not appear to be so injurious to plants in the atmosphere as many other gases. I may also suggest that the benefit of sulphate of lime as a manure may arise from the decomposition it undergoes on coming in contact with vegetable matter, and thus liberating sulphuretted hydrogen.—*Edwin Lankester, M.D.*

A Welshwoman's Cure for a Scald (p. 70).—I am sorry I cannot furnish your correspondent with the "old Welshwoman's" name. When my father was a lad at home with his parents at Cowbridge, in Glamorganshire, it happened that the servant-girl, when in the act of taking off the iron pot, by some means lost her hold, and the boiling contents scalded both her legs dreadfully. Just in the time of need, in came the "old Welshwoman." Seeing all around her alarmed, she very coolly said, "Do not be frightened; send one of the boys out to the field, and let him bring me some green turfs; and I will soon put all right." She would not suffer any of the clothes to be removed until the turf had been applied. The girl never found any ill effects from the scald.—*R. A.*

Guano.—Having read in the *Chronicle*, p. 158 (1842), a statement concerning Guano by your correspondent, Mr. Towers, which is calculated to mislead those who have not yet tried it as a manure, I embrace the opportunity of informing your readers that I have used it for the last twelve months with the most gratifying results, not on one plant or vegetable, but on every kind of plant that is benefited by the application of manure, and for vegetables of every description. For plants in pots it should be used in a liquid state; and my Cinerarias, Pines, and Cucumbers bear testimony to its merits at the present moment. When used in the garden, care should be taken to have it well pulverised, and kept from coming in contact with the seeds until they have germinated; and when used for anything about to be planted by mixing it with the soil in digging or otherwise, no danger is to be apprehended by those who have any idea how to apply pigeon or any other bird's dung. Being engaged at present with experiments to ascertain what are the proper quantities to apply on a given space, and what vegetables are most benefited by its use, should you deem the results worth knowing, I will feel pleasure in forwarding you the result; for "facts are stubborn things."—*Aliquis.* [We shall be greatly obliged for such information.]

On the Shrivelling up of the incipient Bunches in an early-forced Grapery.—In attending to the early forcing of Vines, I have several times had the mortification of seeing many of the bunches screw up just before coming into bloom. I saw this take place once to such an extent as almost wholly to destroy the crop. The Vines were started that season much earlier than usual; and the roots running deep into a marly loam, I attributed the failure to the want of a reciprocal action between the top and the roots. There was in this instance, I believe, a good show of fruit; and all went on favourably, so long as the large stems of the Vines inside the house, acting as reservoirs, supplied the expanding shoots and incipient bunches with elaborated food; but cold weather setting in, and the border perhaps not being sufficiently protected, a partial stagnation of the roots would take place, and the bunches, being the tenderest and most valuable part of the system, were the first to feel the deficiency of supply, and one by one bid the anxious cultivator farewell. One season, when living at Hyde Park Corner, a number of bunches threatened to serve me in the same manner. The house was of great width, and very imperfectly heated by hot water; so much so, that I never could have obtained an early crop of Grapes, nor yet such a good crop, either early or late, if I had not had recourse to a great body of fermenting dung inside the house. The border was covered with fermenting material and dry litter, that the roots might be brought into action along with the top. On examining the border, I found there was not much heat thrown into it, as I was very anxious not to part a quantity of rootlets which had been incited to come nearer the surface during the preceding season. I should have stated that the principal roots were deep; and to their not being excited sufficiently I attributed the screwing up of my incipient bunches. I state these circumstances because, though the appearance of the young bunches would tell at once that something was wrong either in the situation or management of the plant, I believe it to be of as much, if not more, importance to know how to make the most of existing circumstances, though unfavourable, than to be conversant with the very circumstances and management that will ensure success. But to proceed: I did not like the idea of losing these bunches, as I found I could not spare many of them, and also insure a good regular crop; so I set about trying to keep them on by suspending small pieces of lead, little stones, &c., with slight strings of matting to the points of these running-away bunches; and where they seemed very obstinate, I clapped an additional one on at the shoulder. They were first perceived by my kind and enthusiastic employer, and afterwards by many gardeners, some of whom smiled, and others laughed at my leaden gravitators. However, I could forgive their risibility at my expense, when in general cases I thus secured a bunch where nothing would have been. I think the idea was suggested either by a visiting gardener or in reading. I have several times tried it since, and found it to answer well, not merely with Grapes, but also with early Cucumbers when suspended, and in setting the fruit of early Melons. The method of applying it will be obvious to any one. It will be seen that my object was to entice more sap into the incipient bunch. Whether this was done by the principle of gravitation, or merely was the effect of increased irritability, or some other cause, I do not take it upon me to determine. However, as this is an age in which nothing is taken on trust, I invite those who are unfortunate enough to have cold deep borders, and early fruit required, when after due care the evil alluded to should sometimes appear, to give the weight-suspending system a fair trial; and in the mean time some one may enlighten us with respect to the principle involved in effecting such a result.—*Robert Fish.*

Hacon's Incomparable Pear.—I have reason to believe that the history of "Hacon's" Incomparable Pear, given in p. 172, is erroneous; but I suppose it is the account that was sent with the grafts first presented to the Horticultural Society. So far from its being a seedling raised 28 years since, I think I may confidently say that what is supposed to be the original tree now growing in a baker's yard, of the name of Hill, at Downham, Norfolk, is at least 50 or 60 years old. I have received grafts and fruit from this tree, which prove identical with the variety named and distributed by Mr. Hacon, who deserves much credit for having brought into notice so valuable a fruit. Some persons at Downham well acquainted with the fact, told me that many years since Mr. H. found out the valuable qualities of this Pear, and purchased fruit from the tree to distribute to his friends; he also had grafts from it, some of which, I presume, were sent to the Horticultural Society. I have long had doubts about its being an English seedling, as I thought it probable that it might be a Continental variety, imported when the names of fruit were not attended to as they now are. I am almost confirmed in this idea by hearing last season that an old tree of it exists in the ancient garden of the late Sir Essex Harvey at Chigwell.—*T. Rivers, Jun.* [If it is a Continental variety, how does it happen that it has never been found among the hundreds of foreign Pears which have been fruited in England? The account we gave of the variety was taken from documents in the possession of the Horticultural Society. It is, however, of little consequence whence it came, seeing that we have got it.]

Celery.—I beg to say for the information of your "Constant Reader, Sheffield," who refers to what I have stated at p. 90, when writing on Celery for the cottager's guidance, that for some years I have annually grown about 6,000 heads of Celery, and made it my study to ascertain the most profitable and economic manner of planting it, which has taught me that endeavouring to obtain large plants is not to be recommended in preference to double the number of moderate-sized ones, on the same space of ground, even in large gardens; and I thought it would be much less so in those of limited extent. I can assure your Sheffield correspondent, I manage to obtain plants 5lbs. weight in double rows, as I have recommended, and if he cannot double that weight, his success has not been proportionate to the distance he describes, but to his early embankments, and draining the wet to his plants, and instead of causing me to promulgate my system, would have led me to have tried another plan. Your correspondent denies that red Celery can be sufficiently blanched in the time stated by me. I can only reiterate, I have blanched red Celery in a month fit for the table of the Duke of Devonshire, and I supposed the same time would surely accomplish it for the cottager. My experience has also taught me that earthing up the main crop of Celery too soon retards its growth, and assists its early decay without "turning most of the rain to the hearts of the plants." To grow large Celery for exhibition, an embankment of earth for blanching it should never be adopted, but some means used to exclude the light which will not prevent the sun and rain penetrating to the roots.—*Joseph Paxton.*

Resined Peas.—Resin is of no service for protecting Peas and Beans if powdered and mixed with them after they have been watered. The contrary to this was some time since stated.—*Arenarius.*—[If any counter-statement has been made it must be evidently erroneous. When wetted, the resin will no longer adhere to the Peas.]

Root-pruning.—As Mr. Totty and Mr. Rivers observe, root-pruning is as old as the hills; but yet to the Pomologist it is of the utmost importance, and it is upon that principle that I have managed my Peach-houses most successfully, both at Lord Bateman's at Shobdon Court, for many years, and at the Duke of Portland's, Welbeck Abbey, as well as with the Grape-vines; and Mr. Tillery still follows my plan with equal success. As my book upon the culture of Vines in pots and in borders will soon appear to the world, it would be superfluous to enter into the subject in detail here. Suffice it that I have a great aversion to having "too much wheelbarrow-work," as the late excellent President of the Horticultural Society, Mr. T. A. Knight, used to remark. I like the food of my tree to be, like the pig's trough, close at its nose, and am therefore a strong advocate for confining the roots of my trees in proportion to the extent I intend the tops to range; and at the end of two or three years, if I find that they stand in need of it, I cut out a trench of from eighteen inches to two feet, to the bottom of the roots, and then clear it all out of this trench, with the whole of the matted roots; smooth the mutilated ends of the roots with a sharp knife, and then fill up the trench again with fresh-chopped turf alone, from a sheep-walk, or an upland dry pasture-field. By the time that the fruit is set and ready to swell off, the fresh soil will be ramified in all directions with young and vigorous roots. Until I adopted the root-pruning system at Welbeck, and chambering the roots, so that they could not possibly get deeper than eighteen inches, they could do no good there with the Apricot, from the low situation, and very cold, wet subsoil. Now those chambered roots flourish amazingly, and produce good crops of fine fruit. I had nearly the whole of the extensive ranges of Peach-houses and Vineries chambered at Welbeck, and the roots confined. I visited Welbeck lately, and was delighted to hear from Mr. Tillery that he still pursues the same system, and that it succeeds admirably.—*J. Mearns.*

Ink for Zinc Labels.—The following receipt for ink for writing upon zinc may be useful to some of your readers if inserted in the *Chronicle*:—Verdigris, in powder, ʒi, sal ammoniac ditto ʒi, lamp black ʒß, water ʒx.—*W. D.*

Cooling Conservatories.—This has at length become a more difficult matter during the hot weather than is the maintenance of heat during the cold weather; though the difficulty has arisen principally from not considering that the same means which prevent the escape of internal heat will prevent the entrance of that which is external. For the purpose, therefore, of repelling the sun's rays, instead of the canvas screens laid upon the rafters, let there be applied, at such a distance as will permit the air to play upon the glass, screens made of straw, two or three inches thick, woven upon wooden frames. The dimensions of these screens would depend upon the size of the conservatory; if they protected one-half of the floor of the house, they would produce perhaps a sufficiently cooling effect. They would form an effectual stop to the sun's rays, as regards both direct penetration and conduction: while the canvas screens laid upon the rafters do, in reference to the heat, only what ground glass does in reference to light—diffuse it.—*A. Ainger.*

Birds.—In this neighbourhood we keep birds from attacking Peas, Radishes, and newly-sown seeds by placing green wine-bottles, filled with water, at convenient distances from each other on the beds.—*W. M., Stalbridge, Dorset.*—[Are the birds afraid of the bottles?]

Carrots.—Carrots, if sown in unmanured ground, and carefully watered with liquid manure, so as not to touch their leaves will not fork, but will be extremely fine.—*Arenarius.*

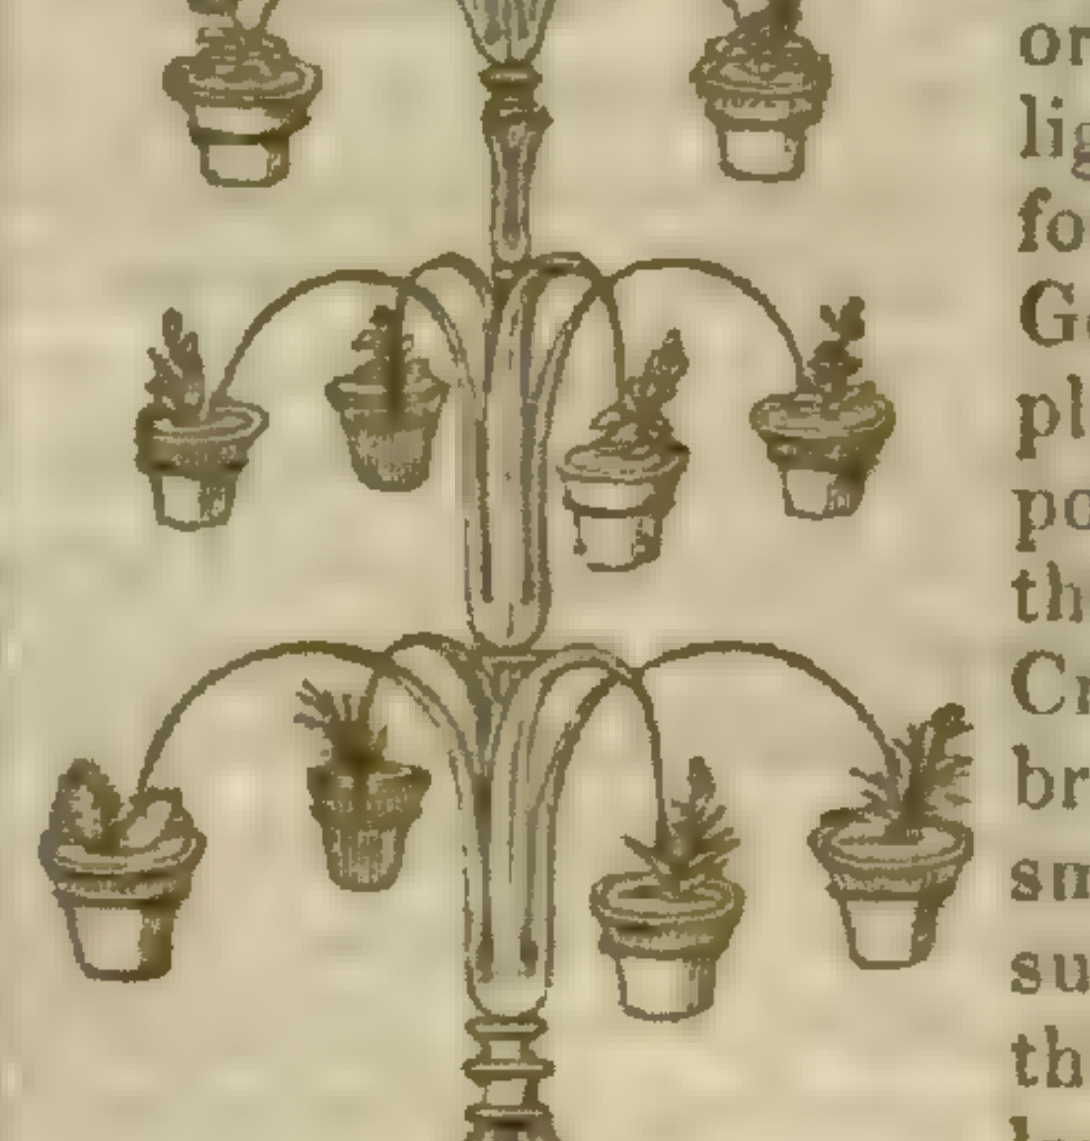
Shale a Manure.—Shale is commonly thought to be unfit for gardening and agricultural purposes, and the idea of sterility is generally attached to it; this is only true in part. I have never seen any work that has treated the subject fully, giving an account of the different varieties of shale that accompany the coal, sandstone, and limestone of this country. From the few observations that I have made, I am inclined to think that some kinds may be turned to good account in improving certain soils. Shale is described as massive, slaty, grey, dull, opaque, meagre, brittle; it disintegrates on exposure to the air, and by degrees becomes plastic. Some kinds of it, however, resist the influence of the atmosphere for a long time, and are used for couplings in drains. In some parts of the country where limestone is worked with an open cast, large quantities of shale have often to be removed, and some of it abounds in organic remains; one should imagine that where bivalve shells exist, carbonate of lime should be found in it; but I have never been able to detect it by the tests that are commonly used. The component parts of shale are chiefly clay, fine sand, and a small quantity of iron. In places where mounds of it have been raised, trees have been planted upon them and thrive well. Beech, Oak, Larch, and Limes have attained the height of 40ft. and upwards: the Beech near the ground are 2ft. in diameter, Larch 18in., Oak 15in., and Limes 18in. In a plantation about 20 years old, the Scotch Firs have reached the height of 30ft. In that useful work, "Morton on Soils," when speaking of the shale of Derbyshire, the author says, "It decomposes so readily as to form a strong, deep, blackish, cold, wet, clay soil, which, however, when drained, well lined, and properly cultivated, produces good crops; the contrast between the pastures on this and on the sandstone is so great as to be perceived at a considerable distance." When soils are light, it is advised that some stiff material should be laid upon them; but it is well known where common clay has been spread upon fields, that it is both an expensive and laborious operation to incorporate the two bodies; but the shale we would recommend is light in comparison with clay, and could be spread over the land as easily as coal-ashes. When it is exposed to moisture, it soon becomes what chemists would call impure hydrate of alumina; in that state it must become useful on sandy soils, and prevent the rain from filtering through it, and enable vegetation to proceed with greater vigour than when it is starving for want of moisture. From the dark slaty nature of shale, it has sometimes been denominated "Deil's siller;" but if it could be turned into a fertiliser of our fields, and increase the "yellow Geordies" in the purse of the farmer, we think the money of his Satanic Majesty never will have been put to a better purpose since he crossed the boundaries of Erebus.—*Peter Mackenzie, West Plean.*

FOREIGN CORRESPONDENCE.

Paris, Feb. 1842.—The amateurs of Tulips in Paris many years since formed an association which for some time continued in a flourishing condition, at present, however, it does not number more than 10 or 12 members. No public exhibition has ever been established, but instead of this certain days are appointed when the members visit each other's gardens, and afterwards dine together. It may not be generally known that bizarres are altogether excluded; and the amateurs here are perfectly astonished that they should be tolerated in England: in their opinion Catafalque, Marcellus, William 4th, Fabius, Everard, Queen, Polyphemus, and Alexander, possess no merit. As to symmetry, the standard is nearly the same in both countries, with this exception, that a greater length of cup is allowed than the judges at Hampton would admit. The most distinguished grower (for sale) in Paris is M. Tripet Leblanc, who has most of the leading Flemish, French, and Dutch varieties of Roses and Byblomens, together with many seedlings of his own of superior character. This gentleman is entitled to great credit for his exertions in developing the characteristics of a fine flower; and has done, perhaps, more than any other person in Paris, to keep up the interest in this Queen of May. Among the amateurs M. Pirolle has the first rank, not only on account of his long experience but the judgment and taste which ever attend his cultures; his collection is select rather than numerous, and contains several fine light flowers, among others a Louis 16th, bequeathed to him by his father, from which he has, I believe, only obtained one offset. MM. Deschains, Derougé, Prevost, and Dubourg, have also long enjoyed a well-earned reputation. If you ask these gentlemen why they exclude bizarres, their answer will be, either that the colour is not pure, or that custom had so ordered it; or perhaps they would ask you why yellow Picotees of fine shape are excluded from English shows. Carnations and Picotees are extensively cultivated in almost all parts of France, but not with that success a climate so peculiarly favourable would lead you to expect; perhaps this is in some measure to be attributed to the vague notions which have hitherto passed current as to beauty, and the desire to obtain flowers of fantastic colours rather than of perfect form. Long-established prejudices are not easily overcome, and it would be difficult to convince the fancy here that slate and red Picotees (to say nothing of yellows) are inferior to those of white grounds. Not only is the taste defective in this respect, but it equally extends to shape; in fact such varieties as Queen Victoria, Grace Darling, Duke of Leeds, Rainbow, &c., are rarely to be seen. These plants do not fog off on the Continent, neither does the severity of winter affect them when protected by ordinary frames; and even those in the open ground generally escape unhurt if covered by a few leaves. The rage for Dahlias has of late years greatly increased, so that at the present day almost every one professes to be an amateur; and the extravagant encomiums lavished upon some varieties would astonish those unacquainted with the French character: but it must not be supposed that this homage is always paid to flowers of perfect form, on the contrary, fantastic or showy varieties, or large size, would generally be preferred before such as Springfield Rival. Those with weak stems, however otherwise faultless, are never tolerated; and Rienzi, Grace Darling, Ne plus ultra, &c. are discarded as utterly unworthy of cultivation. Fireball is considered by 99 out of 100 as the very model of perfection. With such ideas of beauty, is it any wonder that so few good flowers are raised in France? My firm belief is, that many fine seedlings are thrown away because the colour may not be in accordance with the prevailing taste, or on account of the drooping of the flower. At the present time tipped and bordered flowers are all the rage, and to such excess is this carried, that selfs are hardly noticed. I am, however, afraid this is partly to be attributed to the florists in England, who last season sent over very many mediocre and bad, with specious characters and high prizes. This system, if continued, will effectually prevent French amateurs from ordering new flowers of which they know nothing, but as reported in catalogues or advertisements. English botanical works, especially magazines and newspapers, are now widely distributed in France, and cannot fail to effect much good; even now, there are not wanting those who advocate a reform both by precept and practice. Mons. Pirolle, author of the "Annales des Jardiniers Amateurs" and other botanical works, has not only fearlessly exposed the individual injustice of favouritism in awarding prizes, but shown the injury this entails upon the public; he has likewise defined the properties of a show-flower, and although these do not come up to the rigid standard of Salt-hill or London, yet it is to be hoped they will ere long be more generally adopted. From these observations, it behoves all persons ordering florist's flowers from France to be particular as to whether they wish form, colour, or size, to predominate, otherwise in the case of Picotees they will in all probability receive slate-coloured or yellow Alpines instead of Selfs, or edged Auriculas, and Dahlias tipped or bordered; as to this last I cannot more clearly elucidate my assertion than by giving the following information communicated to me by one of the leading growers, by which will be seen the number of orders he has received for 12 good show Dahlias, and the like number of 12 fancy, or tipped varieties, namely:

Show.	Orders.	Fancy.	Orders.
Admirable	11	Beauty of England	22
Bridesmaid	14	Bicolor	15
Burnham Hero	8	Butterfly	22
Conqueror of the World	25	Fairy Queen	20
Eclipse (Widnal)	7	Lady Jermyn	20
Do. (Catleugh)	1	,, Rae Reid	16
Fanny Keynes	6	Madame Mortier	13
Grand Tournament	8	Mdlle. Degarzet	10
Highgate Rival	3	Modesta	11
Lady Cooper	7	Painted Lady	18
Maid of Bath	11	Princesse Royale	22
Uxbridge Magnet	4	Purpurea alba	36

Frankfort, Feb. 16, 1842.—The ornamental flower-stand represented in the accompanying figure is said to have originated here; it consists of a light iron stand, with branches for holding small pots. The Germans display in it diminutive plants in neatly-made thumb-pots, coloured and embossed; the kinds chiefly used are Daisies, Crassulas, Aubriétia, Mesembryánthemum obcordellum, and small Melocacti; it would also suit Alpines well. The idea, I think, is taken from an antique lamp-stand at Pompeii, and might be varied and improved.



PROCEEDINGS OF SOCIETIES.

HORTICULTURAL SOCIETY.

March 15th.—R. W. Barchard, Esq., in the chair. C. S. Crowley, Esq., was elected. Grafts of the following kinds of fruit were distributed:—Eyewood Pear, raised by Mr. Knight; in shape it resembles a Bergamot; the flesh is yellowish white, melting, buttery, and high-flavoured; it ripens in October and November. Beurré d'Amalis, resembles the Brown Beurré in colour, consistence, and flavour, but it is sufficiently hardy to bear as a standard. Nelis d'Hiver Pear, remarkable for its high flavour, which entitles it to a place in every private garden, though it is not well adapted for the growers for market. Sudbury Beauty Apple, raised by Dr. Maclean, of Colchester; it is a handsome dessert variety; it has the appearance of a well-grown Downton, but the flesh is yellower and more sugary. From the Rev. J. Clowes there was a specimen of Maxillária Skínneri, with three flowers, which measured nearly 5 inches across; they were of a beautiful pinkish white, with a rose labellum mottled with white; it appears to be of easy growth, requiring the same general treatment as other Guatemala Orchidaceæ. Owing to some error the name belonging to this species was applied to one resembling aromática: a large silver medal was awarded for it. Mr. J. Goode, gr. to Mrs. Lawrence, exhibited a collection, among which was a specimen of the singular Colúmnea Schiedeana, with curious yellow flowers, spotted with brown; there was also a pretty yellow Gompholóbium, Maxillária aromática blooming profusely, and Æschynanthus maculatus with fine scarlet heads of blossom: a Banksian medal was given for the three first mentioned. There was a box containing 12 handsome hybrid Amaryllises in full bloom, from Mr. J. Miller, gr. to Lady Mildmay; with them was a cut flower of a hybrid Céreus: a Banksian medal was awarded for the Amaryllises. Messrs. Veitch and Son exhibited a new Cycnoches, like maculatum, and apparently only a variety of it; a pretty Begónia called coccínea, with almost vermilion-coloured flowers, and Prímula denticulata with pale violet blossoms; it is a native of the Himalayas, and was recently introduced by the East India Company: a Banksian medal was awarded for these. From Mr. J. A. Henderson were, Physolóbium carinatum and grácile, and a specimen of the extraordinary Coryanthes speciosa, one of the most singular of Orchidaceæ: a certificate was awarded for it. W. H. Story, Esq., exhibited two Epacrises, one called rósea umbrata, and the other coruscans; they were different from other varieties, but the colour both of the leaves and flowers is too dingy. J. Allnutt, Esq., sent Camellia imbricata, remarkable for its good form—candidíssima, reticulata, and Donckelaerii. Messrs. Rollisson and Sons exhibited Vanda cristata and a cut specimen of a pretty lilac Bignonia; the former is remarkable for the rich brown crests on its labellum, the ground colour being yellowish green: a certificate was given for it. From Mr. Edmonds, gr. to the Duke of Devonshire, there were several large specimens of the king Cineraria: Mr. Gaines also exhibited a seedling Cineraria, purplish crimson, named Prince of Wales, and a semi double Camellia, with round firm petals; and from Mr. Ivery was a Cineraria, named Rival King. From S. Rucker, Esq., there were cut specimens of Dendróbium speciosum and the beautiful Phalænopsis amábilis; with these there was a plant of the rare Chysis bractescens, with thick white flowers and a yellow labellum: a Knightian medal was awarded to these. Mr. J. Wells, gr. to W. Wells, Esq., sent some cut specimens of the white and scarlet Tree Rhododendron, and some beautiful hybrids between that species and Catawbiense; some were of a delicate pink and one was almost white; they were stated to be hardy at Redleaf: with them were some fine cut Camellias of several varieties: a Banksian medal was given for the Rhododendrons. Mr. Rivers sent a box of Roses, containing 25 varieties, chiefly tea-scented; the plants were forced in pits heated by Arnott's stoves; a Banksian medal was awarded for them. Sir J. R. Kynaston, Bart., exhibited some Sweeney Nonpareil Apples, and there were other specimens from T. N. Parker, Esq., who also sent three kinds of seedling Potato. Messrs. Chapman sent a sample of their "new" spring Potato. Mr. J. Stewart, gr. to W. Bagge, Esq., exhibited a brace of Cucumbers, and specimens of a seedling Shaddock. Mr. Brookes exhibited drawings of a botanic garden proposed to be formed in the Isle of Wight. The plants from the garden of the society included Acácia rúbida, a beautiful species with drooping branches covered with golden flowers; Oncidium sphacelatum, a new species, somewhat like Baueri, but dwarfer in habit and more brilliant in colour; Mirbélia floribunda, a rare New Holland plant, with violet blossoms; and Cineraria grandessa, a fine bluish purple variety.

LINNEAN SOCIETY.

March 15.—Edward Forster, Esq., in the chair. Mr. George Gardner was admitted a fellow. A note was read from Mr. Solly, accompanying the exhibition of some microscopic objects which had been kept in a cabinet and had received a coating of varnish from the influence of the oil exhaled from the wood of the cabinet. A collection of plants from the Tyrol was announced as presented to the society. A paper was read on Edgworthia, a new genus of plants of the order Myrsinácese, by H. Faulkner, M.D., superintendent of the Hon. East India Company's Botanic Garden at Saharunpore. This genus, of which the only species is E. buxifólia, is one of the most characteristic forms of the vegetation of lower Affghanistan. It is found in company with Dodonæ'a dioica, O'lea lactoona, and an undescribed species of Asclepiadeous plants, a Campolepis. One of the most remarkable points in the structure of Edgworthia consists in the style being protruded beyond the flower whilst in bud. This fact was pointed out to the author by Mr. Griffiths. Mr. Bowerbank exhibited a number of polypiferous animals in a living state, which he had that morning brought from Sheerness; amongst them was the Bowerbankia.

FLORICULTURAL SOCIETY.

March 15.—Mr. Lane in the chair. Previously to the discussion on the Auricula, Mr. Dickson's paper was again read; after which some conversation took place on its various properties. An attempt was made to settle what should be the minimum height of the stem and the least diameter of the flower of a first-rate variety; but as Mr. Groom, who differed in opinion respecting the relative proportions of the flower, was not present, the discussion was adjourned to the next meeting, without any property having been finally agreed on.

AGRICULTURAL SOCIETY.

March 9.—The Duke of Richmond in the chair. Fifteen gentlemen were elected. The Duke of Richmond laid before the council the report of the house committee, and also that of the seal committee: the former was referred to the special council appointed to be held on the 16th instant; and the latter, recommending the great seal of the society to be executed by Mr. Wyon, was adopted by the council.—W. Miles, Esq., M.P., submitted to the inspection of the council the dibbling machine referred to in his paper on the cultivation of Mangold Wurzel in the last part of the society's Journal. Mr. Miles found that great care was required in depositing the seed in the ground, for if buried too deep it would not vegetate; and to ensure, therefore, a proper depth, he employed the implement then submitted to their notice. The machine consisted of an iron wheel, about three feet in diameter, in the flat circumference of which projected, at every 18 inches distance, the iron dibbles, which were two-and-a-half inches in length, being broad at the base, and tapering and rounded at the end, shouldered on the front side of the rim, and clamped with screws at the back. The wheel being supplied with a pair of handles like a barrow was used by being wheeled upon the top of the ridge by a man walking in the furrow; and holes were formed, which, from the construction of the machine, could never run too deep, and into which the seeds were deposited by women and boys following the wheel, and generally covering the seed as they advanced, by drawing the foot sideways across the ridge over the holes: the roller following and completing the sowing. Mr. Miles states, that one man with the wheel kept six persons well employed in depositing the seed after him, and that since he had adopted this system recommended to him by Mr. W. Hall, his crop had never failed.—W. W. Page, Esq., laid before the council an account of the mode by which the encroachments of the sea were successfully resisted in the island of Walcheren, the baneful effects of whose malaria, arising from its low and swampy situation, were but too well known and recorded in our naval history. Mr. Page states that when he visited Middleburgh, the capital of Walcheren, in the year 1784, the whole island was lower than the sea at high tide, but was protected from inundation by about three miles' extent of its sandy coast being secured from the disintegrating effects of the reflux waves by a matting of straw. J. Rodwell, Esq., of Alderton Hall, Suffolk, presented a paper on the "Cultivation of Lucerne;" H. Gaitskell, Esq., of Whitehaven, a paper on the

'Culture of the Potato;" J. H. H. Foley, Esq, of Prestwood, a copy of the last "Report of the Stewponey;" and the Hon. H. W Wilson, a copy of the "Leicestershire Agricultural Society." These communications were referred to the Journal Committee.

ROYAL CALEDONIAN HORTICULTURAL SOCIETY.

March 3.—The spring meeting of this society was held in the Council-room, at the Experimental Garden. The weather was unfavourable, being boisterous and rainy, yet the show of Camellias, New Holland Plants, and Hyacinths, was excellent. Much regret was expressed that the plants and other competition articles could not be properly displayed for want of room; but this evil is about to be remedied, the society having approved of a spacious hall, and also contracted for its erection. On this occasion, for the prize offered for the six finest and newest varieties of Caméllia japonica, seven competitors appeared, and three premiums were awarded: the first to Mr. A. Smith, gr. to W. Forbes, Esq. of Callander, the kinds being Eliphinstónia, Chandleri, conspícua, imbricata alba, coccínea superba, and Fairlei; the second to Mr. D. Brewster, gr. to Col. Lindsay of Balcarres; and the third to Mr J. Young, gr. to T. Oliver, Esq., Newington Lodge. For New Holland Plants, two prizes were given: one to Mr. J. Addison, gr. to the Earl of Wemyss, at Gosford, for Epacris impressa, Lechenaúltia formosa, and Córræa speciosa major; and another to Mr. Young, for Epacris campanulata rubra, Pultenæa subumbellata, and Chorozema várium. For Cape Heaths likewise two premiums were awarded and gained by the same cultivators; the first by Mr. Addison, whose species were linnæoides and picta; and the next by Mr. Young, with linnæoides and elegans. For stands of six fine Hyacinths in flower, separate prizes were offered to nurserymen and to private growers. The silver medal was found due, in the former case, to Messrs. J. Dickson and Sons, Inverleith-row, the flowers being Henrietta Wilhelmina, Bellerophon, Acteur, La Grande Vidette, Grand Vainqueur, and Lord Wellington. Among private competitors a first prize was assigned to Mr. Young for Grand Vainqueur, Grande Vidette, La Tour d'Auvergne, Yalm, Waterloo, and Lord Wellington; and a second to Mr. J. Fargie, gr. to Mrs. Dr. Gregory, Canaan Lodge, for Washington, Grand Vainqueur, Waterloo, Monarque du Monde, Voltaire, and Mignon de Dryfhout. The Apples produced this day in competition were in beautiful preservation, being as firm, smooth, and glossy as if they had been only two or three days instead of five or six months off the tree. Two premiums were voted, the one to Mr. J. Murray, gr. to A. Fletcher, Esq. of Salton, for Golden Pippin, Ribston, Yorkshire Green, Baltimore Pippin, and Salton Favourite; and the other to Mr. W. Sharpe, gr. to Sir J. Stuart Richardson, Bart. of Pitfour, for Golden Pippin, Old Nonpareil, Old Ribston, Winter Strawberry, Reinette de Canada, and Yorkshire Green. The specimens of forced Rhubarb were excellent. A first premium was voted to Mr. J. Goodall, gr. at Newbattle Abbey, for remarkably large and heavy stalks. The kind was Myatt's Victoria, which seems well adapted for forcing. The plants, growing in the open ground, were covered about New Year's time, with dry-ware casks, surrounded with hot stable-dung, and covered over with a layer of tree-leaves. The other prize was adjudged to Mr. R. Watson, gr. to D. Anderson, Esq. of Moredun, whose kind was also Myatt's Victoria. In the council-room was a fine specimen of a seedling Camellia, raised by Professor Dunbar, Rose-park; but on this occasion there was no competition in seedling Camellias. There was also a beautiful plant of Hóvea pungens in flower, from the Inverleith Nurseries; and there were two pretty seedling Cinerarias from Gosford, and one from Mr. Oliver, Newington-lodge. An elaborate report by Mr. J. Macnab, superintendent, on the state of the society's garden, and describing experiments now in progress, was laid on the table for the perusal of members. A communication from J. Hunter, Esq. was read, mentioning a number of ornamental plants which, though generally accounted rather tender, succeed in his garden at Hafton, in Argyleshire, with a little protection during winter. A letter from Mr. Norman Howie, a successful horticulturist at Stornoway, in the Lewis, was also read, describing a mode by which he has been enabled to raise good crops of Onions on the same spot of ground for a number of successive years, free from the attack of wire-worm or grub. The liberal use of pig-sty manure seems to be the preventive; but over the manure a thin layer of earth is placed, on which the seed is sown.

MICROSCOPICAL SOCIETY.

March 16.—Professor Lindley, President, in the chair. Mr. E. Quekett brought before the meeting some samples of coal in which structure is apparent. He stated that the organisation appeared to resemble that of Araucaria, and is similar to what occurs in silicified wood. It was added that Stuart's Wallsend, or what was so called, had furnished the specimen. Upon examining the preparation by means of Powell's microscope, it was found that this tissue consisted in part of double fibres rolled spirally. Mr. Busk brought for the inspection of the society some specimens of an insect from Brazil, related to the genus Pediculus, which is found to be exceedingly mischievous in that country. They are stated to fall from the trees and bushes, and to attach themselves to animals and passers-by. They are said to insinuate themselves within the fibrous tissue of animals, producing irritation, gangrene, and death. Mr. Busk described the structure of the mouth of this insect as peculiarly well suited for producing such effects, it being provided with a knife and saw, by means of which it soon burrows beneath the skin. The Brazilians call the creature Carapata. As many as 40,000 head of cattle are said to perish annually in Brazil from this pest; and travellers attacked by it are obliged, at the end of a day's journey, to scrape themselves with an iron instrument, in order to tear the creatures out of their skin.

NOTICES OF NEW PLANTS WHICH ARE EITHER USEFUL OR ORNAMENTAL.

NIPHÆA OBLONGA. Oblong Snow-wort. (*Greenhouse Herbaceous Plant.*) Gesneraceæ. Didynámia Angiospérmia.—Although not to be compared for beauty with the charming Achimenes rósea, or the still more striking Achimenes longiflora, introduced by the Horticultural Society from Guatemala, yet the Niphæa is itself a great acquisition from the same country, where these and many more species of a similar nature were found by Mr. Hartweg. It is the more acceptable because it is one of the few instances of a pure white flower among the Gesneraceous order. In its appearance it is much like Ramonda pyrenaica, but both the form and colour of the flowers are different. In habit it approaches some of the stemless Gesneras. In structure it is very distinct from all the genera of its order yet upon record. Like many other plants from Guatemala, it seems to require a temperature between that of a greenhouse and stove. It flowers in the autumn and winter, after which the stems die off, and the plant remains in a dormant state until the following season. When in this state it ought of course to be kept perfectly dry, on a light warm shelf, and then when the season of rest is past, which will be indicated by the young stems making their appearance, it may be repotted and liberally supplied with water. It forms a great number of curious imbricated scaly buds, both on the surface and under ground, by which means it may easily be multiplied in the same manner as the Achimenes; it also strikes readily by cuttings. Any rich light soil will do for its cultivation.—*Bot. Reg.*

LYSIMACHIA LOBELIOIDES. Lobelia-like Loosestrife. (*Hardy Perennial*). Primuláceæ. Pentándria Monogýnia.—Nepal, Kamaon, and other districts of Northern India produce this pretty species of Loosestrife, which was first found by Dr. Wallich's people in 1821, but which has been only recently introduced to our gardens by the Hon. Court of Directors of the East India Company, who presented seeds of it to the Horticultural Society. It is a hardy perennial, well adapted for rockwork and similar purposes; for although its flowers are simple and unattractive, they are very sweet-scented, and the foliage is neat, while the general growth of the plant is close but graceful. In a good season it would ripen seeds abundantly, but we fear the rainy autumn of last year has prevented it for this time. In habit the species agrees with the section called Ephemerum, but its indehiscent fruit, bursting irregularly round the base, is at variance with all the sections of the genus. This is easily cultivated in any good garden soil, flowering during the months of July, August, September, and October. It is increased by seeds, but the seedlings will not flower before the second season; also by dividing the old plants in the autumn. Its seeds were said to have been collected in Cashmere.—*Bot. Reg.*

COLUMNEA SCHIDEANA. Mr. Schiede's Columnea.—(*Stove Climber.*)—Gesneraceæ. Didynámia angiospérmia.—This plant, which is not more curious than beautiful, was imported from Mexico in 1840 by J. Rogers, Esq., of Sevenoaks, in whose collection it first bloomed, and subsequently in that of the Horticultural Society, It assimilates slightly, in the form and nature of its stems, leaves, and flowers, to the remaining species of the genus. Still it possesses features by which it may be at once distinguished, and which, indeed, render it very conspicuous. In its natural habitat it is said to grow on old trees, thus assuming much of an epiphytal character. The stems are, moreover, pendent or trailing, unusually stout and succulent, with indented rings or annular contractions at the joints, and the leaves are of a peculiar colour. The blossoms stand out from the stems on long, half-drooping peduncles, and are singularly large; both these and the segments of the calyx being prettily mottled and streaked with brown on a cream-coloured ground. They are produced in great profusion for a lengthened succession of months, including most of the summer and autumn seasons. If grown in a pot, with plenty of room for its roots, a moderately nourishing soil, and a barrel-shaped trellis to support its branches, it attains to great luxuriance, and the flowers reach a particularly large size. It is thus treated at the Horticultural Society's garden, and apparently kept in a stove of the average temperature. Messrs. Rollison do not give their specimens quite so much encouragement, and subject them in winter to the comparatively dry atmosphere of a house with a heat intermediate between that of the greenhouse and stove, in order to throw them into flower during summer and autumn. But we should advise that this plant be neither cultivated in pots nor in soil, but placed in rustic baskets of wood, filled with sphagnum, decayed wood, the fibrous part of heath soil, and similar vegetable matters, and suspended from the roof of the house, as is done with Orchidaceæ. So treated, the shoots would hang down over the sides of the baskets, and add much to the interest of a collection. Nothing can increase more readily than this species by cuttings, and we expect shortly to see it in every garden where stove plants are grown.—*Paxton's Mag. of Botany.*

MISCELLANEOUS.

Manures.—The following communication has lately been made public by M. Schattenmann, of Bouxwiller, in Alsace:—"Ammoniacal salts are extremely powerful manures. In Switzerland water is poured over the fresh stable-dung, so as to wash it; the fluid thus obtained is saturated with sulphate of iron, or sulphuric acid, and a liquid manure of great power is the result. In explanation of this M. Schattenmann has entered into the following more detailed illustration of the manner in which such manure is prepared, and the effects resulting from its use. It has for many years been the custom in Switzerland to preserve stable urine, to wash the fresh manure, and to collect the fluid in reservoirs where, after fermentation has taken place, the ammonia is saturated and converted into sulphate of ammonia by sulphate of iron (green vitriol) sulphate of lime (gypsum), or sulphuric acid (common vitriol). The fluid thus obtained, when employed for watering land, produces a strong vegetation, an effect that is ascribed to the sulphate of ammonia, which is not volatile like the carbonate, if acted upon by the sun. Fresh manure, like urine, contains ammonia, which it is important to preserve, but which is generally wasted by the common modes of managing manure. Horse-dung is said to be greatly inferior to that of cattle; but this seems to be owing entirely to the manner in which it is managed, namely, in Alsace and Lorraine, and generally in France, by placing it in a heap in a ditch, where it is sometimes flooded with water, or more commonly by laying it in a heap a couple of yards high without watering it sufficiently. The notion that horse-dung can only be brought into a proper state by stirring and making it, generally causes that to be done two or three times. The dung lying in water will not ferment, and the straw remains undecayed; that which is lightly thrown together, without being watered enough, heats and becomes mouldy; ammonia thus produced flies off into the atmosphere, and then the most active part of the manure is lost. The residue is a light, unsubstantial manure, the action of which is incomparably inferior to that of cattle, which is naturally indisposed to heat. I have for many years been in the habit of treating stable-dung in a manner entirely different from that commonly in practice. At Bouxwiller I have had for several years the control of the stable-dung of 200 artillery horses quartered there in a single building, at the back of which lies some land of my own. There I have formed a trench for manure occupying 800 square yards superficial, and divided into two equal parts. This trench is an inclined plane which rises forward and right and left, so that all the water which enters it runs down to the middle, where it collects; at that place I have a pump, by means of which I am able at pleasure to return to the manure the water which runs away from it. What water I want, I obtain from a well and pump placed by the side of the manure trench. By these means, at a trifling expense, I obtain that great quantity of water which stable-dung requires, while at the same time I do not lose a drop of the saturated fluid, which eventually is altogether absorbed by the manure by the time that it is taken away, unless I prefer employing it directly, and to replace it by pouring more pure water over the manure. The two halves of my trench are alternately filled from the stables. The litter is made up six or eight yards high over the whole surface of the excavation, trod down by the feet of the men who bring it and spread it, and abundantly watered by the pumps. In this way I have it thoroughly made up, and as much water as I want; two conditions which I consider indispensable, in order to counteract the violent fermentation of the stable-dung, which would destroy the most active parts of the manure, which are volatile. I add to the saturated water, and I scatter over the manure green vitriol in solution, or gypsum, so as to change into a sulphate the ammonia as it is produced, and which readily flies off at a slightly elevated temperature. By means thus simple and cheap I obtain, in two or three months, a mass of manure thoroughly made, as soft and pasty as that of cattle, and of great energy, as is proved by the remarkable results I have obtained both on arable and meadow land for several years. When this manure or the liquid which flows from it is applied to land, the most striking effects are apparent. Letters formed upon a meadow, by pouring it from the spout of a watering-pot, speedily acquire a deep rich green, remarkable among the surrounding herbage. It is, however, necessary, in forming such dunghills, that they should be so placed as to allow the water to run completely off them, and that they should be frequently drenched. Farmers do not employ anything like the quantity of water required to decompose stable-dung. Care also must be taken that the litter is thoroughly trodden down by man and horses, as the dunghills are made, partly in order to enable it the better to retain its moisture, and partly to check the excessive heating, which drives off the best parts of the manure.

Rhubarb.—A person states that for some years past he has grown Rhubarb in chimney-pots. By placing a pot over the crown of the plants early in the spring, the leaves are not only made to grow more rapidly, but the stalks are drawn up so much longer as to furnish double the quantity in weight, and the flavour is much superior to that grown in an exposed manner. It is more delicate, and free from the medicinal taste.—*Globe.*

Botanical News.—It is stated in letters from Vienna, that a Supplement to "Endlicher's Genera Plantarum" will appear in a few weeks. M. Gay has published an account of several new Erysimums, chiefly Oriental, and a critical view of the synonymes of E. murale, to which he reduces many supposed species. In Holland a work on the plants of the Dutch East Indian possessions has been commenced: four parts, each containing ten plates, have reached this country. A new number of the "Nova Acta" has also been received in London. We are told by the newspapers that Mr. Fielding, of Stodday Lodge, near Lancaster, has given his fine Herbarium and Botanical Library to the Royal Botanic Society, but this is not true; all that has been done by Mr. F. has been to inquire of the Royal Botanical Society whether, in the event of his entrusting it to them, after his death, they would be able to make arrangements for its safe custody. The late Mr. Lambert's Herbarium has also been bequeathed to the British Museum, and the newspapers tell us that the collection of Cryptogamic (or as they have it, Crypotoganeous) plants in this bequest is perhaps unique; they should have added, for its worthlessness. The fact is, that this Herbarium is not of any great value now, although it was some twenty years ago.

Kidney-bean Potatoe.—This is a curious variety, with extremely small yellow, smooth, elongated tubers, which can be used whole in stews, and this is its only value. Like many other odd things, it has been all the rage in Paris on account of its singularity.

Snow Sorrel.—This is a species lately found on the higher Alps, within the limits of perpetual snow, by M. Moritzi, Professor of Natural History at Soleure; who thinking it might be a useful kind to cultivate, transplanted some roots into his garden: leaves were produced by them much earlier than by the common Sorrel, and the plants seemed to vegetate under the snow. M. Moritzi recommends it as a winter plant, either to be cultivated by itself, or to be hybridised with common Sorrel. We must observe, however, that plants from the higher Alps are generally difficult to cultivate in the plains; and on the other hand, many varieties of the Mountain Sorrel are earlier than the common kind; while Patience (Rumex patiéntia), an excellent vegetable, comes in before any of the cultivated Sorrels. In Paris, Sorrel is forced in winter under frames; but if this new Alpine species can be produced out of doors, it will be an advantage.—*Bon Jardinier.*

GARDEN MEMORANDA.

Fence, Macclesfield, T. Brocklehurst's, Esq.—A method of supplying moisture to the air in the Orchidaceous houses has been adopted here, which answers the purpose. The plants stand upon inverted pots, just above the water, in lead cisterns about 3 inches deep; and the roots of the plants which hang over appear to luxuriate in the moisture arising from the water. In addition to this, steam is admitted into the houses, morning and evening, from a small boiler (4 ft. by 2½ feet) outside. The steam is conveyed in cast-iron pipes (1 inch) all round the houses inside, within an inch of the floor; into these pipes are screwed ¼-inch pipes, 6 inches long, with a T top, furnished with taps. These stand up, about every 6 ft., and are for the purpose of letting out the steam to any, or every, part of the houses at pleasure. This steam has been used 18 months, and gives every satisfaction. By being let out at so many places at once it is quite mild in its effects, and the plants are saturated with moisture on both the upper and under surface of the leaves, giving them a healthy and vigorous appearance. In addition to the Orchidaceous plants, an experiment has been tried to grow Pines in the same temperature and houses. They are plunged in tanner's bark, in two beds, one in the middle house, 17 ft. by 10, and one in the end house, 36 feet by 10. The smaller bed is occupied with plants in fruit, and produced last year more than 100 fine fruit; and there are some fine fruit now in it, particularly Montserrats and Envilles, which are as well swelled even at this season as in summer. This shows that the excessive humidity of the Orchidaceous house is very beneficial to the Pine-apple; and that a dry arid atmosphere must be injurious to it. The larger bed is occupied with succession plants ready to fruit as the others are cut; even in it, which is kept 10° cooler (65°), the plants often show fruit before they are removed into the other house. There are now in it some fine New Providence Pines, showing well, and promising to produce extraordinary fruit. The Orchidaceous plants continue to flourish well; the following are now in flower:—Aeránthes grandiflora, with its curious spider-like flowers, Aspásia epidendroides; Brassia Lanceana, several varieties; Burlingtónia cándida; Batemánnia Cólleyi, very curious and pretty; Blétia Shephérdi, a fine species with dark purple flowers; Broughtónia sanguínea; Catasetum laminatum; C. tridentatum, several varieties, one particularly fine, with a spike of 20 flowers; C. purum; Cypripédium purpuratum, a beautiful new species; Cyrtopódium Andersoni, one plant has two flower-stems 5 ft. high; Cyrtochilum bictoniense—this is a valuable species on account of its long season of flowering, it having been in bloom more than three months; Coryanthes macrantha, a fine specimen; Dendróbium macrophyllum—this is a very handsome plant, it has a spike more than 4 ft. long with 50 flowers on it; D. Pierárdi, with spikes 5 ft. long; Epidendrum aurantiacum, a fine variety with five and six flowers on each stem, a much larger and better opening variety than the common one; E. aloefólium; E. pachyanthum, with greenish-yellow sepals and petals, and a white labellum striped with pink, very handsome; Eria flava; E. pubescens; and E. stellata, one plant has 10 flower-stems—this species is remarkable for its agreeeable perfume; Fernandésia acuta and élegans; Gongoras always in flower, several fine species and varieties; Isochilus lineare and gramíneum, the latter dark purple and very pretty; Leptotes bícolor and cóncolor, both neat pretty species; Maxillária cristata, a fine species with dark flowers and a white fringed crest; M. macrophylla; M. chlorantha; M. pallidiflora; Mormodes lineatum, very curious and pretty; M. atropurpúreum; Oncídium lúridum—several fine varieties, some beautifully spotted; O. bifólium; O. Bauéri, with a fine spike 10 ft. long; O. divaricatum, a large specimen, with flower-spikes 8 ft. long, and another with bright shining large thick leaves and a stout flower-stem, apparently a new species; Stanhópea ebúrnea and grandiflora—these two species are remarkable for flowering at all seasons; Vanda unícolor, a brown-flowered rich-scented species; Pháius grandifólius—several seedlings are now in flower of this good old plant, but do not appear different from the species; P. Wallichianus and P. maculatus; and Zygopétalon rostratum. Some few stove plants are grown with the Orchidaceæ, among which Gloxínia hýbrida, and Passiflora kermesina and princeps, are in flower. Poinséttia pulchérrima bloomed in the autumn, and has been cut down; it is now flowering again quite in a dwarf state. P. pulchérrima álba is also blooming again. There are also a good collection of Cacti; but the humidity necessary for the Orchidaceæ does not appear to suit them, for they are rather drawn. The curious little New Holland Pitcher Plant, Cephalotus, is producing its singular little pitchers, and is thriving well. In one portion of the houses, a collection of the better kinds of Ferns is grown, under a number of Orchidaceæ, that are hung up to the roof in baskets, and on logs of wood; and Dendróbium nóbile and cærulescens are noble plants, and showing abundance of flower-buds.—*Y.*

Messrs. Chandler and Son's Nursery, Vauxhall.—The Camellias in the large house are now beginning to make a handsome display; at present the kinds expanded are too exclusively red or rose-coloured, but in a few days when more white varieties are in perfection, the *tout ensemble* will be charming. The most interesting varieties now in bloom are Albertus, one of the most distinct striped varieties; concinna, a pretty rose-coloured kind, with regular double flowers; Lindleyana, large showy pink; a semi-double white; flórida, a variety remarkable for the cupped character of the opening bud, which gives it the appearance of a cabbage Rose; althæiflora—of this there is a magnificent specimen planted out and covered with larger blossoms than usual; Colvíllii, a pretty striped kind, with a good white ground colour; incomparábilis, a large single crimson; Woodsii, a noble rose-coloured kind; and crassinervis, a variety resembling the Waratah, but possessing the valuable property of retaining its flowers a much longer time than that variety. There was also a plant of Press's Eclipse, which, like Pompone, had some flowers pure white, others pink, and others pink and white. A few hybrid Rhododendrons are coming out, and among them we noticed the true Smíthii; a variety like, but more purple, called conspícua; and one named variábilis, which at first is almost scarlet, but gradually changes to pink as it dies off. There was also a Rhododendron named fragrans, the flowers of which possess a peculiar and grateful perfume; it is stated to be quite hardy, and is an excellent kind for early forcing; it was apparently raised between an Azalea and a Rhododendron.—*March* 12.

Rivers's Nursery, Sawbridgeworth.—Many Standard Roses have been well forced here in a very simple way; the houses consist merely of four walls, on which lights are fixed without rafters, and the heat is supplied from Arnott's stoves. One house, 56ft. long and 9ft. wide, is heated with an 18in. stove, placed in the centre, close to the back wall, so as not to interfere with the path. From the appearance of the plants the heat must be very regularly diffused, as the foliage on the plants close to the stove scarcely differs from that on those at the extreme ends. On each side of the stove, at 18in. distance, a half-inch board is placed, which prevents the stems of plants from becoming dried too much; on the top an iron pan, constantly kept full of water, is placed, and as no air is ever admitted, excepting the little that enters when the doors are opened, the house is always damp, and in the morning the plants are covered with dew. The following were some of the kinds in flower:—*Hybrid Perpetual:* Prince Albert, handsome velvety crimson, one of the most highly-perfumed Roses we ever smelt; and Duchess of Sutherland, pretty bright rose. *Tea-scented:* Anteros, large globular, cream colour; Elise Sauvage, beautiful pale yellow; Dremont, rosy buff; Smith's Yellow; Pactolus, fine lemon colour, with a darker centre; and Romaine, pale blush. *Bourbon:* Queen and Armosa. *Noisette:* Angelina, pretty purplish crimson; Lamarque, fine pale lemon; and Victorieuse, pale blush.—*March* 14.

Review.

The Tasmanian Journal of Natural Science, Agriculture, Statistics, &c. Barnard, Hobart Town. Vol. I. No. 1.

This is the commencement of a Natural History Journal in Van Diemen's Land, under the fostering patronage of Sir John Franklin, and will, we trust, prove of good omen for the cause of science in that colony. Its objects being the elucidation of the zoology, botany, geology, agriculture, and meteorology of Tasmania, a name gradually thrusting that of Van Diemen's Land aside, it will be sure to receive a welcome from the naturalists of Europe.

The present number contains papers by Mr. Gould, Dr. Joseph Hooker, Dr. Richardson, Mr. M‘Cormick, and others; among which we find several passages of popular interest.

Mr. Gunn gives an account of the eatable plants found in Tasmania. They are generally of very small importance; the following species are the most remarkable:—

Tasmanian Cloudberry.—The finest fruit in the colony, however, is produced by a small species of this genus (Rubus Gunnianus) bearing yellow flowers, found commonly on the summits of all the mountains, and also in the level country of the Hampshire and Surrey Hills; which are from 1200 to 1500 feet above the level of the sea. It is a small creeping plant, seldom exceeding an inch or two in height, but covering patches of ground of several feet in extent. The soil in which I found that it bore most fruit was composed principally of decayed wood. The fruit, which is large, of a fine red colour, and formed like that of the Rubus Arcticus, is hidden from sight under the leaves (and also often partly buried under the light soil), which densely cover the ground. The flavour resembles that of the English Cranberry.

Pig-faces.—Mesembryanthemum æquilaterale, the canagong of the Aborigines. The pulp of the almost shapeless, but somewhat ob-conical, fleshy seed-vessel of this plant is sweetish and saline; it is about an inch and a half long, of a yellowish, reddish, or green colour. The celebrated Dr. Robert Brown observes, that this is the most widely diffused plant in Australia, being found on all the coasts. It seldom extends many hundred yards inland, except along the margins of rivers like the Derwent and Tamar, which may indeed be called estuaries. The fruit is ripe about the end of January, February, and March.

Native Currants.—Coprosma microphylla, one of many plants thus called in the colony, grows from six to ten or twelve feet high, in almost every umbrageous ravine, and in many places forms the principal underwood in dense forests. The fruit is a small red round drupe, about the size of a small Pea; and these it bears abundantly. Some years ago, when our British fruits were scarce, it was made into puddings by some of the settlers; but the size and number of the seeds were objectionable. C. nitida is smaller than the last, more erect and dense, and seldom exceeding from four to six feet in height. It exists on the sides and near the summits of all the mountains; but also abounds in the open country about the Hampshire and Surrey Hills. The fruit, which it bears in profusion, is elliptical, of a coral-red colour, sometimes approaching to amber. In an excursion some years ago, I was enabled to relieve three men, who formed my party, when suffering severely from excessive thirst, by the berries of this species.

Leucopogon Richei is also called Native Currant. This is a large dense shrub, growing only on the sea-coast, and attaining to a height of from four to seven feet. The berries are small, white, and of an herby flavour. M. Riche, a French naturalist in D'Entrecasteaux's voyage in search of La Perouse, was lost for three days on the south coast of New Holland, and supported himself principally upon the berries of this plant; in commemoration of which circumstance it has received its specific name.

Wax cluster.—Gaultheria hispida is "abundant in the middle region of Mount Wellington, and in other elevated and moist situations in the colony. The fruit is formed by the thickened divisions of the calyx, enclosing the small seed-vessel: when ripe, it is of a snowy white. The flavour is difficult to describe, but it is not unpleasant. In tarts, the taste is something like that of young Gooseberries, with a slight degree of bitterness." It usually grows from three to six feet high.

Kangaroo Apple; Solanum laciniatum.—This is a shrub growing from four to six feet high, with large deeply-cut leaves, bearing blue flowers, succeeded by a large fruit resembling that of the Potato. This fruit when perfectly ripe, which is indicated by the outer skin bursting, may be eaten in its natural state, or boiled or baked. It has a mealy subacid taste, and may be eaten in any quantity with impunity; but until the skin bursts, although the fruit may otherwise appear ripe, it has an acrid taste, and causes an unpleasant burning sensation in the throat. Mr. Backhouse latterly thought our Kangaroo Apple distinct from the S. laciniatum of New South Wales. The Kangaroo Apple flourishes best near the coast; but I have seen it on the Derwent, ten miles above New Norfolk. It is a perennial of rapid growth, but tender; a very slight frost injuring it.

Grass Tree; Xanthorrhæa arborea.—Mr. Backhouse observes—"The base of the inner leaves of the Grass-tree are not to be despised by the hungry. The Aborigines beat off the heads of these singular plants by striking them about the top of the trunk with a large stick; then they stript off the outer leaves and cut away the inner ones, leaving about an inch and a half of the white tender portion joining the trunk; this portion they ate raw or roasted; and it is far from disagreeable in flavour, having a nutty taste, slightly balsamic. There are some other species of Grass-tree in the colony, the base of the leaves of which also may be used as food: those of the dwarf Grass-tree (Xanthorrhæa humilis), so abundant about York Town, may be obtained by twisting the inner leaves firmly together and pulling them forcibly upwards; but care is required not to cut the fingers by slipping the hand." The different species of Xanthorrhæa are only found on the poorest land, and usually in quartzose sand, in very open situations.

CALENDAR OF OPERATIONS *for the ensuing week.*

In the hurry of business at a season when the gardener has so many various calls upon his attention, some of the sowings and plantings recommended in former Calendars may possibly have been overlooked; if necessary, however, such crops may yet be put into the ground without any great loss of time resulting from their previous omission, because in early spring a difference of a week or two in the time of sowing any particular crop does not make a corresponding difference in its period of maturity. For example, the Woodford's Marrow Pea sown now will not generally be fit for table under 14 weeks in the neighbourhood of London, while the same sort sown a month hence will be ready to gather in about 12 weeks, thus gaining a fortnight. On this account, what is called a "cropping table" will be found extremely useful by young gardeners. In this should be entered the date of the sowing of the crops; and in an opposite column, the time they arrive at maturity is to be noted. A daily register of the atmospheric temperature would make the table more perfect; but this is not essential. Assisted by a table of this nature, any person may so regulate his various sowings that their produce would be ready for use just at the time required. This precise knowledge cannot be acquired from any Calendar, because the proper periods for putting in crops must necessarily vary in some degree according to the nature of the soil, the local situation, and the climate of the district.

I.—KITCHEN-GARDEN AND ORCHARD.

In-door Department.

Pinery.—Plants in fruit should be aided by every auxiliary, that the fruit may swell to a large size. If more suckers are thrown up than it is thought advisable to retain, the hearts of those which are not wanted should be twisted out while quite young, that they may not uselessly exhaust the plant. Encourage the emission of young roots by pulling off two or three (not too many) of the lower leaves, and then earthing up the stems with rich compost. Or if this cannot be conveniently done, give manure-water occasionally. Keep the atmosphere of the house moist and warm.

Vinery.—If the Vines in the latest house show signs of vegetating, let them be tied up immediately. Curve the ends of long rods either down towards the floor of the house, or back towards the stems of the vines; this will make the lower buds break stronger and more regularly. Take great care in tying down the advancing shoots in the more forward houses; these, as before mentioned, ought to be brought gradually down to the wires by repeated tieings, and not roughly forced at once into their places, or many shoots will unavoidably be broken. A perfect leaf beyond the fruit is indispensable; and to make sure of this, it is better not to stop the shoots close above the bunch, but allow them to grow one joint farther.

Peach-house.—Continue the treatment recommended last week. Watch closely for red-spider, and if any are found, increase the washings.

Cherry-house.—Fruit that is safely set should be encouraged to swell freely by a little increase of heat. At this season of the year, 60 degrees of fire-heat will not be too much, but a free interchange of air is essential.

Fig-house.—Manure-water now and then will be beneficial to the swelling fruit. Under this form, food may be apportioned to the plants according to their wants; those which carry the largest crop being allowed more frequent supplies, while it might be altogether withheld from luxuriant trees. If necessary, the house may be kept at 65° by fire-heat, but a high night temperature is not approvable; it is better to close early and use no more fire than can be avoided.

Strawberries.—Keep a succession in different stages of advancement, and support with short sticks any large bunches of fruit.

Cucumbers and Melons.—If cold winds prevail, it will be better to keep in use the protection to the linings (thatched hurdles or long straw) formerly advised. The forward beds may receive their final earthing, choosing a calm and warm day for the operation; the soil must on no account be wet. Keep the shoots regularly trained, and do not over-crop the plants.

Prick out Celery, Sweet-herbs, &c., as soon as large enough. All young vegetables for planting out must be kept near the glass, that they may grow stocky.

Out-door Department.

Artichokes will no longer need protection; therefore, whenever leisure permits, the dung or rotten leaves used for that purpose may be spread over the ground and dug in.

Asparagus beds should be forked over if the soil is heavy and binding, that the young shoots may more readily penetrate it; in light soils, raking the surface neatly will suffice. It is customary in many gardens to increase the covering of the beds, either now or in autumn, by an addition of soil from the alleys, the object being to obtain a great length of blanched stalk. By this process much labour is expended in order to produce the least possible quantity of useable substance, the whole of the stalk which grows below the surface being so tough and stringy that it cannot be eaten, and that part only which is exposed to light and air being really good.

Borage, Marigolds, and all hardy annual herbs, may be sown now; but the tenderer kinds had better be kept back a week or two.

Cabbages.—Earth-up the largest plants, and keep them free from weeds. Also sow seeds of two or more sorts which will succeed each other.

Celeriac.—Sow in rows on a warm border.

Lettuce.—Prick out on a warm spot part of those sown on a hotbed.

Peas.—Earth-up and stick any that are high enough.

Radishes.—Sow the Spanish kinds, if such are used.

Stored Potatoes should now be examined, and if beginning to grow, the sprouts must be rubbed off; those intended for sets should not be sprouted.

See also to Carrots, Beet, and all stored roots.

Orchard.—Strawberry-runners which were put out in nursery-beds in autumn may now be planted where they are to remain, previously well manuring the ground if it is at all poor. Peach-trees will soon require protection; therefore preparation should be made, if not already done. Moveable copings of boards are very efficient in this respect; they are beneficial by keeping the blossoms dry, as well as by checking the radiation of heat. Fruit-trees of all kinds may be grafted; but it matters little whether this be done now or next month, provided the grafts are kept dormant.

II.—FLOWER-GARDEN AND SHRUBBERY.

In-door Department.

Stove.—Such plants as Gesneras will now send out a quantity of young shoots, some of which may be taken for propagation, and others trained properly, to form a good head to the specimen. Finish the general potting as soon as possible, giving strong plants with broad leaves, such as Musas, very rich soil. Do not keep strong fires at night, but allow the temperature to fall rather low. If the house is moist enough, the plants will always be covered with dew in the morning, which they like better than a high night temperature.

Greenhouse and Conservatory.—Continue to pot, as necessary, soft-wooded plants which are intended to grow large. Any of the hard-wooded species that require shifting ought soon to be done, that they may get root-hold before being placed in their summer quarters in the open air. Some plants of Fuchsia fulgens, corymbiflora, and other ornamental kinds, should be removed to a warmer situation, and encouraged to grow. Keep the leaves of Camellias and Orange-trees free from dust or dirt, which, besides being unsightly, materially affects the health of the plants. Twining plants on ornamental frames will require frequent attention. For the Tropæolums the twiggy top of a young Larch-tree makes an excellent support. Many kinds of Heaths will now strike root readily.

Pits and Frames.—All plants intended for the decoration of the flower-garden in summer, should now be exposed to the free air at every suitable time. Plants for forcing must not be forgotten, but be regularly introduced into heat as required. Pinks, and plants of similar habits, should be placed almost in contact with the glass. This is a good time to propagate Pinks for forcing next winter. Take the pipings from forced plants, and put them into pans, in a mixture of sand and leaf-mould, and they will soon strike root in a gentle heat. Shift Carnations into their flowering pots.

Out-door Department.

Pinks, Carnations, Sweet-Williams, and in short all herbaceous plants yet unremoved, must be transplanted without delay; when removed late in spring, they seldom flower well. Finish the principal sowing of annual flower-seeds: a few for late blooming may be put in hereafter. Turn gravel-walks, and re-face those which are worn out. Take the opportunity of wet weather to well roll the lawns.

NURSERY AND FOREST DEPARTMENT.

Nursery.—Small trees, such as seedlings from the seed-beds, may yet be transplanted; but the sooner such work is completed, the better. Propagation in every form ought now to be carried on in earnest, especially the layering of the rarer kinds of shrubs. Cuttings of some plants, as Privet, may yet be put in. Holly, Whitethorn, Yew, and other seeds which do not vegetate quickly, should be sown immediately.

Forest and Coppice Woods.—If the planting of Forest-trees is completed, all tree-tops and other loose wood may be faggoted. Cut the larger branches into proper lengths for cord-wood, to be afterwards burnt into charcoal, or used for fire-wood. Decaying and useless trees might be felled for the above purposes, but no good timber should be cut down now.—*J. B. Whiting, The Deepdene.*

State of the Weather near London for the Week ending March 17, 1842, as observed at the Horticultural Garden, Chiswick.

March	Barometer. Max.	Barometer. Min.	Thermometer. Max.	Thermometer. Min.	Thermometer. Mean.	Wind.	Rain.
Friday 11	30.040	29.825	50	27	38.5	S.	
Saturday 12	30.045	29.938	58	40	49.0	S.W.	.06
Sunday 13	30.132	29.888	57	37	47.0	W.	
Monday 14	30.284	30.223	49	45	47.0	S.	.02
Tuesday 15	30.332	30.324	54	46	50.0	S.W.	
Wednesday 16	30.316	30.138	56	44	50.0	S.W.	
Thursday 17	30.131	29.761	56	43	49.5	S.W.	.05
Average	30.183	30.014	54.3	40 3	47.3		.13

March 11. Densely overcast throughout.
12. Very fine; clear at night.
13. Very fine; mild and overcast.
14. Slight rain; overcast and dull; slight rain at night.
15. Overcast; very fine; mild and densely overcast.
16. Hazy; overcast and fine.
17. Fine, with sunshine; cloudy; rather boisterous, with rain at night.

State of the Weather at Chiswick during the last 16 years, for the ensuing Week ending March 26, 1842.

Mar.	Aver. Highest Temp.	Aver. Lowest Temp.	Mean Temp	No. of Years in which it Rained.	Greatest quantity of Rain.	Prevailing Winds. N.	N.E.	E.	S.E.	S.	S.W.	W.	N.W.

Sat. 26	52.3	32.9	42.6	6	0.12	—	2	2	2	4	1	2	3

The highest temperature during the above period occurred on the 20th, in 1829—thermometer 69°; and the lowest on the 21st, in 1837—thermometer 21°.

REPORT ON COVENT GARDEN MARKET,

For the week ending March 18, 1842.

DURING this week there has been little alteration; trade generally has been toleraby good, and the supply of most things well kept up. *Fruit.*—Pines are not so abundant as they were. Grapes are becoming scarce. Apples have advanced a little in price: good Nonpareils are fetching from 14*s.* to 30*s.* per bushel; Golden Knobs, 5*s.* to 6*s.* 6*d.*; and Pearmains from 3*s.* 6*d.* to 5*s.* 6*d.* The kinds of Pears are chiefly Beurré Rance and Nelis d'Hiver. Strawberries and Cucumbers still continue scarce. *Vegetables.*—The supply of Cabbages and Broccoli has been large, and the quality is excellent. Kidney-beans are becoming more plentiful. The supply of Asparagus is increasing, and the quality is generally good. Excellent Seakale abounds. Endive has somewhat improved in quality. Celery and several sorts of salading are rather indifferent. Good Rhubarb is plentiful. Mushrooms are not very abundant.

PRICES SATURDAY, MARCH 19, 1842.—FRUITS:—

Apples, Kitchen, per bush. 3*s* 6*d* to 7*s*
— Dessert, per bushel, 4*s* to 12*s*
Pears, dessert, per half-sieve, 4*s* to 16*s*
Strawberries, forced, per oz., 3*s* to 5*s*
Pine Apple, per lb. 6*s* to 12*s*
Cucumbers, each, 3*s* to 6*s*
Grapes, Spanish, per lb., 1*s* to 2*s*
— Portugal, per lb., 1*s* to 5*s*
Oranges, per doz., 9*d* to 2*s*
— per 100, 3*s* 6*d* to 16*s*
— Bitter, per 100, 7*s* to 18*s*
Lemons, per doz. 1*s* to 2*s*
Lemons, per 100, 6*s* to 14*s*
Almonds, per peck, 7*s*
Sweet Almonds, per pound, 2*s* 6*d* to 3*s* 6*d*
Chesnuts, per peck, 5*s* to 10*s*
Walnuts, per bushel, 16*s* to 24*s*
Filberts, Eng., per 100 lbs., 130*s* to 140*s*
Cobb Nuts, per peck, 3*s* 6*d*
Nuts, per bushel—
— Brazil, 20*s*
— Spanish, 16*s*
— Barcelona, 20*s* to 24*s*

VEGETABLES.

Savoys, per dozen, 1*s* 3*d* to 1*s* 6*d*
Cabbage, Red, for pickling, 2*s* to 6*s*
Cabbage Plants, per doz., 3*s* to 5*s*
Brussels Sprouts, per hf. sve., 1*s* to 1*s* 6*d*
Broccoli, White, per bunch, 6*d* to 2*s*
— Cape, 9*d* to 1*s* 3*d*
— Purple, 6*d* to 9*d*
Turnip Tops, per bushel, 6*d* to 1*s*
Kidney Beans, forced, p. 100, 2*s* 6*d* to 3*s* 6*d*
Potatoes, per ton, 40*s* to 80*s*
— per cwt. 2*s* to 4*s*
— per bushel, 1*s* 6*d* to 2*s* 6*d*
— Kidney, per bush. 2*s* to 2*s* 6*d*
Artichokes, Jerusalem, p. hf. sve., 1*s* 6*d*
Turnips, per dozen bunches, 2*s* to 3*s*
Carrots, per doz. bunches, 4*s* to 5*s*
Parsneps, per dozen, 6*d* to 1*s*
Red Beet, per dozen, 6*d* to 1*s* 6*d*
Scorzonera, per bundle, 1*s* to 1*s* 3*d*
Salsafy, per bundle, 1*s* to 1*s* 3*d*
Horse Radish, per bundle, 1*s* to 5*s*
Radish, pr. doz. hands (24 to 30 each) 2*s* to 2*s* 6*d*
— Turnip, per bunch, 6*d*
Spinach, per sieve, 1*s* 6*d* to 2*s*
Leeks, per dozen bunches, 9*d* to 1*s*
Garlic, per lb. 8*d*
Shallots, per lb., 1*s*
Onions, Old, per bushel, 3*s* to 3*s* 6*d*
— for pick., per hf.-sieve, 3*s* to 6*s*
— Green, per doz. bunches, 2*s* to 4*s*
— Spanish, per dozen, 1*s* 6*d* to 6*s*
Chives, per pot, 6*d*
Asparagus, per 100, large, 6*s* to 9*s*
— Second or Middling, 3*s* to 4*s*
— Sprue, or Small, 1*s* 6*d* to 3*s*
Sea-kale, per punnet, 1*s* to 3*s*
Lettuce, Cabbage, per half sieve, 1*s* to 2*s* 6*d*
Endive, per score, 1*s* 6*d* to 4*s*
Celery, per bundle (12 to 15) 6*d* to 2*s*
Small Salads, per punnet, 3*d*
Corn Salad, per half sieve, 9*d* to 1*s*
Watercress, p. dz. small bunch., 4*d* to 8*d*
Dandelions, per punnet, 9*d*
Parsley, per half sieve, 2*s* to 4*s*
Tarragon, per dozen bunches, 4*s*
Fennel, per dozen bunches, 3*s*
Thyme, per doz. bunches, 2*s*
Sage, per doz. bunches, 3*s*
Mint, per doz. bunches, 4*s* to 8*s*
Savory, per dozen bunches, 2*s*
Rhubarb Stalks, per bundle, 6*d* to 2*s*
Mushrooms, per pottle, 1*s* to 1*s* 6*d*
Truffles, per pound, 2*s* to 3*s* 6*d*

Notices to Correspondents.

We have such constant applications for the PRICES of books, plants, and other articles, and for information as to where they can best be had, that we find it necessary to state for the information of all inquirers that it is not our practice to recommend any tradesman in particular, and that if persons interested in selling do not ADVERTISE their goods we cannot do it for them. We beg our readers will look to our advertising columns for all information of this description. This is a sufficient answer to *Daffodil* and others.

J. S., of Addiscombe, can have No. 21 if he will order it from his Newsman.

F. H. S.—The double-bearing RASPBERRY is the best variety for affording a late supply. It may be obtained from the nurserymen.

Anne.—The ARBOR VITÆ will bear slight pruning, which should be confined to reducing some of the smaller branches: if, however, the loose branches were tied up close with wire or tar twine, the plant would be soon restored to its compact form, and last so for years. Want of light is the reason that your Diosma and Acácia do not flower.

A Subscriber.—Tree PÆONIES should not be placed at once in large-sized pots, but they may have what is termed a large shift each time they are shifted: much, however, depends on the health and size of your plants, also on the kind of soil you use. They may be bloomed well in six-sized pots, but as they like rich soil, you may, by freely supplying them with liquid manure, grow them in much smaller sizes. Coarse green gauze is the best thing to prevent bees or other insects from entering GREENHOUSES.

Omikron.—The following kinds of ROSES will suit your purpose well, and they may be easily procured:—

Beds.

1. Moss Roses
2. Hardy kinds of Noisette (late flowering)
3. William's Double Yellow Sweet Briar
4. Different Pompones
5. Indica sanguinea (late)
6. Perpetuals (late)
7. Common China (late)
8. Scotch Roses
9. White Sweet-scented China (late)

Standards.

1. Crested Moss
2. Mordaunt de Launy
3. Madame Desprez
4. White Moss
5. Village Maid
6. Parny
7. Queen of Denmark
8. Madame Campan
9. Globe White Hip
10. Brennus
11. Scarlet Moss

A Subscriber.—The following hardy herbaceous plants will be least damaged by rabbits; but where these animals abound few plants will exist, as they are destroyed by the rabbits running over them, and scratching about their stems. The different kinds of Monkshood, Iris, Pæony, Hellebore, St. John's Wort, Euphórbias, Asclépias, Centaúrea, and Erýngium—Bérberis aquifólium, repens, and glumacea, are excellent under-shrubs to plant where rabbits abound, as they are not injured by them. Very gentle fumigation with good tobacco will destroy the GREEN-FLY on Peach trees without injuring the fruit; but it must be mild, and frequently resorted to. Sow the seeds of Ipomœa rubro-cærulea and insignis in pots filled with any good light sandy soil, and place them in a moderate dung frame, and treat them afterwards, when they come up, in the ordinary way, by potting and keeping close and warm. The seeds of Brachycome should be sown in a light sandy soil, and placed in a warm greenhouse or close pit, but not subjected to a moist heat after they have come up.

A Hedge-maker.—None of your plans will preserve Pelargoniums, &c., in hard winters; we doubt if they will in mild ones. Such plants *must* be kept dry if they are to bear cold at all. The SWEET BRIAR is raised extensively in Norfolk. Two-years-old seedlings are generally employed in making hedges; they cost about 12*s.* a thousand. It is raised from seed, placed in heaps and treated like the haws of Whitethorn. It does not make good hedges, being too weak a plant, and apt to become very bare at bottom. It will, however, bear cutting down; which is, in fact, necessary when it becomes naked. You cannot propagate it by cuttings, and layering is a tedious process for so common a plant. It is a bad stock for budding Roses on.

J. Biggar and other correspondents who inquire about the best way of using the AMMONIACAL GAS-WATER will be fully answered next week.

F. W. S.—We are not aware that any experiments have been tried upon NITRATE OF SODA and PINE-APPLES. In making any experiment use the nitrate very weak, and if it does no harm increase its strength. Do not apply it overhead, but pour it on the mould when the plants are growing fast. We think your gardener is right in confining such manure to the succession-plants; if fruiters are forced too much, you will run the risk of having crowns and gills instead of fruit.

H. T. S.—Your plants will not suffer from being watered with WATER taken from cast-iron tanks; but if these tanks are placed upon flues for evaporation, you must take care not to use the water when it is very hot, otherwise you may scald the plants.

W. Baker.—The quantity of FURZE seeds required, depends much on the quality of the soil and seeds, and whether the land is to be thickly covered and quickly. From two to three pounds should be sown to the acre, as it is better the plants should come up rather thickly, and they will soon cover the ground. There is no difference in the growth of English and French Furze, provided the seeds in both cases are good and fresh.

Frutex.—The treatment you have adopted for your RHODODENDRONS is not a bad one; but you would have done much better if you had taken them up, well mixed the soil, adding, at the same time, a little well-rotted cow-dung, and then replanted them rather thick. All kinds of peat are not suitable for growing American plants; among the worst is close black peat, or very poor sandy peat, or such as is obtained at any considerable depth from the surface. Nitrate of soda is beneficial if applied in small quantities (½lb. to the rod). It may be sown over the surface before the ground is planted, or afterwards, which is easily done if mixed with dry sand, but care must be taken that it does not lodge on any part of the stems or leaves. Full directions for the cultivation of American plants, the Arbutus and Laurustinus, would be too long for such a notice, and had better form separate articles at a future time, as a short account would be of little use to the amateur.

E. F.—It is difficult to say what occasions the decay of some of your bunches of GRAPES before blooming in the same house in which others come forward very well. It may be owing to the particular variety having imperfectly ripened its wood; or the vine may have been exposed to a direct current of cold air, which would produce such a result. Air ought to be admitted with great caution to vines in the stage of growth in which yours are, and always before the temperature of the house has reached its maximum. See a paper by Mr. Fish in another part of to-day's Paper.

Arenarius.—Sow Onions in drills a foot apart, and use an ordinary six-inch hoe. The black-seeded Cos LETTUCE is an upright Lettuce, like the Paris Cove Cos; but the black-seeded Gotte Lettuce is a very small round Cabbage Lettuce only suited for an early crop, or for growing in frames during the winter. The number of main branches on dwarf standard Apples depends entirely on the age, the strength, and the state the trees are in. The quantity of water that should be added to sulphuric acid before it is mixed with the urine is immaterial—say four parts to one of acid.

F. C.—We are afraid of opening a discussion about the cause of SHRIVELLING IN GRAPES, because we know from experience that it will lead to much assertion and very little proof. We are persuaded that the coldness and wetness of the border, one or both, are the real cause; a soil which will suit perfectly such hardy Grapes as the Hamburgh and Sweetwaters, will still be too cold for so delicate a variety as the white Frontignan. If you will cover your border with a roof or other contrivance which will throw off the water in winter—or, which is better, place on it a glazed sash or two—the shrivelling will, we expect, be prevented. By the latter means you will warm your border as well as dry it. If it becomes too dry, let it be watered with *warm* water.

E. R. is informed that POTATO plants may be obtained from the tubers exactly in the same way that plants are obtained from the Dahlia roots; that in this way one tuber will produce fourfold the number of plants that can be obtained by cutting it into sets; that the plants so obtained are more productive, and that when the tubers have yielded all the spires they can, they are still nearly as good for the pig as at first, for that by keeping them on the earth they do not become flaccid or shrivelled. If this is correct, it may be important for cottagers, and the editor's opinion is requested. [We are of opinion that a great loss of produce and of labour must be the result of this system, and that it is a very expensive mode of feeding pigs. If soot and salt are to be used for Potatoes, they had better be applied at the time when the Potatoes are earthed up. It will no doubt be a good dressing for such Grass-land, if used in small quantities.

R. G.—The following hardy ANNUALS, if sown now, will flower by the end of June; they are very showy, and last a considerable time in bloom:—Gília trícolor, Collínsia bícolor, C. grandiflora, Nemóphila insígnis, Platystemon californicum, Clárkia pulchella, Godétia Lindleyana, G. rubicunda, G. tenuifólia, Lupinus nanus, Eútoca víscida, and Leptosiphon androsáceus.

J. B.—The following are the newest and most showy kinds of hardy ANNUALS, but hardly any of them are of very recent introduction:—Erysimum Perofskiánum, Lupinus Hartwegii, Sphenógyne speciosa, Calandrínia díscolor, Nolana atriplicifólia, Centaúrea pulchra, Calliopsis Drummóndii, Godétia albescens, G. rubicunda, Callichroa platyglossa, Impátiens glandulígera, I. tricornis, I. cándida, Papaver amœnum, Clintónia pulchella, Leptosiphon androsáceus, L. densiflorus, and Oxyura chrysanthemoides.

W. K., Bushy Park.—Your Bees are infested with the HONEYCOMB MOTH, Galléria cereana, and the white masses you sent us are clusters of cocoons, containing larvæ or pupæ, which about August will become small yellowish moths. You had best burn all the infested comb, and examine those hives that do not appear to have suffered yet, and wherever there are cocoons cut them out.

J. C., Arundel.—Procuring BROCCOLI for table during the months of January and February, depends more on the management than on the particular kinds. The sorts you mention are very good, if sown and treated properly at different seasons. If Grange's Early White is sown at three different times, between the beginning of May and the end of June, it will produce heads from October to January; but they must be protected from the severity of the winter. If severe weather occur, the Early Sprouting will, if sown in April, produce heads from November to February, and the Green Close-headed will, if sown about the end of May, be in perfection from November to February, if the weather is open. The proper time for sowing Broccoli and after-treatment, with a list of the best sorts, will be given at a future time.

B. Kingdon—Send your address to our Office, and we will give you the information you require.

Pimelea has sent Veronica decussata. Yes.

R. W. has sent Cornus máscula.

Speculative.—We are not aware whether the Cherry has ever been successfully grafted on the Laurel.

Marianne.—If your seeds have been well preserved, sufficient will grow for your purpose. Rhododendrons will not bear much pruning, but some of the sorts grow more compact than others. In pruning cut the longest shoots within an inch or two of the ground.

A. H.—Your shoots, like those of the true Knight's Monarch Pear, have a yellowish tinge; those of the false sort have a violet hue. We believe yours to be right.

W. M.—The mature leaves of Borecole are not useful where sprouts are wished, and therefore it is better to remove them. The younger leaves at the top should also be considerably reduced.

T. S., Bradfield.—Your Apple, No. 1, called the Flanders Pippin, is not known by any other name. No. 2 is a fine specimen of the Court of Wick.

F. I. C.—Your plants are Oncídium altíssimum and Epidendrum Stamfordianum. The Apples are, 1, Winter Pearmain; 4, and probably 18, Bedfordshire Foundling. The others were so much decayed that it was not possible to make them out.

Amateur.—The Auvergne Pea is a dwarf kind, and the Wyker a tall variety; they are both vegetables, and consequently must be grown in the kitchen-garden.

W. S. (Bury Hill).—Your plant seems to be a drawn-up specimen of Polytrichum vulgare.

Do You See?—Yes, pretty clearly that your Sea-kale plants are worn out, but whether from being over-heated in forcing, too severely cut so as not to admit of the growth of sufficient foliage, or from the natural decay incident to old age, combined with the consequences resulting from forcing, it is difficult to say. At all events, the sooner you direct a fresh plantation to be made in a sunny aspect, the better. When the blue Sálvia is growing, it requires a good supply of water. Mesembryánthemums must be but sparingly watered at all times. Probably your greenhouse has not been kept warm enough to cause Hyacinths or Lilies-of-the-Valley to vegetate much before the usual time

Ignoramus is answered in a leading article of to-day.

W. R.—One of Stephenson's stoves mentioned in last week's *Chronicle* (p. 175) will probably give you heat enough; or a small Arnott, if you can manage it; or you will find a new mode of heating described a few weeks hence. The way of distributing the heat will be to place the stove in the middle between the two compartments to be heated, and to stop the water from flowing into the one not in use, which may be done by a stopcock.

W. Taylor.—There is no work on foresting which we can recommend; Sir Henry Stuart's is, perhaps, the best, but it is by no means equal to its reputation. We are unable to supply any copies of the *Chronicle* for 1841 for the present.

Geddenensis.—It is Ipomœ'a, and not Ipómœa.

An Amateur and Subscriber.—We never admit into our columns anonymous letters abusing the productions of others; all you have asserted has been denied by the raiser of the flower in question, and the judges who on three different occasions thought so well of it must have been blind indeed, not to have discovered the faults which you perceive so clearly.

L.—You may strike out of your list as sorts not adapted for standards, the brown Beurré, Gansel's Bergamot, Old Colmar, Crassane, Winter Bon Chrétien, and St. Germain. Increase the Marie Louise, Passe Colmar, and Beurré Rance. Add Beurré Diel, Hacon's Incomparable, Dunmore when you can procure it, Knight's Monarch, Althorp Crassane, Louise Bonne of Jersey, Glout Morceau (Thompson's), Nelis d'Hiver, and Ne plus Meuris. On these you may rely for ultimate satisfaction; those objected to in your present list would have become productive of disappointment only.

As usual, many letters have arrived too late for answers this week.

NEWS OF THE WEEK.

IN the House of Commons last night, Lord John Russell announced his determination to oppose the Income Tax, and to take the sense of the House on its necessity. Sir R. Peel then developed the details of the proposed measure; he stated that the tax of three per cent. is intended to apply to all incomes without exception; that the amount on which he proposes to levy it, is to be the average of three years' profit in trade, and the produce of the current year in professions; that composition may probably be made for the whole period during which the tax is to continue, and that the machinery for collection is to be that organised by Lord Lansdowne's Act of 1806, under the control of the Office of Stamps and Taxes. The Corn Importation Bill has made some progress during the week; an amendment moved by Mr. Ward for the appointment of a select committee to inquire whether there are any peculiar burdens specially affecting the landed interest has been rejected by a majority of 115. A discussion has taken place on the state of the Church of Scotland, and in consequence of the declaration of Sir James Graham, that it is the intention of Government to maintain the law, a motion for a select committee was negatived by a majority of 77. The adjourned debate on Lord F. Egerton's motion for a Bill to allow marriages between certain degrees of affinity has been resumed, and the introduction of the measure negatived by a majority of 23. The House has also negatived, by a majority of 50, a motion for affording compensation to the merchants for the amount of the opium destroyed at Canton by the Chinese Government. During the debate on the proposed Income Tax, Sir R. Peel stated that when he had represented to the Queen the necessity of bringing the measure before Parliament, Her Majesty spontaneously intimated to him, that if the necessities of the country were such as to require the tax, it was Her Majesty's wish that her own income should be subject to a similar deduction.

The chief interest of our foreign news is derived from the commentaries of the Continental journals on Sir Robert Peel's scheme of financial and commercial policy, and on the intelligence received last week respecting the disasters of our army in India. The French journals of all parties do not attempt to disguise their feelings at these reverses; they avail themselves of the opportunity to predict the downfall of our Indian empire, and at the same time dwell with evident satisfaction on the financial embarrassments which have rendered necessary so decided a measure as that of Sir R. Peel. A discussion of some importance has taken place in the French Chambers on the conversation between Lord Aberdeen and the French ambassador in London with respect to the occupation of Algiers. M. Guizot maintains that the sanction which time has given to the conquest of that settlement is fully admitted by the British Cabinet, and that France will not only retain her conquest, but will call upon Lord Aberdeen for a formal recognition on the first occasion when the appointment of a new British consul at Algiers shall be necessary. The tone assumed by M. Guizot on this occasion is said to have produced great sensation in the diplomatic circles; and its effect is somewhat increased by the demand of the Minister of Finance for a considerable increase in the Navy estimates, and for an additional fleet of war-steamers of the largest class.—Accounts from Spain announce that extensive preparations are still taken by the Government to resist any outbreak on the frontier, although no immediate demonstration on the part of the conspirators is considered probable. The Cabinet continues to gain strength, and the internal tranquillity of the country appears to be comparatively restored.—Letters from Greece allude to the increasing desire of King Otho to declare war against Turkey, and even mention the probability of an actual collision; but there is little doubt that the Protecting Powers will interfere to prevent a course so disastrous to both countries.

Home News.

COURT.—Her Majesty, Prince Albert, the Prince of Wales, and the Princess Royal are well, and continue in town. The Queen held a Court on Saturday and yesterday, for the reception of addresses on the throne. Her Majesty held a levee at St. James's Palace on Wednesday, which was very numerously attended; and a Court at Buckingham Palace on Thursday. The Queen's first ball, at Buckingham Palace, is announced for the 11th of the ensuing month. It has been announced that her Majesty, accompanied by Prince Albert, will honour the Lord Primate with a visit at Lambeth Palace this day, and will take luncheon with his Grace and Mrs. Howley. The Countess of Charlemont has succeeded the Countess of Dunmore as Lady-in-Waiting on her Majesty. Prince Albert presided on Tuesday at a meeting of the Commission for Promoting and Encouraging the Fine Arts in the Rebuilding of the Houses of Parliament.

The Queen Dowager.—Our readers will be pleased to learn that her Majesty the Queen Dowager is going on favourably, and has nearly recovered her strength. Several places have been named as the probable resort of her Majesty this summer, particularly Clifton, Worthing, and Lord Stuart de Rothesay's seat on the Hampshire coast, but nothing positive on the subject is known. A report, which appears to have gained circulation, stating that her Majesty would winter at Malta this year, is said to be premature.

Parliamentary Movements.—Two Liberal candidates, Mr. John Nicholson, of London, and Mr. Brooker, of Alfriston, have come forward to contest the representation of Brighton with Lord A. Hervey, the Conservative candidate, announced in our last.

Official Appointments.—It is reported that either Sir Richard Jenkins, M.P., or Mr. Sprot Boyd, the Political Commissioner at Baroda, will succeed Sir William M'Naghten, Bart., as Governor of Bombay.—The death of the Duke of Norfolk, which took place on Wednesday, occasions another vacancy in the Order of the Garter. Ministers have now four garters at their disposal, caused by the deaths of the Earl of Westmoreland, the Duke of Cleveland, the Marquis of Hertford, and the Duke of Norfolk.—It is rumoured in military circles that Sir Henry Hardinge will have the command of the army in India, about to be reinforced to the amount, it is said, of ten thousand men.—It is announced in last night's Gazette that Lord Elgin has been appointed Governor-General of Jamaica.

The New Tariff.—In our notice last week of Sir R. Peel's speech developing the views of Government in reference to the financial and commercial policy of the country we gave the leading feature in the Right Hon. Baronet's proposed financial scheme, and that which appeared to be of paramount and most general interest, viz.—that in order to meet the great deficit in the revenue, all incomes above 150*l.* a-year shall be taxed to the amount of 7*d.* in the pound, being something less than three per cent. The other less important features of the measure embrace one or two additional items of taxation, more particularly in relation to Ireland. As that country has never been subject to a property-tax, and there is no machinery for levying it, Sir R. Peel proposes as a substitute an increase on the duty of spirits and stamps; the former to be raised from 2*s.* 8*d.* to 3*s.* 8*d.* the gallon, which is expected to increase the revenue 250,000*l.*; and the latter to be equalised with those in this country, and which it is expected will realise 160,000*l.* Irish absentees, however, are to be liable to the property-tax. It is also proposed to impose a duty of four shillings a ton on all coal exported from this country, whether in British or foreign ships; and this, it is calculated, will realise 200,000*l.* From all these sources, then, the anticipated revenue will be as follows:—1. From the income-tax, 3,770,000*l.*; 2. From the Irish stamp-duty, 160,000*l.*; 3. From the Irish spirit-duty, 250,000*l.*; 4. From the duty on British coals, 200,000*l.*: making in all, 4,380,000*l.*, being a surplus of 1,800,000*l.*, after covering the deficit for 1843, which, as stated in our last, is estimated at 2,570,000*l.* This surplus it is proposed to employ for the relief of our commercial tariff. All the articles under the tariff have undergone a complete revision, the general principle acted on being the removal and relaxation of all duties of a prohibitory nature, and a reduction of the duties on 750 out of 1,200 articles of consumption imported. We have extracted from the resolutions about to be proposed by Sir R. Peel, in reference to the customs' duties, the following alterations in the rates of duties now payable on the importation of articles in which most of our readers are largely interested. As stated above, in addition to the reduction of duty, all prohibitions and restrictions of any such articles are to cease and determine; and it will be seen that the produce of British possessions, imported from them, is favoured to the amount of half the duty levied.

No reduction is proposed in the duties on sugar, wines, or spirits.

Foreign.

FRANCE.—The disastrous intelligence received by the last overland mail from India, and the speech of Sir R. Peel developing the views of the British Government with respect to the financial and commercial policy of this country, occupy the principal portion of the Paris journals. The greater number of them do not conceal their satisfaction at the reverses sustained by the British arms, and attribute our disasters in India to "inordinate ambition;" whilst the opposition papers confidently predict the speedy downfall of our Indian empire. With respect to the proposed financial scheme of Sir R. Peel, the journals are unanimous in their praises of the boldness of the measure, and the clear and comprehensive manner in which it was developed in the speech of the Prime Minister. They all, however, seem to regard it as an evidence of the failing prosperity of this country, and as a proof that "the system of credit on which England has so long existed has been at length shaken." The "National," a republican print, concludes a long article on the subject by saying that "there is sufficient matter in the position of affairs in England to raise high expectations in the minds of those who desire the degradation of a power whose ambition, avidity, and political doctrines have caused so much injury to human nature." All the journals, indeed, though not in such strong terms, prognosticate the downfall of Great Britain, owing to her financial difficulties; and the Ministerial paper, the "Débats," terminates a powerfully written article on the subject in the following terms:—"The Prime Minister of Great Britain has just affixed his name to an event, without contradiction, the most important that has for a long period occurred in England. Sir R. Peel, who hitherto has been distinguished less for the grandeur of his views and the boldness of his undertakings, than for great tact in the administration of affairs, rare oratorical talents, and an almost infallible appreciation of the course of public opinion, has just signalised himself by an attempt the most bold, and, in the philosophical sense of the word, the most revolutionary, that any Ministry has dared to make in England for half a century. The heart of London and its Exchange palpitated and beat high; all business was suspended, and the effect of this desperate remedy was waited for with anxiety. But towering above this portentous silence—this fear—this stupor, a kind of concentrated enthusiasm was felt to master the situation; a compressed outbreak of nationality, as well as a stifled cry of patriotism. The dead bodies of 5,000 Englishmen extended, without burial, on the snows of Affghanistan called for vengeance. And when the head of the Government spoke in ardent language of British blood, of British courage, and of British honour, irresistible acclamations broke from all sides of the Chamber. England is now attempting one of those supreme efforts of a drowning man. But whatever she may do, and should we again meet her as an enemy, in every part, whether by sea or land, we shall respect the courage which she displays in the midst of such crises, and we shall decree to her, without envy or fear, the testimonial of our admiration."

The Capital.—The journals inform us that one of the most violent hurricanes ever witnessed in Paris occurred on Wednesday evening, the 9th inst. and the following day, and that very extensive damage has been done by it. A committee of Germans has been formed in Paris for getting annual subscriptions for completing the Cathedral of Cologne. Viscount Walsh, the proprietor of the Royalist "Mode," was on Saturday sentenced by the Correctional Police to three months' imprisonment and 3,000f. fine, for the attempt to get up a subscription to pay the fine imposed on that publication by the Seine Court of Assizes for a seditious libel. The publisher of the "Mode" for the same offence was condemned to two months' confinement and a fine of 2,000f.

Algeria.—In the Chamber of Deputies on Thursday, after a discussion on the grant of one million francs for secret service money, which was voted by a majority of 219 to 142, one of the Deputies, M. Durand, referred to the conversation that had taken place between Count St. Aulaire and Lord Aberdeen, with respect to the conquest and occupation of Algiers by the French, and which has already been the subject of so much discussion. M. Guizot replied to M. Durand at great length, and in the following terms :—"In the conversation which I related to the Chamber during the debate on the address, Lord Aberdeen spontaneously told the Ambassador of the King in London, that in 1830, he had addressed to the French Government protests, and urgent and unceasing reclamations, with regard to our occupation of Algeria, but that now he did not intend to resume that position; that his attitude was different; that a possession of ten years was, in his eyes, a fact of importance—a thing effected, and that he had no objection or observation to make on the subject. 'The difference between these two words,' said M. Guizot, 'I must say, is of little moment. The conversation had not been brought about by our Ambassador. The words were spoken spontaneously. The sanction of time, the conquest becoming progressively thus accomplished, behold! what struck Lord Aberdeen, and what he simply and rationally said; for, in reality, this is a simple and evident fact, which ought not to have given rise to such a controversy. Ten years ago,' continued M. Guizot, 'I was perhaps the first to say from this tribune,—France has conquered Algeria, France will retain her conquest! The words which I pronounced at that period I now repeat: everybody repeats them, or will soon do so. You cannot wonder that time was required to accomplish that result,—conquests naturally always require time. Such was the case in all conquests; the sanction of time alone gives to them an authority and an acknowledged security. Well! the words addressed by Lord Aberdeen to the Ambassador of the King in London implied nothing else than the acknowledgment of the sanction progressively given by time to our establishment in Algeria. Those words were pronounced with a good feeling, in a spirit of good understanding and peace, for the sake of not being obliged, after a lapse of ten years, to renew the reclamations and controversy which were so lively in 1830. Those explanations, spontaneously given by the English Minister, were fairly transmitted to me by the Ambassador of the King in London. A difference in the expressions is of little consequence. Between grave and sensible men, the main point is alone of importance; I am not come here to raise a discussion about words; I merely assert the fact, that France has conquered Algiers, and that a possession of 12 years has induced the British Cabinet, and the statesman who had raised the most serious objections, and protested in the most earnest terms, against the occupation of that country, to take, on his resumption of office, a totally different attitude, and to observe on that question the same silence as his predecessor. When a still longer space of time shall have elapsed—when the authority of additional years shall be added to that of our firm determination to keep our establishments in Algeria—you will see the British Cabinet, as well as other Cabinets, and the Porte itself, take new steps; and the most complete and definitive sanction, and the admission of our rights by all, will consolidate our establishment in Africa, as has been the case with respect to every other great conquest." In a subsequent part of his speech, M. Guizot distinctly tells Lord Aberdeen that upon the very first opportunity he will put the validity of his recognition to the test, and that should anything occur to necessitate the appointment of a new British Consul at Algiers, he must either have his *exequatur* from the French Government, or England must remain without a Consul at Algiers. All the journals comment at great length on this speech of M. Guizot, which they term a remarkable one; and some of them state that the determined language assumed by M. Guizot on this subject surprised the diplomatic corps. Coming so immediately after his refusal to ratify the treaty of the five Powers for the suppression of the slave-trade, this voluntary proceeding of M. Guizot is regarded by the papers to be an intimation to the British Cabinet that it must not expect hereafter to find the French Government disposed to meet and acquiesce in its wishes; and they even assert that the late news from British India is not unconnected with the change which has taken place in the Minister's language.

Treaty of Commerce with England.—It is stated by the journals that a deputation, consisting, among others, of several members of the Chamber of Deputies, waited upon M. Guizot a few days since, and urged the termination of the Commercial Treaty with England that has been so long pending. M. Guizot, in replying to them, is said to have expressed his thorough conviction of the benefits which would arise from this great compact, and the incumbent duty of bringing it to a conclusion; but added, that at the present critical moment it was not possible to proceed with a measure which, amidst its great advantages to the community at large, militated so much against so many peculiar interests; at the same time, he said, that as soon as the elections, which will take place in July, were accomplished, the treaty of commerce would be the object of his earliest and most zealous efforts.

The Navy.—The Minister of Finance presented to the Chamber of Deputies, on Saturday, the demand for the augmentation of steam-boats according to the recently-published report of Admiral Duperré on the new organisation of the Navy. The increased demand for the Navy estimates, over and above what was in the budget, is 5,385,000 francs. The ordonnance of 1837 fixed the number of steam-vessels at 40, of at least 150-horse power. The new ordonnance fixes the number at 70 steam-ships, of which five are to be frigates of 540-horse power, 15 to be frigates of 450-horse power, 20 to be corvettes of from 320 to 220, and 30 smaller vessels. At the end of 1842, the French navy would have 48 steamers, of which two are of 540-horse power, five of 450, one of 320, nine of 220, 22 of 160, and nine of inferior power. The augmentation ordained will require an additional annual expense of 140,000*l*, not included in the budget of marine. Toulon letters of the 8th instant state, that the four ships of war under orders to leave the French division under Admiral Lasusse at Ourlac were to sail on the 20th Feb., and were consequently expected daily at Toulon. The same accounts announce, that a frigate and war-steamer had sailed from Toulon for Barcelona, where it was apprehended that disturbances would occur. Another report prevalent in Toulon stated that the six ships of the line lately detached to Brest would shortly return to the Mediterranean.

SPAIN.—Accounts received from Madrid of the 5th inst. state that the reports of a Carlo-Christino conspiracy continued to create much excitement in that capital, and that extraordinary precautions were being taken in consequence by the authorities. The officers of the National Guard had held a meeting to consider the best mode of resisting any attack which might be made. The Cabinet was gaining strength, and from the preparations and movements of troops on the French frontiers, was evidently prepared for any outbreak; but the latest accounts report that such a movement was no longer regarded as probable. The debates in Congress continued to be of little interest. On the 7th inst. the Chamber of Deputies authorised Government, by a majority of 123 to 10, to continue to levy the taxes. It was reported that the Queen and her sister would pass the Easter holidays either at Toledo or at the royal seat of Aranjuez; but this appears to require confirmation. The Regent was making preparations for giving an entertainment at his palace of Buena Vista on a grand scale. Private letters state that the Government had sent a power of attorney to M. Sancho, its Minister in London, authorising him to issue the new stock arising out of the centralisation of Spanish coupons; and that a further remittance had been forwarded to London by M. Surra y Rull on account of the British legion. The "Gazette" contains a circular letter of the Minister of Justice, denouncing a pamphlet printed in Toulouse by M. Magin Ferrer, in vindication of the Pope's "allocution," dated the 1st March, 1841, as advocating principles contrary to the rights of Spain, and to the laws which she had given to herself, and consequently forbidding its circulation through the kingdom. Gen. Van Halen, the Commander-in-chief in Catalonia, who had been in Madrid on leave of absence, had left the capital to return to his post, with special instructions for putting down any insurrectional movement in Catalonia. The Carlist chiefs, Felip and El Machacho, continued to scour that province. The "Constitucional," Barcelona journal, having published several articles in which King Louis-Philippe was spoken of in offensive terms, the French Consul in that city had demanded reparation for the insult from Gen. Van Halen. The latter had referred the matter to the Government, who, it appears, had enjoined the Captain-General to grant the required satisfaction. Tranquillity was quite restored in Valencia; and the authorities had despatched cruisers on the coast of Andalusia to prevent any landing of Christino insurgents between Tarifa and Tangiers. Private correspondence from St. Sebastian of the 7th inst. states that the authorities continued to enforce the strictest precautionary measures along the frontiers. Gen. Rodil was shortly to transfer his head-quarters from Vittoria to Tolosa, and Gen. Alcala from St. Sebastian to Irun, that is, on the very extreme frontier. A proclamation, dated the 5th inst., had been issued by Gen. Rodil, commander-in-chief of the Spanish army of the north, from his head-quarters at Vittoria. By this *bando*, every individual arrested in the Basque provinces, whose passport is not strictly *visé*, both by the Spanish and French authorities, is to be tried by a court-martial and shot. Every soldier, national guard, or inhabitant of the Basque provinces, who shall seize any person attempting to corrupt the troops or population, is to receive 500 reals, and a similar sum will be delivered to any one who arrests a Spanish emigrant, even unarmed, found in the provinces without proper authority to return to Spain. This *bando*, it is said, had been issued in consequence of alarming rumours of an insurrection that was to break out in a few days. Gen. Rivero, who was at Pampluna, had received orders to repair immediately to Burgos, to answer some accusations brought against him. The National Guard of Murcia had resolved that, should any crisis arise, every Moderado should be put to death, and the installation of a central junta in Andalusia was agitated. Algesiras letters of the 2d inst. mention the endeavours of a Carlo-Christino junta, established at Gibraltar to produce an insurrection in the south of Spain, and state that money and arms are not wanting. They add, however, that the authorities at Algesiras and Tonfa were on the alert, and were well seconded by the National Guard.

PORTUGAL.—We have received by the Montrose steamer intelligence from Lisbon to the 7th inst. The Queen having refused to grant decorations to the chiefs of the late Chartist movement, had given dissatisfaction to their friends, and had occasioned a report of a dissolution of the Cabinet. Private correspondence, however, informs us that for the present, at least, no changes were deemed likely to take place. A council of state had been held to regulate the plan of the ensuing elections. It appears that the Government, as now formed, expected the general support of the leading men of the Chartist party; but it was believed that intrigues would not be spared against Costa Cabral, against whom the opposition is both hostile and personal, and whose influence is shaken by his being unable to reward his Oporto friends. Private letters ascribe the origin of the late events to causes proper to Portugal itself, and not to any foreign influence or intrigue—to the ambition of Costa Cabral, the opposition being also viewed as not directed against the change, but against its author. A French steamer of war had arrived from Toulon; and it appears that a small French squadron was expected at Lisbon. Dinner-parties to the Pope's Nuncio had been given by the Queen and the Duke of Palmella. The Duke of Terceira had also given a grand entertainment to the diplomatic body, the Duke of Palmella, and the members of the Cabinet. A letter from Oporto mentioned that the Spanish troops had withdrawn from the northern frontier, and there were reports of an insurrection in the north of Spain. It was reported also by passengers arrived from the south of Spain that a Christino movement was on the point of breaking out in Andalusia.

GERMANY.—Accounts received from Vienna confirm the report mentioned in our last, that Prince Paul Esterhazy has finally made up his mind to retire from public life altogether, in order to devote himself to the improvement of his extensive estates in Hungary. Private letters received from Goritz give a satisfactory report relative to the latest examination of the fractured thigh of the Duke of Bordeaux, made by Dr. Delauny, a French surgeon. Dr. Delauny's report, published with the sanction of Professor Récamier and Cruveiller, of Paris, and of Doctors Bougon, Watman, and Russ, who attended the Royal patient, states that the consolidation has been effected without any shortening of the limb; and what is regarded as surprising, from the nature of the fracture, without the slightest deviation of the foot from its normal direction. On the 21st Feb., nothing remained of the accident but a little weakness and articular rigidity, the natural consequence of the long confinement of the Prince, and of the restraint on the limbs by the apparatus.—Accounts from Berlin of the 9th inst. inform us that the King of Hanover had arrived in that capital from Hanover; and various reports were afloat relative to the object of his visit. According to one of these rumours, his Majesty is about to abdicate, and to fix his future abode at Berlin. The Government has been consigned to his son during his absence; and if affairs should be satisfactorily managed, it is said to be the King's intention to renounce the throne. It does not, however, appear that much credit is given to this report. The journals state that the military operations in British India become more and more interesting; Captain Von Ortish, an able officer, will be sent on the part of Prussia to be present at the operations there. He will, it is said, shortly embark for England, to accompany the next expedition, with the full pay of an English captain. It is now announced as certain that the King will go in June to St. Petersburg, to be present at the celebration of the 29th anniversary of his sister, the Empress of Russia, on the 13th June. His journey, it is said, will be attended with the same splendour as that to England. His Majesty has conferred the Order of the Red Eagle of the first class on Sir Henry Hardinge.—Intelligence has been received of the death of the Grand Duke of Mecklenburg Schwerin, who died at Schwerin after an illness of several days, in the 42d year of his age. He is succeeded by his son Frederick Francis, born 28th February, 1823. By the death of his Serene Highness the Courts of Berlin, St. Petersburg, the Hague, &c., will be placed in mourning.—Prince Puckler Muskau is stated to have had another serious fall from his horse at Muskau, which it is feared will render it necessary for him to use crutches for some time.

ITALY.—The "Giornale delle due Sicilie" of the 14th ult. speaks of earthquakes which had caused considerable alarm throughout the kingdoms of Naples and Sicily during the last two months. At Rossano in the Upper Calabria, and at Patti in Sicily, the earthquake was felt at intervals during four days from the 19th to the 22d Jan. Teramo, Civita St. Angelo, Torre de' Passeri, in the Upper Abruzzi, and Chieti and Lanciano, in the Lower Abruzzi, have also been visited with this scourge, which spread desolation amongst the inhabitants, and it required great vigilance on the part of the police and gendarmes to prevent disturbances. A letter from Naples states that on the 22d ult. an accident, which might have been of a serious nature, happened to the Duchess de Montebello, the lady of the French Ambassador. The Duchess was on horseback coming out of the grotto of Posilipo, when she was thrown from her seat by coming into sudden contact with a horse mounted by one of the piqueurs of the Queen Dowager. The Duchess had her wrist sprained, and received a severe wound on the cheek, the skin being nearly torn off. The surgeons have succeeded in closing the wound, and it is hoped that no traces of it will remain.—Letters from Milan state that the court of Brazil has not acceded to the terms proposed by the Sardinian Government for the marriage of the Prince de Carignano with the Princess Januaria; and consequently the negotiation is broken off. Letters from Naples state that at San Salvador, near Mount Vesuvius, an astronomical observatory and physical and chemical laboratory have been established for the purposes of scientific inquiry during eruptions.

Russia.—Letters from St. Petersburgh say that a mutiny of some importance had broken out among the troops there, and that several staff-officers had lost their lives. No details, however, respecting the grounds of the dissatisfaction of the soldiers are given in the letters, and the whole report appears to require confirmation.

Denmark.—Accounts received from Copenhagen, dated the 4th inst., inform us that several meetings of part of the inhabitants of that city and neighbourhood had taken place to consider of a plan for paying off the national debt by means of voluntary contributions. An address to his Majesty, stating the desirableness of such a proceeding, and the general wish of the nation that it might be realised, and giving the outline of the plan, was agreed upon. This address was presented to the King on the 3d, and graciously received. His Majesty thanked the authors of the address for the feelings which had prompted them to set about so great a work, and expressed his hope that he might be able to assent to their plan, respecting which he promised to declare his determination in a special rescript.

Greece.—Private letters from Athens, dated the 27th Feb., state that a rupture between Greece and the Porte is in all probability near at hand, unless the European Powers prevent it by prompt interference. The Turks, it is stated, have collected above 8,000 men on the frontiers, where the Greeks have also assembled about 4,500 men, which the Government is daily increasing. On the 23d inst., Mavrocordato embarked on board the Austrian steam-packet for Constantinople, as Greek Minister to the Porte; while, on the same day, it is added, the cavalry stationed at Athens marched to the frontiers, and cannon were embarked from Nauplia for Zeitouni. These accounts state that King Otho hopes to take advantage of the public feeling against the Turks; that he openly declares that he will sign a treaty with the Sultan at the gates of Constantinople; and that he calculates on the French, who, it is said, have declared that the Turkish fleet shall not come out of the Dardanelles.

Turkey.—Private correspondence received from Constantinople, by way of Germany, states that Sir S. Canning has recommended the Sultan to send Emir, third son of Emir Beschir, to govern the Lebanon in lieu of Omar Pacha. Hafiz Pacha has taken the War-office *ad interim*, which is considered to betoken the increasing influence of Chosrew. Intelligence had been received in Constantinople of an extensive fire at Trebisond, on the evening of the 4th Feb. It raged the whole of the night, and destroyed 500 ships, about 10 houses, and a khan, but fortunately the greater part of the property contained in them was saved. Three deputies of the Greek, Armenian, and Armenian-Catholic population of Pera, who had been appointed to make the distribution of the ground situated in the quarter of Pera lately destroyed by fire, have just been arrested and imprisoned on a charge of fraud in the exercise of their functions. Letters from Belgrade, of the 1st inst., state that a sanguinary scene had lately been enacted on the frontiers of Montenegro, in the direction of the Herzegovine; that a troop of Turks had made a sudden inroad upon the territory of Gralsone, which is considered as neutral, and is inhabited by Christians, and had decapitated seven shepherds, and carried off 40 other inhabitants, with numerous head of cattle. Reprisals were expected to be made by the Montenegrians. Prince Vasenich, the English Vice-Consul at Novi Bazar, is said to be not only confined there, but, in consequence of orders from Constantinople, to be treated with increased severity. The arrival of Prince Mavrocordato from Athens, to assume his functions as Ambassador, was daily expected.

South America.—We have advices from Buenos Ayres of the 18th Dec., and Rio Janeiro of the 19th Jan. The Admiral of the Buenos-Ayrean fleet had captured a Montevidean 14-gun brig with 103 men. The United States had five first-rate frigates cruising off Rio. News from Rio Grande to the 21st Dec. reports that the rebels were much weakened. His Excellency Señor de Silva Pontes has been named President of the province of Para, and Manuel de Souza Pinto for Maranham. A considerable remittance has been received by the packet that brought these advices for the Brazilian dividends, more particularly, it is stated, on account of those which fall due in June on the Portuguese loan taken to account by Brazil.

Parliament.

HOUSE OF LORDS.

Monday.—After the presentation of petitions, the Lord Chancellor stated that the select committee to which the Dissenters' Marriages (Ireland) Bill had been referred, had come to a resolution that the further proceedings on that measure should be postponed until the return of the judges from the circuit, some cases having occurred in Ireland which had been reserved for the Court of Queen's Bench in that country, and would probably be brought under the judicial consideration of their lordships.

Lord Brougham agreed that no inconvenience would arise from the suspension of the bill for a time. There would, he thought, be no risk of any party marrying a second time. After what had been said on the subject, any one who should do so would do it at his own peril.—Lord Campbell concurred in the propriety of the proposed course.

The Marquis of Clanricarde put questions to the Secretary for Foreign Affairs as to the advice given by the British Government to that of Spain, in reference to the presentation of the credentials of the French Ambassador.—The Earl of Aberdeen replied that the British Government, in the spirit of sincere friendship towards Spain, had suggested a compromise of the matter in dispute, but the Spanish Government put a construction upon the constitution of their country which prevented this friendly suggestion from taking effect. This, he said, was unfortunate, as it tended to obstruct the efforts of this country to promote the renewal of diplomatic intercourse between Spain and the Northern Courts. His Lordship added that he would not, however, despair of the ultimate accomplishment of this important object.—After a few remarks from Lord Clanricarde, the conversation dropped.

The Lord Chancellor laid on the table a bill for the amendment of the law respecting bankruptcy.

On the motion of Lord Wharncliffe, the Loan Societies' Bill, and the Regulation of Apprentices' Bill, were read a third time and passed.

Tuesday.—The Lord Chancellor stated, in reference to the report which he presented on Monday, from the committee on the marriage law of Ireland, that he had that morning received some resolutions passed by the general assembly of the Presbyterians of Ireland, held at Belfast, and communicated to him by the moderator. Two of those resolutions referred to a case which had been tried at Carrickfergus, and the first of them expressed an anxious wish that under the circumstances of that case Parliament would abstain from legislation until a decision had been obtained by appeal to the House of Lords, which might determine what the marriage law of Ireland really is. The second resolution expressed their satisfaction at the appointment of a select committee by the House of Lords, and the reference of the Irish Marriage Bill to that committee. The Lord Chancellor thought that these resolutions were an additional proof of the expediency of the recommendation of the committee to postpone the bill for the present.—Lord Brougham concurred in this view of the question. A number of petitions on different subjects were then presented, and Lord Brougham postponed until Thursday a motion of which he had given notice relative to the Income Tax.

Thursday.—After some conversation between Earl Fortescue and the Duke of Wellington, on the subject of the proposed alteration of the New Poor Law, Lord Brougham brought forward his resolutions on the proposed Income-Tax. After vindicating the right of the House of Lords to discuss all matters connected with the finances of the country, he admitted that the state of the revenue, as compared with the expenditure, compelled Government to resort to the hard necessity of an income-tax. He then reviewed the conflicting opinions of those who opposed and those who supported an income-tax; declared that it would be unjust not to make distinctions between incomes derived from different sources, such as from property and from professional labour; dwelt on the inquisitorial nature of the tax, exposing private affairs; and expressed his regret that, in a time of peace, the situation of the country should compel Government to resort to such an expedient as an income-tax, which he hoped would not be retained one hour beyond the existence of the necessity by which it was required. "I cannot conceive," he said, "anything more deplorable than the situation of a professional person whose income is reduced by the weight of this tax—a tax which he cannot, if honest, escape—a tax which no honourable man would endeavour to escape—a tax which it may be utterly impossible for many such persons to pay without reducing them to a state of exigency which it is painful to contemplate; having no capital to support them in case of emergency, their whole subsistence and that of their family, and the chance of providing for that family, depending upon their personal exertions; where illness, weakness, altered circumstances (without any fault of their own), may concur to overwhelm them; with none of the resources of capitalists, and with no means of borrowing money to help out the diminished income; and exposed to all the hazards which beset professions—I lay on one side, and set off in favour of the trader, and as against him, the chances of a profession--of my profession, or the medical profession, or the church, in which success depends, in a great degree, upon the party's own exertions,—I set off in favour of the trader these chances of professions, and the variation of the popular gale; but the professional or literary man has many difficulties and risks in a situation which requires a continuance of health and strength:—a weakened mind and spirits; a debilitated frame, exhausted in the exercise of his profession; disease and premature decay suspending his powers and cutting short his life." The noble and learned Lord proceeded to say, that he hoped and trusted that some attention would be paid to the peculiar situation of professional men before the decree went forth subjecting them to the same rate of tax to which those who derived profit from the land, the funds, and trade were about (he must say justly) to be exposed. If other incomes were subjected to 3 and 4 per cent., and those of professions, clergymen, physicians, lawyers, and literary men, were taxed at 1 per cent., he thought there would be still enough to supply the deficiency. He had not, as yet, said one word upon that part of the income-tax which, after all, was the most hateful and the most difficult to avoid—he meant its inquisitorial character. As if it were the fate of this tax to fall most unequally upon different persons and different species of property in different classes of the community, instead of being recommended, as it was most vainly and thoughtlessly said to be, by its great equality; as if it were to be the fate of this tax to fall unequally in all its pressure, so in this, its worst of pressure, its inquisitorial action, it fell most unequally upon different classes. What was it to the fundholder to let the extent of his income be known, a thing which of necessity must be known to all mankind? What was it to the person in a public office, whose income was as well known as the name of the office itself? Compared with the trader and the professional man, what was it to the landowner? It might be that the landowner was sufficiently punished by having his incumbrances inquired into. Still what was it? It was a great inconvenience. But what might be only an inconvenience to him, might be absolute ruin to the trader. It was not a a matter of morbid sensibility, of wounded vanity or pride, or what you will, that made the trader adverse to have any one prying into his concerns. To him, as a trader, it might be a matter of life or death to have it known in what particular circumstances he was placed. The consequence as regarded him was this, that he was obliged to pay upon a much larger income than he really possessed. He gave in his account sinking his losses, and the next year might see his name in the "Gazette" for having done so. It was said that these things were told to honourable persons—that they were not made public, that they were brought before a board, and that it was commissioners only to whom they were made known. But, then, they were commissioners not of the trader's own choosing, and they might be just of all the community the very individuals from whom he would rather conceal the exact state of his affairs. The regret with which one saw such a magnificent national resource as this presented in time of war anticipated and resorted to in time of peace—the bare knowledge by the rest of the world that we had this splendid resource upon which to retreat, that we might levy, as we did before, by war taxes, upwards of 20,000,000*l.* in one year, to support the necessities of the war—the bare knowledge of that fact incalculably increased, and to a certain degree, notwithstanding our now having recourse to it partially, would still incalculably increase the weight, the name, the power, and the influence of this country in all its negotiations and proceedings—an influence which it might possess, which it ought to possess, and which he hoped it ever would possess, as long as the moderation and justice, and conciliatory and peaceful spirit in which its immense power was wielded should entitle it to possess, but not one instant longer; and as long as it acted in that spirit, its power and influence would never be thwarted by any part of the world, because all the world would respect it. The noble and learned lord then moved a series of resolutions in accordance with these views, affirming chiefly that a direct tax upon income ought never to be resorted to unless in some great emergency of public affairs, when an extraordinary expenditure may become unavoidable for a time, or in some pressure upon the finances of the country, which can be sustained by no other means.—The Earl of Ripon moved the previous question. He thought the course adopted by his noble and learned friend likely to produce inconvenience, by fettering their lordships, and prejudging a measure about to be regularly brought under their consideration.—The previous motion was carried with only one or two dissentient voices.

HOUSE OF COMMONS.

Saturday.—Mr. Greene, the chairman of committees, brought up the report of the Committee of Ways and Means, containing the following resolutions:—1. That there shall be levied, after the 11th March, 1842, on every gallon of spirits in Ireland an additional duty of 1*s.* 2. That the malt allowance now payable on every gallon of spirits distilled in Ireland from malted corn only, not being mixed with any unmalted corn or grain, shall cease and determine. 3. That, towards making good the supply granted to her Majesty, the sum of 8,000,000*l.* be granted out of the Consolidated Fund of the United Kingdom of Great Britain and Ireland. The report was agreed to, and leave given to bring in bills conformably with the resolutions.

Mr. Greene brought up the report of the Committee on the Exchequer-bill Loan Act. The committee had resolved "That her Majesty be enabled to direct issues to be made out of the Consolidated Fund of the United Kingdom of Great Britain and Ireland, to an amount not exceeding 360,000*l.* per annum, to commissioners, to be by them advanced towards the completion of works of a public nature, for the encouragement of the fisheries, or the employment of the poor, on due security being given for the repayment of the sum so advanced." The report was agreed to, and leave was given to bring in a bill in conformity with the resolution.

Mr. Greene brought up the report of the Queen's Bench Prison Bill, which was agreed to, and the bill ordered to be read a third time on Monday, if then engrossed.

On the motion of Lord Eliot, the Newgate Gaol (Dublin) Bill was read a third time and passed.

Monday.—After several notices of motion, Lord Stanley stated, in reply to a question from Sir G. Grey, that it was his intention to bring in a bill to regulate the constitution of South Australia.—To a question from Mr. C. Buller, in reference to the proposed Income Tax, the Speaker replied that it was against the rules of the House that any petition should be received against any tax which had come under the consideration of the House, and therefore after Sir R. Peel had proposed his resolution, it would be impossible to receive any petition against the tax in question.—In the course of a conversation as to the stage at which the discussion on the Exchequer-bills Fraud Bill should be taken, the Chancellor of the Exchequer stated that the names of the Commissioners he proposed to appoint were Lord Devon, Serg. Stevens, and Mr. R. Mitford. The bill then went through committee.

Mr. Sheil put questions to Sir R. Peel, in reference to Spanish affairs, similar to those put by the Marquis of Clanricarde to the Secretary for Foreign Affairs in the upper House.—Sir R. Peel made a reply similar in substance to that of Lord Aberdeen.

The House then resolved itself into committee on the Corn Importation Bill.—Mr. Ward moved for a committee to inquire into the amount of those burdens, peculiar to land, which had been pleaded as the reason for a special protection to landed produce. The poor-rates, the highway-rates, the church-rates, the tithes, he could not agree to consider as burdens borne exclusively by the land; which, he contended, suffered no burdens that were not just and equitable.—Col. Wood (Brecon) shortly argued for the equitable title of the landed interests to be compensated for their burdens, in the shape of a protection on corn.—Mr. M. Gibson maintained that the manufacturers had as good a right to bring foreign corn to market through the agency of exchange for their goods, as the agriculturists have to sell corn grown upon English lands; and it lay therefore on the agriculturists to show why the importation of foreign corn should be restricted. He called on the representatives of the landed interest in the House, for their own sakes, to grant the committee of inquiry.—Mr. Darby contended that Mr. Ward had not stated the case either fully or fairly, and repudiated the idea that the House was not to legislate on corn until an inquiry had been made into the burdens borne by the land.—After a few remarks from Dr. Bowring and Mr. Childers in support of the motion, and from Mr. Scarlet and Mr. Palmer in opposition to it, Sir R. Peel called the attention of the House to the position in which it was placed. Was it, he said, wise to go on with protracted discussion, and impede the progress of a bill admitted to be a great improvement on the existing law? He protested against the tactics of Mr. Ward, who had now brought on his motion in a form wholly different from that of his notice. It might or might not be fitting to inquire into the subjects now mooted, but certainly it was not fitting to delay this law till that inquiry could be completed. The existence of special burdens upon land was only one of the reasons he had urged for this law. To disprove Mr. Ward's opinion, that tithes and church-rates do not constitute such a burden, the right hon. Baronet then cited Dr. Adam Smith and Mr. Ricardo. He had not found, he said, any repugnance among the landed gentlemen to meet the inquiry now sought; but it would not be a very brief one, nor very easily disposed of; and he could not be content to wait a three years' investigation, and should therefore oppose the present motion.—Mr. Strutt quoted a former speech of Sir R. Peel to show that church-rates were a burden, not on the landowner, but on the land.—Mr. Cobden complained of the apparent indisposition of the Ministerial party to discuss this subject. So far from bearing special burdens, the landowners, he considered, had ever employed their legislative influence to exempt themselves from taxation, and impose exclusive burdens on other classes. He inveighed against the proposed income-tax, and threatened Sir R. Peel with the indignation of the middle classes, who would not, he said, bear inquisitorial visitations to uphold the monopoly of the landholders.

Lord Worsley said that he was strongly opposed to Sir R. Peel's bill, but that he could not consent to combat it by means of such a motion as the present.—Mr. Villiers apprehended that Lord Worsley resisted the inquiry, just as the gentlemen opposite did, from fear of its result. He entered into some particulars of taxation, in which he considered the landholders as unduly favoured.

Lord Howick would not support the motion. He felt the force of Sir R. Peel's argument against further delay, and objected to the practice of bringing on motions by way of amendment to the orders of the day, as tending to narrow the time available for the important measures of Government.—After some remarks from Mr. Wakley, recommending Mr. Ward to withdraw his motion, and from Mr. Duncombe, the House divided, when the numbers were—For the motion, 115; against it, 230. Majority, 115.

In committee on the bill, Sir V. Blake recommended, as an Irish member, some encouragement to the production of potato-flour, and expatiated, amid considerable laughter, upon the history and virtues of the potato. He concluded by moving to fill up the first blank with a date which would have the effect of suspending the payment of the duties until April 1843. His amendment was negatived without a division.—Some other unimportant amendments were proposed, all of which, however, were negatived without a division. Some progress was then made with the bill, and the House resumed.

The Rivers (Ireland) Bill passed through a committee. The West India Clergy Bill was read a third time and passed.

Tuesday.—The House was occupied with private business till past six o'clock, after which a variety of notices of motions were given, and questions asked, for the most part, however, of an unimportant character.

Sir B. Hall opposed the second reading of the Marylebone Parish Bill, moving that it be read that day six months. After some discussion, Mr. Wakley defended the Marylebone Vestry, and affirmed that they had reduced both the parish debt and the parish rates, and had attended to the poor. The bill, he said, was a flagrant and flagitious job, and he hoped it would be rejected.—After some observations from Mr. Hardy, and Sir C. Napier, for and against the bill, Mr. Leader asked if it were reasonable to pass a bill of that kind, called a private but really a public bill, containing 275 clauses, in the face of the facts of the case? On a division, the second reading was carried by 206 to 131.

Mr. F. T. Baring put a variety of questions as to the mode in which Government intended to collect the proposed Income Tax?

Sir R. Peel complained that Mr. Baring had put so many questions, to all of which he required answers. He could not explain the proposed machinery for collecting the Income Tax, consistently with a sense of his public duty, until the fitting time arrived, which would be on Friday.

Lord Howick thought it would be hard to ask the House to assent to the resolution, affirming the Income Tax, on Friday, without giving time to consider the nature of the machinery for collecting the tax, which was a very important consideration.—The subject dropped, after some explanations from Mr. Baring and Sir R. Peel.

Dr. Bowring then moved a resolution, having for its object the continuation of inquiries and negotiations relative to the quarantine system. He represented it as not only vexatious, but extremely expensive in the losses inflicted by it upon commerce, and attributed the maintenance of it to the sinister interests of the various officers employed in its enforcement.—Sir R. Peel acceded to the motion.

Sir A. L. Hay brought the state of the Church of Scotland under the consideration of the House. After giving a sketch of the various circumstances out of which the present difficulties of the Scotch Church have arisen, he contended that Government must interfere, in order to prevent the disastrous consequences likely to ensue from collision between the General Assembly and the civil courts. He wished to see an amicable settlement of these difficulties, by which the wishes of the people of Scotland, as to a voice in the choice of their pastors, might be consulted; and he called, therefore, on Government to deal with the question boldly, according to the dictates of common sense and reason.

Sir J. Graham deeply felt the merits of the Scottish establishment, and sincerely regretted the recent divisions; but the gallant mover had suggested no practical course for healing them. At this moment there were legal questions pending before the Court of Session, the decision of which would go far to settle the matters in dispute; and such a moment was one peculiarly unfit for legislation. The duty of Government for the present would be, therefore, not to legislate, but to stand by the law, whose decision had been against the validity of the Veto Act. He could not comply with the present motion.

Mr. F. Maule took a different view of what was the law of the land. The Church of Scotland, he said, had an independent spiritual jurisdiction, guaranteed by legislative enactment; and he deeply regretted the determination of Government not to interfere in a question involving so much of difficulty and practical doubt.—Mr. A. B. Cochrane had intended to support the motion, but was satisfied by the declaration of Sir J. Graham that the law should be obeyed.—Mr. A. Campbell little thought that his first speech in the house was to be in condemnation of a Government which he had done all in his power to place in its present position. Sir J. Graham, he said, would find that he could not put down the Church of Scotland. The hon. Member then attacked Mr. Cochrane in terms of great vehemence, regretting that his father, Sir Thomas, had not brought him up in better principles.—After explanations from Mr. Cochrane and Mr. Campbell, Mr. C. Bruce eulogised Sir J. Graham for the mode in which he had disposed of the Crown patronage in the Church of Scotland; and contended that before a new law was passed, the church must exhibit its disposition to obey it, by submitting to the existing law.—After some observations from Mr. Duff, Sir A. L. Hay withdrew the motion on which the discussion had been founded.

Mr. A. Campbell, in moving for a select committee on the Church of Scotland, apologised for the warmth of his previous speech, and urged, as a reason for his motion, the imperfect knowledge of English members in general upon this subject. On a dispute between two co-ordinate powers, some higher power, he thought—in this case that of Parliament—should be called in.—Mr. W. Cowper admitted his unacquaintance with the subject, and wished for that information which he thought a committee would be likely to afford.

Sir J. Graham said, that as Government had determined to sustain the law, it would be acting inconsistently to grant a committee to inquire into the law.—Mr. F. Maule, seeing that Government were not going to interfere in the question, would vote for the committee, in order to elicit information.

Sir R. Peel said, he was not surprised that Mr. F. Maule had advanced no reasons in favour of a select committee. If that hon. member had thought such a course at all a likely one for the settlement of the question, he would doubtless have proposed it when in office. Had the present Ministers wished to act shabbily, and escape responsibility, their resource would have been to concede this committee. If gentlemen wanted information, they would find enough in the judgments of the judges, and the voluminous pamphlets of individuals, without resorting to a select committee. The course which Government now proposed to take was that already taken by Lord Melbourne. A committee would only inflame existing differences, and not advance the settlement of the question a single step. If any gentleman had any probable plan for settling it, let him bring in a bill for that purpose.

Mr. A. Campbell read an extract of a letter from Dr. Chalmers, approving of his intended motion. He would willingly, he said, bring in a bill, but he knew it would be opposed by the blind supporters of Government. The House then went to a division, when there appeared—For the committee, 62; against it, 139; majority, 77.

Mr. Ferrand moved for copies of convictions under the act against the truck system. He declared himself ready to prove a strong case of oppression by the masters upon their workmen, and to falsify those denials of truck-dealing which some of the manufacturers had sent to the House.—After a few words from Mr. Scholefield, the return was ordered.

Wednesday.—A number of petitions were presented, and several private bills were forwarded in their respective stages.

In reply to a question on the subject of the proposed Income Tax, by Mr. M. Gibson, Sir R. Peel stated that the operation of the tax would apply to pensioners on the Consolidated Fund, in common with the rest of her Majesty's subjects. The right hon. Baronet then proceeded to make the following statement:—I may take this opportunity of making a communication to the House, which I am sure the House will receive with the greatest satisfaction. When I, on the part of Government, intimated to her Majesty that the servants of her Majesty thought that the financial exigencies of the country were such as to make it necessary that the income of this country should be taxed to the amount of 3 per cent., her Majesty, prompted by that feeling of deep and affectionate interest which she has ever shown for the welfare of her people, observed to me, that if the necessities of the country were such as to require that her subjects should submit to an Income Tax of 3 per cent., it was her Majesty's wish, voluntarily intimated to me, that her own income should be subject to a similar deduction. The announcement was followed by loud and reiterated cheers.

In reply to some observations by Mr. O'Connell, on the subject of the religious privations to which Roman Catholic prisoners were subjected in gaols, Sir J. Graham said he believed that any prisoner requiring a clergyman was entitled, subject to the rules and regulations of the gaol, to have one.

A conversation on the subject of the charges made by the hon. Member for Knaresborough, Mr. Ferrand, against the manufacturers of the Anti-Corn Law League was then brought on by Mr. Villiers. It terminated by Mr. Ferrand stating, that "during the recess, it had been his task, and his pleasure, to converse with the working classes in his own neighbourhood, as well as with deputations from Lancashire, on the subject of their distress, and they had universally attributed it, not to the operation of the Corn-law, but to the plunder and tyranny of their masters."—Mr. Villiers, in reply, stated "that the rules of the House prevented his giving the only answer he could give to the hon. Member for Knaresborough."

Several hours were occupied by a technical discussion on the bill introduced by Mr. E. Tennent, for protecting copyright in the patterns of manufactured goods; after which Lord Mahon moved the second reading of the bill for the extension of the term of copyright in literary productions. He prefaced that motion by presenting petitions in favour of the measure from three classes of petitioners:—first, from several distinguished authors; secondly, from some of the most considerable publishers; and, thirdly, from many eminent printers. The second reading of the bill was allowed to take place without opposition, on an understanding that the discussion of its principle should take place in the committee.

The adjourned debate on Lord F. Egerton's Marriage Amendment Bill was then resumed by Mr. Borthwick, who supported the motion. He urged first, that Holy Writ contains no prohibition of a widower's marriage with the sister of his deceased wife; secondly, that the long-established objection of the Roman Catholic Church against such marriages was one of discipline, not of morality; and thirdly, that there exists no reason of social expediency to forbid these unions.—Mr. Curteis, in support of the motion, adverted to a command that the brother surviving should take to wife the widow of the brother deceased. He should vote at least for the introduction of the bill.—Mr. C. Buller also advocated the motion. If the higher classes alone were in question, he should doubt the expediency of the alteration; but considering the benefit of orphans in the lower and middling orders, he was prepared to support the proposal. There were, he said, many recommendations of the marriages in question,—equality, mutual knowledge of character, and a common affection for a beloved and departed object.

Mr. Goulburn considered discussions like the present to be injurious in themselves, as suggesting to many minds what otherwise would not have occurred to them. Thus the act of 1835 had greatly multiplied these marriages. The bill now proposed would frustrate its own object, by preventing the sister from taking the care of the children in any character except that of wife.—Mr. Brotherton said he would not oppose the introduction of the bill.—Mr. V. Smith, though his respect for Lord F. Egerton would have induced him on the former night to admit the introduction of the bill, yet, deeming the adjournment of the debate to have now put the question in the same position in which it would have stood upon a second reading, intended on the present occasion to vote against that introduction.

Mr. O'Connell also opposed it. Among the Roman Catholic population of Ireland such marriages, he said, did not occur. He thought the bill would make no addition to the happiness of domestic life.—Lord Ashley, who opposed the motion, cited the opinions of several French authorities against its principle, and the concurrence of Napoleon in the prohibition. He disliked these discussions, as unsettling the public mind upon subjects of great delicacy.—After some remarks from Mr. C. Wood, the Solicitor-General explained what was the real object of the bill of 1835, with reference to the then state of the law; and expressed his persuasion that the general sentiments had always been adverse to the marriages now in question. The proposed relaxation would, he thought, prevent the sister from giving the desired protection to the children, by rendering it inconsistent with the feeling of society for her to inhabit the house of their father.—Mr. Wakley defended the characters of surviving sisters, and of English women in general.—Mr. Hardy said a few words; after which Lord F. Egerton replied. He admitted that such discussions had their disadvantages; but this particular subject was one which, at all events, in the present feeling of the country, could not have remained unconsidered by the House. He trusted they would not give their verdict lightly, but as jurymen on a capital trial; for if it were an adverse decision, it would be the death-warrant to the happiness of many who were then anxiously waiting at their bar. The House then divided; and the numbers were—For the bill, 100; against it, 123. Majority, 23.—The Colonial Passengers Bill passed through committee *pro forma*; and various returns were ordered, on the motion of several members.

Thursday.—On the motion of Lord G. Somerset, it was ordered that Mr. Howard be taken into the custody of the Sergeant-at-Arms, for not attending to be sworn in as a member of the Wigan committee.

To a question from Lord J. Russell, Sir R. Peel replied, that he had determined to proceed at once to reinforce the army in India on getting information of the late events. To supply the deficiency of the regiments sent away, a supplementary estimate would be necessary, but he would not enter into detail as to the amount at present.—The subject of compensation to British merchants and others, for the amount of the opium destroyed at Canton by the Chinese Government, was brought under consideration by Mr. Lindsay, who moved, that on the 7th April the House should resolve itself into a committee, for an address to her Majesty, praying that a sum of money equivalent to their losses should be awarded to those merchants who, on the assurance of Capt. Elliot, acting on behalf of Government, surrendered 20,283 chests of opium.—Sir G. Staunton seconded the motion, and pointed out the serious loss sustained by these merchants, most of them Indian merchants, and some of whom had committed suicide, driven to desperation. He contended that Government was bound in honour and good faith to make compensation.—Sir G. De Larpent took a similar view, and hoped that no circumstances of financial difficulty would prevent Government from doing justice to the sufferers.—After some remarks from Sir C. Napier, the Chancellor of the Exchequer contended that the British merchants were in the power of the Chinese authorities, and were in fear both for their lives and property. Under these circumstances, though the conduct of Capt. Elliot did him honour, both the late and the present Governments did not consider that the pledges he had given were binding. Compensation was to be obtained from the Chinese Government, and was not due till the termination of hostilities with China. Apart from this, strict inquiries were going on as to the alleged value of the opium destroyed, which, he feared, was greatly exaggerated. He, therefore, resisted the motion.

Lord Palmerston admitted that the pledges given to the merchants were, that her Majesty's Government would endeavour to obtain restitution from the Chinese Government, and also that it was only the real and true value of the opium, not any specified sum, which was to be made good. But under the peculiar circumstances of many of the sufferers, he thought that the sum obtained from the Chinese Government might be drawn upon, to give them provisional relief.—After some observations from Mr. M. Philips, Mr. Jardine, Mr. J. A. Smith, and Mr. C. Wynn, all in support of the motion, Sir R. Peel rose to do justice, he said, to another party as well as the merchants, namely—the people of this country. The object of our war with China was, first to obtain restitution for injury and insult, and next, compensation to the merchants. But if it were right to appropriate the ransom of a city, not to the expenses of carrying on the war, but to the granting compensation to the merchants, why should not Parliament grant the entire sum at once? The present Government did not refuse to fulfil any engagement entered into by their predecessors; but all sums recovered from the Chinese during the war should, he considered, be applied to the vigorous prosecution of hostilities, as the means by which compensation was ultimately to be obtained.

Lord J. Russell thought that there were circumstances which entitled the merchants to favourable consideration, which might be given in a committee of the whole House.—After a few words from Mr. Lindsay in reply, the House divided, when there appeared for the motion, 37; against it, 87; majority against the motion, 50.

Lord G. Somerset moved for leave to introduce a bill to provide for the more effectual inspection of houses licensed by magistrates in Quarter Sessions for the reception of insane persons in England and Wales; and spoke at considerable length in support of his motion.—Mr. Wakley expressed his thanks to the noble Lord for the attention which he had bestowed on the subject. But his proposal, after all, amounted to this, that two persons of the legal profession should inspect hospitals for the medical treatment of persons afflicted with the most grievous of diseases. He asked the noble Lord to postpone, to a distant day, the second reading of his bill, and he (Mr. Wakley) would, in the mean time, go into the entire subject, and bring it before the house.—Mr. Hawes coincided with Mr. Wakley.—Lord Ashley hoped that Mr. Wakley would enter on his proposed analysis of the conduct of the metropolitan commissioners as speedily as possible.—After some observations from Mr. Wynn, Lord G. Somerset said that he would move the second reading of his bill before Easter, but would give ample time for its consideration in committee.

Mr. T. S. Duncombe moved for the appointment of a select committee to inquire into the administration of relief to the poor in parishes incorporated under Gilbert's Act; and to report whether it would be expedient or just to repeal those acts for the purpose of instituting in lieu thereof the Poor-law Amendment Act.—Capt. Pechell seconded the motion.

Sir J. Graham reminded the House that he had given notice of his intention to introduce a measure on the general subject of the Poor-law after Easter. He thought that by granting this committee, it would be something like shrinking from the principal question, and he thought it his duty to oppose the motion.—Mr. Wakley, Mr. Colville, Mr. R. Yorke, Mr. Liddell, Mr. Hardy, and Mr. S. Wortley, severally supported the motion.

Sir R. Peel resisted it on the ground that the appointment of the proposed committee would have a tendency to unsettle the mind of the country, and paralyse the existing authorities in the administration of the Poor-law.—After a few words from Mr. Duncombe in reply, the House divided—For the motion, 41; against it, 108; majority, 67.

Friday.—Mr. Howard was brought up in custody of the Serjeant; and, on explanation, was discharged on payment of his fees.

On the proposition that the Speaker leave the chair, in order that the House might resolve into a committee of ways and means, Mr. F. T. Baring rose, and in declaring his opposition to the Income Tax, pointed out an error in excess, in the statement of the deficiency in the finances, amounting to 100,000*l*., which he begged to present to Sir R. Peel as the first fruits of his (Mr. Baring's) "fishing for a budget" on the Opposition side of the House. After a reply from the Chancellor of the Exchequer, Lord Howick advocated a moderate fixed duty on Corn as a preferable measure to a tax on income.

Lord J. Russell then commented on the omission of sugar from the tariff. He admitted that something must be done, but the necessity was not such as to justify an Income Tax, and both Sir R. Peel and Mr. Goulburn had expressed similar opinions within very recent periods. The grand objection to an Income Tax was its inquisitorial character; its influence on the morals of the country was of more importance than the sum it extracted from the people, while its proposition held us up in the eyes of foreigners as driven to the extremity of our resources. He intended to take the sense of the House against the proposition of the Income Tax, both on the resolution in committee, and, if it should be carried, on the bringing up of the report.

The House then went into a Committee of Ways and Means; and Sir R. Peel declared that he was not disappointed by the announcement of Lord John Russell's intention of determined opposition. He had been quite aware that he had entered on no easy task to repair the financial difficulties caused by the late Administration. After explaining the amount of the actual and apprehended deficit, he said that the Government had proposed their measures to remedy the financial condition of the country, and that the existence of the Ministry depended on their being carried. He then defended the tariff from the remarks which had been made on it in the course of the evening, and contended that it was the public necessity which demanded the imposition of the Income Tax. There was no middle course to be taken between taxes on consumption and a tax on property, to make up the four millions required. He did not deny the inquisitorial nature of the Income Tax; but, apart from that, it was the best tax that could be devised; for if the Government measures became law, there would be a reduction in the cost of living which would practically reduce the amount of direct imposition. Speaking generally, he proposed to adopt the machinery for collecting the tax which was adopted by the act of 1806. The general management of the collection of the tax to be under the superintendence of the office of Stamps and Taxes; and the Land Tax Commissioners in each county are to appoint additional local commissioners, who are to appoint the assessors of the tax. The profits of trade are to be returned on an average of the three preceding years; of professions, the year preceding. Should individuals appealing against surcharges object to have their affairs canvassed before the local commissioners, then they will have the option of applying to the office of Stamps and Taxes to appoint Special Commissioners, strangers to the neighbourhood, and sworn to secrecy, whose decision is to be final. He also hoped to be enabled to introduce a provision to enable parties to compound for their assessments; and individuals would also be enabled, if they wished, to pay their assessments on property into the Bank of England, so as to ensure entire secrecy in their own neighbourhoods. No difference was to be made in the rates leviable on terminable annuities, as compared with dividends derived from stock. The tax was to be uniformly laid on income, and no exceptions would be permitted.

On the conclusion of Sir R. Peel's speech, Mr. Labouchere rose, and defended the course adopted by the Opposition with respect to the resolution on the Income Tax, the odiousness of which was not compensated by the commercial reforms proposed by Government.—After some conversation between Lord Worsley and Sir R. Peel, as to the amount of duty from foreign corn expected under the new law, the debate was adjourned.

CITY.

Money Market, Friday.—No large speculative accounts appear just now to be open in the English funds, which rose on Monday and continue firm. Consols closed $89\frac{5}{8}$ for money, and $89\frac{3}{4}$ to $\frac{7}{8}$ for the account; Exchequer-bills, 29s. to 31s. premium; and New $3\frac{1}{2}$ per Cents., $99\frac{1}{4}$.

Metropolis and its Vicinity.

Public Meetings.—On Saturday, a numerous meeting of delegates from the parishes of St. James, Westminster, St. George, Hanover-square, St. Pancras, and other places, assembled with those of St. Marylebone, to receive the answers from Sir R. Peel and Sir J. Graham to the communications as to the intended course of Government with reference to the Bill now in Parliament, for altering the present local acts of the parish of Marylebone, as noticed in our last. The letter of Sir R. Peel expressed his regret that business precluded his receiving a deputation on the subject, and stated that, as it was a private Bill, he should remain passive regarding it. That from Sir J. Graham declared that he would take no part with regard to the private portion of the Bill, but would give his best attention to the clauses referring to public Acts, especially those having reference to the administration of the Poor Law. Sir B. Hall, M.P. for the borough, said he felt certain that the Bill had been postponed in order that the clauses might be so shaped as to introduce the Poor Law commissioners into Marylebone. Other gentlemen expressed a similar opinion, and said they were satisfied that those commissioners would soon afterwards obtain the control of the other Metropolitan parishes. It was, therefore, ultimately determined that a general opposition should be given to the Bill; that the Metropolitan Members should be communicated with; that meetings should be called; that a letter should be sent to Sir R. Peel, apprising him that, though a private Bill, it went to the repeal of a public Act, and that a deputation should see Sir J. Graham on the subject. It will be seen under our Parliamentary intelligence that a discussion arose in the House of Commons on Tuesday, on the motion for the second reading of this Bill, and that it was ultimately carried by a majority of 206 to 131.—A meeting of the various branches of the leather trade took place on Wednesday for the purpose of considering the effect which the new tariff of Government would have on the leather manufacture of this country, and to take such measures as might to the meeting seem advisable. The opinion of the meeting was embodied in the following resolutions, which were passed:—That this meeting views with alarm the new tariff proposed by Government on the subject of leather, believing that the intended low rate of duty will not adequately protect the British manufacturer; that the present depressed state of the trade will not allow increased imports from the Continent, but that the meeting relies upon her Majesty's Government for a scale of duty high enough to afford protection to the British manufacturer; that while the reduction, if carried into effect, will cheapen the price of boots and shoots purchased by the higher classes of society, those worn by mechanics will not be affected; and that a deputation be appointed to represent the opinion of the meeting to the President of the Board of Trade. A petition was also prepared for presentation to the House of Commons, after which the meeting broke up.—On Thursday, the half-yearly general court of proprietors of Bank-stock was held at the Bank of England, when, after a dividend of 3½ per cent. on the half-year had been declared, it was resolved on the motion of Mr. Ricardo, in reference to the Income Tax, "That this court consider it most unjust to tax a terminable annuity in the same degree as a permanent one, by which means Bank-stock proprietors will have to pay in 'dead weight' alone no less than 20,000*l.* on capital, in addition to that on income (reckoning the interest of capital at 4 per cent. during the three years the tax would continue); and the court, therefore, requests the Governor and directors to take steps to send up a representation to Sir Robert Peel, pointing out the injustice of the case."—On Thursday, a public meeting was held to adopt measures for securing a regular and safe transit of passengers, goods, &c., to and from New Zealand and Australia, across the Isthmus of Panama. The chairman, Mr. Cotter, of Port Philip, briefly stated the object of the meeting. Mr. Evans went into a long statement upon the present mode of travelling from this country to Australia. The latter, he said, was 16,000 miles distant, and it required 66 days to reach it by steam. The mode of transit proposed, by way of Panama, was by the West India steam mail packets to Clarges, distant 3,750 miles, a journey performed in 25 days. From Clarges the goods and passengers would be passed over the Isthmus of Panama to Port Nicholson, a distance of 6,280 miles, which would be performed in 26 days. Thence they would be conveyed to Sydney, a further distance of 1,285 miles, which would be completed in five days. This overland travelling would be a saving of ten days within the time at present required. Mr. Walker could state that the shortening of the distance from this country to Australia was an object desired by the colonists. Another gentleman said that he was satisfied, from the survey taken by Mr. Lloyd, under the sanction of Government, that a passage across the Isthmus was impracticable, from its being so shoally. There was a bay about eight miles higher up that would suit the navigation very well. Several gentlemen having expressed their views upon the proposed overland passage to Australia, it was resolved to adjourn the meeting until the opinion of those who had crossed the Isthmus could be obtained.

Addresses to Her Majesty.—On Saturday, the Lord Mayor, several aldermen, the recorder, and city officers, and a large number of the common council waited upon her Majesty and Prince Albert at Buckingham Palace with congratulatory addresses on the birth of H.R.H. the Prince of Wales. The Queen received the addresses graciously, and replied to the first, which was from the Court of Aldermen, in the following words:—"I thank you for your congratulations on the birth of the Prince my son. This declaration of duty and loyalty gives me entire satisfaction. The City of London may always depend on my constant favour and protection." To the address from the Court of Common Council her Majesty replied—"I receive with great satisfaction these affectionate expressions of your duty and attachment to me and to my family. Every event which gives permanence and stability to the institutions of my kingdom fulfils my wishes, for my own happiness is inseparably connected with the welfare of my people." Similar addresses of congratulation having been presented to Prince Albert, his Royal Highness replied as follows:—"I am most sensible of the kind expressions in which you have couched your congratulations upon the birth of the Prince of Wales. The affectionate interest evinced towards the Queen is most grateful to my feelings. I pray that Almighty God may answer your prayer, that our child may grow up in every virtue, and that we may live to see our anxious care amply repaid." Addresses of congratulation were also presented to the Duchess of Kent, who returned suitable replies.

Metropolitan Improvements.—In the House of Commons on Tuesday, the Earl of Lincoln obtained leave to introduce a Bill to extend and enlarge the provisions of an Act passed in the present reign, entitled "An Act to enable her Majesty's Commissioners of Woods to complete the contract for the sale of York-house, and to purchase certain lands for a royal park." Also a Bill to empower the Commissioners of her Majesty's Woods to form a new opening from the Knightsbridge-road into Hyde-park, and a new opening from High-street, Kensington, into an intended new road across the Palace-green; and for annexing a piece of extra-parochial ground in the royal garden to the respective parishes of St. Mary Abbots, Kensington, and St. Mary, Paddington, in several portions.

The Horse Guards.—Great activity, it is said, at present prevails at the Horse Guards, and it is reported to be in contemplation to raise a second regiment of cavalry, or to add 50 additional men to eight of the cavalry regiments. The augmentation of six battalions of infantry, 14 companies of 800 rank and file to 12 companies of 1,200 rank and file, will, it is added, be effected by the selection of 36 officers, 108 non-commissioned officers, and 2,400 privates.

Mortality of the Metropolis.—The following is the number of deaths in the Metropolis, from all causes, registered in the week ending Saturday the 5th inst.:—males, 484; females, 473; total, 957. Weekly average, 1838-9-40-1, males, 467; females, 445; total, 912.

Murders.—On Sunday morning a murder of an unusually painful description, which produced great excitement not only in the immediate neighbourhood, but throughout the Metropolis, was committed at Sion College Gardens, Aldermanbury. The murderer, who, after destroying three of his own children, committed suicide, was a person called Lucas, aged 38. It appears that he had been for many years employed as a warehouseman in different houses of business in the City, but, owing to the slackness in trade, had been out of employment for nearly six months; and this circumstance, and his being unable to procure any other means of subsistence, appears to have been a source of great uneasiness of mind, and to have been the cause that led him to the commission of the act. He is stated to have been a sober and well-conducted man, and to have been much attached to his children. On the morning in question, it seems that after shaving he secreted one of his razors about his person, and then went up stairs, as was his custom, to bring down his three children to their breakfast. Having remained there a considerable time, the wife sent her niece upstairs to see what detained him; and on her entering the bedroom she perceived the bodies of the father and the three children lying on the floor with their throats cut, and an open razor in the hand of the father. Assistance was immediately procured, but life was found to be quite extinct. The children, two of whom were boys and the third a girl, were 10, 7, and 4 years of age. Immediately on the occurrence becoming known, great excitement prevailed in the neighbourhood, and thousands of persons congregated round the dwelling. The Lord Mayor and other city officers visited the spot, and every attention was paid by them to the widow, to relieve her distress and provide for her necessities. An inquest was held on the bodies the following day, but no evidence was adduced beyond the simple statement of facts given above, and the jury returned a verdict of "Temporary insanity."

Accidents and Inquests.—On Wednesday an inquest was held which developed some facts of public interest in regard to the construction of dwelling-houses. Its object was to inquire into the cause of the death of Anne Taylor, the servant who was killed, as noticed in our last, by the falling of a stack of chimneys at the residence of Mr. Atkinson, Holloway, during the violent storm on the morning of the 10th inst. The inquiry, which lasted a long time, was chiefly directed to the obtaining the evidence of professional men as to whether there had been any negligence in the construction of the premises, or non-compliance with the provisions of the Act of Parliament on this subject. From the evidence adduced it appeared that the original chimney, which was only five feet high, had lately been increased in height several feet, and though built in a zig-zag direction, had not been strengthened by any stay or bar. By the Act of Parliament, builders and others, raising or altering chimneys, were, it was stated, bound to give notice thereof to the district surveyor; but it was seldom that they did so, and in this case it had not been done. District surveyors had no power whatever in the act to control the building of a chimney to any height, or order it to be pulled down. The coroner wished to be particular upon this point, as at the present moment, he said, it was very important, inasmuch as the subject was before a committee of the House of Commons. If the law was strained, the case was one of manslaughter; but as it was proved even by surveyors, although in accordance with the law, they seldom received notices in such instances, it would be unfair in this case to press it so stringently. A verdict of accidental death could not be returned, because the Act of Parliament had not been complied with; therefore the only term which would meet the case was to say that deceased had come by her death by misadventure, from the falling of a certain stack of chimneys. The jury concurred, and after a eulogy on the conduct of the police, who, at the risk of their lives, rescued the young lady, Miss Feast, from the fate of deceased, who slept in the same apartment, a verdict to that effect was recorded.

Provincial News.

THE heavy storm that prevailed on Wednesday the 8th inst. appears to have been severely felt throughout the country, more especially in all the south-western counties: and the Wilts, Dorset, Somerset, Hants, and Devonshire papers contain long accounts of the injury done to property by the high wind. Along the coast, also, the damage to shipping has been very extensive, and numerous wrecks, attended with serious loss of life, have been reported.

Axbridge.—On Sunday night a young man, named Hadfield, entered the Parsonage-house in this town while the family were at church. His sister, who resided near, discovered a light which he had kindled, and raised an alarm, upon which several neighbours surrounded the house; and on their effecting an entrance, he shot himself, in the presence of his brother and some other relations and friends. It was then discovered that he was armed with another loaded pistol, a life-preserver, a large knife, and that his feet were padded. At the coroner's inquest, on Tuesday, a verdict of *Felo de se* was returned, and he was buried at night without funeral rites.

Berwick.—A meeting has been held under the fiat of bankruptcy against the Tweed Bank, for the purpose of closing the examination of the bankrupts, and of proving debts. The attendance of creditors for proving was large, principally from the country, and mostly for bank-notes; but the proofs, though numerous, were not heavy in amount. The schedules of the bank, and of the individual bankrupts, were read; and the balance-sheet, adjusted by the assignees, showed a dividend of 10s. 6d. per pound. A meeting of creditors had been previously held, when resolutions were entered into, to request an adjournment of the examination, and that in the mean time the schedules should be printed and circulated among the creditors, to enable them to be prepared; and that the assignees be requested to retain counsel for the examination. The assignees, however, decided against all of these requests, and the court closed the examinations.

Birmingham.—Mr. Clark, who was well known in his profession as a sculptor, died suddenly in this town on Saturday morning. At the inquest held on Monday, the first witness examined stated that about 9 on the morning in question, while in the shop of Mr. Burdett, a surgeon in New Hall-street, deceased staggered down the steps of the surgery, and appeared very ill. Witness called for a surgeon, who proceeded to bleed him, but life was extinct. Mr. Burdett, surgeon, spoke to having seen him on the preceding Thursday, when he laboured under dyspepsia, and complained of pain in the region of the stomach. He considered death to have been occasioned by the rupture of one of the large blood-vessels of the heart. The jury returned a verdict assigning this as the cause of death, as also that deceased "Died by the visitation of God." Mr. Clark was in his 47th year, and at the time of his death was engaged in casting the leaves of the foliage of the capital of the Nelson monument in Trafalgar-square, and had finished the two first. He is best known by his statue of Major Cartwright in Burton-crescent.

Brighton.—A correspondent of a morning paper states that this town has reaped some advantages from the earthquake which was predicted to take place on Wednesday in the Metropolis, as numbers of families of the middle and upper classes have recently arrived here in order to avoid its consequences. In the course of Tuesday night nearly twenty carriages arrived; a circumstance, it appears, that has not occurred since the opening of the London and Brighton Railway.

Carlisle.—On Saturday morning the Angel Inn, in this town, was discovered to be on fire, but the flames were subdued in about an hour. On examination of the premises, however, by the superintendent of police, evidence, it is said, was discovered that they had been wilfully set fire to, in consequence of which, Mrs. Christopherson, the landlady, her servant, and daughter, were taken into custody, and examined before the magistrates, when the servant confessed to having prepared peat, wood, shavings, and other materials, by her mistress's order, to burn the house, for the purpose of recovering the insurance upon the premises, under a promise to convey her to America to her husband. Mrs. Christopherson recriminated by laying the blame of the proposal to the girl. The prisoners were then removed, and ordered to be kept in separate confinement.

Monmouth.—A local paper informs us that a misunderstanding which has existed for some weeks between the proprietors of collieries on the hills, and the workmen in their employ, in consequence of which the red ash coal trade of this port has been at a stand, to the great injury of every interest connected with the trade, has at length been amicably adjusted by the masters abandoning the resolution they had adopted to reduce the wages of the men. The colliers have gone to work at the prices which they received before the strike.

Oxford.—On Sunday a serious fire broke out in the High-street in this city, in a room over the Post-office. Several engines were soon on the spot, but no water could be obtained for half an hour. During this time the fire continued to spread, and soon caught the adjoining house, which it consumed, nothing being left but the bare walls. Two adjoining houses also caught fire; but by the exertions of the firemen, aided by the citizens and gentlemen of the university, they were saved from sustaining any serious injury. Fears were entertained at one time for the Masonic Hall; but owing to an effective engine constantly playing upon it, the fire was prevented from communicating to it. Much anxiety was manifested as to the safety of the letters, till the Postmaster issued a notice stating that they were all preserved, and would be delivered in due course. The business of the post-office will be carried on for the present at the Town-hall. The origin of the fire is not known; but it is thought to have been accidental. It is stated that the amount of damage exceeds 8,000*l.*

Railways.—The following are the receipts of Railways for the past week: Birmingham, 13,416*l.*; Great Western, 10,155*l.*; Brighton, 1,918*l.*; Blackwall, 646*l.*;

Birmingham and Gloucester, 1,433*l.*; Manchester and Birmingham, 358*l.*; Eastern Counties, 703*l.*; Croydon, 326*l.*; Greenwich, 846*l.*; Northern and Eastern, 860*l.*; Manchester and Leeds, 4,133*l.*; Birmingham and Derby, 1,019*l.*; South Western, 4,299*l.*; Great North of England, 1,111*l.*; Midland Counties, 2,300*l.*; Grand Junction, 7,266*l.*; York and North Midland, 1,657*l.*; and Edinburgh and Glasgow, 1,015*l.* It is said that the Bude light is about to be applied to the Box tunnel, and that an experiment was made with it last week, which appeared to be perfectly successful. It is also proposed to have a similar light on each engine, in order to see, by means of its great brilliancy, any impediment or obstruction on the line. The twelfth half-yearly general meeting of the proprietors of the West London Railway, took place last week. The secretary read the report, which regretted that the works were in much the same condition as at the previous meeting, with the exception of having suffered some damage from the late wet season. The present unsettled state of the money-market had precluded the proprietors from rendering the directors sufficient support to enable them to complete the line. Negotiations had been entered into with the London and Birmingham, and Great Western Railway, Companies, with a view to allow them to carry their line in continuation westward, forming a junction with those two railways; but, although as yet unsuccessful, it was hoped the time was not far distant when things would be the reverse. Mr. Britton, in moving the adoption of the report, observed that he was convinced, if the company could only find sufficient funds for completing the line to Knightsbridge, the Great Western Railway must of necessity avail themselves of it to take their passengers to all the west-end districts. The motion having been seconded and carried, a long discussion ensued as to the course the directors intended to pursue with regard to the payment of the creditors of the company who had signed letters of licence extending to the 1st April. Mr. White condemned the conduct of the directors, and moved a resolution to the effect, that an adjourned meeting of the proprietors would take place on that day fortnight, in order that some distinct proposition should be laid before them as to the means of meeting the demands of the creditors of the company, to explain the course the directors intended to pursue as to the disposal of any of the property of the company for such a purpose. Being seconded, several of the directors showed that the debts of the company, amongst a great number of creditors, amounted to 37,000*l.*, and that it was impossible arrangements could be made to meet the creditors within so short a period. Mr. Crawford subsequently moved an amendment, which was carried, adjourning the meeting for a month, to receive a report from the directors as to the arrangements they had come to with the creditors of the company.—The half-yearly meeting of the proprietors of the London and Croydon Railway has been held. From the report it appeared that, through the repeated landslips on the line, the traffic had been greatly and seriously interrupted, and had greatly impeded the development of that of the Brighton Railway. Notwithstanding, the traffic for the last half-year, with the toll received from the Brighton Company (5,750*l.* 14*s.* 1*d.*), sufficed to pay the ordinary expenses of the railway, the interest on borrowed capital, and left an accumulated sum, with a former balance, of 11,125*l.* 14*s.* 7*d.* to be divided amongst the proprietors. In consequence of the unforeseen occurrences, a further capital would be required, but not for several months. The directors had concluded an arrangement with the South Eastern Company for the joint working and management of their locomotive power, the cost being to each company in proportion to its use of it. The treaty between the Eastern Counties and the Northern and Eastern Companies had induced the directors to hope that the Greenwich Company would see the propriety of relaxing their tolls, so as to lower the fares on both lines of railway. To enable the South Eastern Company to get a station for cattle and merchandise as near to London as possible, the directors had entertained their proposition to join in making an approach to the Croydon line from Corbit's-lane, about two miles from Westminster-bridge, the bill for which was before Parliament. The total capital received to Jan. 31, 1842, was 626,842*l.* 10*s.* 1*d.*, and the total payments, 637,875*l.* 10*s.* 2*d.* The coaching account for the half-year (214,833 passengers) was 14,174*l.* 19*s.*; the other receipts made a total of 19,232*l.* 13*s.* 11*d.*, which, after the expenses, left a balance of 1,073*l.* 17*s.* 6*d.*, to add to the accumulated fund. The toll paid to the Greenwich Company was 1,029*l.* 10*s.* 10*d.*; and the company's payments towards the joint station already amounted to 48,149*l.* 19*s.* 2*d.* The chairman entered fully into the various subjects of the report, and stated that 21,000*l.* had already been spent in consequence of the landslips, and that about 50,000*l.* more would be required for other purposes; and to complete the joint station the company's share required about 30,000*l.* more. After some conversation the report was adopted. Mr. Levy thought that as they were to be called upon in a few months for more capital, it would be better not to divide the 11,000*l.*; but Mr. Pare thought differently, and proposed that a dividend of 6*s.* 8*d.* per share be paid out of it, which was seconded by Mr. Capel, and carried by a large majority. The chairman then mentioned that a proposal had been made from the Brighton Company to take their railway, allowing them five per cent. per annum on the sum expended, and also that they, the Croydon directors, had proposed to the Greenwich Company 6,000*l.* per annum, in lieu of the increased toll of fourpence-halfpenny; but it was declined.—On Thursday a special general meeting of the shareholders of the London and Brighton Railway was held, for the purpose of receiving the report of the committee appointed on the 20th Jan. From the report, it appeared that the committee had examined the various accounts of the company, and had inspected the works of the railway; but from the unbusiness-like manner in which the books were kept, they could not enter into many of the points required: they, however, could report that the additional capital wanted was fully provided for, the value of the surplus land being 60,000*l.*, as stated, and the amount to be received from the South Eastern Railway an available asset. In conclusion, they recommended that the number of directors should be reduced; that the accounts should be henceforth kept upon a system; that all bonds should be signed by two directors at least; and that three shareholders should be appointed auditors. Sir I. L. Goldsmid, Bart., thought that all the shareholders would, like himself, feel much indebted to the committee; but as their report contained matters of great importance, and that required consideration, he should move that it be adopted, printed, and circulated amongst the proprietors, and that it be taken into consideration that day fortnight. The chairman and other directors thought the adjournment unnecessary, and only likely to prejudice the company, which gave rise to an amendment that the report be adopted, printed, and circulated amongst the proprietors, which was carried unanimously, on the assurance of the chairman that the recommendations of the committee should be carried out by the directors.—On Tuesday the following extraordinary accident occurred on the Great Western Railroad, about four miles from the terminus at Cirencester. While the down-train from London was proceeding at a rapid pace towards its destination, the engine, followed by the tender and two of the luggage-trucks, suddenly whirled out of the direct line, and were precipitated down a steep of from 90 to 100 feet in depth. Fortunately for the passengers, the chain which connected other trucks to those which followed the engine and tender snapped, and left them, together with the carriages attached, in safety on the bank. The engine, with its conductor, who was not hurt, was hurled down the declivity, and when near the bottom became clogged in the soil. The tender followed with a man in it, who also escaped uninjured. Higher up on the slope the two trucks became fixed, so that they could not follow the power which broke away from them. The passengers were shortly after conveyed unhurt to the terminus by another engine. The engine descended about the distance of 40 feet before it became clogged, and the tender and trucks were destroyed, and deeply sunk in the earth; but neither the conductors nor passengers suffered any injury.

IRELAND.

Dublin.—The usual weekly meeting of the Repeal Association was held on Monday, Mr. J. C. O'Callaghan in the chair. The Secretary read a letter from the St. Louis Missouri Association of the Friends of Ireland, enclosing a bill of exchange for 200*l.*, to be applied for the purposes of repeal. With the exception of this communication, the proceedings of the meeting were without interest.—An inquiry, by order of Government, is now holding into the state of the following charitable institutions receiving grants from Parliament, with a view, it is supposed, of some contemplated reduction of the amount of money hitherto voted in the Irish estimates. A similar inquiry took place in the year 1830:—Female Orphan House, Westmoreland Lock Hospital, Lying-in Hospital, Stephen's Hospital, Cork-street Fever Hospital, Hospital for Incurables, Meath-street Hospital, Cowpock Institution, Shelter for Destitute Females and Children.—A deputation of Irish and Welsh Members of Parliament had an interview with Lord Eliot on Saturday, to urge upon Government the necessity of a continuation of the Chester Railway, by Bangor, and the establishment of a packet harbour in Wales, which would greatly facilitate the Post-office communication between London and this city. Lord Eliot, it is said, promised to obtain the opinion of the Board of Admiralty upon the subject of a packet harbour.

THEATRICALS.

Italian Opera.—Her Majesty's Theatre was opened for the season on Saturday, under favourable auspices. During the recess, various alterations and improvements for the comfort of the audience have taken place, the most important of which is the adoption of a new system of ventilation, on the principle recommended by Dr. Reid. There is also an improvement at the box entrance, the different approaches being covered with crimson cloth, which, in addition to the fresh colouring of the walls, gives the whole theatre a gay appearance. The opera produced on this occasion was a new one by Donizetti, called "Gemma di Vergy," in which several performers, new to this country, made their appearance, and were favourably received. The following is a brief account of the plot of the piece:—The *Conte di Vergy* (Signor Santi), taking a fancy to *Ida di Greville* (Signora Bellini), repudiates his wife, *Gemma* (Signora Moltini), of whom *Tamas* (Signor Guasco), a Saracen prisoner and slave, is enamoured. *Tamas* avenges the object of his passion by stabbing her inconstant husband, and, being detested by her for the deed, stabs himself. *Gemma* swoons, and the curtain drops, the chorus imploring the sun to cover the walls which such abominations have sullied, with a *notte eterna* and *eterno orror.* The *prima donna*, Signora Moltini, who personated the heroine of the piece, is a fine woman, with an expressive countenance and handsome person. Her voice is a clear soprano, of large compass; her style is good, and her intonation true. She was energetic and impassioned; and her performance elicited frequent applause. The other principal performers were Signor Guasco, the new tenor, who performed in an able manner the part of *Tamas;* Signor Santi the *basso*, and Signora Bellini, who personated *Ida* in a pleasing manner. The choruses were well sung, and there was a good deal of applause at the fall of the curtain, when Signora Moltini and Signor Guasco came forward to make their acknowledgments to the audience.—The ballet which followed was styled *La Giselle*, and is founded on a wild Sclavonian legend, of certain maidens, who, being betrothed, die before their wedding-day; and, finding no rest in the grave, rise at midnight, and dance in spectral troops, arrayed in their bridal dresses. Any young man who comes upon their nocturnal orgies is lost: he is compelled to join their unearthly revel, and to dance till he drops down and expires. One of these damsels is represented by Madame Perrot, late Carlotta Grisi, and her husband was the youth who fell into their haunt, but with a less tragical termination than that contained in the legend. Both of them danced well, though M. Perrot was suffering from a hurt in his leg, on which account an apology was made for him. Mlle. Fleury, a *débutante* at this theatre, made a successful appearance, and was much applauded. The house was well filled, and many persons of distinction were present.

Covent Garden.—On Tuesday, Miss Adelaide Kemble made her appearance at this theatre in a new character, viz., *Susanna*, in "The Marriage of Figaro," and with complete success. This opera of Mozart is too well known to require any comment. The different parts in it were most effectively sustained by Miss Kemble, Miss Rainforth as the *Countess Almaviva*, Madame Vestris as *Cherubino*, Mr. Leffler as *Figaro*, and Mr. Stretton as the *Count*. The inferior characters were filled in a satisfactory manner, and the piece, so represented, went off with great spirit. The concerted pieces were well sung, and the accompaniments beautifully played by the orchestra. The scenery, costumes, and decorations, as usual at this theatre, were rich and beautiful. The success of the opera was complete.

Miscellaneous.

The Predicted Earthquake.—Wednesday, the day foretold as that on which this event was to take place, has passed by without any disturbance of the order of nature, and thus this popular delusion has proved to be as unfounded as many others of a similar character. It appears, however, that the prophecy was not only very popular and held in much repute at the east end, but obtained influence at the west end of London also. Amongst other instances mentioned, a man residing in Paddington-street, Marylebone, formerly a police constable, is said to have sold a good business to provide the means for his leaving London; and a clerk holding a salary of 200*l.* per annum, residing in the same parish, also resigned it for the purpose of escaping the anticipated calamity. The credulity of belief in this vicinity is stated to have been not confined to the lower and more ignorant classes of Roman Catholics, but to have been participated in by many belonging to the Wesleyan and other sects. On Tuesday morning, about four o'clock, several of the inhabitants of the southern parts of the Metropolis imagined that the earthquake had actually commenced, in consequence of there being two or three loud peals of thunder, accompanied by several vivid flashes of lightning, which caused the horizon to present an appearance similar to when a large fire is raging. Numbers, it is said, left their beds, and several refused to return on any account. Many persons, it is added, were observed leaving London; amongst them an elderly lady, who had resided at Kennington for 40 years, although nearly 80 years of age, left for Gravesend, on a visit to her son-in-law, as it is asserted to be out of the way, "until after the earthquake was over." Numerous carts and waggons laden with furniture were also seen to leave the Metropolis by different routes, for the purpose, it is stated, of being deposited beyond the prescribed limits of the expected convulsion. The origin of the prophecy does not appear to be traced to any authority more authentic than that London would be destroyed within a certain period when it had no king. About 1720 was the last prophecy for the destruction of the Metropolis by an earthquake which met very extensive belief. Although, however, shocks of earthquakes have been felt in various parts of this country, none have ever been experienced in London, where, from the nature of the strata, it is considered impossible they could occur.

The Olive-trees of Jerusalem.—The following is an extract from Dr. Robinson's recently-published "Researches in Palestine," which perhaps may prove interesting to some of our readers. The vaults spoken of are immense crypts some hundreds of feet in extent in the immediate neighbourhood of the Temple: "The ground in these vaults rises rapidly towards the north, the southernmost columns with the double arches being about 35 feet in height, while those in the northern parts are little more than 10 feet high. The surface of the ground is everywhere covered with small heaps of stones, the memorials of innumerable pilgrims who have here paid their devotions. It is a singular circumstance that the roots of the large Olive-trees growing above have in many places forced their way down through the arches, and still descending, have again taken root in the soil at the bottom of the vaults!"

Chimney-Sweeping.—It may be worth while to draw the attention of our readers to a recent Act of Parliament, entitled an Act for the Regulation of Chimney-sweepers and Chimneys, from which the following is an extract:—"And be it enacted, that from and after the first day of July, in the year 1842, any person who shall compel or knowingly allow any child or young person under the age of 21 years to ascend or descend a chimney, or enter a flue, for the purpose of sweeping, cleaning, or coring the same, or for extinguishing fire therein, shall be liable to a penalty not more than 10*l.* or less than 5*l.*" This act was passed in the summer of 1840, and its operation was delayed for two years by the Legislature, that such chimneys as required it might be altered and adapted to the use of the machine. These two years will expire on the 30th June next, and it would therefore have been desirable that those who had not attended to the subject should have had their chimneys examined by some one qualified to determine whether they could be swept by the machine without alteration, or they might have been subjected to serious inconvenience. An ingenious machine, however, for which a patent has been taken out, has just been invented to meet the difficulty; and being equally adapted to every form of chimney, it is expected to obviate the necessity of incurring any expense in building new chimneys, or altering old ones. This new machine is called the Ramoneur, and is calculated, it is stated, to sweep the most crooked or tortuous flues, and will even adapt itself to horizontal branches of chimneys lying at a right angle with a perpendicular flue. This invention is regarded as important, as being from its peculiar construction capable of penetrating into places in flues into which children could not have gone. The instrument has also the power of contracting or expanding to suit the width of the various flues in which it may be employed. The foreign patents not being completed, a full description of the principle and construction of the machine has not yet been published.

Antiquities.—At a recent meeting of the Society of Antiquaries, the Secretary read a letter, addressed by Lord Albert Conyngham to Mr. Akerman, giving an interesting account of his lordship's excavations in the tumuli on Breachdown, near Canterbury, in September and October last; and which were noticed in this paper at the time. A letter was then read from Mr. Akerman to his lordship, in which the writer expressed his conviction that these interments took place towards the close of the sixth, or the beginning of the seventh century, and cited evidence in support of such opinion. Several of the objects discovered were exhibited to the meeting. They comprise spear-heads, swords, knives, umbos of shields, an elegant gold bulla, a brooch set with garnet, crystal and porcelain beads, and a necklace composed of oblong beads, formed, apparently, of native amethystine quartz.

Geology.—In a late sitting of the Académie des Sciences at Paris, M. Elie de Beaumont read a detailed account of what may be called the economy of warm springs. The experiments on which this report is based were made by M. François at Bagnères de Lucton, who lays it down as a general law, that mineral waters are the result of springs, which, after having oozed through fissures in the crust of the globe, come up on the surface by a sort of natural artesian well. By following up this argument in a series of experiments, M. François has been able to treble the amount of water in the warm springs of Bagnères.

New European Animal.—By the kindness of a friend, a retired artillery officer, who is the manager of some mining establishments in the Sierra Morena, I have been able to make the curious addition to the European Fauna of no less an animal than the Ichneumon. I ascertained the existence of this animal when in Spain, from my friend the Marquis de las Amarillas, now Duca de la Ahumada; but from the vague description he gave me could only infer that it was a martin, which inhabits the Pyrenees and the vicinity of Rome, and it was only very recently I received the skin with one of the beautiful spotted lynx (Felis pardina), which were known to exist in the same locality, and of which I brought home some imperfect skins in 1834. Both these skins are now at the British Museum. The Ichneumon is not uncommon in the Sierra Morena, but is difficult to take.—*S. J. Widdington, Carlton, 9th March.*

Law.

COURT OF CHANCERY.—*The New Orders.*—Mr. Romilly, on the part of the Six Clerks, moved for the opinion of his lordship on a point of practice, arising out of the twenty-third of the new orders, which applies to the service of the copy of a bill on a party from whom an answer is not required. By that order it is directed that such bill as against such party shall not pray a subpœna to appear and answer, but shall pray that such party on being served with a copy of the bill may be bound by all the proceedings in the cause. A difficulty had arisen in consequence of some doubts as to the place in which the process of service should appear, it being by some placed in the prayer for relief. The Lord Chancellor was clearly of opinion that it ought to be placed in that part of the bill in which process had been hitherto placed, and directed it to be so for the future.

VICE-CHANCELLOR'S COURT.—*Stubbs* v. *Iveson.*—The only point of interest arising in this case was under the words of the will of a testatrix, by which she directed her executor to pay all the clear residue of the money to arise from her real and personal estates to her cousin, Thomas Marshall, if he should be living at her decease; but, if he should not be so living, to pay 50*l.* to the society of Wesleyan Methodists, and a certain sum to Mary Ann Stubbs. For the plaintiff, it was submitted that there was no sufficient evidence of the death of Thomas Marshall; and, therefore, there should be an inquiry as to whether he survived the testatrix; as to Mary Ann Stubbs, or the person so called in the will, an inquiry must also be made, for it had been discovered that her name was Augusta. With regard to the gift to the Wesleyan Society, it was urged that there could be no doubt, on the authority of several cases decided by Sir J. Leach, and affirmed on appeal by Lord Lyndhurst, that so much thereof as arose from real estate was void; and with respect to the payment of any part of the gift arising from personalty, an inquiry must be made as to the party to whom it was due under the designation of the "Society of Wesleyan Methodists." His Honour, on the cases cited, decreed that the gift was void, so far as it related to real estate, and declared that it had been converted into personalty for the benefit of the residuary legatee, and that the estate itself would not go to the heir at law, and directed the proposed inquiries, and amongst them who were the parties entitled to the share of the gift arising from personal estate; and whether the real name of the plaintiff, sueing as Mary Ann Stubbs, was such, and if not, what was her name, and who was the person meant by the testatrix by the name of Mary Ann Stubbs.

Ford v. *Clough.*—In this case, a lady of the name of Allen, who was possessed of considerable money, and who was of weak intellect, was induced to marry the plaintiff, Ford. A licence was obtained on an affidavit, in which Ford stated that he was 21 years of age; and though by this proceeding he had rendered himself liable to a criminal prosecution, the Court had declared the marriage valid. The question now before the Court was as to the settlement of the wife's property. His Honour directed the property to be settled on the wife for life, with remainder to her issue, and in default, to her next of kin, thus excluding the husband from all participation and power whatever.

On Tuesday, before Sir K. Bruce, the proper treatment of a horse, legatee under the will of its late master, was made the subject of investigation. The testator had bequeathed 50*l.* per annum to his executor in trust for the benefit of his "black mare." The executor had placed the animal out at grass at Harrow. After counsel had been heard *pro* and *con.*, the Vice-Chancellor delivered judgment to the effect, that the legacy was valid, and that occasional supplies of corn, as well as of grass, should be granted to the quadruped legatee.

[illegible] COURT.—*Hewitt* v. *Forster.*—This was an application *ex-parte*, for an injunction to restrain the directors of the Guardian Assurance office, from paying to John Forster a sum of 1,000*l.*, which had become due upon a policy of assurance, effected upon the life of Sarah Hewitt, who died on the 21st Oct., 1841. It appears that Amelia Jane Pinckney, by her will, gave a sum of 2,394*l.* consols to Sarah Hewitt for life, with remainder to the plaintiff, Mary Ann Hewitt, and the other children of Daniel G. Hewitt and Sarah his wife, of whom there are ten. It appeared that defendant allowed the whole of the stock to be sold, the proceeds to be paid to H. G. Hewitt; a suit was afterwards instituted, and an order was made upon H. G. Hewitt, directing him to pay a sum of 1,947*l.*, the proceeds of the stock, into court, but this order was not obeyed, and instead Mr. Hewitt agreed to give security to John Forster. Accordingly, on the 8th June, 1839, he effected a policy of assurance with the Guardian Assurance office, upon the life of Mrs. Hewitt, for 1,000*l.*, and he assigned the policy to Mr. Forster. He also mortgaged certain estates to secure another sum of 1,000*l.* to Mr. Forster. Mrs. Sarah Hewitt died in Oct. last, and Mary Ann Hewitt having attained 21, applied to Mr. Forster for payment of her share of the trust property, upon which it was alleged that he was very angry, and threatened to wind up his affairs in this country and leave it for America. Application was then made to the insurance company not to pay the 1,000*l.* which had become due on the policy; but on the 3d March last, the company informed the plaintiffs that they should pay the money unless they were restrained by the order of this court. Under these circumstances the present bill was filed to obtain the injunction. Lord Langdale considered that he must grant the injunction, but he did not approve of parties coming to this court to obtain an order to restrain payment of a sum of money just previous to the day of payment. He however made the order in the present case, on the ground that the plaintiffs on the 3d March only became aware that the directors intended to pay the amount.

ASSIZE INTELLIGENCE.—The trial of the Wraxhall burglars, for the robbery committed in the house of Mr. Audrey, the circumstances connected with which we gave at the time the offence was committed, in December last, has come on at the assizes at Salisbury. The case excited great interest and sensation in the county, from the daring manner in which the crime was committed, and the great presence of mind displayed on the occasion by the Misses Audrey. The court was crowded during the trial, which lasted nearly 12 hours. John and George Stokes, Nathaniel Burge, John Milsom, John Gough, and William Allen, were placed at the bar, charged with the offence. On the indictment being read, John Stokes pleaded guilty, all the others not guilty. Several witnesses were brought forward on the part of the prosecution, the most important evidence being that of the Misses Audrey, who were examined at great length, their testimony, however, only proving the same facts that have already been before the public. The judge summed up the case at considerable length, after which the jury returned a verdict of guilty against all the prisoners except Milsom. They were then sentenced to be transported for life.

MIDLAND CIRCUIT.—On Saturday John Jones was tried at Nottingham for the murder at Mansfield of Mary Hallam, on the 30th Dec last. As a full account of the transaction appeared in this Paper at the time, it will be sufficient here to state that, by the evidence of the father and mother of deceased, and of the constable who apprehended the prisoner, that statement was fully substantiated on oath. The prisoner's counsel did not dispute the fact of his having committed the murder, but pleaded that the excited state of his mind on the occasion, when told by deceased that she could never marry him, should extenuate the enormity of the crime in the eyes of the jury, and lead them to bring in a merciful verdict. Lord Abinger having summed up, wherein he strongly denounced the views suggested by the prisoner's counsel, the jury returned a verdict of Guilty of Murder. The Judge having put on the black cap, sentence of death was then passed.

WESTERN CIRCUIT.—On Saturday, an action that excited considerable interest was tried at Dorchester, being an indictment against Mr. Drax, the sitting Member for Wareham, under the Bribery Act, found at the last October sessions, and which was moved by *certiorari* into the Queen's Bench. Mr. Serg. Bompas, for the prosecution, stated the case to the jury, and called several witnesses, who proved the election at Wareham in June last, the return of Mr. Drax, who was opposed by Mr. Calcraft, and that Thomas Hutchins was a voter for Wareham, and voted on that occasion. Thomas Hutchins was then brought forward and examined at length, and stated that he had for a long time been in the interest of Mr. Calcraft; that he had been advised before the last election, by a person of the name of Cribb, who was a relation of his, to vote for Mr. Drax, upon the ground that he would get more by doing so; that shortly before the election, Mr. Drax sent for him at Cribb's house, and in effect offered to give him 20*l.* if he would vote for him; that Cribb suggested, that in order to make sure of his vote, the money should be deposited in his hands, and that Hutchins should not have it until after the election, to which Mr. Drax nodded assent. That upon a representation, however, to Cribb, that he was greatly pressed for money, and that he should have his goods seized by his landlord if he could not give him some. Cribb subsequently, before the election, let him have 5*l.* of the money so deposited. The witness went on to state that he afterwards informed Mr. Bartlett, who was Mr. Calcraft's agent, of this affair, and that at the time he did so two other persons were present, viz. Mr. Broshfield and Mr. Cole. He also stated that he marked the sovereigns which he received by a mark across the nose, and gave them so marked to a Mr. Robson, in the presence of Mr. Dugdale. A number of witnesses were then examined in support of the above statement, after which Mr. Cockburn, counsel for the defendant, made a powerful address to the jury in defence of his client. The judges then summed up, beseeching the jury not to be led away by the powerful and varied speech of Mr. Cockburn which they had listened to; dwelt with particular force on the enormity of the charge preferred against Mr. Drax, and then went over the evidence in all its bearings. The jury returned a verdict of 'Not Guilty.'

NORFOLK CIRCUIT.—On Monday, at Aylesbury, William Cooper was indicted for having assaulted Anne Tripp, and with having unlawfully stabbed, cut, and wounded her, with intent to do her some grievous bodily harm. This case, which was one of a rather mysterious character, from the want of any apparent cause for the unprovoked assault, was reported in this Paper at the time of the occurrence, on the 2d Nov. last. It will be remembered that Miss Tripp, while taking a walk on the road towards Dean's-wood, was overtaken and accosted by the prisoner, who, without any provocation or assignable reason, made an attempt to cut her throat, which, however, he did not succeed in effecting, though he seriously wounded her, and then made his escape. He was afterwards apprehended and identified by Miss Tripp. In confirmation of the statement of the prosecutrix, collateral evidence was adduced, bringing home the crime to the prisoner, and the jury, after a careful address from the judge, found the prisoner Guilty, and he was sentenced to 15 years' transportation.

TATTERSALL'S, THURSDAY.—The betting was flat in the extreme, and beyond the advance of Auckland to 16 to 1, consequent on the Warwick running, and a few inquiries after the Lord of Holderness, presented nothing worth dwelling on. The odds quoted against the other horses mentioned do not differ materially from those reported last week.

MARK LANE, FRIDAY, MARCH 18.—The greater part of English Wheat disposed of on Monday has been for resale, owing to the inferior condition, and such qualities are selling at lower prices. Free Foreign is in retail demand at Monday's currency; Bonded very dull.—Barley is difficult of sale; the same prices demanded. Peas and Beans remain without alteration.—There is no improvement in the value of Oats.—Since the determination of the Board of Trade has been known, to continue the present duty on Clover Seed until the 1st June, confidence has been restored in the trade, and prices are much the same as on this day se'nnight.

March 16, 1842.

NEW & SUPERB GERANIUMS, CALCEOLARIAS, FUCHSIAS, DAHLIAS, VERBENAS, PANSIES, &c.

WM. CATLEUGH respectfully informs the Nobility, Gentry, and the Public, that his Spring CATALOGUE of the above Flowers will be ready in April, including —Fuchsia, Conspicua arborea, raised by S. R. Prouse, Esq., which will be let out in May, at 10s. 6d. per plant, of vigorous and erect growth, with a bold and ample foliage, flowers of a delicate carnation, or pale flesh colour; Sepals beautifully tipped with a distinct green, having when fully out and expanding bright scarlet Corolla; Pistil and Stamens rather more rosy than the sepals. Also two new and distinct Verbenas, Ne Plus Ultra, and Elegans. Dahlia, Lady Ann Murray, a beautiful mottled white, tipped with bright rosy purple, a well-formed flower, with fine centre, one of the most constant Dahlias grown, desirable to the most limited grower, 3 feet, 10s. 6d.—Hans-street, Sloane-street, Chelsea.

DAHLIA CHALLENGE.

HEADLY'S PHŒNIX, superb dark scarlet, great depth of petals, beautifully cupped, extra fine, 10s. 6d. See the coloured plate of PHŒNIX in "Wakeling's Florist's Guide" for December last.

HEADLY'S SATIRIST, rich shaded orange, fine back row flower, 7s. 6d.

J. HEADLY, Florist, London road, Cambridge, will show Twelve Blooms of Phœnix for 10l. or 20l. against any other Scarlet Dahlia, at the ensuing show of the London Floricultural Society, and will deposit [illegible] in the hands of the Secretary, p. p. Strong and well rooted plants of the above will be sent out the last week in April, if required. His Catalogue for the season may be had immediately.

ARAUCARIA IMBRICATA.—Fine strong Plants one year from seed.—The most noble, hardy, and splendid ORNAMENTAL EVERGREEN TREES ever introduced into the British Empire, are now selling at Messrs. W. and F. YOUELL'S NURSERY, GREAT YARMOUTH, at 3l. 3s. per dozen, or 25l. per 100. Specimens may be seen and orders taken at their Agents', Messrs. Flanagan and Co., No 9, Mansion house-street, and at Messrs. Noble and Co.'s, 152, Fleet-street, London.

CARNATIONS and PICOTEES.—The Nobility, Gentry, and Florists are respectfully informed that Messrs. W. and F. YOUELL can supply the above Flowers at the following prices. Their collection is the most extensive and select in the kingdom, and for strength and healthiness are unrivalled. They beg to state that none but first-rate show flowers will be sent out.

12 pairs of fine Show Flowers, by name		£1 10s. 0d.
25 do. do.	do.	3 0 0
12 do. extra fine	do.	2 10 0

Amongst which will be included a pair of that splendid Red Picotee ANACREON.—Great Yarmouth Nursery.

ROBERT BUCK, BLACKHEATH GARDENS, KENT, has Two-year-old VINES in Pots, from single eyes, of the following sorts to dispose of.

Black Prince
Black Hambro'
Black Grape from Oporto
Clew's St. Peter
Raisin des Carmes
Grizzly Frontignac
Cannon-hall Muscat
Charlesworth Tokay
White Muscat of Alexandria
Money's Escholata Muscat
White Dutch Sweetwater
White Muscadine

Blackheath Gardens, March 24, 1842.

RANUNCULUSES, ANEMONES, AURICULAS, CARNATIONS, PICOTEES, AND GERANIUMS.

H. GROOM, CLAPHAM RISE, near London, (removed from WALWORTH), by Appointment Florist to Her Majesty, respectfully informs the Nobility, Gentry, and the Public, that he has a fine Selection of the above Flowers, which he can offer at the following very moderate Prices.—

	£	s.	d.
RANUNCULUSES.			
500 Roots in 100 superb sorts, with their names .	5	0	0

12 superfine sorts, with their names, 1 pair of each	2	2	0
GERANIUMS.			
25 superfine sorts, with their names, 1 plant of each	3	10	0

A Catalogue of Geraniums can be had on application.

MYATT'S VICTORIA RHUBARB.

J. AND W. MYATT having a good Stock of Strong Roots raised by offsets from the original Seedling, can supply them at 16s. per hundred.—N.B. As various spurious sorts have been sold and are now selling under the name of "Myatt's Victoria," purchasers would do well to require them warranted.—Manor Farm, Deptford, Oct. 23, [illegible].

T. JACKSON, Nurseryman, &c., Kingston, Surrey, respectfully informs his Patrons and the Admirers of Horticulture, that his Supplement CATALOGUE OF PLANTS, with their prices, for 1842, and his List of Choice Show DAHLIAS may be obtained on application.

Kingston Nursery, March 17th, 1842.

VERBENA JAMESONII.—For description, &c., see Floral Cabinet for Jan., Feb., and March. Plants, second week in April, 5s. Usual discount to the Trade where more than two plants are taken. Also Scions of their APPLE the Sturmer Pippin (true from the original), may be had forwarded by Post, upon the receipt of 2s. 6d. Address S. and J. Dillistone, Nursery, Sturmer, near [illegible].

SEEDLING CINERARIAS AND VERBENA

WILLIAM IVERY, FLORIST, PECKHAM, near London, begs respectfully to inform the Public that he has a few more blooming plants of the Cinerarias, Rival King, Royal Blue, Imperial Blue, and Queen Victoria, pure white, at 3s. 6d. each; also, Verbena, Queen, pure white, at 7s. 6d. each. For particulars, see *Gardeners' Chronicle* and "Gazette" 19th inst., and "Floricultural Cabinet." Catalogue of all the newest Fuchsias and Verbenas can be had on application.—P.S. Verbena can be forwarded by post.

J. MITCHELL, PILTDOWN NURSERY, Maresfield, Uckfield, Sussex, begs respectfully to acquaint his friends and the public he intends sending out in May his two superb seedling DAHLIAS, viz., "SNOWFLAKE," pure white, occasionally tipped with beautiful lavender, cupped petals and first rate show flower, strong plants the first week in May, 4 feet, 10s. 6d.; and "MISS SHIFFNER," beautiful rosy pink, cupped petals, and superior shape, strong plants the third week in May, 4 feet, 15s.—March 22, 1842.

NEW AND SUPERB FUCHSIAS.

THE Nobility, Gentry, and Florists, are respectfully informed that Messrs. W. and F. YOUELL having bestowed great care and attention in forming a collection of all the new Fuchsias sent out by various parties, which have proved to be of great beauty and distinctness, and having selected about thirty varieties which they can confidently recommend, they offer to send them out the first week in April, at the rate of 21s. per 12 varieties, fit for competition at any of the Horticultural exhibitions of the ensuing season. By enclosing a Post-office order for one pound, they will be sent post free to any part of the United Kingdom. Their list of Fuchsias, with respective prices, can be obtained by enclosing a Postage Stamp.—Great Yarmouth Nursery, March 15.

J. HENCHMAN begs to inform Cultivators of the PANSY, that he still has for Sale good healthy well rooted Plants of many of the leading varieties in his collection; and begs to call the attention of Amateurs to the very moderate rate at which they may improve their collections of this favourite flower.

12 fine Seedling varieties by Name	42s.
12 first-rate Show Flowers, selected from the best of last year's varieties by various growers	21s.
12 superior varieties ditto ditto	18s.
25 good Show Flowers, including many of last year's var.	30s.

A few Packets of Seed at 2s. 6d. and 5s.

N.B. A remittance is requested from unknown Correspondents.

Edmonton, near London, March 15, 1842.

C. FARNES, 128, St. John-street, Smithfield, as the season for sowing Broccoli, &c., is now arrived, begs to call the attention of Amateurs and Gardeners to CHAPPELL'S SPLENDID CREAM BROCCOLI, for which an early application is requested, as the Stock is small. Also the undermentioned Seeds:—

Ady's fine large Cos Lettuce
Black seeded Bath, ditto
Chappell's early White Broccoli
Early White Cape ditto
Large Wakefield ditto
Fine Purple Cape ditto
Knight's Protecting ditto
Fine Early London Cauliflower
— Late ditto ditto
Fine dwf. White Solid Celery
„ Red ditto ditto
Early Hope Cabbage
„ Sugarloaf ditto
„ [illegible] ditto
Fine Large Imperial ditto
„ Drumhead Savoy
„ Blood red Beet
Early [illegible] Turnip

Also a fine collection of the newest and best varieties of Flower Seeds.

C. F. can confidently recommend the following Agricultural Seeds to the notice of Gentlemen and Farmers, being carefully selected from the best stocks:—

Skirving's Liverpool Swede Turnip
Golden Melon ditto
True Purple-top ditto
„ Yellow Tankard ditto
„ Hybrid Yellow Green top do
Large White Belgian Carrot
„ Selected Altringham ditto
True Cowgrass ditto
Italian Rye ditto
Peacey's ditto ditto
Large Drumhead Cabbage
„ „ Red ditto
„ Turnip-rooted ditto
Long Red Mangel Wurzel
Yellow Globe ditto ditto
Red ditto ditto ditto
Bokhara Clover
New Lucerne
Mixed Meadow Grass Seed of the best description
Mixed Grass for Lawns

SEEDLING DAHLIAS to be sent out in May next, by N. GAINES, FLORIST, SURRY-LANE, BATTERSEA.

Gaines' ORANGE PERFECTION, beautiful orange, at times shaded. This flower was sent for the opinion of the Horticultural and Floricultural Societies of London, at both places considered first rate. It is a fine grower, throwing its flowers well above its foliage. A good show flower. Awarded first Prize at Kingston, and 2nd Prize at Teddington. 4 ft. 10s. 6d.

Gaines' EMPEROR, beautiful rosy crimson, very superior petal, with great depth of flower, and well up in the centre. A constant good show flower. Awarded 2nd Prize at Kingston. 3 ft. 10s. 6d.

Gaines' COMPACTA; fine purple, very superior form, of excellent habit, throwing its blooms well above its foliage; its centre well up. A good show flower. Awarded 2nd Prize at Hammersmith. 5 ft. 10s. 6d.

N.B. The above were considered first-rate flowers by those that saw them growing. Plates of them will appear in "Wakeling's Amateur Guide," in April and May next.

N. Gaines' extensive List of first rate Dahlias, Geraniums, Pansies, Calceolarias, &c. may be obtained by post-paid application as above. His new Cineraria, Prince of Wales, is now ready for delivery.

WANTS a SITUATION as GARDENER, a married man, aged 26, who perfectly understands the management of Kitchen garden, Flower garden, Wall trees, Greenhouse, &c. Can be highly recommended, and a most unexceptionable character given from the gentleman whom he has lived with eight years.—Address A. B., Mr. Pawley's, White Hart Hotel, Bromley, Kent.

WANTS a SITUATION as GARDENER in a Nobleman or Gentleman's family, and near a Catholic chapel, a Married Man, 40 years of age, with two Children, the youngest 4 years old; with an unexceptionable character, having lived six years with a great plant grower in Yorkshire, and who understands the Forcing of Fruit, and Gardening in all its branches. Address J. Seymour, Mr. James Seymour, Countess of Bridgewater's, Ashbridge, Berkhampstead, Herts.

WANTS a SITUATION as GARDENER, a Single Man, aged 28, who thoroughly understands the management of Pines, and of the Forcing department generally, with the Kitchen, Fruit, and Flower Gardens. He can be highly recommended by the master he is about to leave, whom he has served upwards of three years. Wages, if to live in the house, not under 30l. per annum; or if out of the house, 1l. per week. Letters, post-paid, addressed to C. H., Post-office, Norwood, will be promptly attended to.

WANTS a Situation as GARDENER, a Single Man aged 26, who thoroughly understands the management of Pines and Forcing in general, &c., Kitchen and Flower Garden. Would have no objection to take the management of the farm if not too extensive. Upwards of three years' character will be given from the last place, and most respectable reference for character and ability can be had from different families with whom he served. Has no objection to what country he goes. Apply personally, or by letter, to — C[illegible], care of Messrs. Loddiges, Nurserymen, Hackney, near London.

SPLENDID SEEDLING GERANIUM.

MESSRS. ROGERS and SON beg to say they are now sending out that Superb Geranium BENNETT'S LADY COTTON SHEPPARD; strong plants 42s. each. It is allowed to be one of the best kinds grown, and indispensable to exhibitors of the Geranium. Blooms have been inspected by the Editors of the "Gardeners' Gazette," "Floricultural Magazine," and "Floricultural Cabinet." A Circular, stating the opinions, may be had as above. Plants also may be had of the following, who are appointed Agents:—Mr. Gaines, Battersea; Mr. Mearns, "Gardeners' Gazette" Office, Strand; Messrs. Warner, 28, Cornhill, London; Mr. A. Pontey, Plymouth; Mr. Blackford, Clarendon Garden, Jersey; Mr. May, Bedale, Yorkshire; Mr. Miller, Newcastle-under-Lyne; Messrs. Godwin, Market Drayton, Salop; Mr. Lodge, Broughton, Manchester; Messrs. Pope and Sons, Handsworth, Birmingham; Mr. Holmes, Sudbury, Derbyshire; Mr. Groom, Clapham Rise.

Uttoxeter, Staffordshire, Feb. 10th, 1842.

CHOICE FLOWER SEEDS.

LUCOMBE, PINCE, & CO., having an extensive and well-selected Stock of all the newest and choicest FLOWER SEEDS, to the cultivation of which they have paid considerable attention, and the quality of which they can confidently recommend, beg leave to offer them for sale, delivered carriage free to any part of the Kingdom, on the following terms:—

25 packets of distinct named sorts .	21s.
50 do do do . . .	30s.
100 do do do . . .	42s.

Amongst them are—Asters, Brachycome Iberidifolia, Clintonia pulchella, Erysimum Perowskianum, Godetia Willdenowii and Schamini, Lupinus Hartwegii, Martynia fragrans, Mesembryanthemum tricolor, Phlox Drummondii, Stocks, Zinnias, &c. &c. Catalogues of which may be had on application to them.

Exeter Nursery.

BROWN'S MARQUIS of LANSDOWNE DAHLIA.—This most essential Show Flower will be sent out in May next. Colour, shaded salmon; fine cupped petals, which are beautifully arranged; and one of the most constant and successful Dahlias of the season, having obtained Seven Seedling Prizes, three of which were first, and twice defeating "Conqueror of the Plain." Also shown in three successful Stands of two 24's, and 12 blooms for three 2nd prizes. A drawing was made by Wakeling, which will appear in the *Florist's Guide*, March 1842.

T. B. has a few strong Plants on hand of his much admired Seedling PANSIES the "Countess of Orkney" and "Jewess," at 7s. 6d. each.

A CATALOGUE, containing a choice selection of DAHLIAS and HEARTSEASE, is now ready, and may be had on pre-paid application.—Slough, March 26, 1842.

SCARLET PELARGONIUMS.

PHILIP CONWAY, Florist, Seedsman, &c., Old Brompton-road, near the West London Cemetery, has the honour of offering to the Nobility and Gentry the following variety of the above, viz.—Frost's Compactum, a very excellent variety, raised at Dropmore, distinct from every other, having a dense cluster of flowers of a globular form and a peculiarly pretty tint; good plants at 2s. 6d. King, a first-rate scarlet, fine large truss, and free bloomer, 2s. 6d. Shrubland, 2s. 6d. Toward's Pre-Eminent, 2s. 6d. Scarlet Nosegay, very desirable sort for pots or beds, excellent habit, and very free bloomer, 2s. 6d. Frogmore, for bedding (vide *Gardeners' Chronicle*, No. 39, p. 631), 18s. doz., or 2s. each. Ingram's New Dwarf, for bedding, a decided improvement on Frogmore, 30s. doz., or 3s. each. The dwarfishness and brilliancy of colour of the two last-named will ever insure them a place in the flower-garden.

The most approved varieties of Geraniums, Fuchsias, Verbenas, &c. &c., on very moderate terms.

EDWARD BECK, MANUFACTURER IN SLATE, Isleworth, Middlesex, respectfully informs Horticulturists, that his IMPROVED SLATE TUBS for Orange Trees and Conservatory Plants, mounted upon rollers, Slate Cisterns, Shelves, and Edgings for garden paths may be seen in use at his house upon application to the gardener.
